PLC	Programmable Logic Controller
POS	Process Override Switch (also named OOS)
PSD	Plant Shutdown System
RAID	Redundant Array of Inexpensive Disks
RSD	Reactor Shutdown System
RTO	Regenerative Thermal Oxidation (Unit)
SER	Sequence of Event Recorder
SIS	Safety Instrumented System
SOE	Sequence of Event
S-PLC	Safety Programmable Logic Controller
SQL	Structured Query Language
SWS	Supervisory Workstation
UPS	Uninterruptible Power Supply

1.5 PLANT PROCESS UNIT

The plant has been divided into the following distinct process systems:

- Steam Generator System;
- Boiler Steam Sootblowers;
- Boiler Bottom Ash Hopper Removal System;
- Boiler Feed Water and Deaerator system;
- Main Steam system;

- Auxiliary Steam system;
- Fuel Oil System;
- Fly Ash Handling System;
- Flue Gas Desulphurization System (FGD);
- HV, MV, LV Electrical systems;
- Steam Turbine Generator system;
- Condensate system;
- Condensate Polishing System;
- Vacuum cleaning system;
- Waste water collection system;
- Waste water treatment and discharge system;
- Intake Water Band Screen;
- Elettro Chlorination System;
- Deoling System;
- Sea Water Desalination System;
- Water treatment system;
- Coal handling system;
- Overland Coal Coveyors;
- Fire fighting;
- HVAC;
- Circulating Water System;
- Compressed Air system;

1270

- Instrument air system;
- Chemical dosing system;
- Sampling system;
- CEMS;

Dr. Ramón Ma. Lugo Manzello
Abogado Notario Público
Mat. # 2570
Santo Domingo, R.D.N.

2. PLANT OPERATIONS

The Central Control Room (CCR) is the main centre of control and operation and all the actions required for a normal and safe plant management (i.e. either authorization to actions on field devices or instructions to field operators) will be taken by the control room.

2.1 MAIN OPERATOR INTERFACE

One Operator Console containing all operator workstations and equipments required for the Power plant will be installed inside the CCR and will provide the main operator interface.

The Operator Console shall be sized and divided accordingly to permit the Power operators to control and monitor the Power main process and the equipment packages.

The Operator Console shall consists of ergonomic bays able to h

ouse the Operator Workstations (OWS), ESD Shutdown Console (SDC) with hardware push buttons(Emergency Shutdown).

The operator console shall include an additional Operator Workstation OWS equipped with a "Large LCD Screen" for indicating the overview of Allarms Power Plant (both Units).

During normal / routine operation, the plant will be controlled by DCS. In case of emergency, the Shutdown systems will take the control and put the plant in safe condition. The emergency operations will be performed by means of the dedicated hardwired SDC.

Interlock graphic pages on DCS OWS including process alarms, system alarms and sequence of event pages will support the operator in managing the emergency shutdowns.

The package units in the Power Plant process are controlled and monitored (e.g. start/stop) from the DCS to the maximum extent possible (i.e. control and safety logics implemented inside DCS). Exceptions will be for some subsystems which shall have its own dedicated PLC control system with communication interface to the DCS.

2.2 FIELD LOCAL OPERATION

In general, some equipments (motor; pumps etc.) may be started from field by means of dedicated local control boxes (local panels LP). Once started, they will be managed from CCR via the dedicated pages in

DCS OWS. Machine LPs will implement the minimum commands (alarms necessary to start the equipment or to perform emergency stop).

Whenever remote start/stop commands to MCC from DCS are foreseen, any exception due the process requirements is shown in the P&ID.

2.3 SYSTEM ENGINEERING

All activities relating to the configuration and maintenance of the control systems and subsystems shall be carried out from the Engineering Room in control building.

3. PLANT CONTROL PHILOSOPHY

3.1 GENERAL

The entire Power Plant will be controlled from Central Control Room using a Distributed Control System (DCS). Current technology of microprocessor based digital systems shall be used for control and safety systems wherever possible. Most control and operator interface functions shall be implemented using the DCS.

Only PLC Packages Coal Handling, Overland Coal Conveyors, Water Treatment System and Waste Water System will be as stand-alone system and will be established to the plant DCS only for monitoring and trending purposes.

The ESD, which performs related safety interlocks and emergency shutdown functions, shall be completely independent from the DCS process control system to ensure the highest available level of integrity for system operation and performance.

The CONTRACTOR will develop the project on a fully Integrated Systems basis, each system or subsystem being integrated into an overall structure. It will be the System Integrator's responsibility to ensure that the above systems function as individually specified and are integrated to collectively provide satisfactory operation of the necessary interfaces.

3.2 CONTROL SYSTEM DESIGN

The entire automation system will consist of:

- DCS for Power Plant;
- ESD for Process Units shutdown of Power Plant;
- Subsystem PLC Units
- Instrumentation for Power Plant.

A general block scheme of the control system architecture is provided in document General Control System Architecture (3645-JK-DQ-0101).

3.2.1 Basic Requirements for Control Systems

All supplied devices and equipment shall:

- Be latest field-proven in Power Plants
- Be selected according to ambient environment and process requirements
- Be highly reliable
- Perform a minimum availability of 8000 hours per year of continuous operation
- Be robust against electromagnetic and radio frequency radiation [according to IEC-61000 Electromagnetic compatibility (EMC)]
- Be provided in a class of protection suited to ambient conditions
- Be sufficiently protected against the humidity and dust

The fail-safe signal principal criteria shall be applied to all the loops (in particular for safety loops).
In case (if any) DCS and ESD will control the same actuator, the ESD output will be wired to the field actuator and DCS control function will be connected to ESD via serial link.

3.2.2 Master Clock

The DCS shall be available to accept the master clock synchronization from new GPS in order to synchronize the other systems and, if required, subsystems (ST, Hydrogen Package, etc...)
ESD systems will use the synchronization signal for the Sequence of Event (SOE) time stamping.

3.2.3 General note for SIL Classification

The ESD hardware and Software shall be designed and selected, by applying the codes defined in IEC 61508 and implementing a proper Safety Lifecycle as per IEC 61511 providing the guidelines to design and to verify the systems comprised of electrical and / or electronic and / or programmable electric components that are used to perform safety functions.

IEC-61511 requires a design methodology that:

- Remove uncertainly regarding the safety integrity, cost effectiveness and availability requirements
- Reduce over-engineering
- Prevent under-engineering and therefore increase integrity
- Provide a basis for maintenance and operating strategies

This procedure considers SIL classification as a part of verification approach specified in IEC-61511.

SIL classification shall be carried out on the Safety Instrumented Functions (SIF) for the process unit area, including, as applicable, fire / gas detection and packages.

Safety Integrity Level (SIL) is the discrete level (one of a possible four) for specifying the safety integrity requirements of the safety function, where SIL 4 has the highest level of criticality and SIL 1 has the lowest.

The maximum SIL level acceptable in the Process Industry is SIL 3.

The classification and design of the classified Safety Instrumented Functions (SIF) will be performed in accordance to IEC 61511, following Tecnimont working practice H1SD001 and the relevant detailed procedures.

3.3 DISTRIBUTED CONTROL SYSTEM (DCS)

3.3.1 General

The DCS shall continuously monitor and control the plant to produce product on specification, minimizing energy consumption, impact environment, maintenance costs and need of operator intervention.

The DCS equipment will be installed in not-hazardous indoor locations (CCR, FAR and CR).

The DCS hardware and software shall be supplied in order to achieve segregation at any level (Unit, Area, signals, I/O cards, I/O racks, PCU, OWS).

Special care shall be applied on the selection of the electronic devices to reduce the models minimizing the spare holding and applying standardization.

The DCS system will comprise as a minimum:

- Operator consoles (OWS, EWS, etc)
- Data storage units
- Process Control Unit (PCU)
- Interface units to Process
- Interface units to other Control systems and subsystems (PLC, MMS, MCC, etc.)
- Plant Data History stations

3.3.2 Definitions

3.3.2.1 Control Scan Rate:

The scan rate of a controller is defined as the interval between two successive executions of the PID algorithm of the block. It does not indicate the total time needed for a change in the loop analogue input to produce a change in the corresponding analogue output.

3.3.2.2 Graphic call-up time:

This indicates the total time needed from the moment the operator pushes a button calling up a page to the moment all the static parts are displayed on the page and the live (dynamic) areas show the current value in the system database.

3.3.2.3 Graphic Refresh Time:

This indicates the time needed to update the content of all the live areas contained on the same graphic display.

3.3.2.4 Maximun CPU Loading:

By specifying a maximum loading means that all processing functions of a station (i.e., monitoring, control, logic operations, etc.) shall not engage the CPU for more than a certain percentage of its capacity.

3.3.3 Human Machine Interface (HMI)

The HMI is an integral part of the delivery of the DCS system and constitutes the central information and control interface point.

Operator Workstation (OWS) and Engineering Workstation (EWS) mainly compose the HMI.

The operator consoles for the Power Plant are located in the Central Control Room (CCR).

OWS and EWS stations are based on standard market available PC hardware and configured with different software or hardware key to enable their access capability to all DCS functions.

New DCS stations shall have the same operating system software (MS Windows 2000, XP), system diagnostic software and data base management software.

The stations shall share the printers and the auxiliary storage devices through the DCS LAN Ethernet.

3.3.3.1 Operator, Supervisory and Engineering Workstations (OWS/SWS/EWS)

Each new OWS (Operator Work-Station) shall have "read only" global access capability to any point in the new system network.

As a preferred solution, OWS shall be capable of directly fetching data from the Controllers in case of a faulty connection to the assigned data-server.

The OWS shall be configured to have key access and alarm management to the assigned units/areas of the plant, maintaining the global monitoring access to the

other process units (i.e. Heat Recovery Steam Generations, Air Cooled Condensers, Utilities).

The system shall be configured such that the Power OWS cannot control other process units and vice versa.

The OWS shall have the availability to be loaded with a different pre-configured area profile in case it will be necessary to replace the functionality of one faulty OWS.

EWS (Engineering Work-Station) for each plant shall be loaded with system Vendor software tools for configuration and maintenance activities and will be located in the Engineering Room, which is separated from central control room CCR.

Each OWS and SWS shall have its own processor (CPU) and shall include two LCD screens in a stacked configuration and one dedicated industrial keyboard with pointing device.

Each EWS shall be equipped with one LCD screen.

3.3.3.2 Graphic Display

The Functional Design Specification (FDS) for HMI will include a library, a hierarchy structure, a navigation philosophy, coding technique, Event / Alarm animation criteria, Interlock interface and management guidelines, etc.

During engineering phase the details of FDS-HMI will be finalized, below is shown an example of hierarchy architecture (as a base to start):

- Plant Overview
- Unit Overview
- Mimics showing the main process units (e.g. processors, Steam Generator, Chemical Injection, etc...) with the status of all actuators and sensors

- Start-up / Shut down graphic displays for special packages (compressor, Auxiliary Steam, etc.)
- Interlock display, Cause & effects/Sequence function diagram displays
- Motors Status overview displays
- Steam Turbine overview displays
- Group displays, loop displays, faceplate/trend/alarm displays, report display, etc

3.3.4 System Redundancy Criteria

The DCS will be designed to achieve an availability of at least 99.9%.

This will be achieved by use of redundant equipment (where necessary) and by robust and reliable system of diagnostics and alarms management. DCS will incorporate the following redundancy concepts:

- **Redundant Power Supply Units**

  Power supply units redundancy shall ensure that the failure of one unit shall not affect the normal system operation.

- **Redundant design of system bus**

  The system bus is not equipped with a system master. A failure of one of the system buses does not create any disturbs or control loss. The system bus is dedicated to exchange the data between HMI and Process Control and Data Acquisition Units. Internal communication shall be performed without the use of "traffic directors" and shall allow "peer to peer" communication among process control units. It shall be fully redundant including redundant interface modules.

- **Mass Memory Unit**

  The redundancy shall be as per manufacturer's standards. If manufacturer provides one single mass memory device for the entire system, it must be redundant; if memory devices are provided for each process station, at least two devices with the same information must be in the scope of supply. On line back-up shall be provided for data and system files.

- **Redundant design of processing components [Process Control Unit (PCU)]**

  Process control and data acquisition units (PCU) shall be based on a microprocessor controller system suitable to perform analog and digital functions.

  The redundancy shall be for processors (CPU 1:1), memory, I/O, and connection to interface components and to other remote necessary hardware components bus.

- **Input/Output Cards**

  All signals involved in control loops or in safety interlocks (i.e. implemented in ESD) shall be wired to redundant input and output cards.

- **Communication with other process sub system**

  DCS shall be connected to ESD system and other Subsystems (Package PLC, MMS, etc) via redundant communication link (Modbus TCP/IP on Ethernet or equivalent protocol). As a preferred solution communication between DCS and ESD shall be direct between the processors and not through DCS servers.

  The ESD system shall be integrated inside the scope of supply of the DCS vendor and the fault of any unit in redundant configuration shall initiate the redundant back-up unit to take over without affecting the current system operation (bump-less).

  The diagnostic system shall be automatic and run on a continuous basis without operator intervention.

3.3.5 Loading and Spare Requirements

Loading of the system data communication (internal & external) shall not exceed 50% of total time under all loading conditions.

This applies to DCS, ESD and all other control (sub) systems (e.g. PLC of package units).

The DCS System shall have:

- Fully installed and cabled 25% spare capacity complete with field terminals, I/O cards, CPU etc.
- 20% free space spare capacity divided over various plant sub-systems;
- Each DCS PCU shall provide 50% spare loading for future modifications;
- All wires of the field multi-cables shall be wired to the incoming terminal strips.

Typical scan time requirement for refreshes are as following:

- 1 sec refreshing time for graphics and trend
- Each PCU shall be configured with a scan rate of 250 ms for at least 10 control loops, the rest at 1 sec

3.3.6 Alarms and Events

Alarm handling and processing within the DCS shall be handled in a structured manner.

Alarms and Events will be acquired and displayed in DCS as follows:

- Alarms generated by hardwired signals will be acquired with timestamp of DCS/ESD
- DCS/ESD System Event & Operator changes will be acquired with timestamp of DCS
- Package PLC's alarms will be acquired with timestamp of PLC

The DCS Alarm list shall allow integrating the time stamping received from different sources.

It shall be possible to filter the alarms, by process unit or equipment, time window, etc. It shall be possible to inhibit the alarms from specified units, to avoid overloading the alarm list in case some unit would be out of service.

3.3.7 Interface to other Power systems, subsystems, and packages

The DCS system shall be supplied with redundant communications using Modbus TCP/IP or redundant Ethernet network to exchange data with the other systems and subsystems.

Below the list of the redundant links:

<u>X each Unit:</u>

- ST, Auxiliaries and Generator

List of the simple link:

- CEMS

<u>Common part:</u>

List of the redundant links:

- Office Lan
- Dispatching Centre
- HV/MV electrical protections system (for SOE)
- Sub Station

List of the simple link:

- Coal Handling System
- Overland Coal Conveyors System
- Water Treatment System
- Waste Water System
- Air Compressed (also hardwire connection)

List of the Hardwired Connection:

- LV electrical protections system (for SOE)
- Fire fighting
- Emergency Diesel
- HVAC
- MV/LV Automatic Change Over

3.4 EMERGENCY SHUTDOWN SYSTEM (ESD)

3.4.1 Introduction

The plant Emergency Shutdown System (ESD) performs emergency shutdown and safeguarding of the plant. The ESD shall be composed of distributed and independent certified (i.e. TÜV approved) Safety PLC`s.

All ESD shall be separated and functionally independent from Distributed Control System (DCS).

The ESD consists of the following systems:

- Emergency Shutdown System (ESD)

3.4.2 Design of ESD

All the requirements of IEC61508 part 2 and part 3 shall be satisfied, as appropriate, by all the components of the proposed ESD system with no exception (CPUs, I/O cards, power modules etc., but also safety barriers, relays, firmware/embedded software etc.).

The supplier shall show evidence of the compliance by means of certificates, declarations or reports, preferably issued by a known independent organization.

The ESD, being a Safety Instrumented System (SIS) shall be designed using a proper safety lifecycle and per IEC 61511, Clause 6.2, Table 2.

A safety lifecycle is a systematic design process, to prevent the inadvertent omission of important design, implementation or maintenance items associated. ESD supplier shall implement a software development lifecycle as described in IEC-61511, Part 1, and Clause 12.

ESD Hardware shall be based on logic solvers suitable for failsafe application with a fault tolerant and failsafe architecture certified for SIL 3 applications in compliance with IEC 61511.

ESD application software shall use one of IEC 1131 programming languages, and shall be designed to meet IEC 61511, Part 1 and also Part 2, Clause 11.7 for the design of operator interface.

The Safety System shall be interfaced with the DCS using redundant communication buses or links and by hardwired input and output for signals involved in safety interlocks.

Preferably the serial communication between each ESD and DCS should be Modbus TCP/IP on redundant Ethernet network directly at processor level and not through DCS servers; the communication links are only to be used for monitoring signals (also logic Reset from OWS and feedback shall be considered monitoring signals).

Signals from systems or subsystems (as DCS, , Steam Turbine, MMS, MCC, etc.) and used for safety loop trips, for emergency shutdown or for protection machinery circuits shall be hardwired to ESD I/O.

ESD system shall be connected to its Engineering Workstation (ESD-EWS) using TCP/IP protocol.

ESD systems shall be able to perform the Sequence of event recording (SER) (sorted by timestamp) and all related filtering, sorting and saving facilities.

ESD shall generally designed fail-safe such that complete failure of the system components shall not compromise the plant safety.

Any fault resulting in a complete system failure shall be such that all failure modes are fail-safe to the OFF and OPEN state.

This includes all modules and cable faults. The system shall be designed for maximum reliability, safety, and integrity while maintaining overall system availability in both fail-safe and fail danger modes to meet the specified SIL.

3.4.2.1 ESD Scan Time

The scan time of an ESD controller (CPU scan cycle time) is defined as the interval between two successive executions of the logic program including the self-diagnostic checks. It does not indicate the total time needed for a change in the input to produce a change in the corresponding output.

3.4.3 General Functional Requirement

Processors (CPU), communication cards, and power supplies shall be redundant. All safety critical I/O modules shall be redundant.

All modules (including CPU, communication, I/O and power supply) shall be hot replaceable on-line.

Full stroke testing: test interval of the final control elements shall not be shorter than plant-scheduled turnaround.

Mechanism shall be provided for on line testing of field instruments used as SIS initiators without affecting safe operation.

All Process alarms and system faults shall be date & time stamped and recorded in memory circular buffer to be transferred to the SER station (Sequence of Event Recorder SER shall provide a capability to store events for at least 30 days).

Data link from ESD systems to DCS shall include at least the following information:

All hardware I/O image:

- Status of all process alarms and trips
- Status of system alarms (including diagnostic statuses).

3.4.4 Sequence of Event Recorder (SER)

SER functionalities will be supplied into ESD EWS to collect and store the time-stamped events.

The time-stamped events which will be transmitted from ESD to SER EWS stations are change of state for the following signals:

- Status of all process alarms / equipment statuses / initiators / trips and related shutdown commands
- Status of PLC diagnostic and system alarms

Events will be stamped into the system (ESD) that will be kept synchronized with DCS.

Time stamping resolution will be equal at least to the CPU scan time.

SER shall have the capability to sort and analyze the events by unit, time, type and especially first-up indication shall be possible. The SOE messages shall be transferred to the historian system where they will be stored for at least six months.

Printout of the event messages could be done by the SER from EWS on demand.

The application program and software that manages the database will be as per Manufacturer standard.

3.5 FIRE FIGHTING

The POWER plant shall have its separate Fire Fighting System independent from other DCS/ESD systems.

The Gas detectors installed inside new building or field will be connected to addressable dedicated systems (LFCP) and these ones will interfaced to DCS via hardwired connections (cumulative alarms).

3.6 PACKAGE UNITS

The established engineering philosophy for the POWER plant shall generally also be followed in the engineering of the instrument and control systems for Package Units.

Special attention shall be given to the compatibility of equipment / materials obtained from various sources, particularly in relationship to interfacing package unit instrumentation and systems within the plant.

Various package units may also have its associated local start-up panels located adjacent to the package unit, which shall house lamps and pushbuttons, minimum required. To ensure remote monitoring of package equipment, all essential parameters shall be transmitted to/from the CCR.

Start-up of equipment package may be performed in the CCR or locally depending on equipment requirements.

3.6.1 Control Philosophy for Power Packages

Item	Equipment Package	Controlled by DCS / ESD	Controlled by vendor PLC
1	STEAM GENERATORS	X	
2	CONDENSATE SYSTEMS	X	
3	SOOTBLOWER	X	
4	INTAKE WATER BAND SCREEN	X	
5	ELETTRO CHLORINATION SYSTEM	X	
6	SEA WATER DESALINATION SYSTEM	X	
7	DEOILING UNIT	X	
8	FGD	X	
9	BOTTOM ASH	X	
10	FLY ASH	X	
11	FABRIC FILTER	X	

12	SAMPLING SYSTEM	X	
13	CHEMICAL INJECTION SYSTEM	X	
14	STEAM TURBINE – STCS		X
15	DEMI WATER PRODUCTION		X
16	POTABILIZED WATER		X
17	WASTE WATER SYSTEM		X
18	COMPRESSED AIR SYSTEM		X
19	COAL HANDLING SYSTEM		X
20	OVERLAND COAL CONVEYORS		X
21	HV/MV/LV ELECTRICAL PROTECTIONS SYSTEM		X
22	EMERGENCY DIESEL		X
23	CEMS SYSTEMS		X
24	HVAC SYSTEM		X
25	FIRE FIGHTING SYSTEM		X

3.7 MACHINE MONITORING SYSTEM (MMS)

Special machine sensors (vibration, accelerometer, key-phasor, bearing and winding temperature, etc.) of the main rotating equipments (Steam Turbines, BFWP's, FD/PA/ID Fan, CirculatingWater Pumps) will be wired to the racks of a dedicated microprocessor based monitoring system assembled in standard cabinet and located in Field Auxiliary Room (FAR) or dedicated shelter near rotating equipments.

The MMS will be a stand-alone system with a modular structure and redundant power supply units.

Serial link and hardwired signals to DCS will provide all available information, analogue and digital, including alarms.

3.7.1 General

All equipment for MMS shall be in scope of package vendors.

Cumulative trips from MMS will be wired to ESD/DCS/PLC (as applicable) to perform machine protection shutdown.

2 main MMS Systems per each Unit will be foreseen:

- Steam Turbine will be monitored by a dedicated Microprocessor based system.
- BFWP's, FD/PA/ID Fan and Circulating Water Pumps will be monitored by a dedicated Microprocessor based system
- Further rotating equipments (if any) will be monitored by a unique dedicated Microprocessor based system

4. INSTRUMENT ELECTRICAL INTERFACE

4.1 MCC GENERAL REQUIREMENTS

General requirements to interface the MCC with the control systems are:

- The hardwired signals between MCC and the other system shall be through interposing relays
- MV Motors shall be hardwired interfaced to DCS or ESD (or PLC if any)
- LV Motors shall be hardwired interfaced to DCS or ESD (or PLC if any)
- Heater Equipments shall be hardwired interfaced to DCS or ESD (or PLC if any)
- Trip commands from ESD shall always be hardwired (through SIL certified relays)
- Generally the Auto-Restart (if any) of standby motors will be realized in DCS/ESD through dedicated logic.

where is requested (process), motors, pumps etc. may be started from field by means of dedicated local control boxes (local panels LP) connected directly to MCC.

The Local Panel will be enabled in field if receives the release from DCS.

4.2 MCC TEMPERATURE INTERFACE

Winding Temperatures (R-S-T) of the dedicated motors shall be RTD type with T-Transmitter located in local junction box. 4-20mA signals shall be connected to MCC for trip.

ANNEX 1

ANNEX 2

Reference documents: 3645-XZ-SG-0500 Specification for Positive Material Identification (P.M.I.)

1 SCOPE

This specification establishes the minimum welding requirements for carbon steel, austenitic stainless steel (including 904L) and Duplex stainless steel used for fabrication of equipments, including but not limited to pressure vessels, heat exchangers, coolers, towers, columns, fired heaters, tanks and their attachments. This specification applies when referenced on the data sheet, project specification, or in the purchase order.

This specification supplements and does not replace the requirements of the applicable codes and standards. Requirements due to local authority regulations (as required in P.O. and in Project Supply Specification) shall be also complies with and will prevail on this specification.

1.1 In line of principle this specification is not applicable to boilers and related balance of plant (BOP). As concerns P22 and P91 materials, the requirements of specification 3645-XZ-SG-0501 shall be applied considering the following: since the positive results of fabrication and testing of P22 and P91 materials are greately depending on their actual metallurgy and chemistry and also on the experiences of manufacturers (both steel mill and fabricators), the requirements of Specification 3645-XZ-SG-0501 shall be verified and agreed case by case between TCM and each vendor/manufacturers prior to start the fabrication activities. In this concern, every deviations from the above mentioned specifications agreed between TCM and vendor/manufacturers will involve the revision of subject Specification or the issue of a dedicated Technical Report to reflect and summarize the agreed final requirements.

1.2 MATERIALS

If not otherwise indicated in Material requisition or supply specification, Carbon Steel material for Low Temperature design (i.e. colder than –29ºC) shall be supplied by steel mill with certificate including impact tests at the minimum design temperature specified on the equipment data sheet or at colder temperature. In line of principle requalification test by Stockist or Vendor is not permitted.

Steel plates subject during fabrication to heat treatment (i.e. PWHT, normalizing, hot forming) shall be supplied by steel mill with mechanical and impact test carried out **ALSO** after simulated heat treatments. Parameters for simulated heat treatment shall be agree between TCM and equipment Manufacturer considering two additional post weld heat treatment for future weld repair. Manufacturer shall submit to TCM the steel mill certificates for review before starting the fabrication.

1.3 REFERENCE STANDARDS AND CODES

The following standards and codes have been references in this specification.

ASME Section II, Part C	AWS D1.1
ASME Section I, VIII DIV.1 or DIV.2	AWS 5.1
ASME Section IX	AWS 5.4
ASME B 96.1	AWS 5.5
API 620	AWS 5.9
API 650	AWS 5.11
API 661	AWS 5.14
API RP 2000	AWS 5.17
ASNT TC 1A	AWS 5.18
ASME V	AWS 5.28
FOSSIL FUEL ELECTRICAL POWER PLANT sect.48 11 13	
DUCTS, FLUES, AND BREECHING sect. 40 05 16	

1.4 CONFLICTS

Welding and other criteria covered by this specification supplement the requirements of any codes referenced in the purchase specification. In case of conflict between the requirements of this specification and such codes or other project specifications, the most stringent apply. However TCM shall be consulted and a ruling in writing shall be obtained by the vendor before any work is done.

1.5 Terms used in this specification mean the following:

Owner is referred to **ODEBRECHT** or his representative
TCM is referred to Company referenced in the purchase order
VENDOR or **MANUFACTURER** is referred to item supplier or manufacturer
EXAMINER is referred to the personnel of the fabricator who is performing Quality control examinations.
INSPECTOR is referred to Contractor's and/or Owner's inspector or Statutory Agency inspector.

2 WELDING

2.1 WELD MAP AND WELD DESCRIPTIONS

Submit welding information (i.e. weld map, weld descriptions, WPS/PQR) for review when so required by the applicable purchase specification (M.R.). The weld map shall provide space for a simple single-line sketch of an item. All welds except minor non-pressure attachments shall be identified by a separate letter or number. Describe each different weld on weld description. The "Forms" of weld maps and weld descriptions shall be previously submitted to TCM for approval (see annex 1 and annex 2 for reference).

All welding documents shall be collected in an appropriate Welding Book for submission to TCM review. For field assembled equipment, the vendor shall submit two separate welding book for shop and field welds. For field welds, detailed technical instructions for handling, welding, heat treatment, inspection, etc. shall be provided, also test coupons and welding filler metals, including surplus shall be included in the scope of supply.

At the option of TCM, WPS issued on forms provided by ASME Sec. IX can be considered substitute for weld descriptions if they indicate all actual (production) data.
Welding can only proceed after welding books have been received and reviewed by TCM. Any done welding prior to review and acceptance of welding documents is subject to rejection.

Each sheet must be complete and show the purchase order number and applicable item number. Identical items may be included in a single set of forms so long as the data is applicable. Data will be reviewed by TCM's material and welding engineer. Questions may be discussed by phone. If welding documents are returned stamped "NOT ACCEPTED" or "ACCEPTED AS NOTED", the equipment Manufacturer shall revise and resubmit such documents for approval.

The unacceptability ("NOT ACCEPTED" or "ACCEPTED AS NOTED") of welding book after the 2 nd TCM review will require the presence of manufacturer in TCM office for due clarifications.

Accepted Welding Books will be returned to the vendor stamped "APPROVED FOR CONSTRUCTION" or "ACCEPTED". Copies will also be sent to the assigned TCM's inspector for a basis for inspection. TCM's inspector may ask to see any of the vendor's ASME welding procedure specifications indicated on the weld description forms.
Prior to commencement of welding the Contractor shall submit to TCM/Owner's approval the welding procedures to be used in the fabrication of the relevant sections of the work. Please, provide as soon as possible these documents for TCM/Owner's approval as required thereto. Besides the welding procedures required therein, should be included in this current specification that the Manufacturer shall submit for approval the Welding Process Accompaniment & Inspection Procedures.

2.2 Review and acceptance of vendor's welding documents by TCM does not relieve the vendor of responsibility for meeting all of the requirements of the applicable codes, the purchase order, and this specification.

2.3 TCM's acceptance of vendor's welding documents shall not be construed as authority for deviation from the requirements of the applicable codes, the purchase order, or the project specification.
Deviations may only be guaranteed in response to formal, written requests submitted to TCM.

2.4 QUALIFICATIONS

All welding including tack, repair and stud welding shall be performed by qualified welders using qualified welding procedures. Welders, welding operators and welding procedures shall be qualified in accordance with ASME Section IX.
PQR shall be released by official agency recognized by TCM (Lloyd Register, Bureau Veritas, etc); this requirement is not applicable in case of equipment required with ASME stamp.
Copies of the welder and welding operator qualification test records shall be available for review by TCM's representative.

For thickness greater than 50mm, the PQR shall be conducted on material at least 90 percent of the maximum production thickness.

Duplex stainless steel could require impact test per ASME VIII Div. 1 on both component and welding procedure qualification. When the impact test is required for base metal it shall be included also in PQR (W.M.,H.A.Z.).

2.5 Tube to Tubesheet welding

For tube-to-tubesheet welding, welds shall be with filler metal and be 2 pass with each tube welded individually; welding continuously across the tubesheet doing half of the tube circumference on successive tubes is not permitted. In case of manual welding start and stops of successive weld passes shall be staggered.

Welding procedure qualifications according to QW.193 of ASME sec. IX (mock-up) is required for strength welding.
PQR for Titanium tube to tubesheet welding shall include a SHEAR LOAD TEST accordingly ASME VIII DIV.1 APPENDIX A (this test isn't required for U-Tube heat exchangers).
PQR shall be released by official agency recognized by TCM (Lloyd Register, Bureau Veritas, etc); this requirement is not applicable in case of equipment required with ASME stamp.

3 WELDING PROCESSES AND RESTRICTIONS

3.1 The following welding processes are permitted:

3.1.1 Shielded Metal-Arc Welding (SMAW). Do not use SMAW for the root pass of single side groove welds (except for carbon steels with E6010 electrode, when so permitted by strength calculations).

3.1.2 Gas Tungsten-Arc Welding (GTAW).

3.1.3 Automatic Submerged-Arc Welding (SAW-AU).

a) Flux used shall be "neutral" and shall not contribute alloying elements to the weld.

b) The flux-wire combination used for production welding shall be the same brand name and type as used for procedure qualification.

c) Maximum weld deposit per pass shall be 13 mm for carbon steel (P-1) and 10 mm for all other materials.

3.1.4 Flux-Cored Arc Welding (FCAW) for P-1 steels with an external shielding gas. This process is not permitted for root pass in one side welded joints, and for low temperature applications.

3.1.5 Gas Metal-Arc Welding (GMAW) in the short circuiting mode may be used for the following applications.

A) The root pass for any material thickness (subject to TCM's approval)

B) Complete groove or fillet weld provided the wall thickness of either member does not exceed 6 mm.

C) Tack welds, temporary attachments or other applications where the weld metal deposited by the GMAW short circuiting process is completely removed.

3.1.6 Gas Metal-Arc Welding (GMAW) in the spray or globular transfer mode shall not be used for the root pass of open root groove welds.

3.1.7 Plasma-Arc Welding with transferred Arc (PTAW) for hard surfacing and overlaying.

3.2 Welding processes other than those listed above require specific approval by TCM and shall not be assumed as acceptable by the vendor during bid preparation.

4 FILLER METALS

4.1 Use filler metal that is similar to the chemistry, corrosion resistance, and mechanical properties of the base metal being welded.
The use of "G" classification is not permitted.

4.2 Filler metals shall conform to ASME Section II, Part C .
Permission to use filler metals manufactured to other standards must be obtained prior to use. Submit chemical and mechanical properties with the request for approval.
When low temperature design is specified and impact test is required for base material and/or welding procedure qualifications, filler metal shall have impact test guarantees by relevant AWS at the temperature equal to or colder than the specified design metal temperature.

4.3 For welding carbon steels, the weld deposit should meet classification A-1 analysis of ASME Section IX, Table QW-442. For Low Temperature Carbon Steel (with MDMT colder than –29ºC) the chemical composition can exceed A-1 classifications to improve the toughness requirements; in particular, welding material with 1 or 2% Ni shall be used if not otherwise accepted by TCM.

The following requirements for the F-number (weld material certification as per ASME Section IX, Table QW-432)shall also be applied.

Use F1 and F2 for non-pressure fillet welds only.

The use of F3 (E6010 and E6011) electrodes is permitted for carbon steel root passes of groove welds made from one side and for fillet welds only (not for low temperature applications) and provided that strength calculation be satisfied.

Use F4 (E7015, E7016, and E7018) for weldout and fillet welds.

Do not use F4 electrodes for the root pass of groove welds made from one side.
Low-hydrogen electrodes are required for all shielded metal are welding of carbon and low alloy steel (except where permitted E6010).
Do not use C-½Mo weld metal for carbon steel components.

4.4 When joining two different ferritic steels, or when joining ferritic to martensitic steels, the filler metal shall conform to the nominal chemistry of either base metal. However, for attaching non-pressure parts to pressure parts, the filler metal chemistry shall match the nominal chemistry of the pressure part.

4.5 For joining austenitic stainless steel to ferritic or martensitic steels, use Type 309; if the design temperature exceeds 350°C or PWHT is required, nickel-base filler metal shall be used, provided that previous verification and approval is released by TCM.

4.6 For joining nickel-base alloy to ferritic or martensitic steels, use ENiCrFe-3 (Inconel 182), ERNiCr-3 (Inconel 82).

4.7 Do not use type 310 except for welding type 310 to type 310.

4.8 Storage and handling of filler metals and fluxes shall be in accordance with the manufacturer's recommended practice and ASME Section II, Part C.

4.9 For welding carbon steel the submerged arc welding wires shall be limited to AWS classification EL-12 and EM 12K and fluxes shall be limited to F7(A/P)-(X) unless otherwise approved by TCM.
EH 12K filler metal can be also accepted if the hardness, to be measured in PQR and in production joints, do not exceed 200 HB (W.M.).

5 CLAD PLATE AND OVERLAY WELDING

5.1 When integrally clad stainless plates are being joined, strip back cladding on clad plate a minimum of 6 mm (10 mm in case of base metal welded from one side only) from the plate edges before welding of the backing plate. When the cladding is removed, the base material thickness shall not be reduced below the design thickness by more than 1mm. Etching test shall be performed with nitric acid or copper sulphate to ensure complete removal of clad layer on strip back cladded area before start the welding. Weld the backing plate with matching electrodes so that the weld on the clad side is flush with the backing plate surface. Deposited ferritic weld metal must not contact the austenitic or high alloy cladding. For welded seams in austenitic stainless steel clad material, use weld filler metals selected from the following table. Check for the alloy elements of the cladding weld, indicated in the table, using a proven quantitative analytical technique.

CLADDING MATERIAL	WELD FILLER METALS	ALLOY ELEMENTS TO ANALYZE
Austenitic Stainless Steels Types 304, 304L, 316, 316L, 321, 347	1st layer - Type 309L * 2nd layer – matching electrode	C, Cr Ni, Mo, Cb, as applicable

* In case of cladding of 316/316L the welding material for 1st layer shall be 309 MoL and in case of cladding of 321/347 the 1st layer shall be 309 Cb.

The chemical analysis must meet the minimum requirements of the SFA Specification for the welding electrode being used, to a depth of 2 mm from the finished deposit surface, if not otherwise required by datasheets or project specification. Make an analysis for each procedure, on one seam from each shell course, one seam from each head and on each nozzle. If any weld fail chemical analysis, all welds shall be checked. Submit corrective action proposal to the TCM for review and approval.

5.2 In stainless steel weld overlays, if not otherwise required by datasheets or project specification, when alloy overlay protection is specified, the depth of the required alloy composition shall be 2 mm minimum. Weld overlay shall consist of at least two layers. For austenitic stainless steel overlay, use Type 309L filler metal for the first layer. Use matching electrode for the subsequent layer or layers (see also note * in previous para 5.1).
Certain welding procedures may be capable of attaining the required thickness and chemical composition with one layer. Obtain prior approval for use of a one layer technique.

5.2.1 Check the chemical composition of the specified overlay of production welds using a proven quantitative analytical technique. Analyse for the major alloying elements, including carbon to establish that the overlay meets the specified composition to a depth of 2 mm (if not otherwise required) of the specified overlay thickness from the finished deposit surface. Make one analysis of each procedure and one analysis of each shell course, each head, and nozzle.

1300

Weld overlays, both automatic and manual, must be liquid penetrant examined in accordance with Appendix 8 of ASME Section VIII, Division 1. This includes the overlay required to cover welds between courses and around nozzles.

Excessive fissuring in the overlay procedure qualification test shall be cause for rejection (they shall not exceed four for specimen nor shall they exceed 1,6 mm in length). Cracks in corners shall not be considered as a part of examination of procedure qualification test.

In austenitic and duplex (2205-UNS S31803) stainless steel cladded equipment, nozzles, blind and pad flanges with nominal size of 4 inch and above, may be carbon steel overlayed with SS of same composition as the vessel. Solid alloy nozzles in cladded or overlayed equipment can be used only when so permitted by data sheet or project specification on the basis of design temperature, etc.
Tack welding is not permitted on clad surfaces.

6 GENERAL REQUIREMENTS

6.1 All shell and head joints shall be double-welded butt joints with full penetration. In case where double welding is impractical, the root pass shall be made by GTAW process (or SMAW with electrode type F3, E6010 for carbon steel).

6.1.1. If not otherwise indicated on M.R. or Purchasing documents all welds for nozzles and manways shall be full penetration through the vessel wall (SET-IN type). Where heavy wall vessels with small nozzle diameters are involved, an alternative method of full penetration may be permitted if prior written approval is obtained from the TCM.

6.1.2. The layout of shell and head plates shall be made in such a manner that the manways, nozzles, and their reinforcing pads are not located in or on any of the weld seam, whenever is possible.

6.2 Double-welded groove joints shall have their root passes back gouged to sound metal on the reverse side and examined by liquid penetrant before proceeding with welding on that side.

6.3 All single-welded groove joints of nickel alloy, stainless steel, and ferritic steel containing more than two percent chromium shall be welded using a gas tungsten-arc or a gas metal-arc root pass with an inert gas back purge. The back purge shall be maintained for a minimum of two passes.

6.4 All welding including supports, clips, and structural parts shall be completed prior to final heat treatment.

6.5 Permanent weld backing bars other than consumable inserts are not permitted.

6.6 Temporary backing bars must match the chemical composition of the base metal being welded. After welding is complete, they shall be removed flush with the base metal without undercutting. All attachment areas shall be examined by magnetic particle or liquid penetrant methods.

6.7 Grinding and cleaning of stainless steels and nonferrous material shall be done only with tools that will not leave detrimental deposits on the base metal; aluminium oxide or silicon carbide grinding wheels and austenitic stainless steel wire brushes shall be used. These tools shall not have previously been used on other than the material to be cleaned.

6.8 Peening is not permitted. The use of a needle gun for scale removal is not considered peening.

6.9 Welding shall not be performed on cast iron parts.

6.10 When the impact test is required for base metal it shall be included also in PQR (HAZ, weld deposit base material).

6.11 The minimum design metal temperature shall be guaranteed also for filler metal by relevant AWS.

7 PREHEAT AND INTERPASS TEMPERATURE

The minimum preheat shall not be less than that suggested by the applicable code (i.e., ASME Section VIII Division 1, Appendix R, or ASME Section VIII Division 2, Appendix D1.

The minimum preheat for welding shall not be less than 10°C (50°F).

The maximum interpass temperature shall be stated in the WPS.

The maximum interpass temperature for austenitic stainless steel shall be 175°C (350°F).
The preheating required for welding shall be applied also for thermal cutting arc-air gouging.
Preheating of welds in heavy thickness (over 50mm) shall be maintained until the start of PWHT, unless an intermediate heat treatment at 600ºC x 15' min is performed before the joint is cooled under the preheating temperature. Only for butt welds the intermediate PWHT can be replaced by heating at 400ºC x 2 h.

8 POSTWELD HEAT TREATMENT

8.1 In addition to the requirements of the applicable code, the final post weld heat treatment shall meet the following prescriptions:
A continuous recording chart of the temperature indicated by all thermocouples shall be made available to inspector. A copy of these charts shall be included in the fabrication and test records furnished to TCM.

8.2 If the vendor plans to use a local post weld heat treatment, a detailed description of the local heat treatment procedure must be submitted to TCM for review and acceptance prior to use. Attach at least two thermocouples each to the outside and inside surfaces of the equipment (number and location of thermocouples shall be indicated in PWHT procedure).
The use of exothermic kits is not acceptable.

Production welding test plates, when required, shall be heat treated in furnace together with the vessel.

For carbon steel in low temperature service, the PQR shall include all the heat treatment cycles provided for production joints (the sum of holding time in one cycle is not permitted).

8.3 The lower post weld heat treatment temperatures permitted by ASME Section VIII, Table UCS-56 or Table AF-402.2 by increasing holding time are not acceptable. Exception shall require previous approval by TCM.

8.4 Flame impingement on parts being heat-treated is prohibited.

8.5 The temperature of post weld heat treatment of normalised and tempered or quenched and tempered materials shall be kept at least 30ºC below the tempering temperature indicated on material certificates.

8.6 Localized post weld heat treatment may be accomplished by electric resistance or induction heating subject to the following restriction:

A) a full circumferential band must be heated to the required temperature
B) thermal gradients at the extremities of the heater band shall not exceed 80ºC per 300mm
C)heater band shall extend five times the wall thickness on each side of the joint.

8.7 For all ferritic steels with mechanical properties enhanced by heat treatment the vendor shall prove by actual mechanical test results that the cumulative effect of all intermediate and final heat treatment during fabrication does not alter the mechanical properties of the material to values which do not comply with specified requirements. This requirements applied to both parent material and weldments.

9 POSTWELD HEAT TREATMENT FOR SERVICE

9.1 When the vessel data sheet specifies post weld heat treatment for service conditions, welding, hammering, or deformation are not permitted after post weld heat treatment. All internal and external attachments, clips, insulation studs, nameplate bracket, and the like must be welded to the unit before post weld heat treatment.

9.2 On all vessels post weld heat treated for service, paint on two sides of the shell in letters at least 25 mm high, **"POSTWELD HEAT TREATED FOR SERVICE. DO NOT WELD, HAMMER, OR DEFORM".** The paint used must be compatible with both the primer and the finish paint.

10 REPAIR

10.1 MINOR DEFECTS

Repair of surface defects in welds by chipping, grinding and gouging is permitted provided the thickness is not reduced below the minimum required. Removal of defects shall be verified by magnetic particle or liquid penetrant examination. Repair welding of minor defects, as defined in Paragraph 10.3, shall be done only by qualified welders using a qualified welding procedure.

10.2 MAJOR DEFECTS

Major defects in welds and base metals, as defined in Paragraph 10.3, shall be repaired after a written procedure for each individual repair has been prepared.

The written procedure shall include a sketch detailing extent and location of the defect, how defects will be removed, how removal will be verified, qualified welding procedure to be used, subsequent heat treatment and nondestructive examination. This written repair procedure will be included in the data package furnished with the equipment.

Two repair attempts will be allowed on any one defective area. Additional repair attempts require the written approval of TCM.

10.3 The following are the definitions of major and minor defects:

MAJOR DEFECTS

BASE METAL	*WELD METAL*
Crack	Crack, except crater cracks
Repair cavity greater than 6450 square mm (10 square inches)	Repair cavity greater tha6450 square mm (10 square inches)
Repair cavity deeper than 50 percent of thickness or 13 mm (½ inch), whichever is less	Repair cavity deeper than 50 percent of thickness or 13 mm (½ inch), whichever is less
Weld build-up to correct manufacturing error *	Lack of fusion and/or penetration
Edge defects greater than 25 mm (1inch) deep or thickness of base metal, whichever is less	
Edge defects greater than 20 percent of edge length	

* All weld build-up or buttering shall be 100 percent examined by RT or UT.

MINOR DEFECTS

Repair cavities or edge defects smaller than above, excluding cracks	Porosity or Slag inclusions Undercut Crater cracks

11 WELD HARDNESS

Weld hardness of production joints shall be performed when required by commodity specification or Material Requisition.
The welding procedure qualification tests shall include hardness for quenched and tempered carbon steel Mn-Mo steel and Cr-Mo steel regardless of purchase specification.

11.1 Make the hardness test at or near the centre of the weld or surface to be tested on the side exposed to the process environment. Where not practical, make the test on the opposite side. Prepare the surface in accordance with ASTM E10. Use a Telebrineller portable tester to measure hardness.
Make one hardness test for each 3 meters, or fraction thereof, for each longitudinal seam of each course. Make one hardness test for each 3 meters, or fraction thereof, for each vessel circumferential seam. Make one hardness test for each nozzle to shell weld.
Make one test on each surface cut with oxy-fuel or Arc-Air, which is left, unwelded on the finished part. Make one test on each area where a temporary weld was made and removed.

11.2 The hardness limits shall be as follows:

MATERIAL GROUP	MAXIMUM BRINELL HARDNESS
P-1	200
P-3, P4, P-5	225
P-6, P-7	241

Report all hardness readings in excess of values shown above to TCM. Review any corrective action with TCM before proceeding.

11.3 Nonferrous materials and austenitic stainless steel welds shall not require hardness testing.

11.4 If post weld heat treatment (PWHT) is applied, perform the hardness test after PWHT.

11.5 For equipment fabricated from SA-537 Class 2 steel, conduct hardness tests as required in 11.1, above. The maximum acceptable Brinell hardness is 225.
In addition, microhardness traverses shall be made on an etched cross section taken from the welding procedure qualification test coupon. The base metal and weld filler metal shall be equivalent to that which will be used in production, but not necessarily the same heat or lot.

Two microhardness traverses shall be made using the Vickers method, ASTM E92, with a load of 5 kgf or 10 kgf The traverses shall be approximately 1/16 inch from the top and bottom base metal surfaces and shall include both base metals, both heat-affected zones, and the weld metal.

The Vickers hardness numbers shall be converted to Brinell hardness numbers by using Table 2 of ASTM E140 (or Table 2B of ASTM E370).

The microhardness traverses shall be included in or attached to the Procedure Qualification Record.

12 FERRITE MEASUREMENT

12.1 Check the ferrite content of every austenitic stainless steel weld, including overlay welds, in the as-welded condition using a Severn gauge or a Feritoscope. The ferrite shall be between 3% and 10% (2% to 5% for stainless steel with minimum design temperature lower than minus 46ºC).
The specified ferrite content shall be checked also in PQR.
Type 310 welds are exempted from this requirement
In case of PWHT, ferrite measurements shall be taken before and after PWHT.
12.2 Check the ferrite content of every duplex stainless steel weld in the as-welded condition using "Ferrite scope" or severn gauge.
The ferrite shall be between 30 and 60% (if not otherwise indicated in purchase specification) in both PQR and production joints.

13 INSPECTION AND EXAMINATION

13.1 PERSONNEL QUALIFICATION

NDE personnel shall be qualified to the requirements of the applicable code. As a minimum, the qualification should be to the requirements of SNT-TC-1A. An up-to-date record shall be maintained for each person who performs and/or interprets NDE work. The subject record containing test results and applicable documents shall be made available to the TCM inspector on request.

13.2 MAGNETIC PARTICLE TESTING (MT)

Only A.C. yoke shall be used for MT after PWHT. Permanent magnet or D.C. yokes shall not be used.
MT examination and evaluation shall be in accordance with the ASME Code, Section-VIII division 1, Appendix.

13.3 LIQUID PENETRANT TESTING (PT)

Penetrant, Cleaner and Developer solutions shall not have a combined residual sulphur and halogen content more than 1 %. The penetrant and the developer must be from the same manufacturer and the same generic type.

PT examination and evaluation shall be in accordance with the ASME Code Section-VIII, division 1, Appendix 8.

13.4 RADIOGRAPHIC TESTING (RT)

Radiographic examination and evaluation shall meet the following requirements in addition to those specified in code and the data-sheet.

13.4.1 RT examination and evaluation shall be in accordance with the ASME Code, Section-VIII division 1, para UW 51 or UW 52.

Acceptable Class I films: Kodak M; DuPont NDT 45; Agfa Gevaert D2(sc), D4; Fuji 50.

Acceptable Class II films: Kodak AA; DuPont NDT 70; Fuji 100, Agfa Gevaert D4

Only lead screens shall be used.

13.5 ULTRASONIC TESTING (UT)

13.5.1 UT examination and evaluation shall be in accordance with the ASME Code, Section VIII Appendix 12.

13.6 MINIMUM INSPECTION REQUIREMENTS

Examination of welds shall conform to procedures and acceptance standards required by the applicable code and project specifications.

13.6.1 In addition to the requirements of applicable code and project specification the following shall be complied with:

- All welds shall be visually inspected after completion.
- Welds joining nozzles shall be MT/PT examined: the root pass, the backgouged area and the weld cover passes shall be included in the examination.
- All non-destructive examination shall be performed after post weld heat treatment unless otherwise approved by TCM: in that case the welded joint shall be examined at least by MT/PT after post weld heat treatment.
- Ferrite measurements of stainless steel weld overlays shall be made before PWHT (if any).
- Butt welds and vessel support attachment welds of items having 50mm and greater in thickness shall be ultrasonically examined after hydrotest.
- Ultrasonic testing are additionally required on joints containing more than one pass or layer of short-circuiting GMAW.
- Equipment containing hazardous fluids (such as Teal, LPG, Carbon Monoxide and flammable fluids) could require extended radiography of welded joints when so specified on drawings and/or project specifications.
- All pressure containing equipment designed with 100% radiography of joints, shall have all nozzle and reinforcing pad attachment welds examined by MT or PT. Inspection shall be performed on all accessible weld surfaces (inside and outside).

13.7 PMI TESTING

Stainless steel (including Duplex) components, welds, overlay and cladding shall require P.M.I. (Positive Material Identification) when required by data sheet or project specification 3645-XZ-SG-0500.

14 SUPPLEMENTARY WELDING REQUIREMENTS FOR TITANIUM ALLOYS

The welding and assembly of titanium equipment must be carried out in a suitable workshop or sheeted area where an iron free atmosphere can be maintained.
It is recommended that the clean room should be operated with a slight positive pressure of iron free, clean filtered air.

Operators working on titanium equipment shall wear suitable protective clothing and footwear, which is kept exclusively for this duty.

Surfaces to be welded must be cleaned and free of iron contamination. Cleaning may be achieved by abrading with iron free alumina impregnated nylon wheels, alumina flap wheels, wire brushing using titanium wire brushes (stainless steel wire brushes must not be used).

Degreasing of titanium surfaces and welding wire should be with propanol, isopropanol or acetone. Do not use cleaning solvents containing fluorine or chlorine.

Items to be welded or heated must shown to be free from iron contamination by ferroxyl test.

All welding shall be done with GTAW process or the GMAW, using filler metal classified AWS/SFA 5.16 ERTi1 or ERTi2.

Shielding gas, backing gas and trailing gas shall be Argon or Helium with purity of 99,995%.

Shielding and trailing gas are always mandatory.

Backing gas is mandatory for single side butt welded joint, and for all joint type (butt, fillet, partial penetration, etc.) where the thinner member of elements to be joined has a thickness ≤ 10mm.

Maximum misalignment tolerance is 0,8 mm.

Prior to final closure welding, all internal surfaces shall be thoroughly degreased and inspected for iron contaminations.
All the welded joint shall be subjected to the visual examination for coloration (in as welded conditions and without any surface conditioning) to determine whether the weld is contaminated or acceptable:

COLOUR	ACCEPTABLE	PROTECTION	ACTION
SILVER	YES	GOOD	----------
STRAW YELLOW	YES	SUFFICIENT	Coloration shall be completely removed by brushing
BLUE and PURPLE RED	NO	POOR	Remove the WELD and HAZ. Improve the protection
CREAMY WHITE and DULL GRAY	NO	VERY POOR	Remove the WELD and HAZ. Check the protection system and make a test coupon.

15 SUPPLEMENTARY WELDING REQUIREMENTS FOR UNS S31803 (2205 DUPLEX S.S.)

Filler metal used shall be of AWS A 5.9 ER 2209 electrode with process GTAW and AWS A5.4 E2209-17 filler material for SMAW (Impact test could be required by Code).

The heat input used during qualification shall be based on the highest heat input to be used in the production welds. The heat input is an essential variable and shall be indicated in the WPS/PQR.

Interpass temperature shall be less than 100 ºC

The heat input should be maintained within:
Butt joint ⇒ 0,5 KJ/mm ÷ 2,5KJ/mm
Tube to tubesheet welding ⇒ 0,5 KJ/mm ÷ 3,5 KJ/mm
Weld overlay ⇒ 0,5 KJ/mm ÷ 8,5KJ/mm

Weld overlay must be done at least in two layers as per the following table:

CLADDING MATERIAL	WELD FILLER METAL	ALLOY ELEMENTS to ANALYZE**
UNS S 31803 (DUPLEX 2205)	1st layer * – Type 2209 or 309L	C-Cr-Ni-Mo
	2nd to n th layer – Type 2209	

* Type 2209 is preferred except that 309L shall be used when PWHT of first layer and base metal is required.
** See para 5. for number and location of alloy verification

1 FOREWORD

This document shall be read in conjunction with contractual specification "Paints and Coatings" section 09 90 00 and it shows clarification relevant to surface preparation, application procedure, split of work, final tests and acceptance criteria for metal surfaces only.

This document is applicable to insulated or not insulated metal surfaces of static equipment (such as: columns, drums, heat exchangers, etc.), machinery (such as: pumps, compressors, bridge cranes, etc.) steel structures (such as: base plates, beams, columns, pipes racks, piping support, etc.) and piping.

2 DEFINITION

2.1 Contractual terms

CONTRACTOR (C) is the Company in charge for EPC contract.

PAINTING CONTRACTOR (PC) is the party that carries out the painting at field.

VENDOR (V) is the party that manufacturers or supplies equipment, piping, structural and miscellaneous steels and machinery to perform the duties specified by CONTRACTOR. VENDOR is in charge for any painting activity carried out in the workshop.

PARTY (P) is:

Either VENDOR or PAINTING CONTRACTOR

or

Both VENDOR and PAINTING CONTRACTOR

PAINT MANUFACTURER (PM) is the firm that produces paints and relevant thinners.

WORKSHOP painting is the painting applied in a workshop before shipment to the site of erection.

FIELD painting is the on-site painting before, during or after erection.

PARTY PAINTING SPECIALIST is the person appointed by PARTY (internal or external consultant appointed by PARTY at own care and cost), familiar with painting activities including the relevant international standards, that is in charge to review this project painting specification in order to:

- highlight any deviation of this working procedure due to not applicable requirements to the items belonging to the supply
- transfer job specification into field work orders to surface preparation, coating application and coating inspection personnel

2.2 Technical terms

PAINT includes primers, enamels, varnishes, emulsions, catalyzed coatings, bituminous coatings and other organic coatings. Inorganic coatings that are applied in the same manner as paints are included in this definition.

AUSTENITIC STAINLESS STEEL (ASS) includes all materials in SS 300 series (304, 316, etc.).

FERRITIC STEEL (FS) includes: low temperature carbon steel, carbon steel, cast steel, cast iron and low alloy steel (Cr < 9% and Ni < 1%).

ESI is the abbreviation of: ethyl silicate inorganic zinc rich / inorganic zinc rich.

ROUGHNESS (Rz) is the surface profile of the substrate measured as "the average value of the absolute values of the heights of five highest profile peaks and the depths of five deepest profile valleys within the sampling length" (ISO 4287/1).

OPERATING TEMPERATURE to be used for selecting the painting system is the maximum operating value made provision for the item. This temperature shall consider any alternative process condition such as: reactor beds and molecular sieves regeneration phases, etc.

PDS is the abbreviation of Product Data Sheet.

3 SAFETY

The basic concept of safety in surface preparation, coating application and inspection is being knowledgeable in safety procedure, proper use of safety equipment and being aware of the hazard involved. Before starting coating application, it is recommended that VENDOR read all available safety data of handled materials.

PAINTING CONTRACTOR must have a written Safety program. CONTRACTOR before starting any work shall approve the Safety program. PAINTING CONTRACTOR shall be responsible for the safety of his personnel.

PAINTING CONTRACTOR must observe SSPC-PA Guide 3 "A guide to safety in paint application" and all the safety prescriptions relevant to plant area.

4 GENERAL PRESCRIPTIONS FOR PARTY

4.1 General rules

PARTY shall:

a) Advise the CONTRACTOR every time that some prescriptions given in this specification can be improved or do not comply with experience

b) Provide all materials necessary for work execution

c) Verify that all surfaces to be painted are suitable for surface preparation and/or painting

d) Protect all equipment, machinery, piping, steels structures and any other areas from mechanical damaging and paint droppings

e) Remove from the site all used tools and machinery at the end of work

f) Submit the technical data-sheets of all products (paints, thinners, solvents, etc.) in order to obtain approval from CONTRACTOR

g) Have the instrumentation and the personnel able to carry out the required tests

h) Remake painting application for the parts that CONTRACTOR do not consider satisfactory according to this painting specification or that do not have passed the tests;

i) Make any necessary touch-up of the painting

j) Keep the working area cleaned of all empty paint cans and waste materials daily

4.2 Warranty

PARTY shall provide, for painting systems, a guarantee period as long as requested by contract. Once the guarantee period has expired, the deterioration degree shall comply with the acceptance criteria indicated in the contract.

5 SURFACE PREPARATION

5.1 Steel preparation

The metallic surface to be protected by paint shall comply with the following:

- Free from weld spatter
- Sharp edges rounding off or chamfered
- Weld seams continuous with regular wave and smooth

As clarification, for structural steel no sharp edge shall be present (this requirement is applicable on any surface including but not limited to flanges, cut surfaces, drilled surfaces, punched surfaces, bolt holes etc.).

5.2 Removal of exogenous compounds and degreasing

Before starting any de-rusting operation or painting application (when the primer has been already applied), metal surface shall be free from grease, oil and salt. SSPC-SP1 is the standard for removing the exogenous compounds and the method selected shall not spoil the metal surface or remove or softening the primer already applied. It is forbidden to use chlorinated solvent on ASS.

The water shall be pure, free from bacteria, clean and lacking of suspended solid.

These operations shall perform manually, with the help, whenever necessary, of hard fibre brushes. It is allowed to use high-pressure water.

The original conditions of steel surfaces shall examine as per SSPC-VIS1.

5.3 Surface preparation

Surface preparation shall be carried out only when the steel temperature is at least 3 °C above the dew point temperature of the surrounding air.

Temperature and humidity shall be continuously monitored.

Surface preparation shall not be carried out under the rain or in a misty atmosphere or in presence of dew and on moist surfaces.

The abrasive selected shall:

- obtain the required grade of SSPC standard and
- produce a roughness (Rz) that guarantees a perfect primer adhesion as indicated in the PDS

Abrasives materials shall comply with SSPC-AB 1 - 4. Silica sand is not allowed.

Abrasive material consisting only of steel shot shall not be used for surfaces to be coated with ESI; a mixture of steel shot and at least 25% (w/w) steel grit is acceptable.

Only mineral abrasive materials excluding slag shall be used for austenitic stainless steels and/or hot dip galvanized steel. Corundum and garnet are the preferred ones.

Compressed air for blast cleaning shall be dehumidified and free of oil or any similar impurities. Non-oil lubricated compressors are recommended.

Abrasive blasting outdoors is authorized only when the place is sufficiently equipped to avoid environment pollution in the surrounding area. The maximum value of breathable dust, lacking in asbestos and silica, is 10 mg/m^3 TLV - TWA, unless otherwise indicated in local laws.

Surface preparation as per SSPC-SP11 has to be authorized by CONTRACTOR and it can be used only for repairing of limited areas or when abrasive blasting is not really feasible or permissible.

Surface preparation by means of blasting shall be performed when wet paint is not in progress in the surrounding area.

The primer that has been already applied on the surface shall:

- be perfectly adherent and free from voids
- have homogeneous thickness

Scratches and/or defects shall repair by full painting system starting from surface preparation.

6 GENERALS PRESCRIPTIONS FOR PAINTS AND APPLICATIONS

6.1 Can delivery and storage place

All the paints shall be delivered to the shop or at field in original, unopened cans with labels intact. Minor damage to cans is acceptable provided that the cans have not been punctured or the lid seal broken.

The label shall report, at least: name of manufacturer, type of paint and related thinner, instructions for processing, colour, batch number, analysis of contents, identification of all toxic substance, weight (gross and net), filling date and expiration date.

All cans of paint shall remain unopened until required for use. The paints must be used before their shelf life has expired.

Storage place shall:

- be ventilated to avoid solvent vapours accumulation and not exposed directly to sun light
- have a temperature ranging from 10 to 40 °C

Paint, which has deteriorated during storage, shall not be used.

6.2 Application procedure and parameters

Paints shall be thinned and/or mixed according to manufacturer's PDS. The mixing shall be very accurate and carried out by a mechanical mixer. The paint shall be used only within the limits of its pot-life and shall be discharged before the pot-life time has expired. The pot-life of any paint is specified in PDS.

Different brands or types of paints shall not be inter-mixed and the thinner shall be that recommended by paint manufacturer.

Painting application shall be carried out only at the following conditions:

- Air temperature: 5 ÷ 40 °C. Min value of 10 °C for two components catalyses paints
- Air relative humidity: < 85%. Min value of 50% for zinc primer application
- Steel temperature: at least 3 °C above the dew point temperature of the surrounding air

Temperature and humidity shall be continuously monitored.

A system for heating and / or dehumidifying shall be provided in the workshop and used if the environmental condition do not match with min acceptable requirements from abrasive blasting to final curing of the products ('dry to handle time' in case of silicone paints).

Painting shall not carry out under rain, in a misty atmosphere or when the moist can condensate on the surface.

The surface painted shall be protected by: rain, condensation, dust, salts and pollution during from application to final curing.

Primer application shall be performed before any visible rusting occurs and within maximum 4 hours from surface preparation. Should the surface be contaminated prior to painting, the surface shall be restored before primer application.

Primer shall be applied on the welds only after completion of all required pressure testing unless allowed by mechanical code.

Painting application shall be carried out, preferably, by airless spray. CONTRACTOR shall authorize other application methods.

Stripe coating method, by brush or roller, shall be applied on all the areas difficult to reach such as: welds, bolts holes, corners, edges, etc. Stripe coating is requested for each layer of painting.

Intermediate and/or finish coating application shall be performed only if the previous coat is in perfect condition.

The application of the whole painting system shall occur without sag, runs, blistering, wrinkling and spots. The colour shade and the gloss shall be even.

The min dry film thickness shall suit to the requested value. Additional coats shall apply when the request value is not obtained. The max dry film thickness shall suit to the value indicated in the PDS of the product. Dry film thickness higher than the max allowed by PDS is on principle not acceptable unless paint manufacturer provides formal acceptance under own responsibility.

Each coat shall have a different colour from the previous one, to prevent unpainted areas and to facilitate inspection.

Overcoating and curing time indicated in PDS will be the base for establishing the min time schedule. Only for ESI, overcoating time depends from positive execution of rub test (see MEK test in table 1 of paragraph 9.4).

The painting system applied on steel structures shall not obstruct the earthing system. In principle, only a conductive primer, such as ESI or zinc rich epoxy primer shall be applied on the contact surfaces fixed by bolting. The drawing below shows the min surface to be coated only with primer. Vendor could propose alternative solutions if these are more practical and/or provide a better earthing system.

TYPICAL DETAILS

(MASKING AREA)

DETAILS APPLY TO ANY TYPE OF JUNCTION

6.3 Status of delivery

Metal surface of steel structures, pressure equipment, machinery, electrical and instrumentations shall be delivered at site fully painted as per contractual specification "Paints and coatings" section 09 90 00 paragraph 3.12 "PAINT TABLE", unless different instructions have been given in the purchase order.

6.4 Workers qualification

Only skilled and qualified workers shall carry out all the painting operations (surface preparation included). The standard SSPC-PA1 "Shop, field and maintenance painting" shall be followed as guide for each operation.

6.5 Paint products

Paint products shall be selected between those certified by Master Painters Institute (MPI). Products without MPI certification cannot be used.

7 TESTS

PARTY shall carry out the quality control during and after painting application as per the WORKSHOP AND ON-SITE INSPECTION on paragraph 9.

COMPANY and CONTRACTOR have the right to inspect the paint work at all stages of preparation and reject any tools, materials, equipment or work which do not conform to this specification.

CONTRACTOR has the right to take samples of paint for quality tests. Should the sample fail to meet the required specification, PARTY shall remove this paint from areas already covered and re-coat them with the paint that meets the specification.

8 DOCUMENTATION

PARTY shall submit the following documentation to CONTRACTOR.

8.1 Document to be submitted before the beginning of painting

- Working procedure for comments/review. Min info required:
  a) Scope of Work, describing for each item to be coated:
     - Base material
     - Surface temperature: normal operating + upset conditions (i.e. steam-out)
     - Thermal insulation/fireproofing (if any)
  b) Applicable Documents
     - Reference to project specification and requested standards
  c) Selected coating system (including removal of mechanical defects, degreasing and surface preparation)
  d) Application method (stripe coating, mist cost/full coat, etc.)
  e) Inspection tests (type, frequency, acceptance criteria and remedial actions, if necessary)
  f) Repairing Procedure
  g) PDS

1320

h) Daily log (painting inspection report) Template

8.2 Document to be submitted at the end of painting activities

- Daily log
- Repairing (if any) of what was done

9 WORKSHOP AND ON SITE INSPECTION TEST PLAN

9.1 Purpose

This procedure covers the tests to be included in the quality control plan of the VENDOR (V) for static equipment, packages, machinery and structural steel of the PAINTING CONTRACTOR (PC) for on-site erection of piping, storage tanks, final painting and touch-up. This procedure shall be applied before, during and after paint application.

Inspection activities mentioned in paragraph 9.2 and inspection plan mentioned in paragraph 9.3 shall be applied only to Material Requisitions whereas CONTRACTOR deems it necessary. The basis for defining which Material Requisitions shall follow paragraphs 9.2 and 9.3 is:

- At least one item to be painted has a surface larger than 100 m^2
- Overall surface to be painted is larger than 200 m^2
- Machinery, special items and electrical components installed outdoor that have huge impact on plant performance
- Main steel structures

9.2 Painting pre-inspection meeting

PARTY shall notify CONTRACTOR, at least 3 months before the beginning of any painting activity, when ready for painting pre-meeting.

Painting pre-meeting (to be held at Painting Workshop) will be attended by: PARTY PAINTING SPECIALIST, PAINT MANUFACTURER and CONTRACTOR.

The purpose of the pre inspection meeting is to:

- Assure suitability of the workshop
- Check instruments availability calibrated and certified
- Highlight any criticality relevant to the supply
- Assure readiness and skill of PARTY to perform the anti-corrosive painting according to this working procedure and mentioned standards. In particular, the following points shall be available:

a) Organizational chart showing all personnel involved in painting activities including surface preparation, coating application and coating inspection personnel

b) Written responsibility list, internal record of training, qualification, experience, (CV, resume) for all personnel involved in painting activities (surface preparation, coating application and coating inspection personnel). Personnel appointed shall have significant experience with projects in similar site conditions and with same kind of paints

c) Knowledge of international standards relevant to painting activities mentioned in this specification. In particular, Party Painting Specialist shall demonstrate familiarity with the international standards, capability to issue suitable working procedure in accordance with Project Requirements. Failure to meet such requirements imply that PARTY shall address at own care and cost qualified external consultant in order to supervise such activities

d) Suitable daily log for recording all test results

The several phases of the painting application will be followed, as per inspection plan mentioned in paragraph 9.3.

9.3 Inspection plan

The following table shows a guideline for planning the inspection test of painting process. PARTY shall base own inspection test plan as per below table.

No	DESCRIPTION	PARTY	CONTRACTOR
1	Preparation grades of welds, cut edges and other areas with surface imperfections	H	R
2	Removal of grease and contaminants	H	R
3	Measurements and recording of ambient conditions before and during surface preparation (metal temperature, dew point and relative humidity)	H	R
4	Visual examination of steel and surface preparation and measurements of roughness after abrasive blasting	H	R (SW/W/H)*
5	Dust and salts removal	H	R
6	Measurements and recording of ambient conditions before, during and after paint application (air temperature, metal temperature, dew point and relative humidity)	H	R
7	Primer application	H	R
8	Measure of the wet film thickness for primer	H	R
9	Measure of the dry film thickness for primer	H	R

No	DESCRIPTION	PARTY	CONTRACTOR
10	MEK test (only for ESI)	H	R (SW/W/H)*
11	Intermediate application	H	R
12	Measure of the wet film thickness for intermediate	H	R
13	Measure of the dry film thickness for intermediate	H	R
14	Finish application	H	R (SW/W/H)*
15	Measure of the wet film thickness for finish	H	R (SW/W/H)*
16	Measure of the dry film thickness for finishing	H	R (SW/W/H)*
17	Holiday test (wet sponge)	H	R (SW/W/H)*
18	Adhesion test (pull-off)	H	R (SW/W/H)*
19	Adhesion test (cross cut)	H	R (SW/W/H)*
20	Visual examination	H	R (SW/W/H)*
21	Repairing (if any) excluding touch ups due to mechanical damage	H	H

GENERAL NOTES

PARTY shall documents all steps inside daily log in order to allow CONTRACTOR review.

When kind of test is visual, detailed photographic report shall be provided.

* CONTRACTOR reserves the rights to request Spot Witness / Witness / Hold point on case by case basis.

9.4 Inspection guideline

The following table represents a general guideline for inspection to be considered during painting activities. This guideline is applicable also for machinery (in such case test frequency shall be based on lot of production for painting activities).

PARTY shall incorporate this guideline in the PAINTING PROCEDURE to be issued or propose an equivalent one. Only the tests technically applicable to the supply shall be mentioned.

PARTY shall inform CONTRACTOR providing technical justification if some tests of table 1 are not applicable to own supply.

TABLE 1 - INSPECTION GUIDELINE

Test type	Method	Frequency	Acceptance criteria	Consequence
Storage of paints	-	Storage period	As per Paint Manufacturer instructions	New products to be provided
Environmental conditions	Ambient (air) temperature	Three times per shift	10 ÷ 40 °C	No blasting or coating. Use of

Test type	Method	Frequency	Acceptance criteria	Consequence
	Steel temperature		min. 3 °C above dew point	heater and/or dehumidifiers to match acceptance criteria
	Relative humidity		50 ÷ 85%	
	Additional requirements		Any more stringent requirement indicated in the PDS	
Visual examination of metal surface	Visual check	100 % of all surfaces	As paragraph 5.1	Defects to be repaired
			No grease, oil and contaminants shall be present	Cleaning as per SSPC-SP1
Cleanliness	SSPC-Vis 1	100 % visual of all surfaces	FS: SP10	Re-blasting
			ASS: SP7	
	ISO 8502-3	Spot checks	Max quantity and size rating 2	Re-cleaning and retesting until acceptable
Roughness	SSPC-PA17	Each component or once per 50 m^2	FS Rz = 40 ÷ 80 µm	Re-blasting
			ASS Rz = 25 ÷ 40 µm	
Salt test	SSPC-Guide 15	Once after abrasive blasting per item.	Max conductivity corresponding to 50 mg/m2	Repeated washing with potable water and retesting until acceptable
Wet film thickness check	ISO 2808	Spot checks	According to PDS	Additional paint to be applied or repaired as per paint manufacturer instruction
MEK test (ESI)	ASTM D4752	Each component or once per 100 m^2	Rating min 4	No overcoating. Wait until curing is completed. Retest
Visual examination of coating	Visual check	100 % of surface after each coat	No solvent retention, surface contamination, pinholes, popping, runs, sagging, etc	Removal and repairing of defects
Dry Film thickness	SSPC-PA2 Zero set on blasted reference surface	See Table 2	Level 4	Repair as per Paint Manufacturer instruction, additional coats or recoating as appropriate
Adhesion	ASTM D4541	One per painting system per day (or lot) of production to be carried	min 5 MPa, unless otherwise declared by paint manufacturer	Coating to be rejected

Test type	Method	Frequency	Acceptance criteria	Consequence
	ASTM D3359, Method A	out, after curing, on reference panel blasted and coated at the same time and condition of the item	min 4A, unless otherwise declared by paint manufacturer	

TABLE 2 – DFT MEASUREMENT FREQUENCY

Area/length of inspection area m^2 or m	Minimum number of measurements
up to 1	5
above 1 to 3	10
above 3 to 10	15
above 10 to 30	20
above 30 to 100	30
above 100	add 10 for every additional 100 m^2 or 100 m or part thereof

Note: Each measurement consist of the arithmetic mean of 3 individual reading taken in an inspection area with a circular surface diameter of 30 mm.

1 INTRODUCTION

This specification defines the requirements for selection, design and installation of Instrumentation for Coal Fired Power Plant and Associated Coal Receiving Terminal to be built in Dominican Republic.

1.1 Definitions

- **Owner** ODEBRECHT
- **Contractor** TECNIMONT S.p.A.
- **Vendor** Company awarded the order for the subjected equipments

1.2 Codes and Standards

Instrumentation Codes/ References Standards for the design and installation of instrumentation shall comply with the standards and codes for the specific subject. In general the below mentioned Codes and Standards shall apply except where they are overridden by specific project requirements.
Any deviation to codes and standards must be submitted to Contractor for approval.

ANSI	American National Standards Institute
B16.1	Cast Iron Pipe Flanges and Flanged Fittings
B16.5	Steel Pipe Flanges, Flanged Valves and Fittings
B40.1	Indicating pressure and vacuum gages
C85.1(1a)	Terminology of Automatic Control
IEC	International Electro technical Commission
IEC 60051	Direct Acting Indicating Analogue Electrical Measuring Instruments and Accessories
IEC 60079	Electrical Apparatus for Explosive Gas Atmosphere (General Requirement)
UL	Cables construction and Cable tests.
NEMA	Degrees of Protection provided by Enclosures.
IEEE-383	Cables – Flame test.
API RP 551	Process measurement instrumentation.
IEC 60534	Industrial-process control valves
IEC 60546	Controllers with Analogue Signals for Use in Industrial-Process Control System
IEC 60654	Industrial Process Measurement in Control Equipment
IEC 60751	Industrial Platinum Resistance Thermometer Sensors
IEC 60770	Transmitters for use in Industrial Process Control System
IEC 61000-2	Electromagnetic compatibility (EMC)
IEC 61131	Programmable Controllers
IEC 61140	Protection Against Electric Shock
NFPA	National Fire Protection Association
NEC 70	National Electrical code
ISO	International Organization for Standardization
ISO 5167	Measurement of Fluid by Means of Orifice Plates, Nozzles or Venturi Tubes
ANSI/ISA 5.1	Instrumentation Symbols and Identification

ASME	American Society of Mechanical Engineers
PTC 19.3	Performance Test Code on Temperature Measurement
PTC 19.5	Flow measurements
Boiler Pressure	Vessel Code
BPVC Sect. IPower Boilers	
BPVC Sect. VIII	Pressure Vessels

1.3 Units and Terminology

With the exception for pressure, all engineering information shall be in System International (SI) Units; all instruments scales and ranges including DCS displays shall be SI units (Metric Units).

1.4 Environmental Conditions

For site environmental conditions refer to technical specification **3645-YZ-PC-000-001 "Project Design basis"**
Instruments shall be suitable for use in stated environmental conditions of the plant (e.g. vibration, temperature, humidity, corrosion).

1.5 Tagging

An identification tag shall be attached to permanent part of the process (instrument support) for each piece of instrumentation or hung on the hand wheel for each valve and equipment; the tags shall be of sturdy, stainless steel permanently fastened to the material with stainless steel screws or pins.
To each instrument shall be assigned an instrument tag number (fastened to the instruments with stainless steel screws) to be listed on the instruments list and datasheet; this tag shall be used as the unique identification number for that device on all design and construction documentation.
Code letter identifications for instruments and control loops are designated in **accordance ANSI/ISA 5.1**

1.6 Painting

Painting for instruments shall be in accordance with project standard painting specification.

1.7 Electrical Equipment and Enclosures

All field instruments shall be furnished with certification issued by authorized Bodies.

All electronic instruments and wiring shall be suitable for use in the relevant hazardous area classification. For Electronic Instruments installed in hazardous area EEx-d execution shall be provided.

All instruments shall be suitable for outdoor installation with corrosion resistant weatherproof enclosures having mechanical degree of protection IP 65 as minimum according to IEC 60529.

Electronic instrumentation has RFI/EMI noise immunity in accordance with IEC 61000-2.

1.8 I&C Cables, Wiring Connections and Cable ways.

I&C Cables shall be designated in accordance with the UL requirement and tests.
All cables shall be as minimum Flame retardant type, in compliance with IEEE383.

Cables from Instruments to Junction Boxes/Local panels shall be No-armored type, cables from

Junction Boxes to Control cabinets (multicables) shall be No-Armored type.

Cables run shall be preferably above grade.

Cables from Instruments to Junction Boxes/Local panels shall be No-armored type protected by Close conduit Hot Dip Galvanized material; Cables from Junction Boxes to Control cabinets (multicables) shall be No-Armored type protected by Close conduit Hot Dip Galvanized material up to the Main Cable Tray.

All junction boxes shall be provide with certification NEMA 4X, material 316 StSt, with hinged cover.

Installation and Wiring Connection shall be in compliance with NEC requirement.

Others details for Cables type wiring connection and cable ways are indicated in the Project ITB documentation.

1.9 Safety Considerations

All instruments, pneumatic or electronic, shall fail safe on air and/or power failure.

All alarm and safety circuits shall be fail-safe; the relevant initiating contacts shall be closed during normal operation; solenoid valves and relays shall be energized during normal operation.

The redundancy criteria for measurements shall guarantee the maximum reliability. The number of sensors shall be set as follows:

- single sensors for non-critical functions, such as supervision, diagnostic, optimization, non-critical control, configuration;
- double sensors for critical functions, such as main process control, equipment protection, and auxiliary process variables used in plant protection, whose loss of control would cause a possible plant shutdown;
- triple sensors for safety functions (2oo3), such as protection functions and plant shutdown.

The three or two input signals devoted to the same process variable will be connected to different DCS (or PLC where applicable) input cards.
The same signals above described, shall be connected in the differents cables and Junction boxes.

2 INSTRUMENTATION

2.1 Transmitters

Transmitters shall be electronic SMART type with HART protocol, 2 wired with 4÷20mA standard signal (24VDC loop powered from DCS), and equipped with digital local indicator to display the measured value converted to engineering units.

In general, pressure electronic transmitter, inductive (or piezoresistive) sensor, membrane type shall be used; differential pressure transmitters shall be of the force balance type or other negligible displacement type (i.e. capacitive or piezoresistive), except where such devices are not available for a specific measurement.

Thermocouples and thermo-resistances shall be wired to the DCS by means of 4÷20mA Smart temperature transmitter that shall have cold junction compensation, adjustable burn-out action and output signal linearization.

Calibration certificates/records shall be furnished with the instruments.

The on-line diagnostic of 4-20 mA transmitters, in case of detected fault, shall drive the output to a predefined (and preferably selectable) Bad value (Low or High) out of the normal or extended range, in order to allow the failure detection by the control system.

NAMUR 43 recommendations shall be applied, as follows:

Transmitter measuring range: 4 <= I <= 20 mA (corresponding to Low and High transmitter calibration limits)

Transmitter extended range : 3.8 <= I <= 20.5 mA (range where the signal is considered valid)

Low Bad signal : 0 <= I <= 3.6 Ma / High Bad signal : I >= 21mA

2.2 Pressure Instruments

Pressure gauges shall have either a blow-out disk or a blow-out back and an acrylic or shatterproof glass face and shall be fillable; gauge supports should be designed so that the blow-out disk is not covered.

Siphons shall be installed on pressure gauges in steam service as required by the system design; steam pressure-sensing transmitters or gauges mounted above the steam line shall be protected by a loop seal; pressure devices on pulsating services shall have pulsation dampers; pressure test points shall have isolation valves and caps.

Main condenser vacuum shall be measured by absolute pressure transmitters.

2.2.1 Pressure and Differential Pressure Gauges

Description	*Requirements*
Nominal diameter	4 ½" (114 mm.)
Measuring element	Capsule element for p≤0,6bar Diaphragm for 0,6<p≤4bar Spring tube (i.e. Bourdon type) for p>4bar
Execution	Solid front
Materials	Measuring element = 316L SS (for Seawater Monel) Movement = 304 SS Socket = 304 SS Case = Phenol
Process connection	½" NPT (1/4" NPT for DP)
Degree of protection	IP 65
Mounting	Local on tap
Accuracy rating	±0.5% (±2% for DP)

2.2.2 Pressure and Differential Pressure Switches

Description	*Requirements*
Measuring element	Diaphragm
Calibration	Adjustable externally (Fixed differential type)
Materials	Measuring element = 316L SS Body = 316L SS Other wet parts = 316L SS Gaskets = PTFE
Electric switch	SPDT Snap switch (dry type)

Number of switches - rating	1 – 230VAC - 2A
Process connection	½" NPT
Electrical connection	½" NPT
Degree of protection	NEMA 4X
Mounting	Yoke (Brackets for pipe ≥ 2")
Repeatability	±1% of full range

2.2.3 Pressure and Differential Pressure Transmitters

Description	*Requirements*
Measuring element	Diaphragm
Measuring principle	MFR STD
Materials	Measuring element = 316L SS(for Seawater Titanium) Body = 316L SS Other wet parts = 316L SS Gaskets = PTFE
Process connection	½" NPT
Electrical connection	½" NPT
Degree of protection	NEMA 4X
Type	Smart with Hart protocol
Signal - Supply	4÷20mA (2 wires, max load 600Ohms@24VDC)
Mounting	Yoke (Brackets for pipe ≥ 2")
Accuracy rating	±0,075% of calibrated span

2.3 Temperature Instruments

Temperature elements and dial thermometers shall be protected by thermo-wells except when measuring air temperatures at atmospheric pressure; temperature test points shall have thermo-wells and caps or plugs.

Head mounted temperature transmitters shall be provided for RTD.
Remote mounted temperature transmitters shall be provided for Thermocouple.
RTD shall be used on liquid and gas service, with process temperature ≤ 400°C, for remote (DCS) readout through temperature transmitter according this specification; they shall be of PT100Ω @ 0°C, three wires system, class A according to DIN EN 60751, mineral insulated, 316 SS sheathed elements.
Heads shall be corrosion resistant, metallic, with female threaded cover and enclosed terminal blocks; the element shall be spring loaded, mounted in a thermowell.

Thermocouples shall be used on steam service, with process temperature > 400°C, for remote (DCS) readout through temperature transmitter according this specification; they shall be usually type K – Chromel Alumel, class 1 according to DIN EN 60584-2 (except where special process, equipment, or project requirements indicate otherwise) with isolated hot junction, dual-element, mineral insulated, 316 SS sheathed, spring-loaded.
Thermocouple heads shall be of the cast type with an internal grounding screw; if a thermocouple is inaccessible, the leads shall be brought to a junction box in an accessible location.

The thermowell insertion length and tip thickness are designed for each application to meet the requirements for vibration and stress analysis as outlined in ASME Power Test Code PTC 19.3, latest revision; thermocouple/thermowell vibration and stress calculations are provided by the vendor for each thermowell on steam lines whose operating pressure is higher than 30bar.

Temperature measures for protective purpose (2oo3) if any, shall be detected through three couples of thermoelements respectively (each couple) installed inside the relevant thermowell. Both thermoelement for each couple shall be wired to the field junction box where the signal converters (if foreseen) are installed. For each couple, the first thermoelement shall be connected to the relevant converter whereas the second one is kept as spare.

2.3.1 Thermometers

Description	*Requirements*
Nominal diameter	5" (125mm.)
Measuring element	Bimetal actuated type, liquid-filled (gas-filled for high temperature application)
Materials	Bulb = 316L SS Capillary and connection = 316L SS Movement = 304 SS Socket = 304 SS Case = 304 SS
Bulb diameter	Vendor standard (according thermowell dimensions)
Process connection	½" NPT
Option required	Adjustable immersion Every-angle Case compensated Zero adjustment required
Degree of protection	IP 65
Mounting	Local on thermowell (remote installation for capillary type thermometer)
Accuracy rating	± 1% of full range

2.3.2 Temperature Switches

Description	*Requirements*
Type - bulb	Inert gas filled - straight
Calibration	Adjustable externally (Fixed differential type)
Materials	Capillary and extension = 316L SS Bulb = 316L SS Other wet parts = 316L SS Gaskets = PTFE
Electric switch	SPDT Snap switch (Dry contact)
Number of switches – rating	1 – 230VAC - 2A
Process connection	1" NPT
Electrical connection	½" NPT
Option required	Case compensated Zero adjustment required
Degree of protection	NEMA 4X
Mounting	Yoke (Brackets for pipe ≥ 2")
Repeatability	± 1% of full range

2.3.3 Temperature Transmitters

Description	*Requirements*
Measuring element	Suitable to process application
Measuring principle	MFR STD
Execution	Input-output electrical isolation
Materials	Body = 316L SS
Electrical connection	½" NPT
Degree of protection	NEMA 4X
Type	Smart with Hart protocol
Signal - Supply	4÷20mA (2 wires, max load 600Ohms@24VDC)
Mounting	Yoke (Brackets for pipe ≥ 2")
Burn-out	Programmable (Cold-joint compensation required for thermocouple)
Accuracy rating	±0,5% of calibrated span

2.4 Level Instruments

Reflex-glass or magnetic level gauges shall be used; magnetic gauges shall be preferred.

Gauge glasses used in conjunction with level instruments shall, as a minimum, cover a range in excess of that required for alarms and trips; level gauges shall be selected so that the normal vessel level is approximately at gauge center, where practical.

Level indication for corrosive service shall use devices other than reflex-glass gauges; level gauges for HP service shall have suitable personnel protection.

It shall be possible to isolate and blow down all drum level gauges.

Level transmitters for measuring level in storage tanks shall generally be the differential pressure type and shall have local indication and main control room indication.

2.4.1 Level Switches

Description	*Requirements*
Type	Displacer or float type
Transmission	Magnetic (Fixed differential type)
Materials	Float or displacer = 316L SS
	Body = 316L SS
	Other wet parts = 316L SS
Electric switch	SPDT Snap switch (dry type)
Number of switches - rating	1 – 230VAC - 2A
Process connection	1" ANSI (rating in according piping class)
Electrical connection	½" NPT
Option required	Cooling extension (for application with process temperature > 120°C)
Degree of protection	NEMA 4X
Repeatability	± 1% of full range

2.5 Flow Instruments

Flow transmitters shall be of the differential pressure type with the range matching (as close as practical) the primary element; differential pressure (for orifice plates) shall be in the range of 100÷600mbar.

Vortex-shedding meters, pitot tubes, or orifice plates may be used for flow measurements; magnetic flow meters may be used in corrosive service.

For steam and fluid service on lines ≤ 12", concentric orifice plates shall be used as primary elements; in general, material shall be stainless steel or better, connection shall be by means of welding neck flanges.

For steam service on lines > 12", nozzle or Venturi flow type is used.

Nozzles and Venturi flow type shall meet ±3,0% and orifices meet a maximum of ±1,5% of reading accuracy over a 4:1 flow turndown ratio without laboratory calibration when installed in the meter runs.

In general, feed-water flow meters shall be temperature compensated when the water temperature is greater than approximately 120°C; steam flow meters shall be always temperature and/or pressure compensated; air flow measurements shall be temperature compensated. Compensation calculations are performed by the DCS.

Flow nozzles and orifices shall be installed in meter runs having twenty (20) diameters minimum of straight pipe upstream and five (5) diameters minimum of straight pipe downstream of the flow element.

Sizing, construction and installation of the flow elements shall conform the recommendations of ISO 5167 standard and orifice metering flanges shall be minimum ANSI 300 Class; beta ratios are maintained between 0,3 and 0,7.

2.6 Instrument Tubing and Installation

Process connection shall be in compliance with API RP 551 (Process measurement instrumentation).

All primary lead lines shall be generally made by 316 SS tubing, OD size ½" with 316 SS double ferrule compression fittings for pressure Instrument tubing fittings compression type shall be seamless SS316.

Differential pressure (flow and level) instruments shall have five-valve manifolds; two-valve manifolds are specified for other instruments as appropriate; horizontal alignment of two pressure taps, particularly where there are condensation pots; the impulse pipes attaching must be close together and preferably in thermal contact.

Intercepting valves shall be ball or needle type metal to metal seat; pipe shall be installed and fixed in such a way to reduce stresses and vibrations of instruments and to prevent line expansion; pipe routing shall avoid gas separation on liquid service and liquid condensation on gas service; use of fittings on bending pipe should be avoided.

Instrument installation shall be designed to correctly sense the process variable; taps on process lines shall be located so that sensing lines do not trap air in liquid service or liquid in gas service; taps on process lines shall be fitted with a shutoff (root or gauge valve) close to the process line; root and gauge valves shall be main-line class valves; instrument impulse tubing installations shall not be designed for blow down service.

Instrument tubing shall be supported in both horizontal and vertical runs as necessary; expansion loops shall be provided in tubing runs as per piping class or equivalent material subject to high temperatures. To prevent the accidental personnel contact, the tubing shall be insulated. The instrument tubing support design shall allow for movement of the main process line.

Each instrument must have its own primary circuit (orifice taps, root valve, tubing, etc).

2.7 Instrument Air System

Air supply to locally mounted instruments, shall be fitted with an individual combination air supply regulator and filter with pressure gauge.

All instruments shall be connected to the air network, air distribution shall be provide by Stainless Steel pipe (11/2"-1"-1.2") up to the isolation valve installed and by Stainless Steel tubing 3/8" OD *(about 1.5 meters)* from Isolation Valve up to the Pneumatic devices.

2.8 Field Instruments Location

Instruments for vapors or gas service shall be generally mounted above the sampling point with the connection preferably at the bottom whereas instruments for liquid, steam, or condensable vapor service shall be generally mounted below the sampling point with the connection preferably at the top.

Process connections shall be provided thus to minimize the corrosion and erosion in the point of connection or insertion as well as external interfering that may affects the quality of measurement.

Indicators are located such that they are visible from the floor or adjacent operating platforms.

If accessibility, visibility, or clearance requirements preclude either of these situations, provisions shall be made in the instrument piping configuration to ensure proper operation of the instrument.

Instrument manifolds shall be accessible from grade, platform, stairway. Access from portable ladder shall be limited to 4,5m above grade; above 4,5m accessibility shall be from platform, or stairway. Where instrument manifolds are not provided, these criteria shall be applied to the instrument block valves.

Indicating instruments that must be visible for automatic control adjustment or manual operation shall be visible from the adjustment or operating point; if plot or piping arrangement precludes this, other provisions shall be made for indication at the adjustment or operating point.

Indicating instruments not in this category shall be visible from operating aisles or passageways.

Instruments shall be located so that required clearances are maintained for walkways, access ways, and operation and maintenance of valves and equipment.

2.9 Field Mounted Instruments

Field-mounted instruments shall be of a design suitable for the area in which they are located.

Instruments shall be mounted in areas accessible for maintenance and relatively free of vibration and shall not block walkways or prevent maintenance of other equipment.

Where practical, field-mounted instruments shall be grouped on racks; supports for individual instruments shall be prefabricated, off-the-shelf, 2" stand type pipe.

Instrument racks and individual supports shall be mounted to concrete floors, to platforms, or on support steel in locations not subject to excessive vibration.

Individual field instrument sensing lines shall be run in horizontal and vertical lengths that do not affect signal response.

3 VALVES

3.1 Actuated On-Off valves

The type of actuators for valves shall be determined on the base of the functional requirements, size, operating environment, and frequency of operation.

3.1.1 3-Phase Electric Actuators

The actuators shall be suitable for use on a 3 phase alternate power supply and incorporate motor, integral reversing starter, local control facilities and terminals for remote control and indication connections housed within a self contained, sealed enclosure.

The motor actuator shall be placed in a position relative to the valve that prevents leakage of liquid, steam, or corrosive gas from valve joints into the motor or control equipment.

Depending on the service to be performed the motorized valve shall be of the "on-off" or "inching" type.

3.1.1.1 Actuator Sizing

The actuator shall be sized to guarantee valve closure at the specified differential pressure.

3.1.1.2 Environmental

The actuator shall be suitable for outdoor use in marine environment (marine corrosive) and it shall be capable to operate in site environmental conditions.

The actuator shall be 0-ring sealed, weatherproof to IP65.

3.1.1.3 Motor

The electric motor shall be Class F insulated.

Protection shall be provided for the motor as follows:

- the motor shall be de-energized in the event of a stall when attempting to unseat a jammed valve;
- motor temperature shall be sensed by a thermostat to de-energize the motor in case of overheating;
- lost phase shall be detected.

3.1.1.4 Gearing

The actuator gearing shall be totally enclosed in a oil-filled gear case suitable for operation at any angle.

3.1.1.5 Hand Operation

A handwheel shall be provided for emergency operation, engaged when the motor is declutched by a lever or similar means, the drive being restored to power automatically by starting the motor. Provision shall be made for the hand/auto selection lever to be locked in both hand and auto positions.

The handwheel drive must be mechanically independent of the motor drive and any handwheel gearing should be such as to permit emergency manual operation in a reasonable time.

3.1.1.6 Torque and turns limitation

Torque setting: 40% to 100% rated torque.

Latching to be provided for the torque sensing system to inhibit torque off during unseating or during starting in mid travel against high inertia loads.

3.1.1.7 Remote Valve Position/ Actuator Status Indication

Provision shall be made in the design for the addition of transmitter to give a 4-20mA analogue signal corresponding to valve travel for remote indication when required.

3.1.1.8 Local Position Indication

The actuator shall include a position indicator with a display from fully open to fully closed.

Red, green and yellow lights corresponding to Open, Closed and Intermediate position shall be included.

3.1.1.9 Integral Starter and Transformer

The reversing starter, control transformer and local controls shall be integral with the valve actuator suitably housed to prevent breathing and condensation. The starter shall be suitable for 60 starts per hour and of rating appropriate to motor size. It shall have the necessary tapping and be adequately rated to provide power for the following functions:

- energization of the contactor coils;
- 24VDC output where required for remote controls;
- supply for all the internal electrical circuits.

3.1.1.10 Integral Local Control and Control Mode Selector

The actuator shall incorporate local controls for Open, Close and Stop and a Local/Remote mode selector switch lockable in any one of the following three positions: local control only, stop (no electrical operation), remote control plus local stop only.

The local controls shall be arranged so that the direction of valve travel can be reversed without the necessity of stopping the actuator.

3.1.1.11 Control Facilities

The necessary wiring and terminals shall be provided in the actuator for the following control functions.

It shall be possible to reverse valve travel without the necessity of stopping the actuator.

Remote controls fed from an internal 24VDC supply, to be suitable for one of the following methods of control:

- on/off valve: Opening command (N.O. contact, closed pulse output), Closing command (N.O. contact, closed pulse output) and Stop command (N.C. contact, open pulse output).
- inching valve: Position transmitter (ZT), Opening command (N.O. contact) and Closing command (N.O. contact).

3.1.1.12 Monitoring Facilities

Availability: monitor relay having one changeover contact, to indicate that the auxiliary control voltage is available and no electrical protection is actuated.

Remote status: Monitor relay having one changeover contact, to indicate that the actuator is switched for remote operation.

Valve position limit switch.

Position transmitter (for inching valve only)

3.1.1.13 Wiring and Terminals

The terminal compartment shall be provided with three or four threaded cable entries as specified on datasheet.

3.1.1.14 Start-up Kit

Each actuator shall be supplied with a start-up kit comprising installation instruction manual, electrical wiring diagram and cover seals to make good any site losses during the commissioning period. In addition, sufficient actuator commissioning tools shall be supplied to enable actuator set up and adjustment during valve/actuator testing and site installation commissioning.

3.1.1.15 Performance test certificate

Each actuator must be performance tested and individual test certificates shall be supplied free of charge. The test equipment should simulate a typical valve load, and the following parameters should be recorded.

- current at maximum torque setting;
- torque at max. torque setting;
- actuator output speed or operating time.

3.1.2 Pneumatic Actuators

3.1.2.1 Actuator Sizing

The actuator shall be sized to guarantee valve closure at the specified differential pressure.

Minimum design pressure to be considered for actuator sizing is 3.5 bar-g

3.1.2.2 Environmental

The actuator shall be suitable for outdoor use in marine environment (marine corrosive) and it shall be capable to operate in site environmental conditions.

3.1.2.3 General Features

- The actuator design will guaranteed smoothly movement in the full stroke, not depending from the valve position and for any operating conditions, i.e. for the differential pressure of the process fluid between 0 and the maximum defined on the data sheets, and for indicated instrument air pressure range.
- The spring of single acting actuators shall be cylindrical and working by compression, fully enclosed in a metal housing. The spring adjustment nuts, if any, shall be easily accessible.
- The actuators must overcome the inherent hysteresis in the movement of parts, the weight of the moving parts and the differential pressure across the valve. The quick closing actuators, if necessary, shall be provided with end stroke overload absorber device.

3.1.2.4 Control Facilities

The necessary wiring and terminals shall be provided in the actuator for the following control functions:

Solenoid valves (normally three way valves on feed air) will be supplied with the valves, and shall have Class H coils; the coil enclosure shall normally IP 65 minimum, but shall be suitable for the area classification.
The coil of the solenoid valves will be designed with a voltage of **125 V d.c.**
The bodies of the solenoid valves shall be of stainless steel.
The supply shall be complete of the necessary pneumatic tubing between air pressure regulator, solenoid valve and actuators for all valves. All tubing shall be of stainless steel.

3.1.2.5 Monitoring Facilities

Valve open and close position switches (mechanical type), for remote supervision, shall be provided for all on/off-duty actuated valves.
The switches shall be IP 65 minimum, oil and dust resistant, with 1 SPDT contacts.
The limit switches shall be prewired with flame retardant wires, with 1,5m length, of section not below 1,5 mm2 for the contacts and 2,5 mm^2 for the yellow-green earthing wire.

Vendor shall install a Junction box for limit switches cable terminals, with electrical connection ½" NPT

3.2 Control Valves

Control valves in throttling service shall generally be the globe-body cage type with body materials, pressure rating, and valve trims suitable for the service involved; other style valve bodies (e.g., butterfly, eccentric disk) may also be used when suitable for the intended service; for services with temperature of fluids above 300°C applications hardened trim shall be used.

Valves shall be designed to fail in a safe position in accordance with hazard analysis.

Control valve bodies shall not be more than two sizes smaller than line size, unless the smaller size is specifically reviewed for stresses in the piping.

Control valves shall be sized as per IEC 60534.

For non critical services – water distribution, low temperature etc. the minimum seat leakage shall be CL IV (ANSI FCI 70.2).

Critical service valves shall be defined according to ANSI 900; severe service valves shall be defined as valves requiring anti-cavitation trim, low noise trim, or flashing service, with differential pressures greater than 7bar.

In general, control valves shall be specified for a noise level no greater **than 85 dBA**, when measured 1m downstream and 1m away from the pipe surface without insulation; application of control valves exceeding this constrain in term of noise shall be previously approved by Contractor.

Diaphragm motors normally shall be the fully enclosed spring type. Springs shall have linear characteristics permitting full stem travel under operating conditions for signal air pressure range of 0,2 ÷ 1 barg (*note: valve positioners are included in the supply scope*); springs shall be corrosion resistance and shall have a readily accessible adjusting nut; stem position indicators shall be provided.

Electro-pneumatic transducer or positioner shall be furnished for control valves which are operated by electronic signal; electronic devices must not be mounted directly on valves in high temperature service without adequate protection.

The valve actuator shall be sized to fully stroke the valve against the unbalanced forces acting on the valve plug and stem, when the differential pressure across the valve is equal to 110% of the normal operating upstream pressure or the maximum differential pressure that can be experienced in the field (i.e. maximum torque requirement of a butterfly valve, shut off pressure of a pump during start up with the receiver at atmospheric pressure or vacuum), whichever is greater.

Extension bonnet shall be used in service application above 200°C.

Butterfly valves shall be sized for maximum opening with 60° angle.

Handwheels shall be furnished on those valves that do not have manual bypasses and where it shall be possible to control the process by using a handwheel; this solution shall be used in a specific situation where this is the only available solution.

Control valve accessories, like air pressure regulators, air filters, etc. (excluding controllers), shall be mounted on the valve actuator unless severe vibration is expected.

Control valves in flashing service should be located as close as possible to and in direct contact with the downstream vessels inlet nozzle to reduce the probability of flow and pressure transients; this will also minimize the length of piping system subject to typical erosive conditions of flashing flow; however, the control valve must always be located so that the flashing does not occur upstream of the control valve.

3.3 Self Regulating Valves

Self actuated pressure reducing valves shall be used only for minor services, requiring no precise controls and where process fluid regulated by the valve are mainly air or nitrogen.

3.4 Safety and Relief Valves

Safety and relief valve body material, pressure and temperature rating shall comply with the pipe and/or equipment specification.

Safety relief valves, except special applications, shall be spring-loaded type, full nozzle, with metal-to-metal seat, full lift.
Safety valves with balancing bellows shall be used, where necessary, in order to assure valve setting independent from the valve downstream pressure.
Connections shall be generally flanges as per ANSI Standards.
Relief valves sized ¾" x 1", minimum orifice area 0.38 cm2, shall be used for thermal expansion if not otherwise specified in the instrument data sheets.
Safety valves shall be designed in accordance with API-520/521.
Horizontal Reactive Force (Reaction Force) values will be provided by the Vendor along with the calculation sheets.
UV ASME stamps are required for Safety/relief valves. The design, materials, welding procedures, inspections and tests of the Pressure Safety devices shall be approved/ Certified by a recognized local agency.

4 UTILITIES DATA

4.1 Power Supply

- For PLC cabinet: Voltage 230 Vac 50 Hz from UPS
- For Motorized Valves Voltage: 400V ac
- For solenoid valves: Voltage: 125V dc
- For instruments: Voltage: 24Vdc (two wire)
  [or Voltage 230 Vac 50 Hz if dc voltage not feasible]
  24V dc, shall be generated inside PLC cabinet/DCS

4.2 Instrument Air

Compressed instrument air with the following characteristics will be available from the air distribution system:

- operating pressure: min 3,5barg – max 6,5barg
- operating temperature: 50°C
- design pressure: 12barg
- design temperature: 70°C

5 INSTRUMENTATION ON PACKAGE UNITS

For details relevant to Instrumentation for package units refer specification "Instrument Technical Specification for Packages" **3645-KK-SG-000110** and to the relevant specification for Automation and Control.

5.1 Limits of Supply

The package's Vendor is fully responsible for the design, selection, installation and testing of all the instrumentation system relevant to the package.

The plant battery limits are defined by the skid (if any), field local panels (if any), field junction boxes (in package's Vendor scope of supply) and the connection to the plant instruments air header (header excluded).

5.2 Design Criteria

The package's Vendor shall completely design, define and select the required instrumentation (including connecting pipe, valves, tubing and fittings) associated to the mentioned package; the instruments design and selection shall be done in compliance with the technical requirements of this specification. The Vendor may use other different standards only if previously approved by Contractor.

If a dedicated PLC isn't foreseen to manage the package, all field mounted instruments shall be connected to DCS through field mounted junction boxes; different JB shall be installed for different levels of signals.

The manufacturers of the various instrumentation system components shall be selected among those listed in the Instruments Vendor List provided by the Contractor. Any deviations to the Vendor list shall be sent to Contractor for approval.

Approval of any document by Contractor does not release the Vendor from the responsibility of any design mistake or omission.

5 TESTING AND CERTIFICATES 11

5.1 GENERAL 11
5.2 CERTIFICATES RESPONSIBILITY 11

1 GENERAL REQUIREMENTS

This document specifies the requirements for design, specification, procurement, fabrication, inspection and testing of instrumentation provided as part of packaged equipment.
This section applies to any instrumentation associated with all types of skids or packaged equipment to be used Package Units that will be provided for Coal Fired Power Plant and Associated Coal Receiving Terminal to be built in Dominican Republic.

Instrumentation shall be provided in compliance with requirements outlined in the document "INSTRUMENT GENERAL SPECIFICATION **(3645-KK-SG-000101)** and to the relevant specification for Automation and Control.

In case of discrepancy between this document and other documents, Vendor is to point out the discrepancy and wait for approval by Contractor. Contractor will solve the inconsistency.

During the bidding phase, Vendor is to point out any deviation in a table format, where each deviation is listed with a reference to the proper chapter of the specification.

If no deviation/clarification is raised by Vendor, the proposal is considered in accordance with Contractor's specifications. Vendor will comply at no extra-cost and without delay.

The offer must contain the supply of the instruments equipment and the engineering, installation and assembly work (as described in more detail in the scope of supply), final inspection and testing, commissioning, acceptance test and documentation.
Vendor takes over the general functional guarantee for the package unit, independent of the supply and work partitioning.

The entire equipment has to comply with the standard specifications, guidelines and rules that are valid at the time of the order.

Electrical installations and equipment have to be tested and certified by the manufacturer.
The compliance to the rules for the prevention of accidents have to be proved and certified.

4 SCOPE OF SUPPLY

4.1 GENERAL

This section describes the battery limits between Vendor and Contractor. Whenever an "X" is placed under the column "Vendor", Vendor shall supply the items in the relevant line (as material, or engineering or construction). If an "X" is placed under the column "Contractor", the supply of the items will be the responsibility of Contractor. In case "N.A." is placed on both the columns, the item is not applicable for the project.

4.2 MATERIALS

4.2.1 MATERIALS INSIDE PACKAGE

Item list	Vendor	Contractor
Field instruments	X	
Machine Vibration Monitoring System probes (if any)	X	
Machine Vibration Monitoring System cabinets (if any)		X
Package Control System	X(*)	
Package Safety System	X(*)	
Local Panels	X	
Other packages panels (if any)	X	
Power distribution cabinet(s)		X
Remote cabinets (PLC)	X(*)	
Junction boxes with (Cableglands for External Wiring)	X	
Cables (between instruments and junction box)	X	
Cables (between instruments and local panel)		X
Cables (between junction box and local panel)		X
Cables (between local panel and local panel)		X
Power cables to panels and cabinets		X

4.2.2 MATERIALS FOR PACKAGE CONNECTION OUTSIDE THE PACKAGE LIMITS

Item list	Vendor	Contractor
Electrical material (e.g. cables, conduits, trays, etc.) between Local Package panel(s) and main control system		X
Electrical material (e.g. cables, conduits, trays, etc.) between Package and Contractor junction boxes		X
Electrical material (e.g. cables, conduits, trays, etc.) between Package and remote cabinet (in the field or in control room)		X
Electrical material for skid to skid connection (in case of multiple skid packages)		X
Pneumatic material between Package and plant air network		X
Pneumatic material for skid to skid connection (in case of multiple skid packages)		X
Cables (between instruments and remote cabinets)		X
Cables (between package junction boxes and remote cabinets)		X
Special Cables	X	

4.2.3 TYPE OF SIGNALS

Analogue signals: 4 - 20 mA with HART protocol (24VDC loop powered)

Separate instruments shall be used for alarm purpose & trip purpose.

Binary field signals: proximity switches
Switches: SPDT/DPDT
Solenoid valves:125 V DC

Refer to Instrument General Specification **3645-KK-SG-000101** for details.

4.2.4 JUNCTION BOX AND CABLE FORMATION

Separate Junction Boxes shall be considered for the following signal types

- AI/AO
- RTD
- Thermocouples
- Digital Inputs
- Power Supplies

4.2.5 WINTERIZING (IF ANY)

Electrical tracing, material, connection, erection are included in the Vendor scope of work.

4.2.6 VENDOR LIST

Package vendor shall follow the Project Vendor list. In case of any additional sub-vendor not included in the project vendor list, the same shall be submitted to Contractor for approval.

4.2.7 LOCAL CONTROL PANELS

The panel shall be composed by boxes with hinged opening covers and the electrical construction shall confirm to the requirements of the appropriate area classification.

The boxes shall be grouped on self-standing galvanized steel structure complete of 3 mm thickness sunshade. Lifting eyebolts shall be provided.

Alarm repetition lamps, motor commands, signalizations, interlocking relays, active safety barriers if any, etc., shall be located inside dedicated boxes including relevant interconnecting terminal strips.
All components mounted on these dedicated boxes shall also have suitable electrical execution to meet with the requirements of the required area classification.

All push buttons, lamps, switches, etc., on front panel to be protected by transparent acrylic resin covers.

Components & accessories shall be fixed on internal mounting plates. Front lighting to be provided.
The "Local Panel", shall be equipped with all necessary instruments to operate the unit locally.

Suitable devices shall be provided to avoid water condensation inside the panel (electrical or steam heating system).

INSTALLATION : Locally skid board or close to the machine / equipment packages

AREA CLASSIFICATION: According to project specifications

MECHANICAL PROTECTION: NEMA 4X

ENCLOSURE : Material SS316

CABLE ENTRY: bottom side through cable glands.

EXPANDABILITY: 10% of installed and wired spare shall be considered, plus 20% of free space in the panel shall be considered.

FRONT LAYOUT: Alarms, commands, signalization etc., shall be 1900 mm max and 700 mm min from floor level.

NAMEPLATES AND TAGS: as per Clause 1.5 of Instrument General Specification **3645-KK-SG-000101**

ENVIRONMENTAL CONDITION: Refer Project Design basis spec. **3645-YZ-PC-000-001**

VENDOR DOCUMENTS SUBMITTED FOR CONTRACTOR'S APPROVAL SHALL BE IN ENGLISH. FINAL REVISION OF VENDOR DOCUMENTS SHALL BE SUBMITTED IN LANGUAGES AS INDICATED IN ABOVE TABLE.

APPROVAL OF ANY DOCUMENT BY CONTRACTOR DOES NOT RELEASE THE VENDOR FROM THE RESPONSIBILITY OF ANY DESIGN MISTAKE OR OMISSION.

4.3.2 SOFTWARE REQUIREMENTS AND FORMATS OF DOCUMENTATION

The following list specifies the tools to be used; the electronic format and the main requirements for the documentation to be provided by Vendor.

Document type	Electronic format	Software tool
2 D Drawings	Autodesk file	Autocad
WP documents	Microsoft file	Word 2000
Spreadsheets	Microsoft file	Excel 2000
Databases	Microsoft file	Access 2000
Flowcharts	Microsoft file	PowerPoint
Images	*.pdf file	Acrobat
Instr. Data sheet (1)	SmartPlant Instrumenation file	Spec editor
Instr index	Microsoft file	Excel 2000

(1) Vendor shall supply instrument data sheets on contractor's SmartPlant Instrumentation specification forms (ISF FORMAT)

File structures for Spreadsheets and databases shall be provided by Contractor.

4.4 ENGINEERING

4.4.1 RESPONSIBILITY

Activity	Vendor	Contractor
Field instruments erection (inside package)	X	
Panels/consoles erection (inside package)	X	
Process connection (inside package)	X	
Air supply network connection (inside package)	X	
Logic diagrams to be develop (SAMA Symbols) inside DCS System (*)	X	
Logic diagrams developed on PLC package (if any)	X	
Electrical connection and protection (inside package)	X	
Pneumatic connection (inside package)	X	
Electrical or steam tracing (inside package)	X	
Instrument and panel grounding in field	X	
Connection between package and plant junction boxes		X
Package and junction boxes skid to skid connection	X	
Cabinets location and installation in cabinet room		X
Inter-connection wiring in cabinet room		X

Note (*): to be applied if there isn't any PLC by Vendor scope

Installation shall be according to IEC standard.

The local measuring points are to be chosen in a way that the instruments can be installed without being exposed to vibrations and outside areas of strong mechanic or corrosive burdens.

The maintenance personnel have to be able to reach the equipment without difficulties or being endangered during normal operation.

The replacement of devices shall be possible without having to stop the complete installation or the associated plant sections. All installation parts have to be constructed for the expected environment.

4.5 PRE-COMMISSIONING AND COMMISSIONING

4.5.1 RESPONSIBILITY

Activity	Vendor	Contractor
Loop checking for all instrument inside package	X	
Loop checking of instruments inside package and connected to systems out of packages	X	X
Interlock and sequences checking	X	X

5 TESTING AND CERTIFICATES

5.1 GENERAL

This section describes the battery limits between Vendor and Contractor in providing certificates. Whenever an "X" is placed under the column "Vendor", the certificates are the responsibility of Vendor. If an "X" is placed under the column "Contractor", the supply of the certificates will be the responsibility of Contractor. In case "N.A." is placed on both the columns, the certificate is not applicable for the project.

REGARDLESS OF INSPECTION BY CONTRACTOR, THE VENDOR WILL REMAIN RESPONSIBLE THAT ALL PACKAGE EQUIPMENT FULLY COMPLIES WITH SPECIFICATION REQUIREMENTS.

5.2 CERTIFICATES RESPONSIBILITY

Certificates	Vendor	Contractor
Cabinet certification	X	
Components CE mark/Atex certification PTB-certificates	X	
Safety valves certification	X	
Instrument calibration certificates	X	
Intrinsic safety components certificates	X	

5.2.1 CALIBRATION CHECKING ANT TESTS AT VENDOR WORKSHOP

Activity	Vendor	Contractor
Instrument calibration	X	
test, with power supply on, or the measuring and control loops supplies with the package	NA	

FAT AT VENDOR WORK SHOP: Testing of all PLC or DCS logics with the local panel push buttons and lamps physically connected to the PLC or DCS. Test communication (hardwired and software) shall be considered in house of DCS Vendor	X	X
Testing, with power supply on, for the alarm and safety circuits and for all the electrical circuits among field, local panels and/or junction boxes related to the package	X	
Hydraulic testing of the connections to process inside the package skid	X	
Pneumatic testing of the pneumatic connections inside the package skid	X	

5.2.2 SITE CALIBRATION CHECKING AND FINAL TESTS

Activity	Vendor	Contractor
Calibration check and test, with power supply on, or the measuring and control loops supplied with the package	X	
Testing, with power supply on, for the alarm and safety circuits and for all the electrical circuits among field, local panels and/or junction boxes relating to the package	X	
Testing of interconnections between package and DCS	X	X
Hydraulic testing of the connections to process	X	
Pneumatic testing of the pneumatic connections	X

1 INTRODUCTION

This Supply Specification sets out the minimum requirements for the design, manufacture, testing and supply of 2 (two) condensing steam turbine generator units, with the electrical generator and the auxiliary ancillary equipments to be installed in the Power Plant on the site of the Punta Catalina, Bani, on the South coast of the Dominican Republic.
Access to the project site is via local roadway, which is an unpaved road.

The gross electric output of the Unit shall be about 300 MWe (Net) ± 20% at site conditions.
The Units shall be able to operate continuously and without restrictions at turbine maximum continuous rating (TMCR).

2 STEAM TURBINE GENERATORS SCOPE OF SUPPLY

The Vendor shall be responsible for the design, manufacture, engineering co-ordination, supply, delivery, testing, final check-out and satisfactory operation of the whole units and shall be responsible for material and equipment supplied by its sub-suppliers

This Supply Specification sets out the minimum requirements for the design, manufacture, testing and supply of 2 (two) complete steam turbine generators package as hereby named:

- 10MA_10 AY001 (train1)
- 10MA_20 AY001 (train 2)

The following sections describe the design criteria relevant to each steam turbine generators and its equipments.

2.1 Steam turbine and its auxiliaries

Each train shall include one (1) single reheat tandem steam turbine-generator (STG) two-flow condensing, suitable for indoor installation complete with auxiliaries, as described hereafter, for proper operation, function, control, and monitoring of STG.
The turbine shall be fully compatible and matched with separate 3-phase, 60 Hz, hydrogen cooled generator.
Steam turbine shall be designed according to ITB requirement.

2.1.1 Steam turbine

The steam turbine rotor(s) shall be designed to withstand without any damage 120% over speed for a short time during testing at Manufacturer facilities.
Over speed test on site will be 110%;
Bearings horizontally split and lined with white metal.
For each bearing, white metal temperature shall be transmitted to the control room and the latter shall not exceed 100°C during normal operation.

Common supply bearing oil pressure monitoring shall also be provided (2oo3 configuration). Double valving required for systems with design pressure of 565 psig (3.9 MPag) or greater.

2.1.2 Protective valve systems

Protective valve systems shall include main stop valve, throttle valves, and reheat stop and intercept valves complete with:

a. Equipment stop valves with coarse mesh corrosion-resistant metal strainers and temporary fine mesh strainers, multi-hole type.
b. Provide temporary adaptors for steam line blowout.
c. Provide piping between valves and steam chest or turbine casing as required.
d. Exhaust hood spray nozzles and distributing piping.

2.1.3 Steam extractions check valves **(OPTION)**

Steam extractions check valves shall be designed according to ASME TDP 1 (2006);

2.1.4 Vacuum breaker valve;

2.1.5 Rotor turning gear device;

Rotor turning gear device shall be AC motor driven (or provide turning gear oil pump if required by systems design). The system shall include:

a. Manual and automatic engagement, including zero speed sensing device and bearing oil pressure interlock.
b. A complete turning gear system including local turbine-mounted turning gear control station.

2.1.6 Lubrication oil system:

Lubrication oil system shall include:

a. One (1) main lube oil pump (electrical or mechanical driven), one (1) standby AC motor driven lube oil pump, one (1) DC motor driven emergency lube oil pump complete with motor starter and control equipment and two (2), if necessary, jacking oil pumps with suction side directly and independently connected to the oil tanks;
b. Duplex, full-capacity (2 x 100 %) lube oil filters, 25 microns mesh maximum for control oil and lube oil with provisions for on-line switchover.
c. Two full capacity plate and frame oil coolers.
d. Sight flow indicators at all turbine and generator bearings.
e. Oil reservoir including following features and equipment:
   1) Reservoir complete of local indicators and remote control oil level and pressure transmitter with high/low level alarm and overflow level alarms.
   2) Reservoir relief and access doors.
   3) Stainless steel strainers at pump suctions.
   4) Oil reservoir vapor extractor (2x100%) with mist eliminator, ac motor driven.
   5) Arrange tank-mounted oil pumps so motor-to-pump shaft coupling is accessible outside oil tank.

6) Pressure switches for automatic start-up of turning gear oil pump, emergency bearing oil pump and bearing oil pump. Provide test valves with all pressure switches for testing pumps.
7) Pressure switches for running alarm of turning gear oil pump, emergency bearing oil pump and bearing oil pump.
8) tank shall be designed with a sufficient storage capacity to ensure a minimum of six (6) minutes retention time for the oil and fitted with remote control oil level indicators and low temperature oil heating system

f. Supply associated control and safety devices for automatic sequential startup and operation of oil pumps.
g. The oil reservoir will be wired at the factory, and all electrical connections on the tank, excluding motors, will be made to terminals or terminal boards affixed to the reservoir.

2.1.7 Hydraulic oil system including:

Hydraulic (Control) oil system shall include:

a. Control fluid tank made of stainless steel complete of local and remote control oil level indicators and pressure transmitter with high/low level alarm;
b. Two (2) full capacity control oil pumps (100% each) AC motor driven;
c. One (1) bladder type accumulator, minimum;
d. Duplex control fluid filters (2 x 100 %) with differential pressure switches to indicate fouling;
e. Duplex control fluid/water coolers (2 x 100 %) with fluid transfer valve. Tube material shall be stainless steel;
f. Arrange high-pressure piping for socket welding.
g. i. Fire-resistant hydraulic fluid shall be used
h. h. Factory wire electrical devices on reservoir to terminal box mounted on skids.

2.1.8 Oil purifier system

2.1.9 Steam sealing system

Steam sealing system shall include following equipment:

a. Automatic steam seal Provide pneumatically operated valves as required to provide regulated steam supply of proper pressure and temperature;
b. Motor-operated shutoff and bypass valves for high pressure supply, auxiliary supply, and spillover regulators.
c. Gland air steam condenser, Condenser tube material shall be Type 304 stainless steel.
d. A.C. motor driven blowers (2 x 100 %);
e. f. Interconnecting steam seal piping including hangers from supply regulators to turbine and from turbine to gland steam condenser.
f. Gland steam desuperheater system as required. If system is used during normal operation, a pneumatic operated modulating valve, isolation valves, globe bypass valve and temperature controls shall be provide. If system is used as emergency back-up, a globe valve for condensate supply shall be provided.

2.1.10 Turbine drain system

Turbine casing and auxiliary equipment drains with remotely located power-operated drain valves, including piping from turbine to drain valves and manual valves at turbine or auxiliary equipment connection.
Turbine drain system shall include:

a. Pneumatic drain valves

2.1.11 Turbine / generator coupling;

2.1.12 Condenser Exhaust expansion joint (if required);

2.1.13 Turbine Control, supervisory and protection system

Turbine Control, supervisory and protection system shaft vibration shall include;

a. Shell and rotor differential expansion;
b. Thrust bearing wear;
c. Absolute expansion;
d. Turbine monitoring equipment, turbine protection system, automatic turbine run up i system, tripled speed measurement system (See **ITB** – Vibration Measurement Devices **Section 40 91 23-56);**

Note: A vibration monitoring system, including relative and absolute vibration measurements as well as rotor axial displacement measurements, for protection purpose shall be provided - two probes 45° from vertical position per measurement.

2.1.14 Instrumentation for safe operation of steam turbine and auxiliaries;

2.1.15 Turbine insulation

Turbine insulation system shall include:

a. Block and plastic insulation for lower turbine shells, steam valve bodies and exhaust casings, and crossover pipe where required.
b. Preformed segmental pipe insulation with 0.02" (0.5 mm) thick embossed aluminum jacketing for steam piping furnished.
c. Reusable blankets for upper turbine shells and horizontal and vertical shell-flange joints which normally unbolt for disassembly.
d. Insulation thickness: According to manufacturer's standard.

2.1.16 Special tools and wrenches

Vendor shall provide the turbine special tools and wrenches system as required by turbine design

2.1.17 Special turbine accessories:

Vendor shall provide the following accessories:

a. Motor-operated vacuum breaker valve.
b. Shaft grounding brush.
c. One set of special tools and lifting slings.

d. Foundation bolts Shims, seating, and sole plates as required to setting and align the equipment.
e. Fixators as required to set and align steam turbine and generator.

2.1.18 Acoustical enclosure (for Steam Turbine and Generator)

Vendor shall provide with access doors on both sides if necessary to meet the noise level guarantees

2.1.19 Protective devices:

a. Exhaust casing relief diaphragms. Furnish spare diaphragm.
b. Exhaust casing high temperature alarm thermocouple.

2.1.20 ASME Code performance test

Vendor shall provide all required connections to perform ASME PTC 6 and PTC 46 Code performance test including

a. Pressure test connection piping and isolation valves including necessary piping from low pressure extraction points inside condenser to external point on turbine base above foundation line.
b. Thermocouples, wells and terminal heads, including necessary insertion tubing from turbine base to low pressure extraction points inside condenser.
c. Exhaust hood baskets and piping to external connection points on turbine base above foundation line.

2.1.21 Piping and Fittings onboard skids

a. Piping, fittings, and valves 2-1/2" (64 mm) and larger;
b. Piping, fittings, and valves 2" (50 mm) and smaller.
c. Provide for welded connection between turbine and condenser.
d. Terminal points of piping connections shall be arranged for welded connection where possible.
d. Oil piping and fittings shall be pickled to ensure complete freedom from scale, flushed with rust preventative compatible with turbine lubricating oil. Openings shall be tightly capped and sealed to protect piping during shipment and storage at jobsite. Provision shall be made for oil system flushing before initial start of STG and after overhaul with minimum removal of permanent pipe and easy bypass of bearings.

2.2 Generator Package Description

The supply shall include two (2) Generators, hydrogen cooled type, suitable for indoor installation complete of including its excitation system and its auxiliaries, as described hereafter.
The Generator design shall be designed according to **ITB** Large Cylindrical-Rotor Synchronous Generators **Section 48 10 01**
The following sections describe the design criteria relevant to generator and its equipments.

2.2.1 Hydrogen Cooled Generator

The Generator two poles type, horizontal mounted, cylindrical rotor arrangement, three-phase, shall be suitable for indoor installation, complying with ANSI C50.13 Standards.

2.2.1.1 Generator Design Requirements

1. Design generator to withstand bolted 3-phase fault at generator terminals for 10 seconds without damage while operating within rated operating frequency range with an excitation value equivalent to maximum rated terminal voltage at rated lagging power factor.
2. Generator shall be capable of withstanding any other short circuit at terminals for 10 seconds without damage, provided integrated product of negative phase sequence current and time does not exceed values required by standards and maximum phase current is limited by external means to value that does not exceed maximum phase current obtained from 3-phase short-circuit.
3. Generator shall be capable of operating at varying loads and be capable of enduring sudden load changes between zero and maximum generator capability limit without damage.
4. Equipment furnished shall be capable of serving maximum rated output of turbine at rated power factors, under all ambient and cooling conditions, with minimum additional 5% capability while remaining within limits of its reactive capability curve
5. Load rejection:
   a. Generator system shall be capable of full load rejection to island operation.
   b. Sudden opening of external circuit shall not result in damage to generator.
6. Generator shall be capable of synchronizing with system and loading at a rate compatible with loading rate of prime mover.
7. Generator shall be capable of withstanding over speed without mechanical degradation as required by standards..
8. Temperature rise:
   a. Rise shall not exceed limit for insulation system when loaded to maximum rating for ambient temperature, cooling medium temperature, and insulation class specified.
   b. Calculated hot spot temperature shall not exceed that allowed by standards.
9. Design combined core, inner frame, end turns, and end turn supports to have natural frequencies outside range of those for combined prime mover and generator operations.
10. AC generator designed to operate in parallel with the external grid, to which it is connected through the step-up transformer;

2.2.1.2 Generator Description

The Generator shall be 3-phase, cylindrical-rotor, synchronous alternating-current generators complete of:

1. Standard instrumentation;
2. Four (4) hydrogen coolers;
3. Two (2) cooling water flow regulating valves for hydrogen coolers supply water;
4. Slip rings housing complete with ventilation system (closed circuit with air-water coolers);
5. 6 Terminals (bushing type);
6. Monitoring system;
7. Trunnions for stator lifting;

8. Bearings arrangement for vibration pick-ups installation;
9. Foundation plates (or Fixators) and bolts

2.2.2 Generator seal oil system:

Generator seal oil system shall include:
1. Seal oil pumps;
2. Seal oil coolers (2 x 100%);
3. Seal oil filters (2 x 100%);
4. Oil-H_2 differential pressure regulating valves;
5. Piping, valves, instrumentation and safety apparatus;
6. Local and control instrumentation;
7. Vacuum tank with vacuum pump;

2.2.3 Gas System:

Generator gas system shall include:
1. H_2 reduction and H_2-CO_2 distribution panel complete with instrumentation for gas pressure monitoring, safety valve, valve and connection for gas control during filling/purging of generator; gas analyzer for purity control during generator filling / purging;
2. Automatic H_2 drier;
3. CO_2 heater and pressure reduction complete with safety valve and instrumentation for CO_2 temperature/pressure monitoring;
4. Piping, instrumentation and safety apparatus;

2.2.4 Electrical board

1. Generator instrumentation, control and protection / synchronization electrical board;
2. Generator auxiliary system electrical board;
3. Neutral grounding cubicle

2.2.5 Excitation system

Generator Excitation system shall include:
1. Static excitation system.
2. Excitation control with redundant digital AVR, U/f limitation, stator and rotor current limiters, under-excitation limiter, power system stabilizer;
3. Ceiling of excitation current at 1.6 x In for 10 s.
4. Semi-conductor bridges are N+1 redundant;
5. Full capability including 200% ceiling current with one semi-conductor bridge out of service;
6. Redundant digital regulators (automatic and manual);
7. Voltage Regulation System (AVR), reactive power regulation and power factor regulation;
8. Bumpless transfers between automatic regulators;
9. Droop compensation for parallel operation with the existing units (isolated from or connected to the 345 kV grid);
10. Under-excitation, over-excitation, stator current limiters;
11. Current transformers on the phase and neutral terminals (nr. 4 for each phase line side and nr. 4 for each phase neutral side);

12. Neutral side cubicle with earthing, 100% stator earth protection, bus duct connection to neutral terminals;
13. Transformer for static excitation system, cast resin type with metal enclosure IP23.
14. Necessary provisions and protections for generator components transportation as required according to transportation modalities;

2.2.6 Local junction boxes;

2.2.7 Special tools

1. One (1) set complete of tools for rotor assembly and disassembly;
2. One (1) set of special tools for generator shaft seal assembly and disassembly;
3. One (1) set of hydraulic wrench for generator foundation anchors pre-tensioning;

2.3 Generator constructive characteristics

All insulations applied shall be thermal class F, with heat rise guaranteed not to exceed the limits set for class B.

2.3.1 Generator operating conditions

The generator shall be able to operate permanently at rated output for the rated power factor over the ranges of ±10% in voltage and ±2% in frequency in accordance with ANSI C50.13 and according to the Dominican Republic Electrical Law (Reglamento Ley 125-01 article 150).
The Vendor shall consider the following accidental conditions in which the generator is capable to withstand, without suffering any mechanical or electrical damage or dangerous overheating:

1. Duty type S1 - continuous running duty;
2. Rated active power (Pn) and apparent power (Sn): around 360 MWe at site conditions;
3. Rated power factor: cos ϕ = 0.9 lagging and 0.95 leading;
4. Rated voltage : to be determined;
5. Voltage variation range: at least ± 10 % with class B temperature rise;
6. Rated frequency : 60 Hz;
7. Frequency variations: not less than ±2%
8. Rated speed : 3 600 rpm;
9. Number of poles : 2;
10. Unbalanced load to be carried continuously: 8% (ANSI C50.13);
11. Neutral point: earthed through current limiting impedance.
12. Coupling in out of phase conditions with phases difference of 120° and 180°;
13. In case of loss of excitation, the generator has to be designed to withstand to the electrical and mechanical effects of asynchronous operation at a power equal to 0.75 * Pn (Pn, for rated power) for at least the time for tripping providing a reasonable margin for avoiding mechanical damage;
14. Frequency threshold trip equal or less than 57 Hz;
15. Synchronization, at synchronous time of network and plant tension, for a frequency of 60 Hz ± 5% and U = 345 kV ± 15 % in extreme case;
16. Accepting 10 % load unbalance;
17. Grid perturbations (in 10 minutes mean quadratic value):

- total harmonic distortion of grid tension : 3 % of U 60hz
- individual harmonic distortion : 2 % of U 60Hz.

2.3.2 Synchronization:

1. Automatic and manual;
2. Controlled by synchronizing device for automatic synchronizing operation;
3. Verified by independent synchro-check equipment (for automatic and manual);
4. On High Voltage (345 kV) circuit breaker, and on generator circuit-breaker.

2.3.3 Metering and indication

The Generator and its associated equipment shall include a complete metering and indication system, integrated with the Main Control System. The displayed values shall be at least the following:

- Generated active and reactive power
- Terminal voltage and current
- Power factor
- Operating point in the PQ diagram
- Excitation voltage and current
- Stator winding temperature
- Bearing temperature

2.3.4 Generator protections

The generator protections will be in compliance with **ITB** Electrical System Protection **Section 33 72 00**, where applicable.

1. Digital;
2. The main functions shall be duplicated (directly or indirectly).

All protection system shall be able to interface with IEC 61850 Protocol communication.
The following protections will be provided, as minimum:

2.3.4.1 For generator:

- Frequency protection
- Overvoltage protection
- Under voltage protection
- Stator earth-fault protection
- 100% stator earth-fault protection
- Residual voltage earth-fault protection
- Generator differential protection
- Rotor earth-fault protection
- Rotor over current protection
- Minimum impedance protection
- Over current-time voltage controlled protection
- Negative phase sequence over current protection
- Loss of field protection
- Reverse power protection

- Excitation transformer over current protection
- Excitation transformer thermal overload protection
- Stator thermal protection
- Over fluxing protection
- Out-of-step protection
- Capacitive partial discharge detection elements.
- Breaker failure function

2.4 Electric power supply

Vendor shall provide, as **OPTION**, the quotation relevant to MCC, DC batteries, battery chargers and DC distribution boards relevant to its own auxiliary system.

2.5 Steam Turbine Control, Monitoring and Protection System (STCS)

Refer to:

- **ITB** Process Control Panels and Hardware (Section 40 95 13) and
- **ITB** Primary Process Measuring Devices (Section 40 91 00),
- **ITB** Programmable Logic Process Controllers (Section 40 94 43) and
- **ITB** CONTROL SYSTEMS DESIGN REQUIREMENTS (Section 01.36.43)

2.5.1 Control System

1. Electro-hydraulic control governing system, microprocessor shall be interfaced to plant DCS by either hardwired connections and redundant Ethernet connection via OPC protocol or directly integrated on the same control network of DCS.
2. The governing partition shall allow the complete fully automatic run-up, synchronization and loading of the steam turbine as well as the unit shutdown.
3. The governing partition shall perform the active power control and the steam turbine inlet pressure control (both by closed control loops). Moreover the governing partition shall perform the following limiting functions: throttle pressure floor limit, throttle pressure rate of change limiter, governor valves position limit
4. Steam turbine and generator auxiliaries control system, microprocessor based. The auxiliaries control partition shall allow the complete fully automatic steam and generator auxiliaries set up to properly start up and shut down the unit.
5. Engineering and operator workstation (for each Unit) for remote supervision and control of the STG and relevant auxiliaries.

2.5.2 Vibration System

1. Steam turbine and generator supervisory system (Bentley Nevada 3500 or equivalent). It includes sensors, special cables to proximitors, proximitors and elaboration racks. The system will include the hardware modules. Any input and configuration activity related to B/N is in architect engineer scope of supply. For detecting of:
   - Steam Turbine and Generator bearings vibration
   - External casing absolute expansion
   - Rotor/Case differential expansion

- Rotor axial displacement

2.5.3 Electronic protection

Electronic protection system, microprocessor based (based on 2-of-3 logic where physically feasible) for detecting and tripping the unit in case of:

- Over speed
- Low condenser vacuum
- Low lube oil pressure
- Low hydraulic pressure
- High exhaust HP steam temperature
- High L1 stage temperature
- High bearing vibration
- High axial displacement
- Trip request from BOP
- Trip request from emergency push button
- Generator 86 lock out relay intervention

2.6 Miscellanea

The supply shall include all the following miscellaneous equipment:

- Detailed list for first filling lube oil and control hydraulic fluid, flushing oil, grease and other mandatory consumables.
- Steam turbine thermo-acoustic insulation.
- Painting and corrosion protection, according to Vendor's Standards.
- Assistance for P&ID's and HAZOP reviews during engineering phase.
- Shop inspection & tests according to Vendor ITP and applicable Standards.
- Supervision to erection (separate quotation).
- Supervision to commissioning and start-up (separate quotation)
- Special instrumentation for performance tests (on loan basis) with the exception of flow measuring devices.
- Special Cables.
- STG acoustical protection (silent walls and enclosures including relevant ventilation system) as per manufacturer's standards.

2.7 Earthing

All the equipment shall be completed with a dedicated grounding.
The package base plate shall be provided with an earthing and bonding system.
Each base plate shall be an integrally bonded unit with at least two (2) diagonally opposed points of connection to the plant earthing system using a standard earthing boss design.
The package will be bonded to the plant earthing system by others.

2.8 Insulation, Cladding and guarding for personnel protection

All package components that operate at temperatures above 60°C, and which are located within 1 m of the edge of any base plate, shall either be insulated by the Vendor or provided with suitable guards.
The Supply shall include the insulation of all casings, pipes, valves and tanks shall be such as to reduce the surface temperature to max 60°C (considering 32 °C, 1 mph wind speed). Adequate means shall be provided to ensure a satisfactory fixing of the insulation to the equipment.
All insulation shall be non inflammable, hot resistant, chemically inert and shall remain so in the event of being saturated with water.

2.9 Painting

Vendor is required to provide a detailed description of proposed painting cycle within their bid for CONTRACTOR approval.
In general, non-machined external surface of turbine-generator shall be shop-painted with prime coat while Control panels and other equipment normally receiving finish coat painting in shop shall be painted with one prime coat and two finish coats.

2.10 Marking System

Marking by colour code of the equipment, piping, wiring, etc... shall be applied according to the standards and/or to the particular specifications of the Contractor.

2.11 Insulation and Cladding

The Supply shall include the insulation of all casings, flues, ducts, pipes, valves and tanks shall be such as to reduce the surface temperature to max 60°C (considering 32 °C, 1 mph wind speed). Adequate means shall be provided to ensure a satisfactory fixing of the insulation to the equipment.
All insulation shall be non inflammable, hot resistant, chemically inert and shall remain so in the event of being saturated with water.
The use of glass wool as an insulator is not accepted.
The thermal insulation shall be of an approved type, and shall mainly consist of preformed slabs or blankets.

3 LIMITS OF SUPPLY

3.1 Steam

- Steam turbine HP stop valve inlet flange.
- High pressure turbine outlet flange.
- Intermediate pressure stop valve inlet flange.
- Steam turbine extractions outlet.

3.2 Condensate

- Inlet connection to LP exhaust hood spray system and gland steam temperature control device.
- Condensate outlet flanges from the steam condenser
- Sealing return water n. 1 connection to steam condenser
- Condensate make- up line n. 1 connection to steam condenser

3.3 Lube and control oil flanges limits of supply

3.4 Drain / Vents

- Outlet flange of gland steam condenser extractors.
- Outlet flange of oil vapour extractors.
- LP1 drain and vent connections
- Outlet flanges for incondensable extraction system to be defined
- Dirty drains connections to sewage system.

3.5 Close Circuit Cooling Water

- Steam turbine and generator oil coolers in / out flanges.
- In / out flanges of gland steam condenser.
- Inlet connection to LP exhaust hood spray system and gland steam temperature control device.

3.6 Compressed air for instruments

- Local manifolds. One common flange at the edge of the skid

3.7 Generator

- Generator winding terminals arranged on the generator bottom.
- Generator space heaters and power auxiliary terminal block enclosed in a box arranged on the generator casing and fully wired.

- Flanges and terminal blocks for any kind of piping, electrical and signal connection to equipments supplied by others.

3.8 Instrumentation and Control

- Generator winding terminals arranged on the generator bottom.

3.9 Exclusions

- Foundations and civil works.
- Connection of equipment earthing pads to the grounding system.
- Steam turbine by-pass system.
- Piping, instruments, electrical and signals connections of any kind towards equipments not included in the supply.
- Condensate extraction pumps
- Deaerator, boiler feed water pumps and feed water heaters (except LP1 in condenser's Neck
- Generator isolated phase bus duct and relevant branches to potential transformers.
- Power station DCS system.

Dr. Ramón Ma. Ubéez Mancebo
ABOGADO NOTARIO PÚBLICO
Santo Domingo, R.D., D.N.
Mat. #

4 DESIGN BASIS

Refer to Design Basis, doc. no. 3645-WZ-SG-000-001.

5 ENVIRONMENTAL REQUIREMENTS

Refer to Design Basis, doc. no. 3645-WZ-SG-000-001.

6 SERVICE CONDITIONS

Operation: Design and equip turbine-generators for commercial operation as follows:

1. Operate singly or in parallel under automatic load dispatch with other STG's in same station, and with other stations of interconnected system.
2. Capable of operating with steam supplied from a coal fired boiler with integrated boiler turbine control system.
3. Capable of withstanding 100% load rejection to auxiliary power without turbine over speed trip.
4. Capable of coming to rest without bearing damage on loss of cooling water provided that turbine is tripped immediately after loss.
5. Capable of initiating rapid closure of intercept and governor control valves followed by immediate reopening to achieve a rapid reduction in turbine driving power as a means of maintaining STG stability (remaining in synchronism), during severe generator load loss transients due to external system disturbances

7 ELECTRICAL POWER SYSTEM

7.1 General

The electrical power system is designed with adequate auxiliary equipment, stand-by power source, and protection devices to provide maximum continuity of service and also to ensure operation of the essential station equipment during emergency condition.
The Plant will supply electrical power into the national electric grid 345 kV at 60 Hz.
From the HV side of the step-up transformer the energy will be first transmitted via a 345 kV connection (Over head Line) to the 345 kV power plant switchyard air type.
The 6.9 kV and the LV systems are derived from the 345 kV system.
The unit transformer (oil immersed type with two windings) will be sized to supply the load of one unit of auxiliary.
The generator is to be connected to the step-up transformer via isolated phase bus ducts.
The circuit of the generator is to be equipped with a generator circuit breaker (GCB) and a unit transformer for feeding the auxiliary power, which has to be connected at the isolated phase bus duct in between the Generator-CB and the step-up transformer.
In the case of loss of auxiliary power supply (345 kV) the emergency diesel generator system will be capable of supplying the loads necessary to perform an emergency shut-down in safety condition in order to protect the power plant.

In normal operation the starting auxiliary power will be delivered from the HV grid through the step-up transformer and the turbine's unit transformer, while the GCB is open. Black start capabilities are not provided.

For Electric Motor refer to ITB requirements.

7.2 System design information

The system design information is set out in the table below.

A. Site electrical distribution system characteristics:

Electrical System Level (AC)	Nominal Operating Voltage	Frequency (Hz)
Project Site Incoming Supply Voltage	345 kV	60
Backup Incoming Supply Source	138 kV	60
Site Primary Distribution Voltage	6.9 kV	60
Secondary Unit Substation and MCC plant auxiliary loads	480 V	60
General Facility Power Distribution: HVAC, lighting, receptacle, and other branch circuit loads	208Y/120 V	60
DC Power Distribution	125 VDC	N/A

B. Electrical system configuration and grounding method:

Electrical System/ Equipment	Configuration	Grounding Method
345 kV incoming line and high side of GSU	3-phase, 3-wire	Effectively Grounded
138 kV incoming line and high side of SST	3-phase, 3-wire	Effectively Grounded
Generator unit terminal bus , 18 kV	3-phase, 3-wire	Ungrounded
Unit auxiliary medium-voltage distribution system, 6.9 kV	3-phase, 3-wire	Low-impedance Grounded
Plant site primary distribution system, 6.9 kV	3-phase, 3-wire	Low-impedance Grounded
Plant site low-voltage distribution system, 480 V	3-phase, 3-wire	High-impedance Grounded
Plant site low-voltage distribution system, 208Y/120V	3-phase, 4-wire	Solidly Grounded

a. Operating voltages are as follows:

Motor Size	System Voltage (volts)	Nameplate Voltage (volts)	Frequency (Hz)	No. Phases
< 0.75 hp	120	115	60	1
0.75 ≤ hp < 200	480	460	60	3
hp ≥ 200	6900	6600	60	3
MOV's	480	460	60	1 or 3
All DC Motors	125	120	n/a	1

b. NEMA MG-1 Motors. Motors installed indoor or in environmentally controlled enclosure non-corrosive environment shall conform to NEMA MG-1.

c. IEEE 841 Motors. Motors installed outdoor, exposed to ambient salt-laden air, or in corrosive environment shall conform to IEEE 841.

d. Nameplate Rating. The nameplate horsepower multiplied by the nameplate service factor shall be at least 15% greater than the driven equipment maximum brake horsepower. All motor nameplate data shall conform to NEMA MG 1 requirements.

e. Windings and Insulation. Insulated windings will have Class F non-hygroscopic insulation systems with Class B temperature rise and ambient temperature in accordance with NEMA MG1 or IEEE 841 standards.

f. Special Applications. Special requirements for individual motors are to be included in individual specification technical sections and shall have precedence over these general motor requirements.

g. MOV's. Motor operated valves shall be sized in accordance with the valve manufacturer recommendations.

h. Low Voltage Fractional Horsepower Motors. Type, design, and construction of each general, special, and definite purpose fractional horsepower motor shall be coordinated with the driven equipment requirements and shall be in accordance with the requirements of NEMA MG1 or IEEE 841.

i. Direct Current Machines. Direct current machines shall be designed and constructed for continuous operation and in accordance with the requirements of NEMA MG1. DC emergency motors shall operate continuously at the nominal system voltage with any supply voltage between 80% and 112% of the nominal system voltage.

j. Motor Operators for Non-modulating Valve, Gate, and Damper Service. Motors shall be designed for high torque, reversing service in a 50 degree Celsius ambient temperature and shall be in accordance with the requirements of NEMA MG 1 and MG 2.

k. Hoist, HVAC, and Miscellaneous Motors. Motors not related to power production shall conform to applicable requirements of NEMA MG 1 and shall otherwise be manufacturer's standard.

l. Starters. Motors shall be designed for full voltage starting and frequent starting where required and shall be suitable for continuous duty in the specified ambient conditions. Intermittent-duty motors shall be selected where recognized and defined as standard by the equipment standards and codes. MFR shall provide reduce voltage starter to limit impact on system voltages within acceptable operating range during the motor start.

m. Variable Frequency Drive. Provide variable frequency drive for motor requiring soft start and variable speed control.

n. Torque and Acceleration. The torque characteristics of all induction motors shall be as required to accelerate the inertia loads of the motor and driven equipment to full speed without damage to the motor or the equipment at any voltage from 90% to 110% of motor nameplate voltage except those to be individually considered. A voltage drop greater than 10% from the specified motor nameplate rating shall be individually considered for proper motor starting and operating.

o. Space Heaters. In general, space heaters shall be furnished for all outdoor motors, all totally enclosed motors, and all open drip-proof motors in damp locations and for motor sizes greater than 75 hp.

   1. Space heaters shall be sized as required to maintain the motor internal temperature above the dew point when the motor is idle. Motor space heaters shall not cause winding temperatures to exceed rated limiting values or cause thermal protective device over-temperature indication when the motor is not energized.

2. Space heaters rated 1,200 watts and less shall be suitable for operation on 120 volts, single phase, 60 Hz. Heaters rated above 1,200 watts shall be suitable for operation on 208 volts, 3- phase, 60 Hz.

7.3 Power and Control Wiring

1. Cables shall be run in conduits, cable trays, or other acceptable raceways. Cables shall not be hung in free air without being contained in raceway system.
2. Special Cable. This type of cable shall include cable supplied with equipment, prefabricated cable, coaxial cable, communication cable, fiber-optic cable, etc. Special cable shall normally be supplied by a particular manufacturer. Special cable shall be routed in accordance with manufacturer's recommendations.
3. Cable Separation.
   1. The following general practices for cable separation shall be used for all levels of cabling:
      a. Cables of like signal levels and power levels must be grouped together in like raceways.
      b. Different voltage class group levels must run in separate raceways.
      c. Circuit cables dedicated to the unit shall be run in separate raceways from other unit.
      d. Redundant power supply circuit cables shall not be run in same raceway.
      e. If wires are the same level and same type signal, group those wires from one cabinet to any one specific location together in multi-conductor cables.
      f. When unlike signals must cross in trays or conduit, cross them in 90° angles at maximum spacing. Where it is not possible to maintain spacing, place a grounded steel barrier between unlike levels at the crossover point.
   2. Voltage class group level to be used for cable separation:
      a. MV – Medium-voltage
      b. P – Power Low-voltage
      c. C – Control Power (discrete signal, loop power, < 120V control power)
      d. S – Low Level Signal (analog and digital data)
   3. Voltage class group minimum cable separation distance:

	MV	P	C	S
MV	0"	6"	12"	24"
P	6"	0"	12"	12"
C	12"	12"	0"	12"
S	24"	12"	12"	0"

7.4 Cables Design Criteria

4. Service conditions: Provide equipment and material suitable for intended service and installation at location indicated.
5. Low-voltage auxiliary and control power.
   1. Electrical power for ac control and instrumentation equipment:
      a. Provide devices necessary for proper operation and protection of equipment during electrical power supply and ambient temperature fluctuations specified.

b. Design for continuous operation at any voltage from 85% to 110% of nominal voltage. Dropout voltage shall be 60% of nominal for relays and 75% for contactors and starters.

2. Electrical power for dc devices:
   a. Design for continuous operation on ungrounded station battery system, capable of maintaining operation at any voltage from 80% to 112% of nominal voltage.
   b. Electrical devices served shall not impose ground connection on supply.

6. Auxiliary power: Design auxiliary equipment for low voltage service, with electrical power designed to operate from one of nominal electrical power sources as follows and as indicated on Drawings

Volts	Phase	Frequency
480Y/277	3 or 1	60
208Y/120	3 or 1	60
120/240	1	60
125	1	Dc

7.5 Hazardous Area

7. Areas where flammable and combustible liquids, gases, and dusts are handled and stored shall be classified for the purpose of determining the minimum criteria for design and installation of electrical equipment to minimize the possibility of ignition.
8. Project construction drawings will outline the extent of each hazardous location, describing the applicable vertical and horizontal limits of the hazards and identifying each hazardous location by NEC Class, Division and Group. Designation of either specific maximum operating temperature of equipment or temperature ranges will also be indicated. Every effort will be made to locate electrical equipment in nonhazardous areas of facilities having hazardous locations.
9. Electrical equipment in areas classified as hazardous shall be constructed and installed in accordance with the requirements of the National Electrical Code. References for use in classification of areas, as well as specification of requirements for electrical installation in such areas, include the following:
   - National Electrical Code ANSI/NFPA 70, National Fire Protection Association.
   - NFPA 70E, Standard for Electrical Safety in theWorkplace: National Fire Protection Association.
   - NFPA 30, Flammable and Combustible Liquids Code.
   - NFPA 50A, Standard for Gaseous Hydrogen Systems at Consumer Sites.
   - NFPA 497, Recommended Practice for the Classification of Flammable Liquids, Gases, or Vapors and of Hazardous Classified Locations for Electrical Installations in Chemical Process Areas.
   - NFPA 499, Recommended Practice for the Classification of Combustible Dusts and of Hazardous Classified) Locations for Electrical Installations in Chemical Process Areas.
   - NFPA 650, Standard for Pneumatic Conveying Systems for Handling Combustible Particulate Solids.
   - NFPA 654, Standard for the Prevention of Fire and Dust Explosions from the Manufacturing, Processing, and Handling of Combustible Particulate Solids.
   - NFPA 820, Standard for Fire Protection in Waste water Treatment and Collection Facilities.

7.6 Lightning Protection

1. The lightning protection system shall be designed and constructed in accordance with the latest applicable requirements of NFPA Standard 780, ANSI/UL Standard 96A, and all local applicable codes and standards. Provide a lightning protection system, in accordance with NFPA-780 and IEEE-998, if the risk analysis indicates that it is necessary.
2. Location. A lightning protection system, including air terminals, shall be provided for plant structures not included within the zone of protection of another structure. The structures requiring lightning protection shall be determined during detailed design; however, the main plant building, plant chimney stack, hazardous/flammable storage facilities, and electrical equipment enclosures shall be protected regardless.
3. Installation. The material length, diameter, and location of any air terminals and conductor for the lightning protection system shall be determined by detailed design of each individual structure. The structure height, material, and service shall determine the building classification. The zone of protection provided by the lightning protection system shall be analyzed for all structures on the plant site.

8 PLANT OPERATION

The plant will be supervised and controlled directly from the control room, mainly through DCS operator stations.
The control room will be the main centre of control and all the actions for a normal and safe plant run (i.e. either actions on field devices or instructions to field operators) will be taken in control room.
Control room will act as a control centre both during normal/routine operation and during emergency situations.
During normal / routine operation the plant is controlled by DCS, where all the operational logics and sequences are implemented. In case of emergency, the emergency and protection interlocks implemented in ESD takes over the control.
DCS operator stations, shutdown console, graphic console, systems for fire fighting will be located in the control room while process interfaces, such as controllers, process I/O devices will be installed in rack room.

9 TRAINING

Vendor shall include in base quotation the Training according to **ITB requirements.**

10 INSPECTION AND TESTS

Vendor shall submit within their bid their proposed Inspection and Test plan to be in accordance with laws, norms, regulations, codes, project standards, company standard, references and etceteras.

Vendor ITP will be submitted for CONTRACTOR approval, the Inspection & Test Plan (ITP) on Contractor Format that is mandatory.

10.1 General

The vendor and his Sub-Vendor shall operate applying a Quality Management System in compliance with ISO 9001 standard, and shall prepare a Project Quality Plan describing the methods established to meet contract's requirements.
The Vendor shall ensure that his sub-Vendors operate a quality system meeting the specified conformance criteria to ISO 9000 (point 8 of the UNI EN ISO 9000-1).
The Project Quality Plan shall meet the ISO 10005 requirements.
The equipment and services included in the contract scope of work is subject to inspections and tests during shop manufacturing, site erection and commissioning phases.
The Vendor shall carry out all inspections and tests necessary to verify that the equipment and services fulfill all the contract requirements. These inspections and tests shall include both those defined by the Vendor design and manufacturing standards, and those required by the applicable codes and standards as defined in this document.

During execution, Vendor shall prepare appropriate Quality Control Plans (QCP) indicating the kind and extent of inspections and tests to be carried out on row material procurement, workshop manufacturing and assembling, site erection and commissioning.
These QCPs shall be submitted to Contractor for review.

The inspections and tests will be witnessed by CONTRACTOR and his Client, or their representatives. Contractor and his Client will select inspections and tests to be considered witness on the basis of QCPs.

Contractor will participate as minimum at the following tests:

1.	Ultrasonic, magnetic particle or radiographic tests	Certification Review
2.	Functional tests	Witness
3.	Rotor over speed tests	Witness
4.	Steam valves hydro and seat tests	Witness
5.	Shell hydro tests	Witness
6.	Type tests on generator	Witness
7.	Tests on exciter	Witness
8.	Control panel and cabinet hardware tests	Witness
9.	Control panel and cabinet software tests	Witness

11 GUARANTEED VALUES

This section describes the Guaranteed Performances and the Guaranteed Values other than performances to be guaranteed by Contract and verified by tests during commissioning of the plant as part of the Acceptance Tests before Completion.
Refer also to **ITB requirements.**

11.1 Submittal Requirements

Vendor shall submit detailed test procedures to the Contractor for review and approval not less than 6 months prior to performance tests. Test procedures shall address relevant aspects

of testing as recommended by applicable test codes and standards. Vendor and Contractor shall mutually agree to test procedures.
Within a period not to exceed thirty (30) days following successful completion of the tests, the Vendor shall submit the test report to the Contractor.

1. Files of the original test data and copies of the original data sheets and log sheets shall be available to the Contractor upon request.
2. Raw data shall be exchanged in an acceptable electronic format at the site immediately following the completion of the tests.

Correction curves or equations used to adjust test results.

11.2 Performance and Testing Requirements

Performance tests for the Plant shall consist of the following tests:

1. Net electrical output test.
2. Net heat rate test.
3. Lime consumption test.
4. Minimum load test.
5. Emissions tests.

Contractor shall conduct performance testing following the start up and commissioning activities. Performance tests shall be scheduled as soon as practicable after all associated equipment has been placed in "on-line" generating service, proven capable for continuous normal operation, and adjusted for proper operation.

During performance tests, equipment shall be operated in full automatic control, in accordance with the Vendor operating and maintenance instructions, and within the design limits established by the Vendor and Contractor for the equipment and systems. Equipment shall be operated in a manner consistent with continuous-duty operation. The following conditions shall not occur during testing:

1. Components overheating.
2. Excessive vibration.
3. Excessive component power consumption.
4. Operation beyond design limits.
5. Unsafe operation.
6. Operation requiring manual intervention.

Vendor may make minor adjustments to equipment prior to testing, but shall not be allowed to disassemble equipment for purposes such as cleaning or polishing blading, or adjusting or replacing turbine-generator seals.
Preliminary test runs may be performed prior to the actual tests for the purpose of checking and making adjustments to the equipment and familiarizing test personnel with the facility and equipment.

Tests shall be performed at the expense of the Vendor, including:

1. Test procedure/test protocol development.
2. Test personnel
3. Test equipment.

4. Test instrumentation.
5. Test instrumentation calibration.
6. Laboratory analysis.
7. Test calculations.
8. Test reporting.

Testing shall be performed by a third-party testing subcontractor and a third-party stack testing subcontractor mutually agreeable to Contractor and Vendor.
Tests may be witnessed by the Owner and a third party representative retained by the Owner, at the Owner's discretion.

Testing shall be conducted in accordance with ASME PTC 46, MIMARENA and EPA test procedures and methodologies, except that tolerances or uncertainties will not be considered when comparing test results to Guarantees.
Net electrical output, net heat rate, and lime consumption test results shall be corrected to guaranteed conditions prior to comparison to guaranteed values.
Correction curves or equations used to adjust test results for deviations from guarantee conditions shall be prepared by Vendor / Contractor and submitted to Owner for review and approval. Corrections shall be based upon engineering principals and data. Shape of each correction curve shall be smooth with no discontinuities in slope.
Minimum load and emissions test results shall not be corrected.

If equipment or system fail to function properly, or guaranteed performance is not indicated, Contractor shall make necessary corrections, including replacement, at no cost to Owner, and after such corrections are completed, demonstrate to Owner that equipment or system functions properly and guaranteed performance is obtained.

11.2.1 Minimum performance standards:

Plant Minimum performance standards shall be as follows

1. Net electrical output: 95% of guaranteed net electrical output.
2. Net heat rate: 105% of guaranteed net heat rate.
3. Lime consumption: 120% of guaranteed lime consumption.
4. Minimum load: 110% of guaranteed minimum load.
5. Emissions and noise: Guaranteed emission limits.

If minimum performance standards are met, but guaranteed performance is not achieved, damages shall be in accordance with the Agreement. If minimum performance standards are not met, Vendor shall correct the Work and retest unit(s).

11.3 <u>Performance Guarantees</u>

11.3.1 Steam Turbine Generator Guarantees data and parameters

The following parameters are to be considered as Guarantee figures.
Liquidated Damages (LD) or Make Good (MG) condition will apply:

1. STEAM TURBINE NET POWER OUTPUT
   Steam turbine Net Power Output (not less than): _____ **[LD]**
2. STEAM TURBINE HEAT RATE
   Steam turbine Heat rate (not higher than): _____ **[LD]**
3. Noise:
   All equipment shall be designed in order to meet an average sound pressure level LpA < 85 dB(A) at a distance of 1 m from the equipment surface or associated enclosure and 1.50 m above levels normally accessible to personnel, under all operation conditions **[MG]**

11.3.2 Other Guarantees

Guaranteed Start-up time and load change rates
The start-up time will be calculated from the ready to start condition (boiler drum level and condensate recovery tank level at normal start-up level, condensate and feed-water systems operating, auxiliary steam supply available as necessary and required vacuum achieved for start-up initiation) to the operating condition with steam turbine operating on base load and the steam bypass valves closed (steam turbine control valves fully open). Waiting time for e.g. water/steam quality is not included in start-up time.

Definition of "cold", "warm" and "hot" start-up

- "Cold start": more than 50 hours shut-down _____ min [MG]
- "Warm start ": between 8 and 50 hours shut-down _____ min [MG]
- "Hot start": less than 8 hours shut-down _____ min [MG]
- Load change rates between MNCR and MCR shall be guaranteed and expressed in % of MCR/min. _____ %MCR Load/min [MG]

The minimum performance standards for the Plant shall also be applied to the Vendor's equipment.

11.3.3 Applicable standards and codes

For the verification of the Guaranteed Performances, Acceptable Limits and Liquidated Damages (if applicable), it shall be considered that:

- No correction of the results of the Performance Tests, for tolerance allowances, not even measuring tolerances, is accepted;
- No correction of the results of the Performance Tests due to ageing, wear or other factors resulting from normal industrial operation until the Performance Tests is accepted.

Except for the above, the performance tests shall be conducted and reported in accordance with the applicable codes and standards including:

- Flow measurements : ASME PTC 6
- Steam turbine : ASME PTC 6
- All measurements and calculations shall be performed in SI and US units. Steam tables used shall be according to ASME.

For Guaranteed Values relating to the Operation License, the testing procedure shall be performed, in addition, in accordance with the requirements set by the Public Authority issuing the Operation License.

11.3.4 Correction curves

The Contractor will submit the following correction curves, in graphic and mathematical format, relating to the changes in performance values in function of the test conditions, as these may deviate from the conditions of validity:

- Exhaust pressure
- Steam inlet conditions
- Ageing curve
- Generator performance curves
- Power factor

Any other correction curve the Contractor considers necessary and informed at the stage of its Proposal and attached to the Contract.

Only those above mentioned correction curves will be used to transpose the results of the Performance Test conducted at "as run" condition to the reference conditions "corrected as-run", in order to allow to compare the "corrected as-run" test results to the guaranteed performance values.

11.3.5 Tests Duration:

Test runs shall be conducted according to ASME PTC 46 as close as practical to guaranteed net electrical output for net electrical output, net heat rate, and lime consumption tests.

A minimum of **one 4-hour test run** shall be conducted as close as practicable to minimum load for the minimum load test.

Test results for net electrical output, net heat rate shall be corrected to test reference conditions prior to comparison to guaranteed performance.

11.3.6 Tests Reference Conditions

To be revised during discussion with Vendor

Test reference conditions are as follows:

1. Ambient dry bulb temperature at air inlets: 90ºF.
2. Ambient wet bulb temperature at air inlets: 88ºF.
3. Sea water intake temperature: 81ºF.
4. Power factor: 0.90 lagging.
5. Barometric pressure: 29.91 inches Hg abs.
6. Base Load, 100% load, Nominal load or Maximum Continuous Rating, is the boiler output in t/h of superheated live steam at the pressure (±1%) and temperature (±2°C) specified in the Guaranteed Heat Balance, as per the Vendor Technical Proposal, all quantities measured without taking into account any tolerances not even measuring tolerances;
7. Prior to starting the test, the Vendor is allowed to proceed to verifications of the equipment.
   a. Condenser has been cleaned
   b. The heat exchangers are in a normal condition;
   c. All mechanical and electrical parts are in good condition.
8. Steam cycle reference conditions (at MCR):

HP 8 Heat Exchanger:	TTD: -3.42 °C	DCA: 5.37 °C
HP 7 Heat Exchanger:	TTD: -0.83 °C	DCA: 5.20 °C
HP 6 Heat Exchanger:	TTD: -1.49 °C	DCA: 5.09 °C
LP 4 Heat Exchanger:	TTD: 4.97 °C	DCA: 5.75 °C

LP 3 Heat Exchanger:	TTD: 3.19 °C	DCA: Pump forward
LP 2 Heat Exchanger:	TTD: 3.44 °C	DCA: 5.89 °C
LP 1 Heat Exchanger:	TTD: 3.33 °C	DCA: 5.80 °C

11.3.7 Tests Operating Reference Conditions

Tests shall be conducted under the following test operating conditions:

1. Sootblowing: Off.
2. Cycle makeup: Off.
3. Cycle blowdown: Off.
4. Air preheat coils (if provided): Off.
5. Fuel: 100% Performance Coal.
6. Support fuel: Off.
7. Installed spare equipment: Off.
8. Auxiliaries in service: Normal operation for all unit auxiliary equipment and systems except that batch systems such as coal handling, ash handling, demineralized makeup water treatment, and wastewater treatment need not be in service. Standby equipment such as fire pumps need not be in service.
9. Site support facilities and site support auxiliary loads shall be served by site utility service switchgear.
10. Emission limits shall be continuously achieved during tests as demonstrated by CEMS/COMS.

11.3.8 Unit Tests

Each unit may be tested individually.

11.4 Retesting or Supplemental Testing

Vendor shall perform retesting or supplemental testing as necessary to demonstrate to Contractor that equipment or system functions properly and guaranteed performance is obtained.
All costs shall be borne by Vendor.
Contractor shall render bill to be paid by Contractor covering incremental Owner costs incurred due to retesting or supplemental testing. Billings to Vendor for Contractor's costs shall be paid directly to Contractor within 30 calendar days from receipt by Vendor.

12 STEAM CHARACTERISTICS AT STEAM TURBINE BATTERY LIMITS

NOTE: The present paragraph is PRELIMINARY and subject to modification after discussion with Vendor

Interface conditions with the Steam Turbine

Note (1): CRH pressure defined based on assumptions (Delta P RH) / (PCRH) ≤ 9% where Delta PRH = (Pressure at STG HP section Exhaust) – (Pressure at STG RH Inlet section)

13 VENDOR DOCUMENTATION

13.1 General

The minimum documentation requirements/schedule is specified here below.
All the listed documents as well as additional documents based on equipment / supply / laws / norms / regulations / codes / standards etc. shall be submitted during engineering stage and also the final version of these documentation must be included in the final documentation.

13.2 Language

All inscriptions on documents/drawings shall be in English language

Certificates and Test Reports are accepted in English with the translation of title, headings and index in Spanish.
Vendor Drawings and Documents submitted after P.O. during engineering phase can be in English. Translation in Spanish may be done when the documents and drawings are final version.

13.3 Final Documentation

Final documentation consists in:

A	Instruction Operation Manual (IOM)	six (6) sets including the set in the packing
B	Manufacturer Data Report (MDR)	six (6) sets including the set in the packing

13.3.1 Instruction Operation Manual (IOM)

Instruction Operation Manual (IOM) must contain comprehensive information, data, documents covering design engineering, storage, installation, operation and maintenance of the equipment and accessories.
All the Vendor drawings and documents submitted during the engineering phase to Contractor, in its final version, shall be included in the Instruction Operation Manual (IOM) in addition to any other necessary drawings and documents.

13.3.2 Manufacturer Data Report (MDR)

Manufacturer Data Report (MDR) must include all Procedures, WPS, PQR, Material Test Reports, Certificates, Non-Destructive Test Reports, Mechanical and Performance Test Reports as well as any Certification Documents related to the Quality Assurance and Quality Plan.

13.4 Documents Required With Bid and After Purchase Order

Vendor is responsible to Supply/submit the required documents as per below list.
Failure to supply documents - even partial - shall cause the purchase order to be considered unfulfilled.
All documents including sub-Vendor documentation shall be reviewed & certified by the main Equipment/package Manufacturer prior to the submission to Contractor.
The Documents/drawings, which are submitted without fulfilling these requirements, will be summarily rejected without any further consideration and any delay due to this rejection will be on Vendor account. Further each drawing/document shall show Purchaser/Client name, Project No., MR No., P.O. No., Equipment No., Purchaser's Drawing No., Rev. No. etc.
Vendor documents and drawings shall be submitted in the project formats (as minimum in the form of cover page). After order Vendor will be received from PURCHASER all project formats to be used for this project.
While submitting the revised drawings/documents, Vendor must include all the comments marked on previous revision (or) highlight the reason for not incorporating the same on covering letter/transmittal. Vendor shall highlight the area revised by revision mark/cloud mark, which is mandatory. In absence of such revision marks, previous revision will be considered as valid.
The Contractor will return the documents issued for approval within four (3) weeks from the receipt of such documents.
All documents returned to vendor with comments must be resubmitted to Purchaser within ten (10) days after receipt of by vendor.
Document subject to liquidated damages in case of lack to meet the contractual delivery date are indicated with "YES".

The below list/schedule indicates only the minimum Documentation requirements.

THE CONTRACTOR WILL BE REQUIRED TO SUBMITT ON AN URGENT BASIS (1 month after Purchase Order) THE DOCUMENTS AGREED WITH PURCHASER DURING THE KICK OFF MEETING.
These documents shall include as minimum the followings:

- Schedule for design, manufacture, procurement and assembly;
- Steam Turbine and Generator Data Sheet;
- General arrangement;
- Equipment layout drawing;
- Piping and Instrument Drawings (P&IDs);
- Electrical single line diagram
- All documents containing engineering information for civil works (static and dynamic loads, maximum acceptable compliance, tolerance for insert positioning, outline, etc.);
- Electrical Cable List with the indication of cable features (type of cable, cross section, etc.) and indication of Feed From - To (Device Tag);

- Electrical Interconnection Diagram, with the indication of cable wires interconnection (Feed From - To Device Tag and Terminal strips Tag);
- Electrical Load List;
- Control and protection system description and I/O list
- Quality Control Plan (including Inspection and Test Programme);

Complete required document schedule as follows:

Condenser Commissioning/first start-up procedure	60 days before	
Condenser Physical progress report (monthly)	Every month	

Notes

1. 3 months before commissioning start up.
2. Vendor is required to submit one set of dedicated drawing showing weight of components, weight of annexed items particularly including steam valves, location of the mass centers with respect to the shaft with relevant radius of gyration and inertia [Gd2].
3. Vendor to provide the balance grade with the rotor weights or the backup calculations together with Foundation loading design data. Vendor is also required to provide the normal operating torque with the actual time phase relationship. Vendor is also required to provide short-circuit load condition with phase relationship with stator and rotor. Vendor to include the allowable vibration limits for the bearings on the foundation load.
4. Supplier is requested to provide all accidental loads along with the phase-in / phase-out sequencing coming out from the short circuit load combined with earthquake loads to allow Contractor to perform a detailed F.E.M. analysis aimed to verify that clearances are adequate to avoid damages inside the machine.

Proyecto Punta Catalina	ELECTRICAL LOAD SUMMARY		Identification Code 3645-NN-LN-002	
			Sheet	Issue 6
	Plant/Project: Coal Fired Power Plant, Punta Catalina, Bani.	Client Ref. CDEEE	Plant Location: Dominican Republic	

ELECTRICAL LOAD SUMMARY

General Notes:

1. Loads are depicted as continuous (C), intermittent (I) or standby (S) according to the normal expected operating condition of the plant. The Continuous, Intermittent or Standby duty is identified on "CIS" column in "Load List" worksheet.
2. Maximum normal running Switchgear load = (100% of Continuous Loads + 30% of intermittent loads + 10% of standby load)
3. In "Summary" worksheet, all loads fed from Switchgear are automatically calculated from "Load List" worksheet.
4. In "Summary" worksheet, the loads directly fed from Switchgear must be manually input at Switchgear level.
5. Transformers must be sized as follows:
   a. Based on fan cooled rating
   b. Both switchgear bus A and B running loads
   c. 10% future growth after final design

1. INTRODUCTION

1.1 SCOPE

This document describes the Basic Control and Safety Philosophy for the new Coal Fired Power Plant (each of the two Units will be composed by 1 ST and Steam Generator) to be located at the Hatillo Municipality, Azua Province, on the South coast of the Dominican Republic.

1.2 APPLICABLE CODES AND STANDARDS

The Automation Systems that will be provided for the Power Plant shall comply with the latest revised applicable codes, specifications and standards here below listed:

- ISA — Equipment Identification Criteria (for detailed engineering)
- CEI 60529 — Degrees of protection provided by enclosures (IP Code)
- CEI 61131 — Program languages for PLC based systems
- CEI 60617 — Graphic Symbol for Diagrams
- CEI 61508 — Functional Safety of Electrical/Electronic/Programmable Electronic Safety-related Systems
- CEI 61511 — Safety Instrumented System SIS
- CEI 61544 — Panel mounted equipment - Electrical measuring instruments – Dimensions for panel mounting.
- IEEE 315 — Graphic Symbols for Electrical and Electronics Diagrams
- ISA RP 12.6 — Installation of Intrinsically Safe Instrument System
- API 518 — Safe operation of equipment in a hazardous area
- ISA S18.1 — Annunciator Sequences and Specifications
- NEMA ICS 6 — Enclosures for Industrial Control and Systems
- IEC 60801 — Immunity to Electromagnetic Interference
- IEC 61000 series — Electro Magnetic Compatibility (EMC)
- IEC 61000-6 — Electromagnetic Compatibility and Radio Interference (EMC)
- IEC TR 61000-5-2 Part 5: Installation and mitigation guidelines Section 2: Earthing and cabling
- NAMUR NE43 — German fault detection standard

1484

1.3 APPLICABLE PROJECT DOCUMENTS

This specification shall be read in conjunction with other project specifications as follows:

- 3645-JK-DQ-0101 Control System Architecture;
- 3645-KK-SG-000101 General Instrument Specification;

1.5 PLANT PROCESS UNIT

The plant has been divided into the following distinct process systems:

- Steam Generator System;
- Boiler Steam Sootblowers;
- Boiler Bottom Ash Hopper Removal System;
- Boiler Feed Water and Deaerator system;
- Main Steam system;
- Auxiliary Steam system;
- Fuel Oil System;

1486

- Fly Ash Handling System;
- Flue Gas Desulphurization System (FGD);
- HV, MV, LV Electrical systems;
- Steam Turbine Generator system;
- Condensate system;
- Condensate Polishing System;
- Vacuum cleaning system;
- Waste water collection system;
- Waste water treatment and discharge system;
- Intake Water Band Screen;
- Elettro Chlorination System;
- Deoling System;
- Sea Water Desalination System;
- Water treatment system;
- Coal handling system;
- Overland Coal Coveyors;
- Fire fighting;
- HVAC;
- Circulating Water System;
- Compressed Air system;
- Instrument air system;
- Chemical dosing system;
- Sampling system;

- CEMS;

2. PLANT OPERATIONS

The Central Control Room (CCR) is the main centre of control and operation and all the actions required for a normal and safe plant management (i.e. either authorization to actions on field devices or instructions to field operators) will be taken by the control room.

2.1 MAIN OPERATOR INTERFACE

One Operator Console containing all operator workstations and equipments required for the Power plant will be installed inside the CCR and will provide the main operator interface.
The Operator Console shall be sized and divided accordingly to permit the Power operators to control and monitor the Power main process and the equipment packages.
The Operator Console shall consists of ergonomic bays able to house the Operator Workstations (OWS), ESD Shutdown Console (SDC) with hardware push buttons(Emergency Shutdown).
The operator console shall include an additional Operator Workstation OWS equipped with a "Large LCD Screen" for indicating the overview of Allarms Power Plant (both Units).
During normal / routine operation, the plant will be controlled by DCS. In case of emergency, the Shutdown systems will take the control and put the plant in safe condition. The emergency operations will be performed by means of the dedicated hardwired SDC.
Interlock graphic pages on DCS OWS including process alarms, system alarms and sequence of event pages will support the operator in managing the emergency shutdowns.
The package units in the Power Plant process are controlled and monitored (e.g. start/stop) from the DCS to the maximum extent possible (i.e. control and safety logics implemented inside DCS). Exceptions will be for some subsystems which shall have its own dedicated PLC control system with communication interface to the DCS.

2.2 FIELD LOCAL OPERATION

In general, some equipments (motor; pumps etc.) may be started from field by means of dedicated local control boxes (local panels LP). Once started, they will be managed from CCR via the dedicated pages in DCS OWS. Machine LPs will implement the minimum commands (alarms necessary to start the equipment or to perform emergency stop).

1188

Whenever remote start/stop commands to MCC from DCS are foreseen, any exception due the process requirements is shown in the P&ID.

2.3 SYSTEM ENGINEERING

All activities relating to the configuration and maintenance of the control systems and subsystems shall be carried out from the Engineering Room in control building.

3. PLANT CONTROL PHILOSOPHY

3.1 GENERAL

The entire Power Plant will be controlled from Central Control Room using a Distributed Control System (DCS). Current technology of microprocessor based digital systems shall be used for control and safety systems wherever possible. Most control and operator interface functions shall be implemented using the DCS.

Only PLC Packages Coal Handling, Overland Coal Conveyors, Water Treatment System and Waste Water System will be as stand-alone system and will be established to the plant DCS only for monitoring and trending purposes.

The ESD, which performs related safety interlocks and emergency shutdown functions, shall be completely independent from the DCS process control system to ensure the highest available level of integrity for system operation and performance.

The CONTRACTOR will develop the project on a fully Integrated Systems basis, each system or subsystem being integrated into an overall structure. It will be the System Integrator's responsibility to ensure that the above systems function as individually specified and are integrated to collectively provide satisfactory operation of the necessary interfaces.

3.2 CONTROL SYSTEM DESIGN

The entire automation system will consist of:

- DCS for Power Plant;
- ESD for Process Units shutdown of Power Plant;
- Subsystem PLC Units

1489

- Instrumentation for Power Plant.

A general block scheme of the control system architecture is provided in document General Control System Architecture (3645-JK-DQ-0101).

3.2.1 Basic Requirements for Control Systems

All supplied devices and equipment shall:

- Be latest field-proven in Power Plants
- Be selected according to ambient environment and process requirements
- Be highly reliable
- Perform a minimum availability of 8000 hours per year of continuous operation
- Be robust against electromagnetic and radio frequency radiation [according to IEC-61000 Electromagnetic compatibility (EMC)]
- Be provided in a class of protection suited to ambient conditions
- Be sufficiently protected against the humidity and dust

The fail-safe signal principal criteria shall be applied to all the loops (in particular for safety loops).
In case (if any) DCS and ESD will control the same actuator, the ESD output will be wired to the field actuator and DCS control function will be connected to ESD via serial link.

3.2.2 Master Clock

The DCS shall be available to accept the master clock synchronization from new GPS in order to synchronize the other systems and, if required, subsystems (ST, Hydrogen Package, etc.)

ESD systems will use the synchronization signal for the Sequence of Event (SOE) time stamping.

3.2.3 General note for SIL Classification

The ESD hardware and Software shall be designed and selected, by applying the codes defined in IEC 61508 and implementing a proper Safety Lifecycle as per IEC 61511 providing the guidelines to design and to verify the systems comprised of electrical and / or electronic and / or programmable electric components that are used to perform safety functions.

IEC-61511 requires a design methodology that:

- Remove uncertainly regarding the safety integrity, cost effectiveness and availability requirements
- Reduce over-engineering
- Prevent under-engineering and therefore increase integrity
- Provide a basis for maintenance and operating strategies

This procedure considers SIL classification as a part of verification approach specified in IEC-61511.

SIL classification shall be carried out on the Safety Instrumented Functions (SIF) for the process unit area, including, as applicable, fire / gas detection and packages.

Safety Integrity Level (SIL) is the discrete level (one of a possible four) for specifying the safety integrity requirements of the safety function, where SIL 4 has the highest level of criticality and SIL 1 has the lowest.

The maximum SIL level acceptable in the Process Industry is SIL 3.

The classification and design of the classified Safety Instrumented Functions (SIF) will be performed in accordance to IEC 61511, following Tecnimont working practice H1SD001 and the relevant detailed procedures.

3.3 DISTRIBUTED CONTROL SYSTEM (DCS)

3.3.1 General

The DCS shall continuously monitor and control the plant to produce product on specification, minimizing energy consumption, impact environment, maintenance costs and need of operator intervention.

The DCS equipment will be installed in not-hazardous indoor locations (CCR, FAR and CR).

The DCS hardware and software shall be supplied in order to achieve segregation at any level (Unit, Area, signals, I/O cards, I/O racks, PCU, OWS).

Special care shall be applied on the selection of the electronic devices to reduce the models minimizing the spare holding and applying standardization.

The DCS system will comprise as a minimum:

- Operator consoles (OWS, EWS, etc)
- Data storage units
- Process Control Unit (PCU)
- Interface units to Process
- Interface units to other Control systems and subsystems (PLC, MMS, MCC, etc.)
- Plant Data History stations

3.3.2 Definitions

3.3.2.1 Control Scan Rate:

The scan rate of a controller is defined as the interval between two successive executions of the PID algorithm of the block. It does not indicate the total time needed for a change in the loop analogue input to produce a change in the corresponding analogue output.

1492

3.3.2.2 Graphic call-up time:

This indicates the total time needed from the moment the operator pushes a button calling up a page to the moment all the static parts are displayed on the page and the live (dynamic) areas show the current value in the system database.

3.3.2.3 Graphic Refresh Time:

This indicates the time needed to update the content of all the live areas contained on the same graphic display.

3.3.2.4 Maximun CPU Loading:

By specifying a maximum loading means that all processing functions of a station (i.e., monitoring, control, logic operations, etc.) shall not engage the CPU for more than a certain percentage of its capacity.

3.3.3 Human Machine Interface (HMI)

The HMI is an integral part of the delivery of the DCS system and constitutes the central information and control interface point.

Operator Workstation (OWS) and Engineering Workstation (EWS) mainly compose the HMI.

The operator consoles for the Power Plant are located in the Central Control Room (CCR).

OWS and EWS stations are based on standard market available PC hardware and configured with different software or hardware key to enable their access capability to all DCS functions.

New DCS stations shall have the same operating system software (MS Windows 2000, XP), system diagnostic software and data base management software.

The stations shall share the printers and the auxiliary storage devices through the DCS LAN Ethernet.

3.3.3.1 Operator, Supervisory and Engineering Workstations (OWS/SWS/EWS)

Each new OWS (Operator Work-Station) shall have "read only" global access capability to any point in the new system network.

1493

As a preferred solution, OWS shall be capable of directly fetching data from the Controllers in case of a faulty connection to the assigned data-server.

The OWS shall be configured to have key access and alarm management to the assigned units/areas of the plant, maintaining the global monitoring access to the other process units (i.e. Heat Recovery Steam Generations, Air Cooled Condensers, Utilities).

The system shall be configured such that the Power OWS cannot control other process units and vice versa.

The OWS shall have the availability to be loaded with a different pre-configured area profile in case it will be necessary to replace the functionality of one faulty OWS.

EWS (Engineering Work-Station) for each plant shall be loaded with system Vendor software tools for configuration and maintenance activities and will be located in the Engineering Room, which is separated from central control room CCR.

Each OWS and SWS shall have its own processor (CPU) and shall include two LCD screens in a stacked configuration and one dedicated industrial keyboard with pointing device.

Each EWS shall be equipped with one LCD screen.

3.3.3.2 Graphic Display

The Functional Design Specification (FDS) for HMI will include a library, a hierarchy structure, a navigation philosophy, coding technique, Event / Alarm animation criteria, Interlock interface and management guidelines, etc.

During engineering phase the details of FDS-HMI will be finalized, below is shown an example of hierarchy architecture (as a base to start):

- Plant Overview
- Unit Overview

1494

- Mimics showing the main process units (e.g. processors, Steam Generator, Chemical Injection, etc...) with the status of all actuators and sensors
- Start-up / Shut down graphic displays for special packages (compressor, Auxiliary Steam, etc.)
- Interlock display, Cause & effects/Sequence function diagram displays
- Motors Status overview displays
- Steam Turbine overview displays
- Group displays, loop displays, faceplate/trend/alarm displays, report display, etc

3.3.4 System Redundancy Criteria

The DCS will be designed to achieve an availability of at least 99.9%.

This will be achieved by use of redundant equipment (where necessary) and by robust and reliable system of diagnostics and alarms management. DCS will incorporate the following redundancy concepts:

- **Redundant Power Supply Units**
  Power supply units redundancy shall ensure that the failure of one unit shall not affect the normal system operation.
- **Redundant design of system bus**
  The system bus is not equipped with a system master. A failure of one of the system buses does not create any disturbs or control loss. The system bus is dedicated to exchange the data between HMI and Process Control and Data Acquisition Units. Internal communication shall be performed without the use of "traffic directors" and shall allow "peer to peer" communication among process control units. It shall be fully redundant including redundant interface modules.

1495

- **Mass Memory Unit**

  The redundancy shall be as per manufacturer's standards. If manufacturer provides one single mass memory device for the entire system, it must be redundant; if memory devices are provided for each process station, at least two devices with the same information must be in the scope of supply. On line back-up shall be provided for data and system files.

- **Redundant design of processing components [Process Control Unit (PCU)]**

  Process control and data acquisition units (PCU) shall be based on a microprocessor controller system suitable to perform analog and digital functions.

  The redundancy shall be for processors (CPU 1:1), memory, I/O, and connection to interface components and to other remote necessary hardware components bus.

- **Input/Output Cards**

  All signals involved in control loops or in safety interlocks (i.e. implemented in ESD) shall be wired to redundant input and output cards.

- **Communication with other process sub system**

  DCS shall be connected to ESD system and other Subsystems (Package PLC, MMS, etc) via redundant communication link (Modbus TCP/IP on Ethernet or equivalent protocol). As a preferred solution communication between DCS and ESD shall be direct between the processors and not through DCS servers.

  The ESD system shall be integrated inside the scope of supply of the DCS vendor and the fault of any unit in redundant configuration shall initiate the redundant back-up unit to take over without affecting the current system operation (bump-less).

  The diagnostic system shall be automatic and run on a continuous basis without operator intervention.

3.3.5 Loading and Spare Requirements

Loading of the system data communication (internal & external) shall not exceed 50% of total time under all loading conditions.

This applies to DCS, ESD and all other control (sub) systems (e.g. PLC of package units).

The DCS System shall have:

- Fully installed and cabled 25% spare capacity complete with field terminals, I/O cards, CPU etc.
- 20% free space spare capacity divided over various plant sub-systems;
- Each DCS PCU shall provide 50% spare loading for future modifications;
- All wires of the field multi-cables shall be wired to the incoming terminal strips.

Typical scan time requirement for refreshes are as following:

- 1 sec refreshing time for graphics and trend
- Each PCU shall be configured with a scan rate of 250 ms for at least 10 control loops, the rest at 1 sec

3.3.6 Alarms and Events

Alarm handling and processing within the DCS shall be handled in a structured manner.

Alarms and Events will be acquired and displayed in DCS as follows:

- Alarms generated by hardwired signals will be acquired with timestamp of DCS/ESD
- DCS/ESD System Event & Operator changes will be acquired with timestamp of DCS
- Package PLC's alarms will be acquired with timestamp of PLC

The DCS Alarm list shall allow integrating the time stamping received from different sources.

It shall be possible to filter the alarms, by process unit or equipment, time window, etc. It shall be possible to inhibit the alarms from specified units, to avoid overloading the alarm list in case some unit would be out of service.

3.3.7 Interface to other Power systems, subsystems, and packages

The DCS system shall be supplied with redundant communications using Modbus TCP/IP or redundant Ethernet network to exchange data with the other systems and subsystems.

Below the list of the redundant links:

<u>X each Unit:</u>

- ST, Auxiliaries and Generator

1497

List of the simple link:

- CEMS

Common part:

List of the redundant links:

- Office Lan
- Dispatching Centre
- HV/MV electrical protections system (for SOE)
- Sub Station

List of the simple link:

- Coal Handling System
- Overland Coal Conveyors System
- Water Treatment System
- Waste Water System
- Air Compressed (also hardwire connection)

List of the Hardwired Connection:

- LV electrical protections system (for SOE)
- Fire fighting
- Emergency Diesel
- HVAC
- MV/LV Automatic Change Over

3.4 EMERGENCY SHUTDOWN SYSTEM (ESD)

3.4.1 Introduction

The plant Emergency Shutdown System (ESD) performs emergency shutdown and safeguarding of the plant. The ESD shall be composed of distributed and independent certified (i.e. TÜV approved) Safety PLC`s.

All ESD shall be separated and functionally independent from Distributed Control System (DCS).

1498

The ESD consists of the following systems:

- Emergency Shutdown System (ESD)

3.4.2 Design of ESD

All the requirements of IEC61508 part 2 and part 3 shall be satisfied, as appropriate, by all the components of the proposed ESD system with no exception (CPUs, I/O cards, power modules etc., but also safety barriers, relays, firmware/embedded software etc.).

The supplier shall show evidence of the compliance by means of certificates, declarations or reports, preferably issued by a known independent organization.

The ESD, being a Safety Instrumented System (SIS) shall be designed using a proper safety lifecycle and per IEC 61511, Clause 6.2, Table 2.

A safety lifecycle is a systematic design process, to prevent the inadvertent omission of important design, implementation or maintenance items associated. ESD supplier shall implement a software development lifecycle as described in IEC-61511, Part 1, and Clause 12.

ESD Hardware shall be based on logic solvers suitable for failsafe application with a fault tolerant and failsafe architecture certified for SIL 3 applications in compliance with IEC 61511.

ESD application software shall use one of IEC 1131 programming languages, and shall be designed to meet IEC 61511, Part 1 and also Part 2, Clause 11.7 for the design of operator interface.

The Safety System shall be interfaced with the DCS using redundant communication buses or links and by hardwired input and output for signals involved in safety interlocks.

Preferably the serial communication between each ESD and DCS should be Modbus TCP/IP on redundant Ethernet network directly at processor level and not through DCS servers; the communication links are only to be used for monitoring signals (also logic Reset from OWS and feedback shall be considered monitoring signals).

Signals from systems or subsystems (as DCS, , Steam Turbine, MMS, MCC, etc.) and used for safety loop trips, for emergency shutdown or for protection machinery circuits shall be hardwired to ESD I/O.

ESD system shall be connected to its Engineering Workstation (ESD-EWS) using TCP/IP protocol.

1499

ESD systems shall be able to perform the Sequence of event recording (SER) (sorted by timestamp) and all related filtering, sorting and saving facilities.

ESD shall generally designed fail-safe such that complete failure of the system components shall not compromise the plant safety.

Any fault resulting in a complete system failure shall be such that all failure modes are fail-safe to the OFF and OPEN state.

This includes all modules and cable faults. The system shall be designed for maximum reliability, safety, and integrity while maintaining overall system availability in both fail-safe and fail danger modes to meet the specified SIL.

3.4.2.1 ESD Scan Time

The scan time of an ESD controller (CPU scan cycle time) is defined as the interval between two successive executions of the logic program including the self-diagnostic checks. It does not indicate the total time needed for a change in the input to produce a change in the corresponding output.

3.4.3 General Functional Requirement

Processors (CPU), communication cards, and power supplies shall be redundant. All safety critical I/O modules shall be redundant.

All modules (including CPU, communication, I/O and power supply) shall be hot replaceable on-line.

Full stroke testing: test interval of the final control elements shall not be shorter than plant-scheduled turnaround.

Mechanism shall be provided for on line testing of field instruments used as SIS initiators without affecting safe operation.

All Process alarms and system faults shall be date & time stamped and recorded in memory circular buffer to be transferred to the SER station (Sequence of Event Recorder SER shall provide a capability to store events for at least 30 days).

Data link from ESD systems to DCS shall include at least the following information:

All hardware I/O image:

- Status of all process alarms and trips
- Status of system alarms (including diagnostic statuses).

3.4.4 Sequence of Event Recorder (SER)

SER functionalities will be supplied into ESD EWS to collect and store the time-stamped events.

The time-stamped events which will be transmitted from ESD to SER EWS stations are change of state for the following signals:

- Status of all process alarms / equipment statuses / initiators / trips and related shutdown commands
- Status of PLC diagnostic and system alarms

Events will be stamped into the system (ESD) that will be kept synchronized with DCS.

Time stamping resolution will be equal at least to the CPU scan time.

SER shall have the capability to sort and analyze the events by unit, time, type and especially first-up indication shall be possible. The SOE messages shall be transferred to the historian system where they will be stored for at least six months.

Printout of the event messages could be done by the SER from EWS on demand.

The application program and software that manages the database will be as per Manufacturer standard.

3.5 FIRE FIGHTING

The POWER plant shall have its separate Fire Fighting System independent from other DCS/ESD systems.

The Gas detectors installed inside new building or field will be connected to addressable dedicated systems (LFCP) and these ones will interfaced to DCS via hardwired connections (cumulative alarms).

3.6 PACKAGE UNITS

The established engineering philosophy for the POWER plant shall generally also be followed in the engineering of the instrument and control systems for Package Units.

Special attention shall be given to the compatibility of equipment / materials obtained from various sources, particularly in relationship to interfacing package unit instrumentation and systems within the plant.

Various package units may also have its associated local start-up panels located adjacent to the package unit, which shall house lamps and pushbuttons, minimum required. To ensure remote monitoring of package equipment, all essential parameters shall be transmitted to/from the CCR.

Start-up of equipment package may be performed in the CCR or locally depending on equipment requirements.

3.6.1 Control Philosophy for Power Packages

Item	Equipment Package	Controlled by DCS / ESD	Controlled by vendor PLC
1	STEAM GENERATORS	X	
2	CONDENSATE SYSTEMS	X	
3	SOOTBLOWER	X	
4	INTAKE WATER BAND SCREEN	X	
5	ELETTRO CHLORINATION SYSTEM	X	
6	SEA WATER DESALINATION SYSTEM	X	
7	DEOILING UNIT	X	
8	FGD	X	
9	BOTTOM ASH	X	
10	FLY ASH	X	
11	FABRIC FILTER	X	
12	SAMPLING SYSTEM	X	

1502

13	CHEMICAL INJECTION SYSTEM	X	
14	STEAM TURBINE - STCS		X
15	DEMI WATER PRODUCTION		X
16	POTABILIZED WATER		X
17	WASTE WATER SYSTEM		X
18	COMPRESSED AIR SYSTEM		X
19	COAL HANDLING SYSTEM		X
20	OVERLAND COAL CONVEYORS		X
21	HV/MV/LV ELECTRICAL PROTECTIONS SYSTEM		X
22	EMERGENCY DIESEL		X
23	CEMS SYSTEMS		X
24	HVAC SYSTEM		X
25	FIRE FIGHTING SYSTEM		X

3.7 MACHINE MONITORING SYSTEM (MMS)

Special machine sensors (vibration, accelerometer, key-phasor, bearing and winding temperature, etc.) of the main rotating equipments (Steam Turbines, BFWP's, FD/PA/ID Fan, CirculatingWater Pumps) will be wired to the racks of a dedicated microprocessor based monitoring system assembled in standard cabinet and located in Field Auxiliary Room (FAR) or dedicated shelter near rotating equipments.

The MMS will be a stand-alone system with a modular structure and redundant power supply units.

Serial link and hardwired signals to DCS will provide all available information, analogue and digital, including alarms.

3.7.1 General

All equipment for MMS shall be in scope of package vendors.

Cumulative trips from MMS will be wired to ESD/DCS/PLC (as applicable) to perform machine protection shutdown.

2 main MMS Systems per each Unit will be foreseen:

- Steam Turbine will be monitored by a dedicated Microprocessor based system.
- BFWP's, FD/PA/ID Fan and Circulating Water Pumps will be monitored by a dedicated Microprocessor based system
- Further rotating equipments (if any) will be monitored by a unique dedicated Microprocessor based system

4. INSTRUMENT ELECTRICAL INTERFACE

4.1 MCC GENERAL REQUIREMENTS

General requirements to interface the MCC with the control systems are:

- The hardwired signals between MCC and the other system shall be through interposing relays
- MV Motors shall be hardwired interfaced to DCS or ESD (or PLC if any)
- LV Motors shall be hardwired interfaced to DCS or ESD (or PLC if any)
- Heater Equipments shall be hardwired interfaced to DCS or ESD (or PLC if any)
- Trip commands from ESD shall always be hardwired (through SIL certified relays)
- Generally the Auto-Restart (if any) of standby motors will be realized in DCS/ESD through dedicated logic.

where is requested (process), motors, pumps etc. may be started from field by means of dedicated local control boxes (local panels LP) connected directly to MCC.

The Local Panel will be enabled in field if receives the release from DCS.

4.2 MCC TEMPERATURE INTERFACE

Winding Temperatures (R-S-T) of the dedicated motors shall be RTD type with T-Transmitter located in local junction box. 4-20mA signals shall be connected to MCC for trip.

5. 345KV 138 KV SUBSTATION CONTROL PHILOSOPHY

Regarding the control philosophy of the Sub-Station, refer to Plant Description and Design Criteria at paragraph 6.1.1**EMERGENCY DIESEL GENERATORS OPERATION WITH DCS**

In case of full failure of the central high voltage interconnected system lines or bus bars, two main emergency diesel generators 1250 kVA at 6.9 kV are available to feed the critical DC/AC loads to each of two units.

They will be automatically started up through the action of the Minimum Voltage Relay signal coming from the electrical distribution board inside the electrical substation.

The starting systems will automatically isolate the Emergency bus bar of the Main power centre, while the DCS will disconnected not essential loads linked to power centers under emergency diesel generators bus bar and will handle the restart load sequences (connect only essential loads) which will be defined during the detail engineering.

As soon as the Main supply will be restored, the emergency diesel generators, by operator choice, will be connected in parallel to the network and as soon as it is linked and synchronized will send an acknowledge signal to the ATS, who will handle switchgear in order to restore the normal configuration of the system.

1 PURPOSE OF THIS DOCUMENT

This specification and attached documents, appendixes and requirements, define the supply of the distributed control system (DCS) for the COAL FIRED PLANT 2 x 300 Mw to be realized at the Hatillo Municipality, Azua Province, on the South coast of the Dominican Republic.

This specification shall be used in conjunction with other project documents and applicable standards, listed below in this chapter. Any exception to the requirements of this specification or conflict with other projects documents shall be submitted in witting to TCM for resolution. Vendor shall be responsible for the correct design and operation of all provided equipments, the quality of all material and workmanship, and in compliance with these specifications.

The DCS shall continuously monitor and control the plant to produce on-specification product, while minimizing energy use, impact on the environment, cost of maintenance, and need for operator intervention.

The DCS equipment will be installed in rooms (FAR) located in the control building, auxiliaries building and considered as safe and air conditioned areas.

Operator central interfaces such as DCS operator stations and auxiliary consoles will be located in main control room.

The DCS/BMS cabinets (with CPU, I/O cards, feeder, interface with the field) will be located in rack rooms.

The Steam turbines control system will be located in a rack rooms The I/O hardware including the interfaces to connect to the subsystems and marshalling will be installed in FAR. Connections between DCS I/O cards and the relevant termination boards in the marshalling will be performed using pre-fabricated multi-wires cables plug-in connectors.

All the connections between parts of the system located in different buildings will be through redundant optical fibre connections.

The packages, supplied with own PLC, will be monitored by DCS through serial or network link as specified in the relevant chapter.

1512

*360 MW es un valor referencial, favor remitirse a la Tabla TS-02 donde se indica la potencia bruta definitiva

This document shall be read in connection with the following document:

- 3645-JK-SS-110 "DCS Supply Specification"
- 3645-JK-SS-110 "DCS Supply Specification - DCS I/O Count Summary"
- 3645-JK-DQ-0101 "Control System Architecture"

in which additional and general requirements for automation systems are provided. Normally, the process is monitored and interlocked by the DCS.

For safety reasons there shall be a Burner Management System (BMS) which is operating at a higher safety integrity level (SIL-level). The said Burner Management System (BMS) is part of the scope of delivery specified herein.

The decision, which signal shall be controlled by the DCS or the BMS is done according to the SIL classification.

BMS system shall be integrated with the DCS.

1515

- **General Definitions**

  In this and in all the other applicable documents, the following terms will be used to identify the different parties involved:

  - **Vendor:** Selected provider for DCS, other equipment, instruments and services defined in this document. This term includes such descriptions as "Supplier", "Seller", and "Manufacturer".
  - **End User:** Debrecht
  - **Contractor:** TECNIMONT S.p.A. and Odebrecht Party which carries out the activities of issuing the Material Requisition, basic design engineering of the project. From now on it will also be indicated as "Contractor" or TCM.

- **Technical Definitions**

  This document defines the technical requirement for the DCS system to be supplied by Vendor to the Contractor who will be in title of detailed engineering of the plants to be handed-over to the End-User.

  Cycle time:

  The cycle time of a controller / logic is defined as the interval between two successive executions of the controller / logic algorithm of the block. It does not indicate the total time needed for a change in the loop analogue input to produce a change in the corresponding analogue output.

  Graphics call-up time:

  This indicates the total time needed from the moment the operator pushes a button calling up a page to the moment all the static parts are displayed on the page and the live (dynamic) areas show the current value in the system database.

  Graphics refresh time:

  This indicates the time needed to update the content of all the live areas contained on the same graphic display.

  Maximum CPU loading:

  Processing functions of a station (i.e., monitoring, control, logic operations, etc.) shall not engage the CPU for more than a certain percentage of its capacity.

1516

*360 MW es un valor referencial, favor remitirse a la Tabla TS-02 donde se indica la potencia bruta definitiva

Redundancy:

It is intended as a capacity to switch from primary equipment to standby equipment automatically without affecting the process control.

Human Machine Interface (HMI):

HMI is defined as the software / hardware system that provide the interface between the plant operators and plant equipment.

- **Codes and Standards**

The instrument system shall comply in general with the requirements of ISA, ISO and ICE recommendations including graphic symbols for diagrams.

The codes and standards named in this chapter shall be applied in the following order: (This means: 1. supersedes 2. in case of discrepancies)

1. International standards.
2. Further codes and standards.
3. BES Standards (BES-CO-2-006)
4. Guidelines for Management Alarm (CE-009-01)

International Standards

• Instrumentation Symbols and Identification (for detailed engineering)	ISA S 5.1
• Graphic Symbols for Logic Diagrams	ISA S 5.2
• Installation of Intrinsically Safe Instrument System	ISA RP 12.6
• Safe operation of equipment in a hazardous area	ATEX95
• Specification for Degrees of Protection provided by enclosure	IEC 529
• Electrical apparatus for explosive gas atmospheres	IEC 60079
• Degrees of protection provided by enclosures (IP Code)	IEC 60529
• Immunity to Electromagnetic Interference	IEC 60801
• Electro Magnetic Compatibility (EMC)	IEC 61000 series
• Electromagnetic Compatibility and Radio Interference (EMC)	IEC 61000-6
• Partn5:Installation and mitigation guidelines Section 2: Earthing and cabling	IEC TR 61000-5-2
• SIL classification	IEC 61508/61511

1517

*360 MW es un valor referencial, favor remitirse a la Tabla TS-02 donde se indica la potencia bruta definitiva

- Program languages for PLC based systems IEC 61131-3

- **Further Codes and Standards**

  Further Codes and Standards applicable to specific types of equipment are referenced in the pertinent specifications issued separately of this document.

  The vendor shall be responsible to implement any additional state of the art code or/and standard, if applicable.

Fundamentals

All devices and equipment used shall:

- be latest field-proven in power plants,
- be selected according to ambient conditions and process requirements,
- be highly reliable,
- require low maintenance efforts,
- provide the export permits and admissions required for the country of use,
- be robust against electromagnetic and radio frequency radiation (EMC, EMI and RFI according to IEC 60 801 and IEC 61 000-6),
- be provided in a class of protection suited to ambient conditions,
- be sufficiently protected against dust and humidity,
- perform the ex-protection according to the zone of their location,
- achieve an availability of at least 99.99 %.

For all loops, the real (positive) signal principle shall be applied. The analogue loops shall be monitored regarding wire break or short circuited.

An evaluation of risks according to IEC-61511 will be done during detail engineering.

Contractual scope of supply

Refer to separate document "Supply Specification for Distributed Control System".

Reference: 3645-KK-SS-0110.

1518

*360 MW es un valor referencial, favor remitirse a la Tabla TS-02 donde se indica la potencia bruta definitiva

DCS vendor shall supply an Integrated Control System. This system integrates the control and safety system solution. The BMS system shall be included in DCS Vendor's scope.

DCS system execution plan

The execution of the supply will be developed by an Integrated Project Team composed by engineers belonging to Contractor, DCS Vendor(s) and End User representatives. This approach will allow incorporating End User requirements directly as specific inputs during the engineering phase and largely not as comments after the engineering, reducing the need of reworks and optimizing the schedule.

The system supply development will require different major activities:

- Development of system Functional Design Specification,
- System HW detailed engineering and construction
- Application SW implementation
- System testing (Pre-FAT, FAT, iFAT and SAT).

Vendor shall create a preliminary schedule within his proposal, taking into consideration the contractual milestones defined in the project schedule and to be finalized during the Kick Off Meeting (KOM).

Duration of the Vendor activities in the attached schedule is only for reference and shall be confirmed / defined by Vendor.

- **DCS equipment identification**

All devices and elements of DCS circuits shall be permanently marked according to the KKS abbreviation system. KKS designation shall be applied properly also to the project SW.

1519

*360 MW es un valor referencial, favor remitirse a la Tabla TS-02 donde se indica la potencia bruta definitiva

3 DCS FUNCTION DESCRIPTION

This technical specification together with the supply specification, appendixes and attachments, define the supply of the distributed control system (DCS) for the Coal Fired Power Plant 2 x 300 Mw and associated coal receiving terminal at the Hatillo Municipality, Azua Province, on the South coast of the Dominican Republic.

General

The Distributed Control System (DCS) shall consist of hardware and software matched to the process requirements. It shall continuously monitor and control the plant to produce on-specification product, while minimizing energy use, impact on the environment, cost of maintenance, and the need for operator intervention.

The hardware of the DCS shall be of modular design and shall be installed locally (separated by location) and/or functionally distributed. This modularity relates not only to the inputs and outputs, but also to processing units, operator and engineering workstations and software.

The DCS shall allow maintenance and troubleshooting to be performed on-line. The DCS hard- and soft ware shall be capable to perform Basic Calculations related to the process.

DCS equipment will be installed in the Central Control Room (CCR) respectively in the Field Auxiliary Rooms (FAR) - non-hazardous indoor locations.

DCS hardware and software shall be allocated in order to achieve segregation of the signals. In particular, the signals coming from the field, or going to the field, shall be organized and grouped in order to minimize the following troubles:

- Misoperations due to lack of synchronization among different process control units.
- Misoperations in the normal running of operating sequences as a consequence of failure of a process control unit.
- To reduce the communication traffic among nodes on the bus.
- To get easier the identification of the signals coming from or going to the field.
- To get easier the wiring operations.

1520

*360 MW es un valor referencial, favor remitirse a la Tabla TS-02 donde se indica la potencia bruta definitiva

- The types of electronic devices to be used shall be minimized (standardization and reduction of spare holding).
- The DCS shall support End-User requirements for alarm and event management.

The process control stations shall handle all functions related to measurement, control, and monitoring. Most of the field instruments shall be connected via conventional multi-core wiring (no fieldbus solution) to the DCS marshalling cabinets (DCS vendor scope). It shall also include all the miscellaneous accessories (cables, switches, network components i.e. Hart Smart Protocol communication to field instruments, etc.) necessary to make the systems complete and working.

The process control stations shall be linked to the operator stations in the control room by means of data bus lines (the system bus of the DCS). All connected stations shall be able to exchange data via this bus.

Each monitoring and process control station shall be an autonomous unit that performs its functions independently. In the event that a station fails, neither the functions of other stations nor the bus communication shall be impaired.

The software shall consist essentially of proven standard program components and parameterisation of these components.

The programs shall be stored in the system and shall be able to be changed / adapted by means of system resources without need for additional hardware. All stations connected to the bus shall know each parameter change entered into the system. They have access to and work with the same data and time base. If during the project development a new release of the control system SW will be generated, the system update with the SW new release is mandatory (without any additional charge for the Contractor) and shall be possible with DCS in operation.

- **Hardware**

Workstations (OWS, EWS, and SWS) are based on vendor recommended available PC/server hardware and configured with different software or hardware key to enable their access capability to the DCS functions.

1521

*360 MW es un valor referencial, favor remitirse a la Tabla TS-02 donde se indica la potencia bruta definitiva

All workstations shall have the same operating system software, system diagnostic software, data base management software, dedicated DCS package software.

The antivirus software shall be updated automatically and must be approved by the Contracting Party.

DCS stations shall communicate with other devices via a redundant communication link (DCS system bus).

Switching from one link to the other shall be automatic. Single point failure shall not result in loss of communication between operator and the rest of DCS system.

UPS distribution panel power the workstations.

The maximum loading of the DCS workstations (memory use, CPU time, and communication capacity) shall be as defined in the dedicated chapter.

DCS vendor as a minimum has to provide the devices and accessories to support the link connection of the main link (operator client network, etc).

The modem and the switches shall together with necessary servers be installed (rack mounted) inside in a dedicated cabinets located in the control board room.

DCS will be equipped with remote access devices (with the consent by operating personnel) via standard telephone network in order to enable the defects diagnostic, to ensure prompt service reaction and to reduce costs. External access to control system for service purposes will be provided by means of WAN links using VPN technology in accordance with principles applied in the Heat and power plant.

- **DCS Workstation**

  DCS operator workstation shall provide the human-machine interface (HMI) for the whole process control of the plant with the following hardware. Each workstation shall be provided as a minimum with:

  - 2 pieces: TFT display (main characteristics described herein this document)
  - 1 piece: Operator keyboard (process oriented keyboard with special function keys) per workstation. The keyboard should be flat, membrane covered, sealed by rubber pad under keys to protect the keyboard electronics, enunciators and alphanumeric type

1522

*360 MW es un valor referencial, favor remitirse a la Tabla TS-02 donde se indica la potencia bruta definitiva

(Spanish language). A dedicated pointing device (mouse or trackball) could be included in the keyboard or supplied separately.

- PC vendor's standard, DVD/CD drive (read only)

All the workstations (operator, engineering, special purpose station) shall have the same characteristics and appearance of an OS.

Number and distribution of Power Unit's HMIs in control room:

- Nr. 4 Operator stations per each Unit (workstation with up to 2x LCD monitors) for the visualization of the entire process;
- Nr. 1 Video Wall 42" per Allarm Power Plant;
- Nr.1 single screen station (workstation with 1x LCD monitor) for Historian Server;
- Nr.2 single display Steam Turbine per each Unit (supplied by Steam Turbine Vendor) ;
- Nr.2 B/W Alarm and Report Printer (A4);

Number and distribution of Power Unit's HMIs in Engineering Room:

- Nr.2 single display Engineering and Maintenance Workstation
- Nr.1 single display STCS HMI Workstation Unit 1 and Unit 2 (supplied by Steam Turbine Vendor)
- Nr.1 single display CEMS HMI Workstation per each Unit and one laser printer A4 color (as option and supplied by Cems Vendor)
- Nr.2 supervisory servers (redundant) and 1 KVM switch, included monitor-keyboard unit, hardware (tape drive or disc) with capacity for full backup of server and workstation
- Nr.2 switches for redundant LAN
- Nr.1 B/W Printer (A4);
- Nr.1 Colour Report Printer (A4/A3);

1523

*360 MW es un valor referencial, favor remitirse a la Tabla TS-02 donde se indica la potencia bruta definitiva

OPTION:

in case the Vendor is going to offer a Steam Turbines Control System integrated in the DCS (sizing by Turbines Vendor), 1 more OS and 1 more EWS shall be included in the scope for TCS monitoring purpose.

The stations shall be equipped with monitors and displays meeting the requirements below.

The station for machine monitoring system (Bently Nevada racks 3500 or equivalent solutions for turbines and main rotating equipment vibration analysis) is also included in the Turbines control system scope of supply.

NOTE:
whether an HMI is foreseen for a package PLC, not fully integrated in the DCS platform, a dedicated remote workstation (including engineering features) is provided by package Vendor.

- **Small-size monitor**

  Small-size monitors shall be made as LCD displays with the following parameter values (as a minimum):

  - Image diagonal ≥21''
  - Matrix resolution at least 1280x1024,
  - Contrast >1000:1
  - View angle >170°
  - Display surface matt, non-reflecting
  - Brightness appropriate for the conditions prevailing in premises to ensure ergonomic working conditions
  - Screen light intensity >400 Cd/m2
  - CE certificate.

- **Printers**

  Stations shall be equipped with printers meeting the requirements below:

1524

*360 MW es un valor referencial, favor remitirse a la Tabla TS-02 donde se indica la potencia bruta definitiva

- Printers shall be connected to the network,
- Laser,
- B/W,
- A4 format,
- Printing speed – not less than 20 pages/min.

Monitors, displays and printers, as of the commissioning date of the Unit, shall have the quality, parameters and technology meeting the quality requirements above. All deliveries of the above elements are subject to agreement with and acceptance by the Client.

- **Keyboards and pointing devices**

  Stations shall be equipped with keyboards and pointing devices meeting the requirements below:

  - QWERTY keyboards for industrial applications.
  - As pointing devices, mouse devices designed for industrial applications shall be used.

- **ARCHIVING SERVER**

  The Archiving server will be located in the system engineer room and provided with specialized engineering software for current data archiving. It will be equipped with PC class computer supplied by renowned manufacturer with two LCD screens (active TFT matrix) with diagonal of at least 24" with resolution min. 1920x1200.

  Database server and process data archiving functions must be accomplished by means of hard disks in Hot Plug version and in RAID 5 configuration. The servers will be located in computer cabinet.

  The functions performed by the stations:

1525

*360 MW es un valor referencial, favor remitirse a la Tabla TS-02 donde se indica la potencia bruta definitiva

- archiving of process data with record frequency in trend diagrams, every 1s or more frequently;
- export of trend values and events history on external data carriers in formats suitable form processing by means of other programs (Excel, etc.);
- archiving of events and operator actions.

The Archiving Server shall include features and functionality for obtaining on-line, historical, fault and disturbance data.

The Archiving Server shall provide engineering access to the Intelligent Electronic Devices (IED) for settings, configuration and other non-operational data such as fault records.

The archive server shall be supplied by Software Platform: PI System latest version.

- **Engineer station for field instrumentation**

The Engineer station for field instrumentation shall manage:

- full base for field instrumentation specifying designation, type of facility, serial number, place of installation, inspection, calibration and zeroing necessity intervals etc;
- remote self-diagnostics for field instrumentation, positioners and other control devices;
- remote introduction of changes for settings, field instrumentation configuration, positioners and other control devices;
- possibility to perform automatic calibration by means of selected calibrators;
- periodical and „on request" updating of diagnostic data, disturbances and failures;
- automatic documentation of introduced changes;
- automatic creation of reports on inspections and calibrations;
- creation and printouts of reports and data from apparatuses database;
- mechanism of granting the authorizations to individual users;
- recording of failures and disturbances.

*360 MW es un valor referencial, favor remitirse a la Tabla TS-02 donde se indica la potencia bruta definitiva

- **Process Interface**

  The process interface shall be provided by Process Control hard Stations which shall be functionally and physically distributed:

  - Each controller shall handle a limited number of control loops according to detail engineering contractor so that the CPU has enough capacity left (see numbers for spare capacities below).
  - Process controllers shall have multi-tasking capability that can be configured to provide advanced control algorithms and complex built-in sequences as needed by the process control strategy.
  - Necessary devices such as cabinets, terminals, boards, signal converters and transducers, system cables and interconnection cables shall be provided.
  - The power supply to field transmitters shall be fed either from safety barriers, from DCS input card or independent power supply system.

  The number of controller has to define by the DCS vendor according to the sizing coming from the attached I/O count summary with respect to the redundancy and segregation criteria and to the spare capacity described below.

  The number of CPU and/or of I/O cards is not object of the contract; the sizing of the DCS shall be based on specification requirements and I/O count summary.

- **DCS spare capacities and guaranteed parameters**

  The System shall have:

  - CPU memory load: <50% per CPU
  - CPU cycle time load: <50%
  - Fully installed & cabled spare I/O: 25% (Field terminals, I/O cards, CPU)

1527

*360 MW es un valor referencial, favor remitirse a la Tabla TS-02 donde se indica la potencia bruta definitiva

- Additional space for spare cards 25%
- Software (DCS point TAG) licenses: 100% (of FAT numbers)
- Display elements (WS) licences: 100% (of FAT numbers)
- Maximum load for process bus 20%
- Maximum load for operator bus 20%

The Contractor shall provide the Client with essential information confirming that data provided by the Contractor concerning the CPU time reserve are realistic and based on the approved system configuration and its computational capacity

The definitive volume of RAM and mass memory shall be sufficient to cover the required functions, and it shall also be increased by a 25% reserve for RAM and 50% for mass memory.

- **System Redundancy**

The DCS shall be designed to achieve an availability of at least 99.99 %. This shall be achieved by the use of redundant technology, where necessary, and by provision of system diagnostics and alarms.

Distributed Control System shall incorporate the following redundant elements, as a minimum:

- Redundant cabinet power supply units,
- Redundant design of system bus and of system bus connections, The system bus is not equipped with a bus master. A failure of one of the two system busses does not impair the communication of the redundantly connected bus users. In case of a failure of both system busses, the functions of the process stations shall continue as far as they do not need data from other stations.

Doubling of hard disks and/or mass storages as well as automatic mirror image of the content of mass storage 1 to mass storage 2. (Redundancy as per manufacturer's standards. If manufacturer provides one single mass memory device for the entire system, it must be redundant. If memory devices are provided for each process station, at least two devices with the same information will

*360 MW es un valor referencial, favor remitirse a la Tabla TS-02 donde se indica la potencia bruta definitiva

be provided. Online back-up shall be provided for data base and system files). Server switchover in the event of a failure of one of them shall be inconspicuous to the operator and it shall not cause instant loss of the ability to control the Power Unit.

- Redundant design of processing components (process control units) incl. CPU (1:1), memory and connections to interface components and to other necessary hardware components.

On the operating and observation level, the operator stations shall be provided with identical hardware and functions so that each station is able to take over the tasks of any other station. The fault of any unit in redundant configuration shall cause the automatic switchover to the redundant back-up unit without affecting the system current operation (bump-less change over). An alarm shall alerts the operator of the malfunctioning device/component. Failure of a card shall not interfere with the other parts of the system.

For the assignment of multi-channel interface cards, signals of a measuring circuit belonging together should be grouped on one card wherever possible.

Measurements, which allow statements redundant towards each other, shall be connected to different input interface cards. Commands to redundant field equipment shall come from different output interface cards.

The number of signals per input card shall be adapted to the importance of the measuring signal connected.

- **Cycle Time**

  The signals scan time shall guarantee the following performances, and be independent from processors load:

  - Cycle time: default 250ms; for special TAGs 100ms
  - Minimum cycle time achievable whether necessary: 20ms
  - Scan time for trends ≤ 250ms (possibility of selecting different scan time for archived analogue shall be provided)
  - Refresh time for graphics ≤ 1s.

1529

*360 MW es un valor referencial, favor remitirse a la Tabla TS-02 donde se indica la potencia bruta definitiva

- **Time tag resolution and accuracy**

  The system shall provide the possibility of continuous monitoring of process events with time resolution 1ms and accuracy of five (5) milliseconds. Time stamps shall be established directly at the input card

- **System Time generation**

  The DCS system time shall be synchronized with the time plant's master clock. This time shall be used to synchronize DCS and ESD system as well as other systems. GPS synchronization shall be provided by DCS vendor including redundant antennas, cables to connect antennas to time server, time server and time distribution cards. Since most of the local PLC shall be interfaced for time synchronization purpose, the Vendor shall include in the offer the cards for synchronizing twelve (12) PLC via NTP protocol and two (2) via IRIG-B protocol. Moreover a unit price for 1 more NTP or IRIG-B connection shall be included in the offer.

- **I/O Types**

  The system shall be capable of receiving and computing process signals from field devices, without utilizing auxiliary signal conditioning devices. However, separate isolators (e.g. EExi signals) might be used only after approval by TCM.

  The HART parameters in the controllers shall be available for internal use, to integrate the standard live data information in the DCS displays, and to be exchange with the AMS station. All analogue input/output cards as well as digital input cards shall have over current protection and surge protection devices (voltage peaks). All digital output shall be individually protected by fuses. The fuses shall be sand fuses (low resistance). The digital input / output shall be isolated to minimum 500 VDC.

  All I/O cards shall be provided with diagnostic features able to detect any single channel failure, alerting the operator and tagging the point as "BAD" value. All DCS cards shall be replaceable under power, without disconnecting any wire during normal operation, and without affecting any other part of the system.

1530

*360 MW es un valor referencial, favor remitirse a la Tabla TS-02 donde se indica la potencia bruta definitiva

When redundant I/O cards are used, the system will automatically switch over to the redundant card in case of a card failure. The minimum standard for A/D and D/A conversion are:

- minimum 12 bit words for inputs and 10 bits for the part used for engineering units;
- no missed codes for ambient temperatures of 5 - 40°C
- conversion time not shall not exceed cycle time of the application using the I/O
- total accuracy better than 0,1% for AI and 0.5% for AO
- protection against short circuits;
- protection against overloads and overvoltages
- galvanic separation between circuits and frame as well as between the circuits
- input signals diagnostics
- lines continuity check (also for DI cards);
- diagnostics of initiators contacts;

Process control and data acquisition units shall include in their standard set of I/O modules at least the types described below (considering 8 channels for AO, 16 Channels for AI and 32 channels for DI / DO will be offered). The DCS shall be capable of handling:

Input cards shall be provided with filters with at least 4 ms delay (identical for every input) to mitigate results of the contact bounce at short circuit. What is more, the system shall be able to distinguish and reject input from faulty (vibrating) contacts.

Digital inputs

- Dry contact
- 24 V DC loop voltage
- Proximity

Inputs shall be equipped with filter.

1531

*360 MW es un valor referencial, favor remitirse a la Tabla TS-02 donde se indica la potencia bruta definitiva

Analogue inputs

- 4-20 mA input (powered and not powered)
- 1-5 V input
- Resistance Thermometer (3-wire Pt-100 ohm system)
- Thermocouple (type J, K, E, R) or mV Input. It shall be possible to configure up- or downscale signal drive on thermocouple burnout (independently for each channel).

Digital outputs

All digital outputs shall be equipped with protection against voltage surges caused by inductive loads. Digital output shall be relay type, voltage free contacts, suitable for 240 V AC / 1A. Outputs shall be without any common wiring.

Analogue outputs

- 24 V DC loop voltage
- 4-20 mA current loop

Minimum load impedance shall be 600 ohm.

- **Serial/Network link**

The serial link will be based on PROFIBus DPV2 or Modbus RTU or Modbus TCP communication protocol. DCS supplier shall supply the suitable interfaces and connecting cables, and implement the chosen protocol considering always the DCS as master of the link. The serial interfaces shall be sized considering a maximum scan time of 0.2s and baud rate at 9600 bit/second). The supply of fibre optic cables to connect remote I/O boards to CPU cabinets are in Contractor scope.

- **Frequency input**

Pulse counter capable of operating on a 2-wire system will normally be used. Acceptance signal sources shall be:

- Dry contract (low frequency rate)

*360 MW es un valor referencial, favor remitirse a la Tabla TS-02 donde se indica la potencia bruta definitiva

- Current loop (low/high frequency rate)
- Voltage loop (low frequency rate)

Pulse counters shall be capable of detecting signals with frequency up to 10000 Hz.

- **SMART transmitter and positioners**

Transmitters and positioners will be Smart type with HART protocol. DCS I/O cards and barriers shall be compatible with the HART protocol. The communication, used to exchange the smart parameters between field devices and the DCS controllers through the I/O cards, shall not disturb the measured variable. No multiplexer is admitted for HART devices interface. The Hart instrumentation data base shall be managed by the DCS HMI.

- **I/O Connections**

The way of connecting field instruments to the DCS shall be via conventional wiring. In this case the signals shall be transferred via multi-core copper cables to the DCS via marshalling cabinets. These Marshalling cabinets will be used to terminate the field instrument cables / interconnecting cables on the dedicated terminals strips, to house the Field Terminal Assembly (FTA) panel and/or Intrinsically Safe Barriers with or without Motherboard, and to implement the cross wiring between the FTA panel/motherboard and terminal strips.

In case of signals need to go through modules (barrier,...), only one signal has to be wired per module.

- **Marshalling cabinet**

DCS will be supplied with FTA panels, which will be located into the Marshalling Cabinets. Their connection to the DCS I/O cards shall be through prefabricated multi-core cable with plug-in connector on both sides.

DCS FTA panels shall be segregated per input / output signal typology (including analogue, digital and Exi category), per voltage level, and per voltage category.

Terminal strips shall be sized for wire section not less than 2.5 mm2 and, in any case, adequate to the service.

1533

*360 MW es un valor referencial, favor remitirse a la Tabla TS-02 donde se indica la potencia bruta definitiva

The battery limit of the DCS vendor scope shall be the terminal strips of field multi-cables. DCS vendor will have the responsibility of connection on the FTA and I/O cards.

- **Interfaces and communication of DCS (internal and with other Systems)**

The DCS will be interfaced with other systems and subsystem to integrate the control and monitoring functions toward to the packages. Vendor shall provide to homogenize the HMI independently from origin of the signals (serial or hardwired).

The DCS shall be able to exchange data with all systems and subsystem and shall be able to permit the connections to the Company networks. Below are summarized the main communication that the DCS shall have to include.

The exchanged serial signals with the other systems and subsystems shall be presented in the graphic pages, in alarm pages, in historian, trend, etc. having the same features of the implemented signals derived from I/O cards. Below the table shows all serial communications with other system and subsystems, including the interface to the existing Company networks.

The DCS shall be capable of communicating with:

- ST's, Auxiliaries and Generators:

  Ethernet TCP/IP with OPC protocol & hardwired or directly connected to the plant bus (R)

- HV/MV electrical protections system (for SOE):

  Ethernet, IEC 60870-5-104 protocol or equivalent (R)

- Office Lan:

  Ethernet TCP/IP with OPC protocol or directly connected to the supervision network (R)

- Dispatching Centre:

  Ethernet, IEC 60870-5-104 protocol or T.B.D. (R)

- Burner Management System (BMS):

  Ethernet TCP/IP with OPC protocol or directly connected to the supervision network (R)

- Coal Handling System:

  Modbus RTU

1534

- Burner Management System (BMS): Ethernet TCP/IP with OPC protocol or directly connected to the supervision network (R)
- Coal Handling System: Modbus RTU
- Overland Coal Conveyors System: Modbus RTU
- Water Treatment System: Modbus RTU &Hardwired connection
- Waste Water System: Modbus RTU &Hardwired connection
- LV electrical protections system (for SOE): Hardwired;
- Fire fighting Hardwired;
- Emergency Diesel Hardwired;
- HVAC Hardwired;
- CEMS's Ethernet TCP/IP with OPC protocol & hardwired
- Air Compressed Modbus RTU&Hardware (R)
- MV/LV Automatic Change Over Hardwired;
- Sub Station: Ethernet, IEC 60870-5-104 protocol (R) & Hardwired;

Note: (R) redundant link foreseen.

All these PLC's will be interfaced to DCS also by few HW signals for main alarms and status, and for commands and trip from DCS.

1535

*360 MW es un valor referencial, favor remitirse a la Tabla TS-02 donde se indica la potencia bruta definitiva

- **Internal DCS communication**

The communication between the different DCS components shall be realized with a redundant data bus. All the connections between different buildings shall be realized through redundant optical fibre cables laid along different paths. The fibre optic multi-cables, for building interconnections, are in the scope of supply of the Contractor.

DCS vendor shall be responsible for supply and installations into the system and marshalling / auxiliary cabinets of all necessary devices and accessories regarding to communication with data bus. This shall include Modem, Switches, Patch-Panels and converters as required. The supplier shall confirm and advise the number of cores required for the DCS. The battery limit of DCS vendor scope shall be the Patch-Panels for fibre optic multi-cables.

It shall be possible to add / delete nodes on the system without network shutdown. The system shall not exceed 70% of the nodes capacity for each highway.

- **DCS / BMS communication**

The DCS shall be completely integrated with the DCS automation highway. A solution has to be agreed for BMS signals time stamp for first out research purpose.

Otherwise the connection shall be realized via redundant link (supporting time stamp transmission from origin) which will repeat to DCS the data acquired from field instruments, the alarms and statuses generated by interlocks and the internal diagnostic alarms for maintenance operators.

- **Power Distribution**

The power supply for the DCS system shall be redundant from the power distribution cabinet (power supply demands only for information and details refer to "System, Marshalling and Power Distribution Cabinets Specification, doc n°3645-KK-SE-01Q [LATER]).

Two independent lines from UPS 120 Vac and one 230Vac not through UPS system, redundant 125dc supply for solenoid valves, of adequate power sizing shall be provided to power the system in each location where DCS equipments are present. The locations to be considered are FAR. The Vendor shall include in each location, a Power Distribution Cabinet (PDC) equipped to:

- Receive the two main incoming lines from UPS (feeders 1 & 2)
- Distribute the single or redundant UPS Power to all DCS Equipments
- Receive the incoming line from not UPS (feeder 3, option)
- Distribute the single Power to all DCS Equipments for internal lamps and sockets

*360 MW es un valor referencial, favor remitirse a la Tabla TS-02 donde se indica la potencia bruta definitiva

Solenoid valves are always supplied by DCS via MCB's.

Diagnostic alarm indication for Power supply fault, breaker trips, power failure on motherboard, and cabinet high temperature, identifying the faulty unit, shall be reported at each operator workstation (OWS).

- **Network security**

  The preferred approach for networks is a layered Ethernet network with the appropriate use of switches and routers. This high integrity network shall have a secure firewall to prevent any unauthorized system writing into the DCS from the office automation network or outside world.

  DCS vendor shall have methods / solutions to resolve the following security issues:

  - Domain and firewalls: A separate windows domain will be configured for process control network which will be connected to the office LAN. Process control network will be protected against intrusion by way of firewall with restrictive security policy.
  - Virus protection: DCS vendor shall have policy and facility to quality Microsoft hot fixes, patches and Anti Virus definition files with a maximum delay of 5 working days

- **Climatic conditions**

  Control room and FAR are air conditioned at about 22°C (±3°C) with relative humidity around 50% (±10°C) but the design shall consider the possibility for the system to work in case of air conditioning failure, that is in Europe with 0°C (winter) 40°C (summer) and with 20% relative humidity.

- **Software**

  Together with equipment and materials for the DCS described above, the manufacturer's DCS system software shall be supplied. This software shall be supported and supplied with possible updates for at least 30 years as a minimum. The main functions of this DCS software are shown below.

  The software scope of supply will be updated later by the Contractor.

1537

*360 MW es un valor referencial, favor remitirse a la Tabla TS-02 donde se indica la potencia bruta definitiva

- **Main Functions of DCS System Software**

(1) Data acquisition of major process variables and conversion to engineering unit.

(2) Alarm identification and response procedures (high alarm and low alarm), printing and displaying alarm status. Alarms shall be displayed as soon as they are detected in the system (within 1 sec). Alarms shall be presented on priority basis according to CE-009. In addition to the basic information allowing the identification of the time and kind of an event, also the priority and process area shall be defined.

(3) Alarm management (alarm visualisation, alarm acknowledging & silencing, first out alarms, audio alarms, intelligent alarming functions)

The system shall provide the following basic types of reports as a minimum:

- Even lists
- Operator action reports
- Custom reports with fixed and / or variable formats

The report types shall be on demand, at a predefined time or event triggered.

(4) Control of process variables, parameterisation.

(5) The real time trend shall be for a minimum of 1 hour at a sampling rate of 1 second.

(6) The historical trend shall be for a minimum period of 5 days at sampling rates of 10 seconds, 1 minute or 10 minutes. Long term storage by means of periodically writing on CD's.

(7) Supplying graphic symbols, controller algorithms (faceplate).

(8) Supplying graphic display (Overview displays, operating group displays, details displays, trend displays, alarm displays, process graphic displays, interlock displays, sequence displays, system status and diagnostic displays, display chaining)

(9) Operator level control:

The system shall be having password means to control the range of operation allowed. At least three levels shall be considered (Supervisor, Operator and Engineering)

(10) Report generator:

The report generator must be able to built and print customized reports.

(11) Free configuration of graphics, symbols and colours of visualisation elements,

(12) Fully automatic and independent system for backing up the necessary DCS data in order to restore their proper performance after a failure should be provided. These data shall be recorded on stationary disks and portable data carriers. Both methods shall enable analysing the pre-failure conditions.

1538

*360 MW es un valor referencial, favor remitirse a la Tabla TS-02 donde se indica la potencia bruta definitiva

(13) DCS will enable the completion of complex regulation systems e.g. multi-parameter regulators and predictive regulation

All operations and history of processes realized in the Power Unit (incl., inter alia, graphs, event queue records, etc.) shall be filed by DCS, and if necessary, a hard copy of respective report shall be printed on DCS printer(s). All registers and operator's registers shall be entered into DCS, and registers, alarm registers and daily activity reports shall be made available via DCS units, monitors or remote communication with IT system of Combined Heat and Power Plant.

The Client prefers Windows Professional as the operating system of servers and operator stations or a higher system if required, in the server version with licenses for the appropriate number of users. It is admitted to use operating systems with a version not older than 2 years.

A standard office package SW shall be provided on the workstations.

- **Asset Management System**

The optimal service of the company assets is required in the scope of fixed assets accounting as well as maintenance, routine overhauls as well as periodical inspections of facilities.

Therefore the Enterprise Assets Management system enabling the planning and execution of overhaul works and activities preventing potential failures should be delivered. The system supervises the scheduled dates and scopes of overhauls in accordance with defined intervals or on the basis of other parameters e.g. operation hours / mileage. When any defined values are exceeded, the system is able to generate Work Orders automatically for the relevant item of equipment on the basis of actually available human and material resources. Furthermore the professional technical service, transparency and completeness of required documentation and optimization of operation costs are ensured by the system.

The system can be integrated with other business or accounting solutions and ensures efficient information exchange between individual departments of the company contribution to the optimization of its inner processes (reduction of stock levels in the scope of spare parts and consumables in the store, to the increase of effective use of available resources, to the reduction of failure rate as a result of efficient management in the scope of routine inspections and overhauls etc.).

The system should work based on the virtual platform

- **Operator Workstation Software**

Each workstation shall be provided with the following software:

1539

*360 MW es un valor referencial, favor remitirse a la Tabla TS-02 donde se indica la potencia bruta definitiva

- Operating system software.
- System configuration software with proven and complete standard (function) modules.
- Standard Templates for manually operation of controllers, valves, motor start/stop.
- System diagnostic software.
- Data base management software.

The following type of graphics should be usable:

- Overview displays.
- Group displays.
- Loop displays / face-plates and templates (detail displays).
- Graphic displays.
- Trend displays.
- Creation of X-Y field of the facility operation.
- Alarm summary display.
- Status displays for subsystems (e.g. ESD, electrical power distribution).
- Cause and effect diagram displays.
- Sequence function diagram displays.
- System displays for system maintenance including:
  - System status displays.
  - Device diagnostic displays.
  - Variables display.
- System alarms for system failures:
  - System failures shall be tripped on occurrence of system devices malfunction and troubles and be displayed on TFT with audible alarms.
- Process alarms:
  - Process alarms shall function on occurrence that process variables and/or specified signals exceed preset value or reach the designated limit and display (TFT) with audible alarms.

1540

*360 MW es un valor referencial, favor remitirse a la Tabla TS-02 donde se indica la potencia bruta definitiva

- **Graphic displays: functional requirement**

The Functional Design Specification (FDS) for HMI will include the details about display features as a library, a hierarchy structure, a navigation philosophy, coding technique, Event / Alarm animation criteria, MOS / Interlock interface with management guidelines, faceplate, etc. At least these basic functions shall be provided:

- Multi window
- Operator Guide
- Custom Help
- Trending (from real time and long term history database)

The system shall have a real time trend or historical trend for analogue and digital variable. Generally, all trend display shall be pixel based and shall be possible to change the scale, to have zoom and pan facility, to have the availability to calculate the hourly, shift, and daily averages. It shall be possible to group the trends in one display (generally 4 or 8 variables) creating the rend group displays which refresh time shall be ≤ 1 sec.

- Logging
- Face plate displays for instrument and equipment:

Each operating device (e.g. Valves, motors, controllers, etc.) shall have its own faceplate display where the individual information is displayed (e.g. mode, digital statuses, alarms, set points, etc.) and operator manipulation can be done if enabled (e.g. start/stop, set alarm changes, set point changes, etc).

DCS Vendor shall be able to define new faceplate according to special needs, like additional live parameter of HART information (e.g. feedback statuses, feedback analogue value, etc.) or additional live points (e.g. adding winding & bearing temperatures, vibration, and current, inside the motor faceplate). Anyway the DCS Vendor shall include these custom-built activities (for not standard faceplate) in the engineering and configuration scope of supply (and in FDS scope).

1541

*360 MW es un valor referencial, favor remitirse a la Tabla TS-02 donde se indica la potencia bruta definitiva

- Alarm annunciation and display:

  This type of displays shall give the displays of active and acknowledge alarms and event messages. It shall be possible to sort and filter the alarm list. More information on alarm management and information on the live updating are in the chapter "Alarm Handling and Data Messaging".

- Overview displays

  Overview graphic display will contain the main view of process areas, general information about plant condition (overview for Interlocks, for gas, for fire, for electrical, etc.), and hierarchy organization (showing the links to different graphic displays for different access level).

- Process variable, tabular log display:

  Process graphic displays shall be realized in P&ID view to show details of process areas with static and dynamic information incorporating monitor and control capability. It shall be possible to view one or more faceplates, acknowledge one or all alarm present in the graphic, etc. Each process graphic display shall be capable to include at least 200 different live tags, which refresh time shall be ≤ 1 sec and call up time ≤ 1 sec.

  Each group display will contain 8 or 16 loops to permit the operator to manage and monitor the variables. The loops may be digital or analogue or a mix of both and each loop can be inserted in different group displays.

  The system may have availability to configure at least 400 group displays for each assigned area.

- Dynamic Interlock and sequence displays, for analysis and troubleshooting of plant trips and upsets, including PU interlocks & trips.

  These displays shall show the status of interlock or logics sequences with animation of analogue values, digital statuses of cause & effects, MOS, First-out, etc. The same display will be used to show the "Permission to start" condition for complex machines and / or simplified logic flow symbols showing the main interaction of input causes in the logic or interlock.

  These displays shall have to show the information about the process sequence and/or active process task preferably according to IEC 1131 or according to the DCS

1542

manufacturer's standards, where dedicated graphic pages or faceplate shall be realized to show the minimum requirements to monitor and control the sequences.

- SOE and first out alarm displays for plant trip and major equipments.
- Display summaries and hand-over reports to enable the clear hand-over from one operational shift to another.

  These graphic pages shall give the diagnostic information about the hardware and software system modules; the navigation and the structure of the displays shall be organized following hierarchy architecture.

  Overview graphic display will contain the main view of process areas, general information about plant condition (overview for Interlocks, for gas, for fire, for electrical, etc.), and hierarchy organization (showing the links to different graphic displays for different access level).

- A graphic or report showing the major parameters of the units, production balances, fields production targets, which quality requirements shall be defined by the PIM specialists. No independent production balance application is required.

- F&G displays:

  A set of graphic pages, organized in a hierarchical structure and mainly based on plant layouts, will show detailed statuses of the fire and gas sensors of each plant.

  The Fire monitoring overview will be realized as software mimic panel to show the plant and building fire zones with their cumulative alarms. By selecting one animated cumulative alarm, the system will permit to access to the zone in alarm for detailed information on the fire devices.

  The Gas monitoring overview will be organized following the same fire display philosophy, with reference to the gas structure to show the location and statuses of the gas detectors.

- Information for maintenance purpose:

  Every configured point shall have own detail display with manipulation capability (where applicable). HART parameters, if present, shall be included in the detail for monitoring and maintenance purposes.

1543

*360 MW es un valor referencial, favor remitirse a la Tabla TS-02 donde se indica la potencia bruta definitiva

- System Status displays

  These graphic pages shall give the diagnostic information about the hardware and software system modules; the navigation and the structure of the displays shall be organized following hierarchy architecture.

  The synoptic charts shall use a color scheme according to PN-IEC for marking the media types and startup and fault conditions. The form of images and visualization standards (color schemes for particular startup and fault conditions of the equipment) shall be agreed and approved by the Client.

- **Graphic displays**

  During engineering phase the details of FDS-HMI will be finalized, below is shown an example of hierarchy architecture (as a base to start):

  - Plant Overview
  - Unit Overview
  - Overview of process: Showing the main process with the status of all actuators and sensors:
    - Gas and Fire software mimic display, showing the area, location and status of the sensors: Interlock display, Cause & effects/Sequence function diagram displays
    - Group displays, loop displays, faceplate/trend/alarm displays, etc

  Approximately 150 dedicated DCS graphics type 8), 9), 10), 13), 14) have to be created in accordance with the P&ID's and schemes (this number not cover custom popup for field components and other displays' type described).

- **Special Graphic Displays**

  The following special graphic views are required:

  - 1 piece : Plant Overview
  - 1 piece :Mimic Main Process (software)
  - 1 set: displays dedicated to BMS
  - Showing the main process with the status of all relevant actuators and sensors

1544

*360 MW es un valor referencial, favor remitirse a la Tabla TS-02 donde se indica la potencia bruta definitiva

- 1 set: GAS & FAS mimic display: showing the location and status of the sensors
- 1 set: diagnostic displays (PLC, communication…)

- **Engineering Workstation Software**

  In addition to the above mentioned software that is used on/for operator workstations special software that is only available on engineering workstations or other special workstations is necessary.

  - Software for configuration/engineering the DCS.
  - Documentation software.
  - Software for configuration/engineering of field instruments via HART Additional software like a firewall for internet connection.
  - Back-up facilities.

- **DCS language**

  During the engineering phase the DCS language will be English and during commissioning at least the following parts of the DCS will be in Spanish:

  - All graphic displays and custom popup including start up pages texts
  - All dynamic points description (devices' description, alarm, events and report description etc..)
  - Main online documentation
  - Complete tooling and application software as well as with source codes with comments etc. in Spanish version.

4 POWER UNIT PROTECTION SYSTEM

The Power Unit shall be protected per each Unit by an independent protection system meeting the requirements below.

*360 MW es un valor referencial, favor remitirse a la Tabla TS-02 donde se indica la potencia bruta definitiva

The protection system will cover the safety functions for the Steam Generator and of the thermal cycle.

The turbine shall be protected by an independent process and unit adjustment and protection system.

The electric system (generator, transformers, switching stations) and electric actuator protections shall be protected by an independent electric part protection system;

- **Requirements for the Power Unit Protection Systems**

Power unit process protective functions, meaning functions that are directly related to the safety of the personnel and/or to main equipment integrity, are performed by an Emergency Shut Down (ESD) system.

The safety instrumented functions required for risk reduction of the boiler and firing systems are performed by a Burner Management System (BMS).

Both ESD and BMS electronic is certified Safety Integrity Level (SIL) of 3 according to IEC 61508 "Functional safety of electrical/ electronic/programmable electronic safety-related systems".

ESD and BMS are integrated with the non-safety-related DCS process control system.

For signals related to protective functions, the field element is tripled and wired connected to different cards of the ESD/BMS. Generally thresholds on analogue measurements are used to detect process parameters.

The steam turbine trip request from ESD to Steam Turbine Control System (STCS) is transmitted via triple HW signal.

The safety system project begins with the HAZOP procedure, in which representatives of Client, Package Vendors and Contractor are involved. The objective of the HAZOP study is to identify and evaluate safety hazards and operability problems which, although not hazardous, could compromise the plant's ability to achieve design intent and productivity.

Following the HAZOP procedure, a Safety Integrity Level (SIL) classification is performed.

1546

*360 MW es un valor referencial, favor remitirse a la Tabla TS-02 donde se indica la potencia bruta definitiva

The objective of the SIL study is to assess the required SIL of the Safety Instrumented Functions (SIFs) based on an assessment of the risk of injury to people and damage to the environment. The SIL classification defines the minimum level of the safety integrity (or safety reliability) required to be implemented for each specific SIF application. The SIL study covers all the Emergency Shutdown (ESD) SIFs listed in the Interlock Logic document and those identified or recommended during the HAZOP.

After the SIL report has been issued, automantion and control department starts the activity of SIF design reports. Objective of this activity is to perform a quantitative verification that the probability of failure on demand of each safety instrumented function is equal to, or less than, the target failure measure associated with the required SIL level. For each loop mentioned in the SIL Classification Report, and classified at least as SIL 1, it is verified if the required reliability could be matched by means of the designed architecture and instrument types.

The result of the activity is documented through a "SIF loops Design Report", reporting the SIL required, the assumptions, the loop functional architecture, the data and calculations relevant to all instruments in the loop, the Time interval for the periodic test and the final conclusions.

A Functional Safety Assessment shall be carried on before the ESD FAT, in order to verify that all the requirements identified in the engineering of the SIS have been properly considered and implemented

Complete documentation and certification of the electronic equipment and the safety loop test reports are delivered to the Client.

The measuring systems – initiators of the technological protections system will be configured in accordance with the following requirements:

a) measuring devices (sensors, transmitters, relays etc.) will be connected with central part (logic systems) by means of separate pulse cables without any terminal strips and intermediate boxes;

b) measuring devices in measuring system should be characterized by the safety level SIL=3;

1547

*360 MW es un valor referencial, favor remitirse a la Tabla TS-02 donde se indica la potencia bruta definitiva

c) measuring signals from devices will be not directly used (in the form of primary signal) in any other circuits for execution of other I&C functions except of protection functions, but the indirect use of measurements results (after their processing in the technological protections logic system) is allowed;

d) wherever it is technically possible, analogue measurements will be used and their necessary threshold values will be calculated in protections system.

In order to enable the achievement of required (very high) safety level three (3) independent initiators will be used in each circuit. The approval by the Contracting Party will be required in case of justified deviation from this rule.

IEC 61511 as well as IEC 61508 standards are required to determine the safety level. The central part of the technological protections system (logic systems) will be completed on the basis of the requirements included in IEC61508 Programmable Electronic System.

The protections system will generate two paths of shutdown signals independently acting on two elements disabling an actuator (e.g. two coils of circuit breaker).

The protections systems of the plant should be based on doubled structure with application of programming logics 2 out of 3.

The reliability of measurements entered into the protections system is checked in negative logics 2 out of 3 measuring circuits voting and ahall be controlled by a reliable protective failsafe and fault tolerant Emergency shut-down system (ESD). The continuity of lines in all external circuits should be checked on ongoing basis. The main control paths for the plant shutdown should be provided in dual version.

The protections systems performs the automatic diagnostic tasks for all internal and external elements, particularly the shutdown pulses transfer channels. The protections systems is provided with uninterrupted power supply from two independent sources.

The hardware and software of these systems must be separated from the automatic control system. The Complex Protections System of the Coal Power Plant should integrate all protections of the plant associated with the technology and with electric part.

1548

*360 MW es un valor referencial, favor remitirse a la Tabla TS-02 donde se indica la potencia bruta definitiva

Additionally the completion of subordinated protections systems is possible for the individual production units of the plant i.e. Steam Generator, ST turbine and generator which will protect these units.

The protections systems must be equipped with standard testing functions to enable the checking of operation of all elements of the system.

The testing program will be periodically checked for correct operation and it organization must enable the functioning of the protection in course of testing.

I/O modules will be provided among others:

a) protection against short circuits;

b) protection against overloads and overvoltages;

c) galvanic separation between circuits and frame as well as between the circuits;

d) input signals diagnostics;

e) lines continuity check;

f) diagnostics of initiators contacts;

g) possibility of modules replacement without process station work interruption (hot swap);

Technological protections system will be subject to:

a) acceptance procedures in accordance with Pressure Equipment Directive – 97/23/EC (PED);

b) acceptance procedures in accordance with notified entity requirements;

c) plans associated with factory acceptance test (FAT),

1519

*360 MW es un valor referencial, favor remitirse a la Tabla TS-02 donde se indica la potencia bruta definitiva

d) plans associated with site acceptance test (SAT),

e) plans associated with functional tests for the protections system;

f) final acceptance by the competent authorities of Technical Inspection;

The documentation for the technological protections system will be approved by the Central Laboratory of Technical Inspection.

5 TECHNICAL DOCUMENTATION AND INFORMATION

All design and technical documentation shall be in the ENGLISH language. The documents related to safety, the operating and maintenance manuals shall additionally be prepared in Spanish language. All required documentation which has to be provided for DCS Vendor is as follows:

- Project specification of process control system including basic requirement for hardware and software and auxiliary instruments.
- General control room layout (drawing) and preliminary operator console arrangement (drawing)
- General power supply system plan.
- Requirements for electrical, HVAC, grounding and relevant civil works for Central Control Room in which DCS system is located.
- Preliminary description and logic diagrams for the interlocks.
- Input and output List (I/O list)
- The I/O list with the following data shall be provided.
  - Tag No. of Instrument
  - Signal specification

1550

*360 MW es un valor referencial, favor remitirse a la Tabla TS-02 donde se indica la potencia bruta definitiva

- Instrument range and scale (engineering units)
- Trip and alarm setting list

- Control and monitoring scheme. The scheme shows following information:
  - Service description
  - Specification of the instruments
  - Signal flow diagram
  - Special requirement of control mode and function
- Sequence control and interlock diagrams. The flow chart and/or logic diagram for sequence control and interlocking system shall be provided.
- Detailed power supply and grounding system diagram in the DCS main unit.
- Software specification of DCS including below items:
  - Alarm message list. Alarm message list with trigger will be provided.
  - I/O grouping list. The list shall be provided from an operation point of view.
  - Graphic display plan:
    - Static scheme (referred to P&ID).
    - Standards for graphics:
      - Symbol and colour definition.
      - Text and value definition.
      - Target point definition for change of screen.
      - Colour plan and code.
      - Line code.
      - Structure of symbol.

Documents to be submitted by the DCS Manufacturer:

- Final layout of DCS equipment and other instrument cabinet in control room.
- Final layout of equipment and consoles.
- Define formats of lists (including DCS and auxiliary items):

1551

*360 MW es un valor referencial, favor remitirse a la Tabla TS-02 donde se indica la potencia bruta definitiva

- Spare parts.
- Special tools and calibration devices, if any.
- Consumable.

- Hardware:
  - Equipment list.
  - Hardware specification including operator console, printers, control electronics, marshalling panels, and other devices.
  - Construction drawing including auxiliary instrumentation system outside/internal view of each equipment and devices, with parts list.
  - Equipment and parts arrangement drawing inside cabinet, panel and rack.
  - System cable list.
  - Instruction for installation, operation and maintenance.
  - Inspection certificate and test report.
  - Connection table for the equipment in the control room up to the Marshalling Cabinet.
  - Power consumption & heat dissipation list.
  - Hardware configuration drawing.
  - Hardware installation manuals.
  - Detailed wiring diagram inside control room and cabinet room.
  - Inspection.
  - Operation and maintenance manual.
  - Hardware instruction manual for DCS equipment (including auxiliary instrument).
  - Implementation manual for DCS.
  - Instrument grounding system and power supply.
  - Proposal for FAT procedure.

- Documentation of software:
  - Data base development or configuration data.

1552

*360 MW es un valor referencial, favor remitirse a la Tabla TS-02 donde se indica la potencia bruta definitiva

- Program source code list.
- Graphic scheme (Hard copy).
- Reporting format (Hard copy).
- Input/output assignment list.
- Instruction for software configuration, installation, operation and maintenance.
- System assignment list.
- Group definition list.
- Software list.
- Complete back-up documentation of the system.

The complete application software sources not protected with password with comments should be delivered with the system.

Complete set of operation manuals, licenses, complete tooling and application software as well as with source codes with comments etc. – in Spanish version.

6 TRAINING OF OPERATORS AND TECHNICIANS

Training for DCS shall be provided according to related training program of DCS buyer for each group of personnel like engineers, maintenance or operators. Participants and duration is defined below on table list.

DCS vendor shall offer formal training both on site and at supplier's facility for End-user (COMPANY) personnel.

Three (3) training levels shall be taken into account:

- Operator training course:

  A syllabus shall be prepared and provided, and a location recommended. Operator manuals shall be made available to End-user (COMPANY) prior to this course.

*360 MW es un valor referencial, favor remitirse a la Tabla TS-02 donde se indica la potencia bruta definitiva

Estimated Training Durations

Item no.	Equipment Description	Training Party	Duration Days	Sessions	Total Days
1	DCS	Vendor DCS	Operators: 2	4	8
			Technicians: 3	1	3

- Maintenance training course:

  The purpose of the course is to train technicians for first line fault diagnosis, and repair by replacement.

- System engineering course:

  The purpose of this course is to enable End-user (COMPANY) Engineers to be able to modify system configuration control and sequencing and to modify a build new graphics, Basic System Introduction, Peripherals, and Operator Consoles.

A copy of the complete training course, notes, and drawing shall be provided to End-user (COMPANY) eight (8) weeks prior to the commencement of the training course. The copies shall be retained by the trainees on completion of the training course and shall be the property of End-user (COMPANY).

In addition, five (5) copies of the training course shall be on site prior to the installation and pre commissioning for reference purpose.

3645-JK-DQ-0101	Control System Architecture	02
3645-JK-SG-0001	Basic Plant Control and Safety Philosophy	02
3645-JK-SE-0110	DCS General Specification	02
3645-JK-SS-0010	DCS Supply Specification	01
3645-JK-SS-0110-A-B	DCS Supply Specification Enclosure - A	01
3645 -JK-SS-110	DCS I-O Counts Summary	02A
3645-KK-SG-0001	General Instrument Specification	01
TM061	Document for Supplier	02
TM077	Package shipping	11

*360 MW es un valor referencial, favor remitirse a la Tabla TS-02 donde se indica la potencia bruta definitiva

Proyecto Punta Catalina	DCS / BMS - I/O Counts Summary Units 1 - 2	Participant Number: 1303		
Owner:	Plant: COAL FIRED POWER PLANT AND ASSOCIATED COAL RECEIVING TERMINAL - PUNTA CATALINA			
Tecnimont Identification Code 3645-JK-SS-0110		Page	1 of 6	Issue 02A

DCS / BMS - I/O Counts Summary Units 1 - 2

Proyecto Punta Catalina	CONTROL SYSTEM I/O COUNT TABLE SUMMARY	TCM Identification Code 3645	
		Sheet 1/4	Issue 02A

3645 - Santo Domingo - 2 Units Power Plant

DCS

TOT SIGNALS FORESEEN PROCESS SIDE (P&ID)	17865
TOT SIGNALS FORESEEN ELECTRICAL SIDE (single line diagram)	2834
TOT SIGNALS FORESEEN POWER PLANT BASED ON INFORMATION PRESENT ON P&ID AND S.L.D	20699
TCM OVERSIZE I&O COUNT PERCENTAGE	5.0%
FORESEEN IO COUNT WITHOUT SPARE	**21,734**
I&O SPARE REQUESTED BY CLIENT	25.0%
FORESEEN IO COUNT INCLUDING SPARE	**27,167**

BMS

TOT SIGNALS FORESEEN PROCESS SIDE (P&ID)	1,146
TCM OVERSIZE I&O COUNT PERCENTAGE	5.0%
FORESEEN IO COUNT WITHOUT SPARE	1203.3
I&O SPARE REQUESTED BY CLIENT	25.0%
FORESEEN IO COUNT INCLUDING SPARE	**1,504**

Note(*): The I/O Signals spare shall be provided 25 % for each type of electronic card and shall be wired inside cabinets

Note(#): The I/O Counts Summary has not any indication for DCS System - DCS Vendor shall be included also this one on total I/O

Note (@): DCS side - the I/O Signals shall be redundant only for the Control Loops (see coloumn "PNEUMATIC CONTROL VLV ")

Dr. Ramón M. Urbáez Mendoza

PLANNED PLANT OUTAGES

Dr. Ramón Ma. Urbáez Marcelo
ABOGADO NOTARIO PÚBLICO
Mat. # 2570
Santo Domingo, R.D., D.N.

TABLE OF CONTENTS

1 INTRODUCTION....3

2 PLANT AVAILABILITY....3

3 PLANT OUTAGES....3

Dr. Ramón Ma. Urbáez Mancebo
ABOGADO NOTARIO PÚBLICO
Mat. # 2570
Santo Domingo, R.D., D.N.

1 INTRODUCTION

The outage is the period of time in which a power plant shuts down (stops producing power) in order to perform routine maintenance, replacements, and minor reparation.

The outages can last from about 3 weeks up to two months based on the number of activities to be done. The planning, organization and performance of these activities, are the key factors to bring the requested time of outages to a minimum.

2 PLANT AVAILABILITY

The plant availability is defined as:

Plant Availability (per year) = Numbers of hours of plant available to produce / number of hours per year [8760h]

The plant availability depends on many factors:

- Type of technology (Coal Plant, Nuclear Plant, Solar plant, ecc.)
- Respect of the operation limit imposed by the OEM
- Reliability of the maintenance philosophy applied to the plant
- Skillness of the operation and maintenance team
- Technical solutions that add degrees of redundancy on equipments and systems.
- Statutory tests and type of conduction requested by the local laws
- Quality and quantity of the material supplied (Coal, Consumables, Spare Parts, etc.)

Usually, for Coal Power Plants, the availability could be defined between **82-88%,** depending on the previous factors.

Considering the rigorous requirements for quality, redundancy, and performance, totally coped in this Proposal, for the Punta Catalina Project, we can estimate that plant availability to be considered is the upper limit of those figures, or: **88%.**

3 PLANT OUTAGES

The outage plan, of course, will be finally established, after the placement of the orders for the major equipments and systems, and the completion of engineering.

Installation, commissioning, and start-up of the plant, will be done in order to keep the planned outages to a minimum, or to maximize the span of time between them.

Though any and every component of the Plant, surely is taken in account, when defining and planning the outages, these are commanded by the Major Equipments/ Systems:

- The Turbogenerator
- The Boiler
- The ACQS

Based on data supplied by vendors in this proposal phase, to be confirmed, as said above, after the placing of orders for purchase them, we can predict and suggest the following Typical Outage Plan for the Plant.

- Every year outage for inspection and minor repairs on the critical systems;
- Every three year outage for minor Overhaul of the Plant;
- Every six years outage for major Overhaul of the Plant.

Of course, the minor Inspection and Overhaul outages can be programmed for ONE Unit, while the other operates, and it shall confirmed later if a major Overhaul will require the outage of both Units, to provide repairs/ adjustments on the common utilities and facilities, as well as in the electrical system (Subestations, Transmission Lines).

1.0 DESCRIPCIÓN DEL PROYECTO

Consiste en la construcción de una Termoeléctrica a Carbón de 720 Mw (gross), 660 Mw(net) integrada por 2 unidades de 360 MW, para la generación de energía y un muelle para la recepción del carbón, así como todas las instalaciones de apoyo como patios de carbón, instalaciones de descarga, control de emisiones de partículas, sistema de refrigeración y de tratamiento de agua, sistemas de control de emisión de cenizas y subestaciones.

El tiempo estimado para la sincronización de la primera unidad es de 39 meses y la sincronización de la segunda unidad se hará a los 42 meses. El total de horas estimadas hombre directas de la planta es de 17.5 millones de HH. La mano de obra directa total llegará a 4,673 hombres en el pico, y de indirectos llegan a un pico de 600 personas.

La tecnología utilizada será la Sub-critica con reducción comprobada de emisiones atmosféricas y eficiencia del carbón utilizado, el cual será de tipo bituminoso.

Contará con la instalación de una terminal de recepción de carbón para los Portadores de auto-descargadores Panamax o Handymax con una capacidad máxima de 80.000 toneladas.

Además se tiene prevista la instalación de todos los sistemas y / o equipos para la descarga y transporte del carbón, generador de vapor, turbina de vapor, instrumentación y control, sistemas auxiliares y el tratamiento de aguas residuales con el fin de cumplir con los estándares más altos como son: Sea wáter, Flue Gas Desulfurization, Bag House Filters and Low NOx burners.

La electricidad producida será entregada al Sistema Nacional Eléctrico Interconectado a través de un sistema aislado subestación HV en 345 kV y dos aéreas 345 kV de transmisión.

La planta será diseñada para cumplir con los más altos estándares internacionales en materia ambiental, los bajos niveles de de SO_2 (400 mg/Nm^3 seco @6% O_2); en el sistema de desulfuración se utilizara agua de mar, lo que permite una concentración de hasta el 1%.

Para lograr bajas emisiones de NOx (400 mg/Nm3 @ 6% de O2 seco), se instalarán quemadores de bajo NOx.

Para la eliminación de material particulado, es necesario instalar un filtro de manga para cumplir con el límite de 30mg/Nm3 @ 6% de O2 seco. Tal tecnología tiene una eficacia superior que el de los precipitadores electrostáticos, especialmente para partículas finas (<2 micras).

2.0 UBICACION

El proyecto está ubicado en la región Sur-Oeste de la isla, en Punta Catalina, Paya, Municipio de Bani, Provincia Peravia; con una superficie de cuatrocientos mil setecientos veinticinco punto quinientos treinta y un metros cuadrados (400,725.531 m2).

Mapa de la Republica Dominicana

Localización del Terreno

3.0 DESCRIPCION DE LAS PARTES

- **Central Termoeléctrica a Carbón**

Tecnología	Quema Pulverizada (sub- crítica)
Potencia Bruta/ Neta	720MW/ 660 MW
Disponibilidad Anual	90%
Eficiencia Termoeléctrica	7,819 BTU/KWh – LHV (41% HHV)
Consumo de Carbón	120 Ton/h (aprox. 915,000 Ton/año)
Área ocupada	500,000 m2
Enfriamiento por agua de mar	140,000 m3/hora

- **Alimentación y manejo Del Carbón**
  - Muelle de 1,000 m para cargueros Panamax y Handymax de hasta 80,000 TN
  - Patio de carbón cubierto con capacidad para 15 días de almacenamiento

- **Ciclo de vapor**
  - Caldera de carbón pulverizado para 3 niveles de generación de vapor

- Turbina de vapor

- **Eléctrico**
  - Subestación (Step-Up Transformers) que conecta a la Línea de Transmisión 345kV Instrumentación y Control

- **Instrumentación y Control**
  - Sistema de Control Distribuido (DCS)
  - Los dispositivos de apagado de emergencia (ESD)
  - Power Plant Services Management (EMPP)
  - Sistema Firefihting - DCS interfaz
  - Alarma Sistemas de Detección de Incendios y
  - Controladores lógicos programables (PLCs)
  - CCTV
  - Control de acceso

- **Sistemas auxiliares**
  - Sistema de enfriamiento de agua, tratamiento de efluentes, desmineralización del agua, sistema de desalinización, servicio de agua potable, sistema contra incendios, sistema de aire comprimido.

- **Edificios y estructuras**

4.0 PATRONES AMBIENTALES

EL carbón mineral continua siendo una fuente significativa para la generación de energía y debido a la conciencia ambiental mundial, el proceso se hizo más conocido y consecuentemente, varias tecnologías fueron y están siendo mejoradas, para aumentar las eficiencias de control y por lo tanto, reduciendo las emisiones atmosféricas.

En general, ese esfuerzo para tornar tales tecnologías ambientales más fiables, es definido como tecnologías de carbón limpio (*Clean Coal Technologies*), considerando no solo los limites más rigurosos de emisiones, pero también franjas más elevadas de desempeño para la generación de energía, cuando los combustibles carbón o similares son utilizados.

Además del concepto *Clean Coal Technologies*, deberán ser seguidos conjuntos de orientaciones y practicas relacionadas a (I) Medio Ambiente, Salud y seguridad para plantas Termoeléctricos; (II) Medio ambiente, Salud y seguridad y orientaciones Relativas a puertos y terminales y (III) Medio Ambiente, Salud y seguridad para transporte.

4.1 SOCIO-AMBIENTAL

A pesar de la presión ecologista contra el carbón, sobre todo con argumentos acerca de las teorías del calentamiento global, y las reclamaciones para controlar y reducir las emisiones de

contaminantes a la atmósfera, la posición de este mineral se mantiene relativamente bien en el escenario mundial.

Por un lado, se identifica la necesidad de ofrecer a los países, las alternativas que satisfagan sus legítimas demandas de energía de bajo costo y, por otro, no se debe descuidar el compromiso con los derechos y deberes para con las generaciones futuras.

En este escenario, se observó un gran progreso en los últimos años, el uso de la tecnología para la prevención de daños al medio ambiente y la recuperación en la minería y la quema de carbón, con el objetivo de posibilitar un uso más intenso este combustible con el impacto ambiental más bajo posible.

Todo este esfuerzo en investigación y desarrollo parece indicar que el mundo no excluye absolutamente el uso del carbón como fuente primaria para la generación de electricidad.

Sobre la base de esta conclusión, se evaluó la posibilidad de generar electricidad a través de carbón en la República Dominicana, mostrando tecnologías que reduzcan los impactos sobre el medio ambiente (las normas establecidas por las autoridades locales, financiadores e inversionistas); es por esto que se adoptaran las mejores tecnologías ambientales disponibles en el mercado, salvo la captura y almacenamiento de carbono (CCS)(Carbón Capture Storage) que está aun en desarrollo y todavía no es económicamente viable.

5.0 PROGRAMA DE MANEJO Y ADECUACION AMBIENTAL (PMAA)

5.1 PLAN DE MANEJO

El proyecto contará con los recursos y sistemas para la generación de reportes y locación de responsabilidades para la implementación exitosa del Plan de Manejo Ambiental.

Los objetivos de dicho plan serán analizados y monitoreados a todo lo largo de la vida útil del proyecto.
Si el monitoreo demostrara que los objetivos no están siendo cumplidos, se tomarán las acciones correctivas que sean necesarias. Los objetivos del plan pudieran sufrir modificaciones en caso que se registren cambios en las leyes ambientales, regulaciones, estándares y/o tecnologías.

El Plan de Manejo y Adecuación Ambiental (PMAA) tiene como objetivo principal mitigar, compensar o eliminar progresivamente en plazos racionales, los impactos ambientales negativos causados por la (s) actividad (es) relativa (s) al desarrollo del proyecto, tanto en la fase de construcción como en la fase de operación del mismo; por lo tanto, incluirá las propuestas de acción , programas y cronogramas de inversión necesarios para la prevención de contaminación y cuyo propósito es optimizar el uso de las materias primas e insumos, y minimizar o eliminar las emisiones, descargas y/o vertimientos, esto último cumpliendo con las disposiciones legales aplicables o estándares tanto nacionales como internacionales.

Se ha diseñado, con el objetivo de enmarcar todas las actividades del proyecto susceptibles de generar cambios en los recursos ambientales del área de influencia del proyecto (medio físico, biótico y socioeconómico), en un manual de acciones considerando el diseño básico de ingeniería del proyecto y las condiciones actuales del terreno sobre el cual se desarrollará este.

De otra parte, el PMAA responde al compromiso que tiene el CLIENTE, como el promotor del proyecto, y el Consorcio Punta Catalina, como constructor del mismo, con el cumplimiento de las normas ambientales de la República Dominicana aplicables a este tipo de investimentos, con el objetivo de desarrollar un proyecto de una manera ambientalmente responsable; esto implica obtener impactos positivos de manera anticipada los cuales vienen asociados con el crecimiento económico y social del país y la región.

La intensión es que el proyecto sea diseñado, construido y operado bajo los lineamientos marcados por las normas legales de la Republica Dominicana así como las instituciones Financieras Internacionales como el Word Bank, EXIM Bank, Inter-American Development Bank etc.

La República Dominicana se beneficiarán directamente del proyecto a través una actualización de su matriz de generación eléctrica, reducción del costo de generación de energía a nivel interno, una disminución de las interrupciones del suministro de energía, la estimulación del crecimiento económico, y la mejora calidad de vida de las comunidades adyacentes.
Cuando se ejecute el Plan de Manejo Ambiental, el proyecto deberá seguir los lineamientos principales mencionados más abajo:

- Debe estar enfocado en la prevención de riesgos referentes a la salud y seguridad, así como a la parte ambiental.
- El proyecto debe cumplir con todos los códigos y practicas contenidos bajo las leyes Dominicanas.
- Todas las actividades deben de ser desarrolladas de una manera efectiva y segura, y todo el equipo debe de velar por mantener la correcta operación a fin de proteger la salud y seguridad de todas las personas y preservar el entorno físico y psicológico.
- La construcción y operación del proyecto debe cumplir con los estándares internacionales referentes a medio ambiente, salud y seguridad.

5.2 ALCANCES PARA EL PLAN DE MANEJO

- Desarrollo de mecanismos para asegurar el éxito en la ejecución de los programas de manejo
- Prevención y mitigación de los posibles impactos identificados
- Programa para el manejo de desperdicios
- Lineamientos generales para el desarrollo de planes referentes a salud y seguridad
- Entrenamiento del personal en aspectos medioambientales
- Programas de monitoreo en el área del proyecto
- Lineamientos para prevención y control (Plan de contingencia)

- Presupuesto para la ejecución del primer ano del Plan de Manejo Ambiental

5.3 OBJETIVOS GENERALES

Establecer los procedimientos necesarios en cumplimiento de las normas ambientales vigentes para reducir o minimizar los impactos ambientales que puedan afectar negativamente el ambiente, durante las etapas de construcción, operación y mantenimiento del Proyecto Termoeléctrico Punta Catalina; asegurando un balance global positivo, de tal forma que todas las actividades involucradas se desarrollen de manera compatible con el medio ambiente natural y antrópico del área de influencia, asegurando el buen manejo de las obras e instalaciones y posibilitando el cumplimiento de los objetivos empresariales.

5.4 OBJETIVOS ESPECIFICOS

- Disponer de un esquema de actuación coherente que permita materializar, monitorear y controlar la ejecución de las medidas de prevención y mitigación de acuerdo con los impactos identificados en la evaluación de impactos.
- Facilitar el desarrollo de las tareas de supervisión de los aspectos ambientales durante el desarrollo del cronograma de la construcción.
- Garantizar la ejecución de las obras de manera compatible con el medio ambiente natural y socio-económico del área de influencia.
- Garantizar y controlar el cumplimiento de la normativa vigente en materia de medio ambiente.
- Disponer de adecuados mecanismos de seguimiento e información, para su presentación ante la comunidad y las autoridades competentes.
- Promover una adecuada capacitación al personal vinculado a las obras en relación con el Programa de Manejo y Adecuación Ambiental y el desempeño ambiental del proyecto.
- Mantener la integridad física, tanto de los trabajadores como de los pobladores que habitan en el área de influencia directa, producto a la posible ocurrencia de fenómenos no previstos.
- Identificación de cada uno de los impactos ambientales negativos.

6.0 SISTEMA DE GESTIÓN Y MANEJO AMBIENTAL

Para garantizar la implementación del Programa de Manejo y Adecuación Ambiental (PMAA), durante la ejecución del proyecto Termoeléctrico Punta Catalina, en sus etapas de ingeniería de detalle, construcción y operación, se establecerá un sistema de gestión y manejo ambiental que administre, coordine y evalúe todos los aspectos significativos del desarrollo en relación a la variable ambiental.

Se estructurará el sistema de gestión y manejo ambiental para el proyecto con elementos tales como: la Política Integrada de Salud, Seguridad en el Trabajo y Medio Ambiente y el Programa Integrado de Salud, Seguridad en el Trabajo y Medio Ambiente (SSTMA) (ver documento de SSTMA).

El programa integrado de salud, seguridad en el trabajo y medio ambiente se fundamenta en los requisitos de las siguientes normas internacionales:

- Norma ISO 14001 (NBR ISO 14001- Edición 2004) - Sistema de Gestión Ambiental, especificación y directivas de uso.
- Normas OHSAS 18001 (Edición 1999) – Sistemas de Gestión de Seguridad y Salud Ocupacional.
- Norma "British Standard" - BS 8800 (Edición 1996) - Guía para Sistemas de Gestión de la Seguridad y Salud en el Trabajo.

El Sistema de Gestión y Manejo Ambiental (SGMA) del Proyecto será tomado en cuenta para la gestión de los contratos y las obras implementando las siguientes disposiciones:

- Adoptar el PMAA como un documento vivo y dinámico que puede ser actualizado y complementado con la práctica y el surgimiento de nuevos aspectos ambientales producto del desarrollo del proyecto en sus diferentes etapas.
- Implementar las medidas establecidas en el PMAA para la prevención, mitigación y/o control de los aspectos ambientales identificados y derivados de las actividades del proyecto en sus etapas de construcción y operación.
- Cumplir con los requerimientos previstos por la normativa ambiental vigente, la licencia ambiental y los permisos establecidos por la autoridad ambiental competente en el contexto nacional.
- Coordinar con las autoridades Ambientales el seguimiento al cumplimiento de los subprogramas propuestos.
- Coordinar con las Comunidades las acciones de información y participación de las mismas en el proyecto.

6.1 ORGANIZACIÓN DEL SISTEMA DE GESTION Y MANEJO AMBIENTAL

7.0 POLÍTICA CORPORATIVA DE SALUD, SEGURIDAD EN EL TRABAJO Y MEDIO AMBIENTE

El pilar fundamental del Programa Integrado de SSTMA y del sistema de gestión y manejo ambiental para el proyecto Termoeléctrico Punta Catalina está conformado por la Política Integrada de Salud, Seguridad en el Trabajo y Medio Ambiente del CONSORCIO.

7.1 POLÍTICA INTEGRADA DE SALUD Y SEGURIDAD EN EL TRABAJO Y MEDIO AMBIENTE (SSTMA)

El CONSORCIO Punta Catalina tiene una Política Integrada de Salud y Seguridad en el Trabajo y Medio Ambiente (SSTMA) fundamentada en los siguientes principios:

- Cumplir con la normativa legal y los demás requisitos aplicables;
- Supervisión y administración adecuada de los aspectos ambientales y de los peligros y riesgos a la seguridad y a la salud, con objetivos y metas definidos para cada emprendimiento;
- Mejorar continuamente los resultados, dando prioridad a la prevención en lo que concierne a la Salud Ocupacional, Seguridad en el Trabajo y Medio Ambiente;
- Desempeñarse empresarialmente de forma responsable en términos sociales y ambientales.
- La responsabilidad de llevar a la práctica el Programa Integrado de SSTMA, mediante la delegación planificada y la concientización de las personas, corresponde:
- Responsabilidad Institucional Estratégica: del Presidente (Líder Empresarial) y del Directorio (Directores Superintendentes y Organización Dinámica del Líder Empresarial);
- Responsabilidad Empresarial: de los Directores de Contrato en los emprendimientos /contratos;
- Responsabilidad Operativa: de cada Integrante ejecutor directo de las tareas en todas las áreas de trabajo en los contratos.

El área de Salud, Seguridad en el Trabajo y Medio Ambiente (SSTMA), será responsable de difundir y supervisar la implementación del SGMA; actuando como activador y facilitador de la implementación, brindando apoyo a los equipos que dirigen la obra en las acciones proactivas y reactivas que correspondan.

El área de Ingeniería, será la responsable de planificar y garantizar la prevención mediante la:

- Identificación previa de los riesgos e impactos. Define la planificación y los métodos constructivos, tomando en cuenta las medidas preventivas y de protección de SGMA.
- Comunicación actualizada y continua con el área de SGMA en lo que se refiere a la planificación y al cronograma de ejecución de la obra.
- Las áreas de Producción y de Equipos, serán las responsables de implementar efectivamente en los frentes de obra el SGMA y sus elementos, orientados hacia la prevención y en caso necesario a la implementación eficaz de medidas correctivas.
- Las áreas de Administración y Comercial, brindarán el soporte logístico y financiero para el funcionamiento orgánico del nivel operativo en la implementación del SGMA.

Para ver de manera más amplia todo lo concerniente a la política de Salud, Seguridad en el Trabajo y Medio Ambiente ver documento **Plan de SSTMA**

8.0 ESTRUCTURA DEL PROGRAMA DE MANEJO Y ADECUACIÓN AMBIENTAL (PMAA)

Se ha elaborado un Programa de Manejo y Adecuación Ambiental que contempla subprogramas para cada medio, los cuales contienen medidas a aplicar, los impactos a controlar, objetivos, la tecnologías de adecuación ambiental a utilizar para alcanzar los objetivos planteados, la fase de aplicación de las medidas, ejecutor responsable, monitoreo para verificar el cumplimiento de las medidas, coordinación de las instituciones relacionadas con la aplicación de las medidas y los recursos necesarios para su aplicación.

El Programa contempla dos (2) fases: Fase de Construcción y Fase de Operación.
Entre los sub-programas se encuentran:

- **Manejo de las emisiones atmosféricas:** donde se menciona las acciones para asegurar un buen manejo de las emisiones atmosféricas.
- **Manejo de vertidos:** donde se menciona las acciones para asegurar un buen manejo de las aguas residuales.
- **Manejo de residuos sólidos:** donde se menciona las acciones para asegurar un adecuado manejo de los residuos sólidos.
- **Manejo de erosión y deslizamiento:** se describen las medidas a tomar para preservar la capa fértil del suelo, y prevenir el proceso de erosión-sedimentación.
- **Manejo en el medio biótico:** donde se establecen las acciones o medias a ejecutar para prevenir la perturbación y destrucción del hábitat y la deforestación en las áreas intervenidas.
- **Manejo de la conservación del Paisaje**: donde se describen las medidas a tomar para mitigar la alteración del paisaje.
- **Control y prevención de accidentes**: donde se formulan las medidas para evitar accidentes a moradores y usuario de la carretera y caminos utilizados como accesos.
- **Salud y protección laboral:** donde se establece la necesidad de protección laboral.
- **Gestión social:** donde se establecen los lineamientos para mantener la información y comunicación con la comunidad, la generación de empleo para los comunitarios, la adquisición de bienes y servicios locales, la educación y capacitación en ambiente y seguridad al personal.
- **Control y seguimiento:** donde se describen los lineamientos a seguir para el control, seguimiento y evaluación periódica de la eficacia y eficiencia de la ejecución de las medidas planteadas en los diferentes Subprogramas.

9.0 CONTENIDO DE LAS FICHAS AMBIENTALES

Cada una de las actividades que integran un programa se ha organizado en fichas ambientales, estructuradas de acuerdo con el siguiente contenido:

- **Objetivo** Precisa el fin de las medidas de manejo ambiental formuladas.
- **Evaluación Ambiental** Resume los resultados de la evaluación de impacto, incluyendo los efectos a manejar, la importancia del impacto y los componentes afectados.
- **Acciones a Desarrollar** Describe las acciones, procedimientos, técnicas y equipos requeridos para ejercer el manejo ambiental de la actividad.
- **Etapa de Aplicación** Indica el momento del proyecto en el cual se debe realizar las medidas de manejo ambiental propuestas.
- **Responsable de La Ejecución** Establece personas y/o entidades encargadas de la ejecución o control y seguimiento de las acciones de manejo presentadas en la ficha ambiental.
- **Parámetros de Seguimiento a Monitorear** Incluye los lineamientos para la evaluación y verificación del cumplimiento, desarrollo y resultados de las medidas de manejo ambiental.

10.0 IMPACTO AMBIENTAL

Es el efecto que produce una acción sobre el medio ambiente en sus distintos aspectos. Técnicamente, es la alteración de la línea de base, debido a la acción antrópica o a eventos naturales.

10.1 CLASIFICACION:

Los impactos ambientales pueden clasificarse de acuerdo a:

- **Su naturaleza:** Esta categoría mide si un impacto beneficia o perjudica las condiciones de línea base ambiental
  - **Positivos (+):** Son aquellos que implican un beneficio positivo en las condiciones ambientales existentes.
  - **Negativos (-):** Son aquellos que implican daños en las condiciones ambientales existentes.
  - **Neutro (+/-):** Son aquellos que no implican ni daños ni beneficios a las condiciones ambientales existentes.

- **Tipo:** Esta categoría define si el proyecto es el responsable por el impacto o si la causa del impacto proviene de otra(s) variable (s). Estos pueden ser:
  - **Directo (D):** Cuando las condiciones ambientales resultan afectadas directamente por la construcción del proyecto o su operación, sin la intervención de otros factores externos.
  - **Indirecto (I):** Cuando las condiciones ambientales resultan afectadas por otra variable, y no directamente de una acción de proyecto.

- **Duración:** Esta categoría indica la duración en el tiempo que el impacto estará presente en el medio ambiente; y estos pueden ser:

- **Temporarios (T):** Este ocurre durante la fase de la construcción y es reversible, por tanto, los recursos afectados se recuperaría durante o inmediatamente después de la construcción.
- **Corto Plazo (S):** Este impacto puede durar desde el momento de construcción a tres años después de la misma. Si durante el período de 3 años, se espera a que los daños sean recuperados entonces se produciría un impacto a corto plazo.
- **Largo Plazo (L):** Si la recuperación de los impactos ocurridos durante la construcción duraran más de tres años en recuperarse, entonces sería un impacto a largo plazo.
- **Permanente (P):** impacto que no permitiría la recuperación de los recursos durante la vida del proyecto

- **Reversibilidad:** Esta categoría aborda la posibilidad de que si un recurso ambiental afectado regresará a su condición de base natural; estos se clasifican en:
  - **Reversibles:** estos, luego de un determinado periodo de tiempo, vuelve a su condición base original.
  - **Irreversible:** tras haber transcurrido un período determinado de tiempo, el impacto a los recursos no se revertirá a su condición inicial. Este impacto requerirá de la mitigación del mismo.

10.2 CONDICIONES DE REFERENCIA

Como una forma de verificar los posibles impactos asociados con el proyecto, es necesario evaluar las condiciones de referencia (estudios físicos, ecológicos, socio económico, recursos naturales y/o culturales etc.

10.3 ESTUDIOS AMBIENTALES

- **Físicos:**
  - Clima y meteorología
  - Calidad del Aire
  - Ruido
  - Suelos y geología
  - Características Físicas del Mar y de Profundidad
  - Calidad sedimentaria, marina y estuarios acuáticos

- **Bióticos:**
  - Flora y Fauna
  - Biología Marina
  - Biodiversidad
  - Áreas protegidas

- **Socioeconómico:**
  - Uso marino y de la tierra

- Socio-económico
- Salud ocupacional
- Recursos Culturales
- Estética visual

10.4 POSIBLES IMPACTOS AMBIENTALES

Los impactos positivos al medio ambiente superan por mucho los impactos negativos del proyecto. Entre los impactos positivos podemos mencionar:

- Generación de empleos tanto directos como indirectos durante la construcción y operación de la Planta, lo cual resulta de mucha importancia para Baní y en particular para la comunidad de Punta Catalina y Nizao.
- La dinamización económica como el resultado de los gastos directos e indirectos del proyecto.
- Un aumento en la generación y distribución de energía tanto a nivel regional como nacional.
- Mejora en la infraestructura y los servicios del área.

Los posibles impactos negativos se tornaran imperceptibles debido a los parámetros de diseño seleccionados para el proyecto así como la manera en que se mitigaran los mismos.
Entre estos podemos mencionar:

- Las pérdidas de vegetación que resulten tanto de la construcción de la planta como de los caminos y/o vías, serán compensadas con la reforestación.
- Los limites emisiones requeridos por las Leyes de la Republica Dominicana serán superados, consiguiendo menores emisiones y por ende, menor impacto ambiental.

10.5 CONSIDERACIONES MÁS IMPORTANTES

Entre los puntos más importantes a tener en cuenta están:

- CO_2
- SO_2
- NO_x
- Captación de agua dulce
- La temperatura y la calidad del agua de salida (obra de descarga)
- Lugar de captación de agua de mar
- Flora y fauna endémica

11.0 MINIMIZACIÓN DE IMPACTOS

En el orden de minimizar los posibles impactos ambientales, un plan de mitigación debe ser creado para el proyecto. Entre los sub-programas que se van a manejar están:

11.1 MANEJO DE LAS EMISIONES ATMOSFERICAS

Este subprograma contempla la implementación de medidas para prevenir, controlar, mitigar y/o compensar los impactos generados por la construcción de la Planta Termoeléctrica en el aspecto: aire y salud.

OBJETIVOS: Prevenir las concentraciones de particulado en la atmósfera que puedan producir las actividades relacionadas con la construcción.

MEDIDAS A TOMAR: Para prevenir y controlar las concentraciones de material particulado en la atmósfera que puedan producir las operaciones de maquinarias involucradas en las actividades de preparación del sitio de obra, los desvíos utilizados como acceso, el transporte de materiales y las maquinarias y vehículos utilizadas en las actividades se procederá a tomar las siguientes medidas para cada uno de los casos:

11.1.1 CALIDAD DEL AIRE

- Medidas de control da calidad del carbón
  - Verificación continua da composición del insumo de diferentes lotes.
  - Humedecimiento de superficies
  - Mantenimiento periódico a equipos, maquinaria y vehículos
  - Uso de EPP para el personal

- Medidas de control da combustión
  - Analizadores de oxigeno;
  - Análisis periódicos de los gases de emisión;
  - Opacímetros que permiten la medición de la concentración de material particulado;
  - Monitores de vídeo que permiten visualización de la chimenea a partir de las salas de comando.

- Medidas de control de las emisiones de SO2
  - Alteración del combustible: utilización de combustibles con bajo tenor de azufre;
  - Instalación de desulfurizadores e inyección de calcáreo en la caldera.

- Medidas de control das emisiones de NOx
  - Alteración del combustible: utilización de combustibles con bajo tenor de nitrógeno;
  - Mejoría en la combustión: para restringir formación de NOx en las calderas se puede aplicar "Over Fire Air" (bajo exceso de aire); combustión en 2 estados;
  - Recirculación de gases y Quemadores "Low Nox" (bajo NOx) o combinación de los mismos; Instalación de denitrificadores.

- Medidas de control de las emisiones de Material Particulado (MP)
  - Utilización de combustibles de alta calidad;
  - Instalación de equipamientos de coleta: Filtros Manga o Precipitadores
  - Electrostáticos, menos afectados por las propiedades del gas e MP, baja perdida de presión y alta eficiencia;
  - Cortina vegetal para control de polvos fugitivos.

11.1.2 RUIDO

OBJETIVOS: Prevenir el incremento del nivel de las emisiones de ruido, que puedan producir las operaciones de vehículos, equipos y maquinarias involucradas en las actividades constructivas.
Entre las actividades a realizarse están:

- Mantenimiento periódico a equipos, maquinaria y vehículos
- Uso de EPP para el personal
- Utilización de equipos y maquinarias de modelos recientes.
- Mantenimiento periódico de los sistemas de escapes de los equipos y maquinarias en operación.
- Mantener apagados los motores de los camiones, equipo pesado y maquinarias cuando no estén laborando.
- Durante las operaciones de cargue y descargue, los vehículos deben estar completamente detenidos.
- La maquinaria, equipos y vehículos que se empleen en la actividad deberán ser revisados periódicamente y estar debidamente sincronizados para controlar las emisiones atmosféricas y evitar fallas mecánicas.
- En los centros de concentraciones poblacionales se realizarán los trabajos en horario diurno
- Realizar a mantenimiento periódico a los generadores eléctricos utilizados para el abastecimiento de energía en los campamentos e instalaciones temporales para garantizar su adecuado funcionamiento y el control de emisiones en el sistema de combustión.
- Realizar monitoreo de ruido ambiental en los frentes de obra, los campamentos, sitios de préstamo, áreas de plantas industriales y núcleos poblacionales cada tres meses.

11.1.3 ESQUEMA GENERAL DE LOS SISTEMAS DE CONTROL DE EMISIONES ATMÓSFERICAS Y RUIDO

11.1.4 MANEJO DE VERTIDOS

Este subprogramma contempla la implementación de medidas para prevenir, controlar, mitigar y/o compensar los impactos generados por las actividades de construcción y operación del proyecto en los aspectos: Agua y suelos.

11.1.5 MANEJO Y CONTROL DE LA CALIDAD Y EL FLUJO DE AGUA

OBJETIVOS: Prevenir la posible contaminación de las aguas superficiales y subterráneas por aporte de sedimentos. Evitar cambios en los patrones de drenaje.

MEDIDAS A TOMAR: Para prevenir y controlar la posible contaminación de las aguas superficiales y subterráneas por aportes de sedimentos, evitar cambios en los patrones de drenaje durante el proceso de construcción y operación se procederá a utilizar los siguientes parámetros:

- Sistemas para el control de erosión y sedimentación
- Sistemas de tratamiento para efluentes
- Sistemas de control, prevención y limpieza de de derrames de hidrocarburos

11.1.6 MANEJO Y CONTROL DE HIDROCARBUROS

OBJETIVO: Prevenir la posible contaminación de los suelos y las aguas superficiales y subterráneas por vertidos de combustibles y lubricantes.

MEDIDAS A TOMAR: Para prevenir y controlar la posible contaminación de los suelos y las aguas superficiales y subterráneas por vertidos de combustibles y lubricantes, que puedan producir las operaciones, se procederá de la siguiente manera:

- Los cambios de aceite y mantenimientos de equipos se deben realizar empleando sistemas de prevención y control de derrames y los residuos de aceites y lubricantes se almacenarán temporalmente en tanques metálicos debidamente marcados y localizados sobre superficies impermeabilizadas capaces de contener un derrame de su volumen y evitar la contaminación del suelo.
- El lavado de vehículos y maquinarias, sólo se realizará en lugares específicos, los cuales serán adecuados con la infraestructura necesaria para estos fines.
- Los generadores se ubicarán en áreas cubiertas, ventiladas y sobre superficies confinadas que impidan la contaminación del suelo ante una eventual fuga de combustible durante el recargue o ante actividades de mantenimiento o falla del sistema.

- Los equipos fijos que utilicen combustibles y sistemas de lubricación así como el almacenamiento de combustibles para abastecer a los generadores eléctricos y de equipos fijos se realizará en áreas cubiertas, ventiladas y con superficies confinadas que impidan la contaminación del suelo ante una eventual fuga de combustible.
- Se deberá impermeabilizar el área utilizada como patio de maquinarias.
- Se tendrá cuidado con el sistema de lubricación y abastecimiento de combustible de las maquinarias del proyecto.
- En caso de producirse derrames accidentales en las áreas de las operaciones, se procederá a retirar inmediatamente los suelos contaminados por parte de un gestor autorizado por el Viceministerio de Gestión Ambiental.
- Al momento de terminar las actividades de rehabilitación/mantenimiento se tendrá cuidado de no dejar restos de envases, gomas, filtros, hormigón asfáltico y hormigón hidráulico.
- Las áreas de los generadores y de almacenamiento de combustibles contarán con todos los elementos necesarios para garantizar la seguridad de las instalaciones y la prevención y el control de incendios.

Las áreas destinadas al almacenamiento de combustibles y lubricantes cumplirán como mínimo con los requerimientos siguientes:

- Para el almacenamiento de combustibles, se contará con diques de contención y sus respectivas válvulas y con capacidad para alojar como mínimo el 110% del volumen del tanque o los tanques que cubra. El área interna cubierta por el dique deberá ser impermeabilizada en concreto.
- Limitar el área a ocupar al mínimo requerido, compatible con las necesidades operacionales y de seguridad.
- El suministro y transporte de los combustibles requeridos, se hará por medio de una empresa proveedora, la cual deberá contar con una estación de bombeo y medidores para las operaciones de los diferentes tipos de vehículos, equipos y maquinarias.
- Evitar cualquier contacto con cuerpos de agua.
- Se debe diseñar un sistema apropiado para contención de derrames, se deben programar revisiones periódicas para identificar necesidades de reparación de los muros o diques de contención.
- Para evitar el derrame de aceites y combustibles se emplearán bombas para retirar los volúmenes a usar, del tanque principal de almacenamiento.
- Se llevará un control de combustibles y lubricantes mediante inventario, desglosando los usos o destinos dados para posteriormente facilitar la identificación de las fuentes de residuos aceitosos o de lubricantes.
- Con el fin de evitar fugas, derrames o accidentes los envases se deben mantener herméticamente cerrados y debidamente identificados y marcados.
- El área de almacenamiento de combustible debe contar con un sistema para control de incendios.

11.1.7 MANEJO DE AGUAS RESIDUALES

OBJETIVO: Prevenir la posible contaminación de los suelos y las aguas superficiales y subterráneas por el inadecuado manejo de las aguas residuales domesticas y de escorrentía de los campamentos y plantas industriales.

MEDIDAS A TOMAR: Para prevenir y controlar la posible contaminación de los suelos y las aguas superficiales y subterráneas por el manejo inadecuado de las aguas residuales del campamento, instalaciones temporales, los sitios de préstamos y plantas industriales se procederá:

- Los campamentos e instalaciones temporales deben estar localizados a una distancia mínima de 300 m con relación a cualquier cuerpo de agua.
- Construir un sistema de drenaje perimetral, para el manejo de aguas lluvias y escorrentía del campamento interconectado de canal – cuneta revestido, trampa de grasas y tanque pequeña a manera de desarenador final que permitirá la descarga controlada al exterior de las instalaciones.
- En lugares donde se ubicarán las instalaciones temporales y los frentes de obras de ser posible se utilizarán baños móviles, los cuales consisten en unidades provistas de sanitario, lavamanos y tanque de almacenamiento de descargas.
- Para el manejo de aguas residuales provenientes de servicios sanitarios se instalarán sistemas de tratamiento los cuales garantizarán que la descarga final cumple con los requerimientos de calidad establecidos por la Norma Ambiental sobre Calidad de Agua y Control de Descargas. NA-AG-001-03 (Sustituye a la AG-CC-01)

11.2 MANEJO DE EROSION Y DESLIZAMIENTOS

Este subprograma contempla la implementación de una (1) medida para prevenir, controlar, mitigar y/o compensar los impactos generados por las actividades de construcción y mantenimiento del proyecto en los aspectos: Agua, y suelos.

OBJETIVOS:

- Compensar la pérdida de la capa de suelo en las áreas intervenidas por el proyecto.
- Controlar las pérdidas de suelo en los tramos de taludes con ordenadas considerables que presentan proceso erosivo.
- Evitar el arrastre de materiales excavados a los cuerpos de agua.
- Prevenir la posible alteración de los cuerpos de agua por el arrastre de materiales de excavación.

MEDIDAS A TOMAR: Para compensar la pérdida de la capa fértil del suelo por la la construcción de la Planta, es necesario evitar el arrastre de materiales excavados a los cuerpos de agua y prevenir la posible alteración de los cuerpos de agua, se procederá a:

11.2.1 MANEJO DE LA REMOCIÓN Y ACOPIO DE LA CAPA SUPERIOR DEL SUELO

- Todo el material fértil (capa vegetal del suelo) excavado deberá ser retirado, almacenado en capas y reutilizado en medidas de restauración biológica.

- Este se colocará en lugares adecuados sin efectuar compactación, con el fin de preservar la vida de los microorganismos aeróbicos y conservar sus propiedades físico-químicas.
- El material de suelo deberá manipularse preferiblemente cuando esté seco o cuando su contenido de humedad sea menor de 75%, y se deberá evitar el paso reiterado de maquinaria o personas sobre este, a modo de prevenir su compactación.
- El material se colocará en lugares llanos donde no esté expuesto a la erosión.
- El material orgánico será temporalmente almacenado de forma separada en las áreas previstas para botaderos (áreas de disposición de sobrantes de material de corte).
- El transporte y almacenamiento tomará las previsiones necesarias para que el material no se disperse sobre la ruta de transporte o se erosione en el sitio de almacenamiento.

11.2.2 CONTROL DE LA EROSIÓN DE SUELOS

- Preservar la vegetación en las áreas no intervenidas.
- Retirada, acopio y almacenamiento del horizonte fértil de las áreas intervenidas.
- Acopio del residual de agregados (limos y arcillas) para mezclar con horizonte fértil Distribución de la mezcla de suelo en áreas ya minadas.
- Se implementarán prácticas de barreras muertas, zanjas de laderas, y de adecuación de pendientes.
- Estabilización de los taludes a través de banquetas y zanjas de coronación.
- El movimiento de las capas de suelo se hará de manera planificada y con la ayuda de maquinarias.
- En los sitios en donde se observen problemas de erosión hídrica sub-superficial se evaluará la necesidad de construir filtros longitudinales y transversales.
- En las zonas donde se requiera variar la pendiente de los taludes por el diseño geométrico de la vía o por presencia de zonas inestables, se evaluará la construcción de obras de control de escorrentía tales como zanja de coronación, cunetas, canales recolectores.
- La entrega de la escorrentía recolectada a los drenajes naturales se construirá con un adecuado control de erosión.

11.2.3 ACONDICIONAMIENTO PAISAJÍSTICO

El objetivo del subprograma es el de establecer las acciones a realizar una vez finalizado el período de construcción y antes de la primera puesta en marcha de la Central Termoeléctrica.

Luego de finalizado el período correspondientes a la etapa de construcción, se deben desmantelar todas aquellas instalaciones provisorias instaladas para llevar adelante las actividades constructivas, y todos aquellas utilizadas por el personal afectado exclusivamente a esta fase del proyecto.

Una vez hecho esto, quedarán espacios desnudos sin utilizar, los mismos deberán ser reconstituidos a sus condiciones originales de ser posible, respetando la topografía original y

procurando reponer la cubierta vegetal afectada y los primeros centímetros del suelo. Por otro lado, se deberá evitar dejar residuos o materiales, máquinas o vehículos desafectados a la obra durante la siguiente fase del proyecto.

Asimismo, si luego de la construcción y para la etapa de operación es necesaria la reubicación de instalaciones que seguirán siendo utilizadas tal como depósitos de materiales, obradores, etc., se procurará hacerlo recomponiendo del mismo modo los sitios desafectados.

Una vez concluidas todas las tareas se deberá recomponer la infraestructura modificada o bien dañada durante la fase de construcción, tales como alambrados y puestos u obras de cualquier tipo que hayan sido afectadas, procurando su recomposición con similares características, calidad y funcionalidad que las originales.

11.3 MANEJO DE RESIDUOS SÓLIDOS

Este subprograma contempla la implementación de medidas para prevenir, controlar, mitigar y/o compensar los impactos generados por las actividades de construcción y mantenimiento del proyecto en los aspectos: Agua, y suelos.

OBJETIVOS:

- Prevenir la contaminación de los suelos y las aguas superficiales y subterráneas por el manejo inadecuado de los residuos sólidos.
- Prevenir la posible alteración de los cuerpos de agua por el arrastre de materiales de excavación.

MEDIDAS A TOMAR: Para prevenir la contaminación de los suelos y las aguas y subterráneas por el manejo inadecuado de los residuos sólidos se procederá a:

- Estaciones de captación de los drenajes de los patios de carbón, con posterior envío a las cuencas de cenizas;
- Estaciones de captación de los efluentes de las estaciones de pre-tratamiento de agua;
- Sistemas de neutralización de las estaciones de desmineralización de agua;
- Mantener todos los lugares de operación libres de obstáculos y desperdicios de materiales o basura y retirar todo material sobrante e instalaciones temporales tan pronto como sean necesarios.
- Se deberá evitar, por todos los medios, que ningún combustible, aceite, sustancia química y/o cualquier otro producto contaminante sean derramados en el agua o contaminen los suelos.
- Los residuos deben ser clasificados como peligrosos, domiciliarios e industriales, de acuerdo a lo dispuesto en la legislación provincial vigente.
- Los residuos deberán colocarse en los contenedores apropiados para la recolección y disposición de materiales de desecho, escombros y residuos en general. Se deberá instruir al personal respecto de la correcta segregación de los mismos por color de contenedor.
- Siempre que sea posible los residuos generados durante la construcción deberán reutilizarse, o ser removidos de acuerdo con sus características de peligrosidad y lo que estipulan las normas vigentes.

- La disposición de los residuos se deberá efectuar exclusivamente en los lugares aprobados por las autoridades competentes y de acuerdo con las normas vigentes. Su disposición permanente o temporaria no deberá generar contaminación de suelos y aguas, peligro de incendio o bloquear el acceso a las instalaciones del lugar.
- No se permitirá el acopio de materiales en áreas próximas a los cuerpos de agua (ríos, arroyos, cañadas, quebradas y lagunas).
- Establecer una zona restrictiva para la operación de los equipos y la disposición de los materiales de excavación.
- Las volquetas que transporten materiales de construcción, sobrantes de excavación, material vegetal, residuos sólidos o escombros estarán debidamente cubierta con lonas de tal forma que el material permanezca en el interior en todo momento desde el sitio de origen hasta el destino final.

11.3.1 RESIDUOS PELIGROSOS

Residuos peligrosos, generados como resultado de las operaciones de mantenimiento de equipos, vehículos, retiro de aceites e hidrocarburos de las corrientes de pérdida de agua en el sistema, etc.: deberán clasificarse, separarse y disponerse fuera del área del proyecto según la disposición de las normas vigentes en materia de residuos peligrosos.

11.4 LINEAMIENTOS PARA LA CORRECTA GESTION DE RESIDUOS

A continuación se describen los lineamientos para la correcta gestión de los residuos en obra diferenciados por su tipo, estas medidas de gestión alcanzan tanto a las actividades que desarrolla el contratista principal como los subcontratistas.

- **Residuos de Tipo Domiciliarios (zona de comedor)**
  - Los restos de alimentos se colocarán en bolsas de polietileno dentro de contenedores cerrados en todo momento con tapa para evitar el acceso de roedores, otros animales, así como el ingreso de agua de lluvia.
  - Dichos contenedores tendrán la identificación "RESTOS DOMESTICOS" en letras blancas sobre un fondo tal, que permita su fácil identificación.
  - Está absolutamente prohibido enterrar basura doméstica en forma no autorizada por el organismo municipal o provincial de aplicación o su quema en cualquier sitio de la obra.

- **Escombros de la Construcción (obradores y zona de obra en donde se generen)**
  - Se recomienda acumular los residuos en contenedores, o áreas acondicionadas y luego transportarlos al sitio de disposición acordado con las autoridades Municipales.
  - Deberá tratarse que los residuos generados durante la construcción sean reutilizados, removidos o tratados y dispuestos de acuerdo con sus características y lo que estipulan la legislación provincial vigente.
  - La disposición de los residuos se deberá efectuar exclusivamente en los lugares aprobados por las municipalidades involucradas y, su disposición permanente o

temporaria no deberá generar contaminación de suelos y/o aguas, peligro de incendio o bloquear el acceso a las instalaciones del lugar.

- **Chatarra y otros libres de elementos contaminantes**
  - Para la chatarra debe disponerse de un lugar apropiado en los obradores, talleres o depósitos en los cuales se dispondrán de un contenedor o área destinada para tal fin. Se colocará el contenedor con la leyenda "CHATARRA" o similar, en letras naranjas sobre un fondo tal, que permita su fácil identificación.

- **Residuos Peligrosos**

Se utilizará un sistema de identificación y etiquetado para todas las sustancias peligrosas. Durante el uso, almacenamiento y manipulación de sustancias peligrosas deberán tenerse en cuenta los siguientes aspectos:

- Información sobre las sustancias y sus propiedades físicas.
- Precauciones necesarias para su manipulación y transporte.
- Requerimientos específicos para su almacenamiento.
- Tratamiento médico en caso de ingestión, inhalación, etc.

Aquellos restos de materiales considerados como Residuos Peligrosos deberán depositarse en contenedores especiales de acuerdo a la legislación vigente, deberán estar identificados con un color determinado para este tipo de residuos y ser fácilmente visibles, además deberán poseer la leyenda "RESIDUOS PELIGROSOS".

En el caso específico de latas de aceites, grasas y pinturas, el encargado de la limpieza del sitio deberá cerciorarse de que dichos recipientes estén totalmente libres de restos de hidrocarburos o pintura. Si tuviesen algún resto, serán previamente limpiados con material absorbente, que al entrar en contacto con estos productos pasarán a formar parte de los residuos identificados como Peligrosos.

- **Baterías**

Con relación a las baterías usadas de vehículos, camiones y máquinas en general, las mismas serán devueltas en forma inmediata al proveedor de estos insumos al hacer el recambio. Por lo tanto, cuando se realice una devolución de baterías, el proveedor deberá entregar un recibo de recepción de las mismas, haciéndose responsable de su correcta disposición final.

Si por algún motivo de fuerza mayor, las baterías tuvieran que permanecer almacenadas en un depósito, taller o en algún sitio de la obra, éstas se ubicarán siempre bajo techo en bateas especiales a fin de evitar el derrame de su contenido. Su manipulación se llevará a cabo siempre con guantes resistentes al ataque de ácidos.

- **Dependencias Sanitarias**

- Se colocarán en sitios accesibles para el personal, se instalarán baños químicos portátiles, contenedores para residuos sólidos domiciliarios y dispositivos de provisión de agua potable.
- Los baños portátiles funcionarán a base de un compuesto químico líquido que degradarán las materias que se depositen, formando un residuo no contaminante biodegradable y libre de olores.
- El producto químico se cargará en los baños mediante camiones cisterna con equipo especial de bombeo. Los residuos generados en los baños químicos serán evacuados mediante transportes especiales cuando su capacidad fuera colmatada.
- El proveedor de los baños deberá entregar un recibo de recepción de los líquidos residuales, haciéndose responsable de su correcta disposición final.
- Cuando se efectúe el traslado de los baños químicos desde una ubicación a otra, se comprobará que los recipientes contenedores estén perfectamente cerrados, a fin de no provocar ningún derrame accidental durante el transporte.
- Todas las dependencias sanitarias, cualquiera sea su tipo, serán higienizadas diariamente, a fin de evitar la generación de probables focos de enfermedades infecciosas.

- **Residuos Patológicos**

Los residuos patológicos serán enteramente manejados por las empresas encargadas de los servicios médicos de obra.

Toda empresa que brinde servicios médicos a obra deberá presentar, al momento de su calificación, su procedimiento de eliminación de residuos patológicos de acuerdo con la legislación vigente.

En todos los casos de gestión de residuos anteriormente descriptos se llevarán registros de las tareas, las anomalías observadas y sus correspondientes acciones de remediación y de capacitación del personal involucrado.

Los aspectos sobre gestión de residuos que serán controlados periódicamente por el Responsable de Gestión Ambiental, en conjunto con el Responsable de Higiene y Seguridad y el Responsable Ambiental en obra, son los siguientes:

- Identificación de Riesgos Ambientales.
- Remoción de Residuos en Áreas de Trabajo.
- Existencia de Sistemas de Separación de Residuos y Áreas de Almacenamiento apropiadas.
- Existencia de Focos de Contaminación.
- Almacenamiento de Material Inflamable en lugares apropiados.
- Señales y Procedimientos de Identificación adecuados.
- Materiales Peligrosos (procedimientos para manipulación, uso, y almacenamiento).
- Dependencias Sanitarias en estado adecuado.
- Transporte y Disposición Final de los Residuos por Empresas Autorizadas.

11.5 MANEJO DE FLORA Y FAUNA TERRESTRE

Este subprograma contempla la implementación de medidas para prevenir, controlar, mitigar y/o compensar los impactos generados por las actividades de construcción y mantenimiento del proyecto en los aspectos: Vegetación y fauna terrestre.

OBJETIVOS:

- Preservar y aumentar la riqueza de la flora en el área, con especial atención en especies de la flora nativa.
- Rehabilitar la flora en áreas degradadas durante el proceso constructivo y operativo.
- Establecer la relación área verde/área de construcción favorable a la preservación de la flora y la armonía con el paisaje.
- Disminuir al máximo posible la afectación a la diversidad florística.

MEDIDAS A TOMAR: Para disminuir al máximo posible la afectación a la diversidad florística en todo el espacio no sujeto a construcción se procederá a:

- **Delimitar las áreas de intervención**

Se limitara el área de intervención y movilidad de los equipos y maquinarias involucrados en las actividades constructivas para disminuir las afecciones a la vegetación de las áreas aledañas al proyecto.

- **Restaurar y reforestar las áreas marginales.**

Las actividades de reforestación y conservación disminuirán los impactos directos sobre la flora del área. Podrán disminuir la magnitud de afecciones al paisaje y evitar la erosión del suelo.
Para disminuir al máximo posible la afectación a la diversidad florística en todo el espacio no sujeto a reconstrucción se procederá a:

11.5.1 MANEJO DE REMOCIÓN DE COBERTURA VEGETAL Y DESBROCE

- Delimitar el área de trabajo.
- Todo el material fértil (capa vegetal del suelo) excavado deberá ser retirado, almacenado en capas y reutilizado en medidas de restauración biológica.
- Colocará material fértil removido en lugares adecuados sin efectuar compactación, con el fin de preservar la vida de los microorganismos aeróbicos y conservar sus propiedades físico químicas.
- El material de suelo deberá manipularse preferiblemente cuando esté seco o cuando su contenido de humedad sea menor de 75%, y se deberá evitar el paso reiterado de maquinaria o personas sobre este, a modo de prevenir su compactación.
- El material se colocará en lugares llano donde no esté expuesto a la erosión.
- El material orgánico será temporalmente almacenado de forma separada en las de menores pendientes.

11.5.2 MANEJO DE FLORA Y REVEGETACIÓN

- Todo el material fértil (capa vegetal del suelo) excavado deberá ser retirado, almacenado en capas y reutilizado en las mejoras edáficas.
- Rescatar las especies juveniles Nativas y amenazadas y sembrar en áreas marginales.
- En todos los casos se tomarán recaudos y se ejecutarán las tareas de forma de minimizar las posibles afectaciones a las que puedan exponerse la vegetación y la fauna silvestre.
- Se prohibirá al personal la portación y uso de armas de fuego en el área de trabajo (exceptuando al personal de seguridad), cualquier acción de caza en áreas aledañas y acciones de compra/venta/trueque de animales silvestres o subproductos obtenidos de los mismos.
- Se deberán programar las actividades de construcción de forma que se minimicen las afectaciones por ruido y vibraciones extremas a la fauna y flora y otros usos que actualmente existen en el área de trabajo. Los niveles de ruido se deben reducir mediante el uso de silenciadores adecuados en los equipos motorizados, dispositivos de supresión o amortiguación de ruidos en generadores, compresores, etc.

11.6 CONTROL Y PREVENCION DE ACCIDENTES

11.6.1 CONTROL DEL TRÁFICO

El aumento temporal del flujo vehicular debido a los trabajos relativos a la construcción será mitigado creando un (1) Camino de Acceso externo provisional, con las características geométricas, estructura de pavimento, drenaje, señalización, seguridad vial, paisajismo y otros elementos y/o soluciones mínimos necesarios respetando los parámetros mínimos necesarios exigidos por las leyes dominicanas y normas del MOPC.

Este subprograma contempla la implementación de medidas para prevenir, controlar, mitigar y/o compensar los impactos generados por las actividades de construcción operación del proyecto en el aspecto: Seguridad vial.

OBJETIVO: Prevenir la ocurrencia de posibles accidentes, tanto en el área de trabajo como en el entorno inmediato a moradores y al equipo de trabajo en general.

MEDIDAS A TOMAR:

- Al inicio, todas las áreas de trabajo, caminos utilizados como acceso, deberán ser demarcados y señalizados con un adecuado sistema de señalización, de fácil interpretación y visualización tanto para el personal que trabajará en la obra como para el público en general.
- Todas las vías de acceso que utilizará el proyecto, principales y secundarias serán señalizadas adecuadamente para informar al público y a los trabajadores del proyecto sobre su uso y restricciones durante la obra.
- Diseñar un sistema de señalización de acuerdo con el siguiente tipo de señales:

- **Preventivas:** Advierten al personal de la obra y al público en general, la existencia de un peligro y la naturaleza de éste.
- **Reglamentarias:** Indican limitaciones, prohibiciones o restricciones.
- **Informativas:** Identifican y guían al usuario, proporcionándole información que pueda necesitar, así como las direcciones que debe seguir.

- Colocar una persona con banderola en cada una de las intercepciones de los caminos utilizados como accesos al área en construcción, los campamentos, sitios de botes de materiales sobrante y las áreas de préstamo para dirigir el transito durante se ejecuten las actividades constructivas.
- Se colocarán señales especiales las intercepciones de los caminos utilizados como accesos para indicar el peligro de accidente por paso de vehículos pesados.
- Establecer límites de velocidad para el tránsito de todo tipo de vehículo por las calles y caminos utilizados como accesos al área de construcción para evitara la ocurrencia de accidentes a moradores.
- Asegurar que los camiones que transiten por la ruta predeterminada, estableciendo un control de la velocidad de los mismos.
- Cubrir con lonas los camiones para evitar la caída de materiales que puedan causar accidentes a los transeúntes y moradores.
- Todas las áreas a ocupar serán debidamente demarcadas para evitar la intervención innecesaria de áreas, utilizando para ello señales como banderines y estacas pintadas con colores vistosos, cinta de seguridad u otras señales apropiadas para tal fin.

11.7 SALUD Y SEGURIDAD LABORAL

Este subprograma contempla la implementación de medidas para prevenir, controlar, mitigar y/o compensar los impactos generados por las actividades de construcción operación del proyecto en los aspectos: Salud y seguridad en el trabajo (Ver documento SSTMA).

OBJETIVOS:

- Sensibilizar al personal del proyecto en sus diferentes etapas sobre la Política de Salud, Seguridad en el Trabajo y Medio Ambiente, de manera que les permita desarrollar actitudes positivas hacia cada una de las áreas señaladas tanto al interior del proyecto como hacia afuera de este.
- Capacitar al personal de la obra (Profesionales y trabajadores) sobre temas de salud, seguridad en el trabajo y medio ambiente (SSTMA).
- Dar a conocer al personal involucrado en las diferentes etapas del proyecto el Programa de Manejo y Adecuación Ambiental (PMAA) y los compromisos adquiridos en la Licencia Ambiental y Permisos Ambientales ante la autoridad ambiental y que deberán cumplirse durante la ejecución del proyecto.
- Tener personal entrenado y equipado para reconocer, evaluar y controlar escenarios de riesgo durante el desarrollo de los trabajos.

MEDIDAS A TOMAR: La implementación del Subprograma de Salud y Seguridad Laboral (SSL) involucrará el entrenamiento, definición de roles y responsabilidades, así como el desarrollo de un

plan de emergencia para enfrentar circunstancias puntuales asociadas al proyecto. Todos los aspectos relacionados con la salud de los trabajadores y la seguridad en el sitio de trabajo cumplirán como mínimo con los estándares de República Dominicana y también estará sujeto a los lineamientos del CONSORCIO.

Con la finalidad de implementar sistemas y métodos de trabajo libres de riesgos hacia la salud, la seguridad y el medio ambiente; se debe tener un personal entrenado y equipado para reconocer, evaluar y controlar escenarios de riesgo durante el desarrollo de los trabajos, se procederá a implementar medidas siguientes:

Al inicio, todas las áreas de trabajo, caminos utilizados como acceso, deberán ser demarcados y señalizados con un adecuado sistema de señalización, de fácil interpretación y visualización tanto para el personal que trabajará en la obra como para el público en general.

- Cumplir con todas las leyes y reglamentos de salud y seguridad aplicables.
- Disponer de personal profesional calificado para desarrollar y apoyar el manejo de las actividades de riesgo e imponer el cumplimiento de las normas y reglamentos de seguridad.
- Adoptar métodos de seguridad y salud que permitan evitar pérdidas humanas.

- Capacitar en temas referidos a salud, seguridad, y protección del ambiente a técnicos, operarios y obreros.
- Todos los trabajadores recibirán entrenamiento sobre: el uso de equipo de protección personal, conducción segura de vehículos, peligros de incendio y sofocación del fuego, procedimientos para responder a emergencias primeros auxilios básicos.
- Se realizarán registros de entrenamiento firmados por los empleados para verificar recepción y fecha del entrenamiento.
- Establecimiento de una unidad de primeros auxilios (botiquín) encada una de los frentes de trabajo.
- Como parte del contrato las compañías Subcontratistas deberán comprometerse a implementar las medidas formuladas en este Subprograma y en el Programa de manejo ambiental en general.
- Se realizarán registros de entrenamiento firmados por los empleados para verificar recepción y fecha del entrenamiento.
- Será obligatorio para todo el personal en los sitios de construcción el uso de Equipo de Protección Personal, como zapatos de seguridad, cascos, gafas, en caso necesario el uso de protección respiratoria y auditiva.
- En todos los sitios de trabajo se dispondrán equipos para primeros auxilios y atención de emergencia con señales claras indicando su presencia.
- Los niveles de ruido en los sitios de trabajo serán monitoreados por los inspectores de seguridad y se fomentará el uso de protección auditiva, si es requerido.
- Todas las lesiones de los trabajadores serán documentadas. La pérdida de tiempo por lesiones será investigada la causa del incidente y se identificarán posibles medidas de prevención o cambios a los procedimientos de seguridad.

Como medidas de control para evitar la transmisión de enfermedades contagiosas, entre los trabajadores y la población local y viceversa, se recomiendan las siguientes medidas:

- A la contratación del personal, se recomienda solicitar certificados de salud. Además, se recomienda realizar controles médicos periódicos a fin de diagnosticar enfermedades en sus primeras manifestaciones y poderles dar un tratamiento adecuado y así evitar un contagio masivo y/o propagación de la misma.
- Considerar criterios de salud, seguridad, y medio ambiente al otorgar subcontratos.
- Dotar de capacitación apropiada a los empleados, contratistas y subcontratistas para asegurarse que todo el personal esté capacitado en temas referidos a salud, seguridad, y protección del medio ambiente.
- Evaluar el avance en pos de sistemas de seguridad y ambiente de trabajo seguro y saludable.
- Diseñar instalaciones con altos estándares de seguridad, y operar instalaciones con las mejores prácticas de salud y seguridad.
- Cumplir a cabalidad con todas las leyes y reglamentos de salud y seguridad aplicables.
- Disponer de personal profesional calificado para desarrollar y apoyar el manejo de las actividades de riesgo e imponer el cumplimiento de las normas y reglamentos de seguridad.
- Adoptar métodos de seguridad y salud que permitan evitar pérdidas humanas y proteger los recursos físicos y financieros del proyecto.
- Valorar salud y seguridad tanto como los objetivos económicos.
- Limitar el paso de moradores y transeúntes al área de construcción para evitar el peligro de accidentes que podrían ocasionar las maquinarias.

11.8 GESTIÓN SOCIAL

Este subprograma contempla la implementación de medidas para prevenir, controlar, mitigar y/o compensar los impactos generados por las actividades de construcción del proyecto en los aspectos: Humano y social.

OBJETIVOS:

- Informar previamente a la población sobre las diferentes actividades a realizar en el desarrollo del Proyecto
- Difundir las informaciones del Proyecto a las comunidades ubicadas en el área de influencia y a las autoridades locales, regionales y nacionales, sobre las diferentes actividades de construcción y operación.
- Establecer un canal de comunicación y difusión de información del Proyecto con las instituciones, autoridades y sectores interesados a nivel local, y regional.
- Ofrecer respuestas oportunas a inquietudes de las comunidades, instituciones y entidades ubicadas en el área de influencia del Proyecto.

MEDIDAS A TOMAR: Las medidas de información y comunicación a las comunidades son los mecanismos que permiten la información oportuna y crean los canales de comunicación efectiva con las comunidades ubicadas en el área de influencia del Proyecto, las instituciones y demás entes del nivel local, regional y nacional que formen parte del proyecto; entre las medidas recomendadas se encuentran:

- Información y comunicación a la comunidad
- Señalización permanente y anticipada
- Concertación con propietarios y usuarios

11.8.1 PARTICIPACION DE LA COMUNIDAD INVOLUCRADA. CONSULTAS PÚBLICAS

El objetivo del subprograma es garantizar que la comunidad del área donde se desarrolla el proyecto posea la información adecuada para ejercer su derecho a la información y de participación, durante la fase de construcción de la central.

El mismo deberá estar dirigido a dos grupos objetivos: la población del área de influencia que continuará residiendo en el lugar y los propietarios y/o residentes de los predios que se requerirán para la obra.

A los fines de lograr el objetivo propuesto se considera que se deben implementar las siguientes medidas y acciones tendientes a lograr el objetivo:

- Obtención de los permisos locales necesarios para la implementación del proyecto, especialmente en lo que concierne a la disposición de residuos, la extracción de materiales, los desmontes o corte de árboles, etc. o bien elaborar convenios o acuerdos con la autoridad local en la materia y para la localización de los campamentos y depósitos.
- Posibilitar el acceso a la documentación sobre el proyecto que avale cada una de las acciones que puedan potencialmente generar un impacto y que puedan ser de interés a la población general, en lugares públicos y horarios accesibles.
- Se recomienda informar respecto del avance de las obras, poniendo especial atención a la comunicación de las medidas que se implementen tendientes a disminuir o mitigar los posibles impactos devenidos de la etapa de construcción de la misma.
- Implementar formas eficaces de comunicación entre el comitente, los contratistas y las autoridades locales, provinciales y la comunidad involucrada.
- Desarrollar mecanismos de participación comunitaria en caso de presentarse conflictos con la comunidad, a los fines de encontrar soluciones conjuntas haciendo partícipes a los sectores involucrados.
- Informar a los habitantes del área de influencia del proyecto sobre las características, las etapas técnicas para su diseño y construcción, los cronogramas previstos, los diferentes actores que participarán y la entidad responsable del mismo.
- Informar sobre los estudios y procedimientos que se llevarán a cabo con los propietarios, titulares de derechos y residentes de los posibles predios que se deban adquirir o utilizar.

- Informar a cerca de los beneficios asociados al proyecto para la comunidad local, así como a nivel regional.
- Establecer canales eficaces y rápidos de comunicación para responder permanentemente las inquietudes de la comunidad. Para ello se deben establecer de común acuerdo un lugar y horario de atención de la comunidad. Este lugar de atención deberá estar ubicado en el área de afectación y debe ser de fácil acceso, con el fin de evitar costos de transporte a la población.
- Prevenir difusión de información errónea sobre el proyecto.
- Evitar conflictos con las comunidades y riesgos para los mismos en el área de influencia directa del proyecto.

11.8.2 MEDIDAS A DESARROLLAR

El programa de información y comunicación, hace referencia tanto a los mecanismos y estrategias planteadas para brindar información oportuna, como a los establecidos para crear canales de comunicación efectiva con la comunidad del área de influencia del proyecto, así como con las instituciones y demás entes del nivel local, regional y nacional que se constituyen en partes interesadas.

El programa de información se fundamenta en la divulgación masiva de información mediante dos mecanismos principales: las reuniones y las piezas de divulgación escrita; y en la atención a la comunidad mediante la instalación de puntos de atención a la comunidad, que se denominarán PAC.

I. Reuniones informativas de inicio, avance y finalización de obra con las comunidades del área de influencia directa.

Se realizarán tres reuniones informativas generales a saber:

- Reunión de inicio: La cual se realizará quince (15) días antes del inicio de las actividades de obra.
- Reunión de avance: La cual se realizará cuando se haya alcanzado un porcentaje de avance del 50 % de las actividades constructivas.
- Reunión de finalización: Se realizará quince días (15) antes de terminada la obra.

➢ <u>Reunión de Inicio</u>

En la reunión de inicio se brindará la siguiente información mínima:

- Información contractual del Contratista y de la Supervisión.
- Objetivos y tipo de proyecto.
- Localización del proyecto.
- Presentación de los profesionales de las empresas vinculadas al proyecto - contratista y supervisión- y de los responsables del proyecto.

- Presentación del marco normativo vigente para la realización de las obras y para la gestión social y ambiental a realizar.
- Explicación detallada de las obras a realizar (proceso constructivo), con planos en escala adecuada y fotomontaje del proyecto.
- Presentación del cronograma de ejecución de las obras. Explicando la fecha de inicio estimada, la duración de las obras y la fecha de terminación.
- Presentación del Programa de Manejo y Adecuación Ambiental informando sobre las medidas para contrarrestar la incidencia de los impactos de las actividades del proyecto, así como en el programa integrado de Salud, Seguridad en el Trabajo y Medio Ambiente (SSTMA) a implementar.

➢ Reunión de Avance

En esta reunión el responsable(s) de SSTMA del constructor expondrá(n) el estado de avance técnico, social - ambiental del proyecto y los tiempos de las actividades restantes. La presentación deberá estar aprobada por la Supervisión y se presentará ante dicha supervisión con al menos 2 semanas de anterioridad a la realización de la reunión.
En la reunión de avance se brindará la siguiente información mínima:

- Estado de avance de la obra en relación con la programación establecida en la reunión de inicio.
- Evaluación de la atención a la comunidad en el punto de atención a la comunidad - PAC.
- Evaluación de la participación de la comunidad del área en el proyecto.
- Recomendaciones para prevenir accidentes en la comunidad.
- Avances de la gestión ambiental realizada.
- Inquietudes y quejas de la comunidad sobre el desempeño socio – ambiental de la obra.

➢ Reunión de Finalización

En esta reunión el responsable(s) de SSTMA del constructor presentará el estado final del proyecto e informará la fecha de finalización del mismo, recogerá las inquietudes de los asistentes y se realizará un recorrido por la obra con personas de la comunidad, como parte de la entrega oficial de la obra.

Las inquietudes, sugerencias, quejas y/o reclamos que surjan en la reunión de finalización, deberán ser atendidas, previo seguimiento y verificación de la Supervisión.
Los temas sugeridos para esta reunión son:

- Características técnicas de la obra terminada, se sugiere presentar un registro fotográfico de antes, durante y el final de la obra.
- Evaluación del manejo ambiental de la obra.
- Se recogerán las inquietudes y quejas de los asistentes. Todas las inquietudes deben quedar debidamente cerradas y a satisfacción de la comunidad que interpuso dichas quejas.

II. PIEZAS DE DIVULGACIÓN DE INFORMACIÓN ESCRITA

Para hacer masiva la información sobre el desarrollo de las actividades de construcción que se realicen durante la obra se recurrirá a la elaboración y publicación de afiches y la distribución de volantes.

Los afiches deben ser colocados en sitios de concurrencia de público (escuelas, iglesias, centros comunitarios, etc.) en los centros poblados próximos a la obra.
Los volantes se emplearán para:

- Informar sobre las etapas de la obra (inicio, avance y finalización) y puesta en operación;
- Convocar a las reuniones de información (de inicio, avance y finalización);
- Convocar a reuniones extraordinarias y para informar sobre actividades extraordinarias.

Los volantes deben consignar siempre información sobre el punto de atención a la comunidad, el número de teléfono, nombre y apellidos de la persona que atiende a la comunidad.

III. INSTALACIÓN DEL PUNTO DE ATENCIÓN A LA COMUNIDAD – PAC

El punto de atención a la comunidad PAC se instalará en los campamentos y oficinas de obra y tendrá por función recibir y dar respuesta a las inquietudes, quejas y/o reclamos relacionados con el Proyecto.

En el Punto de Atención a la Comunidad se implementarán los mecanismos de documentación de las quejas, reclamos o sugerencias que la comunidad exprese y el seguimiento que se brinde a las mismas; los responsables de SSTMA en la obra serán los responsables del funcionamiento y de la implementación de la documentación correspondiente.

En general, los registros de la actividad relacionada con la "Información y Comunicación a la Comunidad" podrán llevarse a través de los formatos adjuntos (Acta de reunión con la comunidad, Planilla de asistencia a reuniones, Atención de quejas y reclamos, Consolidación atención quejas y reclamos, Control de entrega de piezas de divulgación) o se adaptarán otros formatos que incorporen la información pertinente.

11.8.3 GENERACIÓN DE EMPLEOS

OBJETIVOS: Favorecer a la población del área de influencia directa del proyecto, dando prioridad y oportunidad a la contratación de la mano de obra disponible localmente.

MEDIDAS A TOMAR: El empleo constituye una actividad que aporta positivamente al componente socioeconómico en la región y en ese sentido es altamente valorado por las autoridades y la comunidad local.

Además, el empleo constituye un factor que puede propiciar la creación de falsas expectativas en la comunidad, generar conflictos e inducir procesos migratorios desordenados; por esas razones esta actividad debe ser controlada según los siguientes criterios:

- Se dará preferencia a la contratación de mano de obra calificada y no calificada perteneciente al área de influencia directa del proyecto que cumpla con los requisitos médicos del examen de ingreso y de las calificaciones requeridas para el tipo de empleo ofertado en el proyecto.
- Se dará a conocer a la población los perfiles requeridos para mano de obra no calificada y calificada, el cronograma de actividades, número de cupos para cada una de las actividades, tiempo de contratación, salarios y forma de pago.
- Los requisitos de contratación serán difundidos por medio de publicidad relacionada con el proyecto, explicando calificaciones y la documentación a presentar, acreditando que la persona a contratar vive en las comunidades locales.
- Durante la difusión de la oferta de empleo será necesario hacer énfasis en lo transitorio de los trabajos, para que las fuentes tradicionales de subsistencia (actividades agropecuarias) no se vean afectadas por un eventual desplazamiento de mano de obra.
- En el proyecto se mantendrán registros que contengan los nombres del personal contratado y procedencia, fecha de ingreso, egreso y tipo de entrenamiento brindado durante la permanencia en la obra.
- Todo el personal contratado, de origen local o no local, deberá cumplir con un código de conducta, mediante el cual se regulará el comportamiento de los trabajadores del proyecto en el área de influencia.

11.8.4 ADQUISICION DE BIENES Y SERVICIOS LOCALES

OBJETIVOS: Favorecer el desarrollo económico local en el área de influencia directa del proyecto brindando prioridad y oportunidad a la adquisición de bienes y servicios locales.

MEDIDAS A TOMAR:

- Durante el desarrollo de las actividades constructivas se dará preferencia a los bienes y servicios disponibles localmente siempre y cuando esta preferencia no interfiera con el uso de los mismos por parte de la comunidad.
- La comunidad será informada de la demanda de bienes y servicios necesarios para la construcción del proyecto y los respectivos requisitos para su adquisición y contratación.
- Se establecerá el tipo de bien o servicio requerido, el tiempo de uso y requisitos que deben cumplir estos. Toda la información al respecto será de dominio público y estará disponible en las comunidades.
- La oferta de bienes y servicios locales en el área de influencia deberá cumplir con los requerimientos de: calidad apropiada, disponibilidad y cantidad requeridas y precios competitivos.

- Si el servicio o recurso no se encuentra disponible a un precio competitivo a nivel local, se optará por el nivel regional y en tercer lugar, el nivel nacional. Tal es el caso de vestimenta de seguridad y equipamiento para trabajadores de construcción, como guantes, botas de seguridad, respiradores, entre otros.
- Todos los bienes y servicios adquiridos por el Proyecto se consignarán en un registro, en el cual se indicará el tipo de bien o servicio utilizado, procedencia, fecha de compra y cualquier otra información que acredite el proceso adelantado y el beneficio económico en el área de influencia del Proyecto.

11.8.5 EDUCACION Y CAPACITACIÓN EN AMBIENTE Y SEGURIDAD AL PERSONAL

OBJETIVOS:

- Sensibilizar al personal del proyecto en sus diferentes etapas sobre la Política de Salud, Seguridad en el Trabajo y Medio Ambiente, de manera que les permita desarrollar actitudes positivas hacia cada una de las áreas señaladas tanto al interior del proyecto como hacia afuera de este.
- Capacitar al personal de la obra (Profesionales y trabajadores) sobre temas de salud, seguridad en el trabajo y medio ambiente (SSTMA).
- Dar a conocer al personal involucrado en las diferentes etapas del proyecto el Programa de Manejo y Adecuación Ambiental (PMAA) y los compromisos adquiridos en la Licencia Ambiental y Permisos Ambientales ante la autoridad ambiental y que deberán cumplirse durante la ejecución del proyecto.

MEDIDAS A TOMAR:

- El contratista de obra debe diseñar y desarrollar un programa de capacitación para el personal que labore en el proyecto; la implementación de este programa puede contribuir al desarrollo del mismo bajo el concepto de sostenibilidad ambiental y social.
- El diseño y desarrollo de las inducciones y la capacitación deberán considerar los siguientes aspectos: tema, duración, fecha, hora, ayudas audiovisuales, lugar y población objetivo.
- Para el personal que trabajará en la Ingeniería de detalle, la construcción y las actividades de mantenimiento de la vía, se realizarán inducciones previas al ingreso; estas inducciones incluirán temas de salud, seguridad en el trabajo y medio ambiente, así como también temas de relevancia social en el área de trabajo.

- El programa de capacitación deberá implementarse periódicamente y distribuido a lo largo de las diferentes etapas del proyecto. A continuación se relacionan algunos temas a incluir en el programa de capacitación, lo cual no exime de incluir otros temas que se consideren necesarios:

ASPECTOS AMBIENTALES:

- Política de Salud, Seguridad en el Trabajo y Medio Ambiente establecida para el proyecto.
- Programas que componen el Programa de Manejo y Adecuación Ambiental, medidas y acciones de manejo a aplicar de acuerdo con la actividad contratada.
- Importancia de los recursos naturales y su manejo adecuado.
- Conceptos sobre el sistema de áreas protegidas y desarrollo sostenible.
- Preservación de los recursos naturales, con énfasis en especies endémicas y en peligro de extinción.
- Protección de la fauna silvestre en la zona del proyecto.
- Divulgación de la legislación ambiental aplicable al proyecto y sus actividades.
- Preservación de la vegetación.
- Prohibiciones sobre caza y retiro de elementos de la flora.
- Autoridades y documentos ambientales que regulan el desarrollo del proyecto (Licencia Ambiental, permisos y Programa de Manejo y Adecuación Ambiental).

MANEJO DE ACTIVIDADES DE CONSTRUCCIÓN:

- Manejo de escombros, residuos reciclables y domésticos.
- Manejo de materiales de construcción y obras de concreto.
- Manejo y protección de aguas superficiales y subterráneas.
- Manejo de residuos líquidos.
- Manejo de Actividades de Mantenimiento durante construcción
- Control y manejo de derrames de aceites y lubricantes.
- Manejo de señalización y tráfico.
- Protección del Patrimonio Arqueológico.

ASPECTOS SOCIALES:

Salud y Protección Laboral:

- Relaciones con la Comunidad
- La importancia del uso y mantenimiento de Elementos de Protección Personal (Casco protector, botas de seguridad, mascarillas, protectores auditivos).
- Capacitación sobre los programas de medicina preventiva.
- Capacitación sobre los programas de medicina del trabajo.
- Prevención de Riesgos.

- Primeros Auxilios - Especialmente la brigada debe recibir constante entrenamiento en atención de emergencias, ya que el contratista está obligado a prestar los primeros auxilios en obra, y debido a las condiciones de ruralidad en la mayoría del área del proyecto, cobra mayor importancia la reacción de este grupo, quienes fácilmente pueden marcar la diferencia entre la vida y muerte de una persona.
- Manejo de emergencias, se debe incluir como realizar la coordinación de una emergencia con los organismos especializados.
- Uso y mantenimiento de EPP (Elementos de Protección Personal).
- Procedimientos de trabajo seguro.
- Manejo de herramientas menores.
- Y demás temas obtenidos del panorama de factores de riesgo, o condiciones específicas que se presenten durante el desarrollo de las actividades de obra y aquellos temas que el Especialista en SSTMA considere necesarios.

11.8.6 PROGRAMA DE SALUD

El Programa de Salud para el Trabajador deberá ser desarrollado para satisfacer las necesidades previstas y de emergencia de todo el personal del proyecto durante la construcción. Deberá proporcionar una guía para el mantenimiento de la salud y cuidado de lesiones menores y de emergencia de todos los trabajadores.

Deberá considerar un examen de ingreso a cada trabajador que garantice que las condiciones de salud lo hacen apto para el trabajo a desempeñar. Adicionalmente, los trabajadores deberán someterse a exámenes ocupacionales tales como audiometrías, visiometrías y vacunas contra enfermedades específicas.

Se prestará especial atención a aquellas situaciones que no pueden tratarse en los campamentos como: fracturas, cortes y quemaduras graves, insolación, deshidratación, enfermedades, mordeduras de animales venenosos, descargas eléctricas y otros peligros para la salud que requieran cuidados médicos especializados.

En los campamentos se establecerá un puesto médico para la atención de lesiones menores y afecciones de los trabajadores. Este puesto deberá contar con todo el material médico para la atención de accidentes menores y contará con un profesional médico entrenado en salud ocupacional.

En los puestos médicos se harán todos los arreglos necesarios para disponer de ambulancias durante la construcción del proyecto en caso de emergencias que requieran hospitalización inmediata.

En los lugares visibles de campamentos, puestos médicos, frentes de trabajo, se dispondrá de una lista de los hospitales y puestos de salud a los que se puede acudir en caso de lesiones menores y emergencia. Estos centros estarán clasificados de acuerdo a:

- Tipos de atención en caso de lesiones o emergencias
- Proximidad a la región
- Número de médicos y camas disponibles
- Servicios de emergencia

La lista de todos los hospitales incluirá números telefónicos de atención regular y de emergencia, direcciones con planos de ubicación, especialidades médicas y recursos del sitio.
El encargado del PSST deberá evaluar regularmente las condiciones del campamento e instalaciones para determinar si existen riesgos a la salud como: aguas estancadas, disposición no sanitaria de aguas residuales, almacenamiento inseguro de equipo y otros aspectos que merezcan atención.

El encargado del PSST será responsable de realizar la vacunación completa de todos los trabajadores involucrados en la construcción del proyecto. Las tarjetas válidas de inmunización o vacunación serán los únicos documentos para eximir a cualquier trabajador de esta actividad preventiva. La lista de enfermedades y vacunas se extraerá de publicaciones de la Organización Mundial de la Salud (OMS) y de la entidad estatal de Salud en República Dominicana.

11.8.6.1 PROGRAMA DE SALUD Y SEGURIDAD EN EL TRABAJO (PSST)

El Programa de Salud y Seguridad en el Trabajo esbozará los procedimientos de seguridad que se emplearán e implementarán durante la construcción del proyecto. Algunos componentes de este programa señalarán procedimientos específicos, mientras que otros constituirán especificaciones técnicas.

El Programa de seguridad en el trabajo deberá estar compuesto por los siguientes elementos:

- Instrucciones Generales
- Responsabilidades
- Programa de Seguridad durante la Construcción para Contratistas y Subcontratistas
- Prevención de Accidentes
- Información de Peligros
- Capacitación y Educación sobre Seguridad
- Equipo de Protección Personal
- Primeros Auxilios
- Reglas de Buen Orden y Limpieza
- Agua Potable
- Sanitarios
- Exposición al Ruido
- Radiación Ionizante

- Iluminación
- Gases, Vapores, Humos Polvos y Emanaciones
- Ventilación
- Protección con Respiradores
- Protección y Prevención de Incendios
- Líquidos Combustibles e Inflamables
- Letreros, Señales y Barricadas
- Herramientas Operadas a Mano y a Energía
- Voladura y el Uso de Explosivos
- Soldadura
- Equipo de Aparejos para el Manejo del Material
- Equipo Automotor
- Equipo de Manejo de Materiales
- Trabajo en o cerca al Agua
- Reglamentos para la Construcción
- Respuesta en Caso de Derrames

MEDIDAS A IMPLEMENTAR:

- Los trabajadores nuevos recibirán entrenamiento en:
  - a) Uso de equipo de protección personal
  - b) Conducción segura de vehículos
  - c) Peligros de incendio y sofocación del fuego
  - d) Procedimientos para responder a emergencias
  - e) Primeros auxilios básicos
  - f) Identificación y manejo de materiales peligrosos
  - g) Conocimiento de sensibilidad ambiental.

- El uso de equipo de protección personal, incluyendo zapatos de seguridad, cascos, gafas, protección respiratoria y auditiva, será requerido para todo el personal en los sitios de construcción.
- En todos los sitios de trabajo se dispondrán, apropiadamente, extinguidores de incendio, suministros para primeros auxilios y atención de emergencia con señales claras indicando su presencia.
- En el sitio de trabajo se mantendrá una o más ambulancias equipadas apropiadamente y con personal entrenado para responder a emergencias.
- Los niveles de ruido en el sitio de trabajo serán monitoreados por los inspectores de seguridad y se fomentará el uso de protección auditiva, si es requerido.
- El CONTRATISTA y sus sub-contratistas se asegurarán que las señales de seguridad sean visibles en todos los lugares apropiados, incluyendo las señales de ubicación de las salidas de emergencia, primeros auxilios, equipo contra incendios y equipos de emergencia, no fumar y otras señales de advertencia de peligro y control de tráfico.

- Todas las lesiones de los trabajadores serán documentadas. La pérdida de tiempo por lesiones será investigada con la causa del incidente y se identificarán posibles medidas de prevención o cambios a los procedimientos de seguridad.

11.9 CONTINGENCIAS Y EMERGENCIAS

Una contingencia es una situación eventual y transitoria cuando se presenta o se prevé con base en el análisis objetivo o en el monitoreo de la contaminación ambiental, una concentración de contaminantes o un riesgo ecológico derivado de las actividades humanas o fenómenos naturales que afectan a la salud de la población o el ambiente.

El PMAA incluye un plan de prevención y manejo de contingencia. Este programa se desarrolla en el marco de las reglamentaciones legales vigentes, en el ámbito nacional y provincial, que regulan en materia de riesgos del trabajo, seguridad e higiene laboral, y regímenes laborales de los obreros de la construcción.

11.9.1 OCURRENCIA DE INCIDENTES AMBIENTALES

Se entenderá por incidente ambiental toda aquella contingencia susceptible de ocasionar daños actuales o potenciales al ambiente. En este sentido se presentan los procedimientos que se deben seguir en caso de la ocurrencia de un incidente ambiental:

1) Clasificación del incidente: el proponente de la actividad o proyecto deberá calificar el incidente ocurrido conforme a los siguientes criterios de clasificación:

a) Incidentes Mayores: Se considerarán incidentes ambientales mayores, cualquiera sea su magnitud, a los siguientes:

- Los incendios y/o explosiones.
- Los escapes de gases o vapores tóxicos o peligrosos.
- Los incidentes vinculados con el transporte, manipuleo y uso de explosivos.
- Los incidentes relacionados con productos químicos, productos inflamables, mercancías o residuos peligrosos, que presenten concentraciones superiores a los límites admisibles.
- Todo aquel incidente ambiental que, independientemente de su magnitud, tome relevancia en función de su notoria afectación a la comunidad.

b) Incidentes Menores: los Incidentes Ambientales Menores serán todos aquellos no comprendidos en el punto A.

2) Información del incidente: producido un Incidente, se elaborará un Informe de Ocurrencia. Cuando se trate de Incidentes Mayores, el evento deberá ser comunicado a la Subsecretaría de Medio Ambiente dentro de las 24 horas. Si en cambio se tratase de un Incidente Menor, su ocurrencia deberá ser registrada y debidamente documentada.

11.9.2 OBJETIVO GENERAL

Diseñar las estrategias que permitan tomar las medidas necesarias para preservar las vidas humanas, los bienes materiales y los componentes del proyecto Termoeléctrico Punta Catalina.

11.9.3 OBJETIVOS ESPECÍFICOS

Los objetivos específicos del Subprograma de Contingencias son:

- Establecer una lista de acciones operativas / administrativas para responder ante una emergencia de forma oportuna, adecuada y efectiva.
- Planificar y disponer de recursos necesarios para el control de emergencias.
- Asegurar un mecanismo para identificar periódicamente situaciones de emergencias en el desarrollo de las actividades de rehabilitación/ampliación y operación del Proyecto.
- Evaluar periódicamente mediante el desarrollo de simulacros, las operaciones de control de emergencia, actividades prevención, los medios y recursos establecidos para las situaciones de emergencia identificadas.

11.9.4 SUBPROGRAMA DE CONTINGENCIAS

Este subprograma contempla la implementación de medidas para prevenir, controlar, mitigar y/o compensar los posibles impactos generados por la posible ocurrencia de contingencias y emergencias durante la reconstrucción del proyecto en el aspecto: Aire, agua, suelo, flora, social, humano y económico, salud y seguridad laboral.

OBJETIVOS: Prevenir y responder a los efectos generados por la ocurrencia de eventos asociados a emergencias producidas por alguna falla en las instalaciones de seguridad o error involuntario en la operación y mantenimiento de maquinarias y equipos.

- Asegurar un mecanismo para identificar periódicamente situaciones de emergencias en el desarrollo de las actividades de Rehabilitación/ mejoramiento del Proyecto.
- Prevenir, detectar, evaluar y controlar los agentes de riesgo que generen posibles accidentes de trabajo, daños y/o pérdidas en el proyecto.

MEDIDAS A TOMAR: Para dar respuestas de manera oportuna, adecuada y efectiva a los estados de emergencias que podrían presentarse durante la fase de construcción se establecen los procedimientos siguientes:

- Se mantendrá una coordinación permanente con los Organismos Gubernamentales encargados de enfrentar situaciones de riesgos (Defensa Civil, la

Cruz Roja, Ministerio de Salud Pública, el Cuerpo de Bomberos, Comité de Operaciones de Emergencia, Instituto Sismológico de la Universidad Autónoma de Santo Domingo, Comité de Operaciones de Emergencia, y la Oficina Nacional de Meteorología.

- Todo personal que sea contratado debe recibir un entrenamiento previo sobre las normas contempladas en la Política de Salud, Seguridad Laboral y Ambiente del Proyecto.
- Capacitar al personal sobre primeros auxilios y rescates.
- Mantener las instalaciones, equipos y a los trabajadores libres de riesgos laborales.
- Actualizar periódicamente el Panorama de Riesgos según requerimientos.
- Establecer controles a los riesgos identificados, actuando en la fuente, en el medio y el trabajador.
- Evaluar periódicamente los métodos de control.

11.9.5 RESPUESTAS A EMERGENCIAS

11.9.5.1 CAPACITACIÓN DEL PLAN DE EMERGENCIA

Todo personal debe ser capacitado en respuesta ante una Emergencia durante el primer mes de trabajo dentro de la Central y las áreas de trabajo asociadas. Cada vez que un trabajador es cambiado de actividad debe ser capacitado en respuesta ante el riesgo de Emergencia correspondiente a su nueva ubicación.

El personal del Complejo debe ser capacitado en respuestas que debe dar, desde su actividad específica, en caso que sea activada la Alarma de Emergencia. Este programa de capacitación a lo menos debe comprender:

a) Reconocimiento de las señales de Alarma (acústica).
b) Vías de escape y ubicación de Zonas de Seguridad

11.9.5.2 EN CASO DE OCURRIR ACCIDENTES

- Rescatar al trabajador sometido al trauma.
- Aplicar los primeros auxilios in situ.
- Aplicar atención primaria en el área destinada a salud y seguridad laboral.
- Comunicarse con la agencia de atención de emergencias.
- Trasladar al trabajador al hospital más cercano.

11.9.5.3 OCURRENCIA DE INCENDIO

- **Instituciones de apoyo:** Mantener comunicación permanente con los Organismos Gubernamentales (Defensa Civil, la Cruz Roja y los Cuerpos de Bomberos).
- **Simulacro:** Realizar simulacros cada seis meses de cómo enfrentar un incendio con todo el personal en coordinación con los Cuerpos de Bomberos.

ANTES: En todos los sitios de trabajo se dispondrán, apropiadamente, extinguidores de incendio, suministros para primeros auxilios y atención de emergencia con señales claras indicando su presencia.

- Dotar al personal de equipo de protección personal, incluyendo zapatos de seguridad, cascos, gafas, protección respiratoria y auditiva, será requerido para todo el personal en los sitios de construcción.
- Dotar de trajes para protección de incendio para los obreros que estén más expuestos en caso de la ocurrencia de un fuego.
- En el campamento principal se mantendrá una ambulancia equipada apropiadamente y con personal entrenado para responder a emergencias.
- Establecer un programa de señalización, en los campamentos, plantas industriales y en los frentes de obras que incluya:
  - Almacenamiento de Materiales.
  - Herramientas manuales y eléctricas.
  - Limpieza y Mantenimiento.
  - Prevención contra incendios.

11.9.6 RESPUESTAS A SISMOS

MEDIDAS A TOMAR: Diseñar las estrategias que permitan tomar las medidas necesarias para preservar las vidas humanas, los bienes materiales y los diferentes componentes de la obra de los daños que podrían ocasionar las eventuales ocurrencia de sismos.

Un sismo es la liberación súbita de energía generada por el movimiento de grandes volúmenes de rocas en el interior de la tierra, entre su corteza y manto superior, y se propagan en forma de vibraciones a través de las diferentes capas terrestres, incluyendo los núcleos externo e interno de la Tierra.

Para dar respuestas de manera oportuna, adecuada y efectiva a la ocurrencia de sismos que pudieran presentarse durante la fase de reconstrucción de los diferentes componentes del Proyecto, se establecen los procedimientos a ser implementados:

ANTES:

- Establecer relaciones con los representantes municipales del Comité de Operaciones de Emergencia.
- Establecer relaciones con los representantes del Instituto Sismológico de la Universidad Autónoma de Santo Domingo, para mantener un canal de información sobre los microsismos que se registran en el área.

DURANTE:

- Conservar la calma, infundir serenidad y ayudar a los demás.
- Si no se puede evacuar el lugar, ubicarse en las zonas de seguridad.
- Alejarse de de cualquier utensilio o artefacto caliente y de objetos que pueden rodar o caer. Si el sismo lo sorprende cerca de taludes con presencia de inestabilidad, alejarse de inmediato e impedir que otras personas ingresen al área.

- Si está en la vía buscar protección lejos de edificios, árboles, cables y vehículos en marcha.

11.9.7 RESPUESTAS A HURACANES

OBJETIVOS:

- Diseñar las estrategias que permitan tomar las medidas necesarias para preservar las vidas humanas, los bienes materiales y los diferentes componentes del proyecto de los daños que podrían ocasionar las eventuales ocurrencias de fenómenos meteorológicos.
- Proteger la vida del personal involucrado en las actividades de construcción.
- Capacitar al personal responsable sobre los aspectos preventivos para este tipo de evento.
- Crear mecanismos de respuesta eficientes y planes de respuesta y evacuación en caso de desastres naturales.
- Proporcionar orientación a los responsables sobre lo que se debe y no se debe hacer antes, durante y después del paso de un huracán.

MEDIDAS A TOMAR: Para dar respuestas de manera oportuna, adecuada y efectiva a los estados de emergencias por el paso de vaguadas, tormentas y huracanes durante el proceso de construcción del proyecto se establecen los procedimientos a ser implementados:

- Elaborar un Plan de Emergencia y un Plan de acción para la temporada ciclónica
- Asegurarse de que el Plan de Emergencia y el Plan de acción para la temporada ciclónica estén actualizados y disponibles para los responsables de los diferentes Departamentos.
- Organizar los diferentes Comités de Preparación, Evaluación y Recuperación para tomar acción antes, durante y después del fenómeno atmosférico.
- Coordinar las reuniones de los diferentes Comités antes citados para analizar el plan de acción, definir responsabilidades específicas y en qué momento se pondrá el plan a trabajar.
- Tomar las debidas precauciones para proteger los diferentes componentes del proyecto a fin de minimizar el daño en las instalaciones y edificaciones.
- Mantener comunicación permanente con la Oficina Nacional de Meteorología responsable de hacer las comunicaciones de advertencia a través de boletines del desarrollo de cualquier fenómeno atmosférico que pueda impactar nuestro país.
- Mantener comunicación permanente con los Organismos Gubernamentales (Defensa Civil, Comité de Operaciones Emergencias y la Cruz Roja) para saber el desarrollo del fenómeno.
- Verificar que todas las áreas tengan una lista de prioridades antes de pasar el huracán y que sea conocida por los técnicos, operadores y obreros.
- Seleccionar el personal de apoyo que se quedará en los frentes de obras en las áreas identificadas como seguras y asegurarse de que está debidamente entrenado.

- Mantener al personal informado de la evolución del huracán o del fenómeno atmosférico que ofrece peligro para el área.
- Gestionar los materiales, equipos y herramientas necesarios para ser utilizados en las diferentes áreas del proyecto.
- Evaluar e identificar los riesgos en función de su importancia para cada actividad que se esté ejecutando al momento de presentarse el aviso de la posible ocurrencia del fenómeno.
- En las áreas de campamentos hacer un inventario de aquellos materiales y equipos que requieran de mayor protección, como es el caso de Computadoras, UPS, Fotocopiadoras, documentación, alimentos u otros.
- Identificar personal dentro de su área con las aptitudes requeridas para colaborar con el plan de emergencia.
- No dejar acopiado aquellos materiales que pudieran resultar peligrosos para la población ubicada en el área de influencia directa del proyecto como son restos de maderas, hojas de zinc, escombros.
- Trasladar los equipos a lugares seguros para evitar daños materiales.
- El Comité se organizará y se entrenará tan pronto se inicie la contratación del personal de forma que está preparado para actuar ante cualquier tipo de amenaza natural que pueda presentarse en las instalaciones.
- Debe asegurarse de mantener un control de los diferentes riesgos presentes en las instalaciones y que puedan ser afectados ante la ocurrencia de un huracán.
- Identificar los lugares seguros dentro de las instalaciones para las personas que se quedarán durante la ocurrencia del fenómeno.
- Determinar los equipos de comunicación interna y externa que serán utilizados tanto para las personas responsables en cada frente de obra así como la comunicación con el medio exterior para estar informados de la forma en qué evoluciona el fenómeno atmosférico.
- Inspeccionar el perímetro de toda el área de influencia del proyecto y tomar las medidas de lugar ante los riesgos que puedan ser eliminados tales como acopio de materiales de construcción, equipos y maquinarias mal ubicado.

DESPUÉS DEL PASO DEL FENÓMENO ATMOSFÉRICO:

- Evaluar los daños y hacer estimados de los costos de reparación y reposición.
- Tomar fotografías y videos de las estructuras, equipos y objetos afectados. Comunicarse con las aseguradoras.
- Tomar las medidas pertinentes para evitar posibles daños y accidentes posteriores que puedan ocurrir de acuerdo a los riesgos que puedan presentarse luego de ocurrido del fenómeno.
- Notificar a las Autoridades u Organismos correspondientes de daños causados por accidente del personal, daños a los diferentes componentes del proyecto y /o servicios en los campamentos e instalaciones auxiliares.

11.10 PROGRAMA DE SEGUIMIENTO Y MONITOREO

El programa de vigilancia, seguimiento y control ambiental tiene como objetivo confirmar y documentar que el proyecto cumple con todas las normas y reglamentaciones de la legislación dominicana. Para este fin, es necesario confirmar que las acciones que envuelven el los planes de monitoreo y mitigación, están siendo ejecutados conforme a lo establecido y están siendo efectivos. El programa establece la forma de organización, responsabilidades, mecanismos y procedimientos necesarios para asegurarse que el proyecto cumpla con todas las reglamentaciones.

El continuo y constante monitoreo de las actividades, tanto durante el proceso de construcción como durante la fase de operación relativa a los impactos ambientales, así como la mitigación de los mismos, será una responsabilidad y un compromiso del CONSORCIO con el país.
Existen tres factores que son los más importantes: coordinación, verificación y control de las actividades.

- **Coordinación:** identifica las partes involucradas en los aspectos ambientales del proyecto.
- **Verificación y control:** Describe los procedimientos a ser implementados para asegurarse que los mismos están siendo aplicados conforme a las regulaciones y requerimientos ambientales.

OBJETIVO GENERAL: Realizar el control, seguimiento y evaluación periódica de la eficacia y eficiencia de la ejecución de las medidas planteadas en el Programa de Manejo y Adecuación Ambiental propuesto para el Proyecto.

OBJETIVOS ESPECÍFICOS:

- Establecer los parámetros de seguimiento para evaluar el desempeño y cumplimiento del Programa de Manejo y Adecuación Ambiental.
- Informar al Viceministerio de Gestión Ambiental (Dirección de Calidad Ambiental) del Ministerio de Medio Ambiente y Recursos Naturales el desempeño y cumplimiento del PMAA y el desarrollo del Programa de Seguimiento previsto para el proyecto, a través de los Informes de Cumplimiento Ambiental (ICA).
- Verificar y asegurar la efectividad de las medidas de manejo propuestas para evitar los impactos potenciales sobre el acuífero.
- Verificar y asegurar la efectividad de las medidas de manejo propuestas para evitar los impactos potenciales sobre la calidad del aire y la salud de los trabajadores como efectos de las actividades del proyecto.
- Verificar y asegurar la efectividad de las medidas de manejo propuestas para el manejo de residuos salidos y aguas residuales.
- Verificar y asegurar la efectividad de las medidas de manejo propuestas para el manejo del uso irracional de los recursos naturales.
- Verificar y asegurar la efectividad de las medidas de manejo propuestas para evitar la contaminación de las aguas subterráneas.

LOS PROGRAMAS DE MONITOREO INCLUIRÁN

11.10.1 PROGRAMA DE MONITOREO DE LA CALIDAD DEL AIRE

La calidad del aire se verá afectada por fuentes puntuales y por fuentes móviles en razón de lo cual el monitoreo de la calidad del aire se centrará básicamente en estos aspectos, teniendo en cuenta que las principales fuentes serán las áreas donde se realizan los movimientos de tierra y el transporte de los materiales.

Se verificara el registro de mantenimiento de:

- Señalización y delimitación de las áreas de trabajo.
- Los límites de velocidad establecidos.
- El registro del mantenimiento periódico de las maquinarias, equipos y vehículos.
- Regado para el control del polvo.
- Almacenamiento temporal de materiales de obra.
- Recolección y manejo de residuos generados.
- Registro de las mediciones de PST y partículas menores de 10 micras (PM-10) cada seis meses.
- Registros de las mediciones semestrales de CO, CO2, NO2, SO2.
- Monitoreo de la calidad del aire
- Monitoreo de los niveles de emisiones de la planta
- Verificación del contenido de azufre en el combustible

11.10.2 PROGRAMA DE MONITOREO DEL RUIDO

El ruido se evaluará en los sitios en los cuales los niveles pueden incrementarse en función de las actividades desarrolladas, estos sitios se establecieron en el subprograma de manejo de emisiones atmosféricas, para lo cual se plantea lo siguiente:

- Realizar monitoreo cada tres meses.
- Registro del mantenimiento preventivo realizado a maquinarias y equipos.
- Registros de las mediciones de los niveles de ruido.

1.1.1 PROGRAMA DE MONITOREO DEL AGUA

La calidad del agua será utilizada como indicador general del manejo correcto de diferentes actividades entre ellas: la operación de campamentos, la disposición de material sobrante (botaderos), la conformación de la capa de rodadura, la construcción de obras de drenaje y el cumplimiento de las medidas de manejo propuestas para la operación de los equipos y la maquinaria.

El monitoreo de la calidad del agua se hará tanto a los efluentes, como a los cuerpos de agua receptores de los mismo o a aquellos que potencialmente puedan ser afectados por cualquiera de las actividades de obra.

MONITOREO DE EFLUENTES

Aguas residuales domésticas

En los campamentos se evaluará cada seis meses la calidad de las aguas efluentes del sistema de tratamiento y la eficiencia del mismo. Para lo cual se tomará una muestra a la entrada del sistema de tratamiento y otra a la salida del mismo.

Para cada muestra se analizarán los siguientes parámetros: oxígeno disuelto, pH, DBO5, DQO, Sólidos Suspendidos y Coniformes Totales y Fecales. Los resultados de los análisis se compararán con la norma ambiental.

Aguas residuales industriales

Se refiere a la generación de aguas residuales en las áreas operativas (talleres, plantas industriales), tales como las aguas de lavado de equipos, maquinarias, etc., las cuales serán manejadas de manera independiente; se prevé realizar el siguiente monitoreo:

- Evaluar cada seis meses la calidad del efluente de las trampas de grasas y el sedimentador séptico, para verificar la eficiencia del tratamiento dado. Para lo cual se tomará una muestra a la entrada del sistema de tratamiento y otra a la salida del mismo.
- Para cada muestra se analizarán los siguientes parámetros: oxígeno disuelto, pH, DBO5, DQO, Sólidos Suspendidos, Sólidos disueltos, Grasas y Aceites. Los resultados de los análisis se compararán con la norma ambiental.

Monitoreo de cuerpos de agua

Cuerpos de agua próximos a los campamentos, plantas industriales y botaderos:

Semestralmente caracterizar el cuerpo de agua más próximo al sitio de ubicación del campamento, plantas industriales y botaderos en operación. En cada cuerpo de agua a caracterizar, colectar una muestra aguas arriba del sitio de potencial afectación y otra muestra 100 metros aguas abajo.

Para cada muestra se analizarán los siguientes parámetros: oxígeno disuelto, pH, DBO5, DQO, Turbidez, Sólidos Suspendidos, Sólidos disueltos, Grasas y Aceites. Los resultados de los análisis se compararán con la norma de calidad de agua vigente y se determinará si hay afectación o variación de la calidad del cuerpo de agua, en la zona en evaluación.

Cuerpos de agua en los cuales se construirán obras de drenaje:

En los cuerpos de agua en los cuales se debe hacer ocupación temporal del cauce por efecto de la construcción de las obras de drenaje, se realizará un monitoreo tomando dos puntos de muestreo uno aguas arriba y otro aguas abajo (mínimo 100 m o dependiendo de las condiciones de mezcla del cuerpo de agua evaluado).

En cada punto de muestreo, como mínimo se deben evaluar: Sólidos suspendidos, sólidos totales, temperatura, demanda química de oxígeno (DQO) y demanda biológica de oxígeno (DBO5), color, grasas y aceites y turbidez.

Se harán mediciones en tres momentos del proyecto: antes de la intervención (como línea base), durante la ejecución de las obras y después de la ejecución del proyecto, previo al inicio de la operación.

Se evaluará con base en los resultados de dichos monitoreos la afectación del cuerpo de agua y se comparará con la norma de calidad de agua vigente.

11.10.3 CONTROL Y MONITOREO DE VERTIDOS

En los frentes de obras, el campamento, el campamento y las plantas industriales temporales se verificara semestralmente:

- Sistemas de prevención, control y manejo de derrames de hidrocarburos.
- Limpieza y orden en las áreas.
- Estado y funcionamiento del sistema de drenaje de aguas lluvias perimetral.
- Estado y mantenimiento de los equipos y maquinaria empleados.
- Sistemas de prevención, control y manejo de derrames de hidrocarburos.
- Almacenamiento y manejo de combustibles.
- Presencia de manchas de hidrocarburos en el suelo y en los cuerpos de aguas.
- El registro del mantenimiento periódico de las maquinarias, equipos y vehículos.
- Registro de entrega de los aceites usados a gestor autorizado.
- Utilización de sanitarios móviles en los frentes de obras, el campamento y las plantas industriales temporales.

11.10.4 CONTROL Y MONITOREO DE RESIDUOS

Residuos ordinarios (domésticos, material gastable de oficina)

- Monitorear la cantidad de residuos generados,
- La ubicación y condiciones de operación (limpieza, señalización) de los sitios de almacenamiento temporal de residuos y la disposición final de los residuos ordinarios se hará en el vertedero municipal en cada frente de obra, campamento instalaciones temporales.

Residuos especiales (restos de gomas, envases de aceites, combustibles, filtros usados, hormigón asfáltico, AC-30)

Para la disposición final de los residuos especiales se realizan a través de un Gestor autorizado para este tipo de actividad, el cual debe contar con la certificación expedida por el Ministerio de Medio Ambiente y Recursos Naturales.

Material sobrante o escombros

- En los frentes de obra del proyecto se llevará un registro de los escombros generados.
- Hacer seguimiento al adecuado transporte de los escombros (el tapado de los materiales transportado).
- Material depositado en las áreas de los cuerpos de agua.
- Turbidez de las aguas.
- Registro de desechos depositados.
- Botaderos

Para cada sitio de botadero semestralmente se verificara:

- Señalización del área y acordonamiento del material.
- Instalación y funcionamiento de los sistemas de drenaje.
- Control y registros diarios del volumen de materiales dispuesto en cada sitio.
- Disposición y nivelación del material depositado en cada sitio.
- Estado y conformación de los taludes.
- Restauración y reforestación del sitio.

MEDIDAS A IMPLEMENETAR:

<u>En el campamento y frentes de obra.</u>

- No dejar residuos sólidos dispersos (restos de gomas, papeles, embases) al momento de la desmantelar los campamentos, oficinas de campo y comedores.
- En caso de que se tenga presencia de hidrocarburos en los suelos, sanear los suelos contaminados un gestor autorizado por el Viceministerio de Gestión Ambiental.
- Manejo de las áreas de plantas industriales

La adecuación y manejo de estas plantas industriales deberá considerar las siguientes medidas de manejo ambiental:

- La disposición final de los residuos de las plantas de concreto y asfalto será manejada por un gestor autorizado por el Viceministerio de Gestión Ambiental.
- Los residuos de agregados y asfalto se manejarán como residuos especiales y de acuerdo al procedimiento establecido para el manejo de residuos sólidos. No se permitirá la disposición de estos residuos en el derecho de vía o en lugares próximos a cuerpos de agua.
- Eliminar los sitios de almacenamiento temporal de materiales pétreos.
- En caso de derrame de mezcla de concreto o de asfalto, ésta se deberá recoger y trasladar al sitio destinado para la disposición de escombros. La zona donde se presente el derrame se deberá limpiar, de tal forma que no quede evidencia del vertimiento presentado.

Zonas de préstamo y canteras

- Elaborar plan de cierre de las áreas utilizadas en las canteras para la extracción de materiales de construcción autorizadas con Permiso por el Viceministerio de Suelos y Aguas.
- Evaluar el manejo de las canteras para asegurar que la gestión se ha realizado acorde a los lineamientos establecidos en la legislación ambiental y laboral.

Botaderos

- Al igual que con las canteras se debe realizar un plan de cierre de las zonas utilizadas como sitios de disposición de materiales.
- Realizar la restauración superficial, revegetación y cierre adecuado de los sitios.

11.10.5 MANEJO Y CONTROL DE LOS SUELOS

Se llevará a cabo el monitoreo de potenciales eventos de contaminación en los suelos de las inmediaciones de la obra y depósitos, almacenes o acopios de material y residuos, así como la calidad de las aguas en los principales cuerpos de agua.

11.10.6 MANEJO DE LA FLORA Y FAUNA TERRESTRE

Durante la fase de operación cuando se ejecuten los trabajos de mantenimiento y limpieza, de cunetas y control de maleza del proyecto el técnico encargado llevará un registro de todas las actividades, realizada para ver el progreso de las plantas, carencias, cualquier aspecto relevante. Durante la fase de construcción se verificara:

- Cantidad de especies autóctonas usadas en la restauración.
- Registro de las actividades de siembra y plantación.
- Cantidad de plantas obtenidas, plantadas y por ciento de supervivencia.
- Relación de área incluida dentro del área verde o reforestada.

Se realizarán conteos periódicos de supervivencia y se repondrán las fallas observadas.

11.10.7 MONITOREO A LA PREVENCIÓN DE ACCIDENTES A MORADORES Y USUARIOS

Diariamente se verificara que:

- Todas las áreas de trabajo, demarcadas y señalizadas.
- Todos los caminos de acceso que utilizará el proyecto, señalizados.
- Las señales Preventivas para indicar las entradas y salidas de camiones a 500, 300, 200 y 100 metros.
- El personal con banderola en cada una de las intercepciones de las calles utilizadas como accesos.
- Los límites de velocidad para el tránsito de todo tipo de vehículo por los caminos utilizados como accesos al área de construcción.
- Estadísticas del desempeño del Subprograma.
- Registros de Incidentes y Accidentes.

11.10.8 MANEJO DE SALUD Y SEGURIDAD LABORAL

Los parámetros a monitorear serán los siguientes:

- Estadísticas del desempeño del Subprograma.
- Registros de Salud.
- Registros de Incidentes y Accidentes.

11.10.9 MONITOREO Y SEGUIMIENTO A LA GESTIÓN SOCIAL

Información y comunicación a la comunidad

- Número de reuniones realizadas con la comunidad.
- Número de reuniones realizadas con instituciones.
- Número de quejas/reclamos recibidos.
- Número de quejas/reclamos resueltos.

- Control de entrega de afiches de divulgación y volantes de información.
- Contenido, lista de asistentes y actas de las reuniones informativas de inicio y avance y con las comunidades del área de influencia directa.
- Programación de reuniones.
- Registros de inquietudes, quejas y/o reclamos recibidos y resueltos en los Puntos de Información a la Comunidad (PIC).

Generación de empleo

Los parámetros a monitorear serán los siguientes:

- Número de Reuniones realizadas para selección y contratación de mano de obra.
- Número de convocatorias realizadas para ofertar empleo Programación, actas y lista de asistencia a reuniones informativas.
- Número y tipo de empleos y contratos Registro de aspirantes que atendieron las convocatorias y criterios de calificación empleados en la selección; así como también el registro de aspirantes contratados.
- Registros de la mano de obra calificada y no calificada contratada perteneciente a la comunidad del área de influencia del proyecto.

Adquisición de bienes y servicios locales

- Tipo, cantidad y costo de los bienes y servicios adquiridos por localidad en el área de influencia del Proyecto.
- Tipo y cantidad de bienes y servicios adquiridos en otras localidades afuera del área de influencia del Proyecto.

Educación y capacitación en ambiente y seguridad al personal

- Tipo y cantidad de cursos ofrecidos.
- Número de Participantes a cada uno de los cursos ofrecidos.
- Cantidad de horas de capacitación por temas.

Fase de operación

Desmantelamiento de campamento e instalaciones temporales. Al desmantelar el campamento y las instalaciones temporales se verificará que:

- El suelo esté libre de manchas de combustible u otro producto.
- La limpieza y disposición de los residuos de canales o cunetas revestidas y áreas duras en general.
- Demolición de las estructuras y disposición de los escombros.
- La clausura de los sistemas de tratamiento y retirados del lugar.
- Concluido el desmonte y limpieza de las instalaciones temporales, se hará una inspección detallada del área para evaluar las necesidades y el alcance de la limpieza y la restauración ambiental que deben desarrollarse en cada uno de los sitios para su cierre definitivo.

11.11 PROGRAMA DE MANEJO Y ACOPIO DE INSUMOS

En la Central se almacenarán distintos materiales, insumos y sustancias que se utilizan durante su operación, como ser:

- Carbón,
- Cenizas,
- Cal,
- Arena,
- Aceites, lubricantes, grasas y solventes (para uso en mantenimiento y reparaciones)
- Aditivos para los procesos de tratamiento de aguas (sanitarias, potable e industriales)

Para el acopio y transporte de carbón deberá controlarse el cumplimiento de las especificaciones realizadas en la descripción de proyecto, ya que de esta manera se impide la generación de numerosas fuentes difusas de material particulado. Para todas las torres de transferencia se dispondrán sistema de captura de polvos a través de sistemas de depresión, por cuanto deberán llevarse registros del mantenimiento y auditoría de dichas instalaciones de forma tal de prevenir incidentes por roturas.

Para el caso de los filtros manga que retengan partículas con contenido de carbón deberán implementarse medidas de puesta a tierra, para evitar corrientes electrostáticas que favorezcan la ocurrencia de incendios o explosiones, con el consecuente escape del particulado. También se dispondrán discos de alivio para evitar el colapso de la estructura de algunas de las mangas en caso de incendio o explosión.

Los aditivos, aceites, lubricantes grasas, resinas, solventes, etc., serán almacenados en recintos especialmente acondicionados para tal fin. No se colocaran en el mismo recinto sustancias que puedan reaccionar entre sí, que sean incompatibles, inflamables o reactivas.

Se identificará inequívocamente cada contenedor, detallando el tipo de sustancia que almacena, sus especificaciones de seguridad y acción a tomar en caso de derrame, incidente o incendio.

Todos los depósitos contarán con sistemas de control de incendio, salidas de escape y protección ante la generación de gases tóxicos, acordes al tipo de sustancias que en ellos se almacene.

12.0 DEPÓSITO DE CENIZAS

Como es sabido, el proceso de generación energética a partir del Carbón genera cenizas, y por lo tanto la necesidad de construir un depósito especialmente diseñado para ello.

Se estima que para un carbón con una composición típica con un máximo de 3.7% de azufre, el contenido de cenizas (porcentaje peso) debería estar en torno al 15.4%, es decir, 0,154 kg de cenizas/kg de carbón quemado en la caldera. Por lo tanto para un consumo a plena carga de 120 t/h de carbón (para generación de 360 MW) se podría esperar una producción de cenizas de 11 t/h (equivalente el 0.09%); como son 2 unidades seria el doble de cenizas, osea 22 t/h.

La ceniza producto de la combustión de carbón, se divide en un 20% de ceniza de fondo y un 80% de ceniza volante. Estos productos se manejan y almacenan en silos diferentes, debido principalmente a su diferente granulometría. Entre las características físicas de las cenizas, se destaca una fina granulometría. Aproximadamente el 80% tiene un tamaño inferior a 74 micrones, lo que se traduce una vez compactada, en una permeabilidad del orden de 10^-5 cm/seg, valor propio de limos y/o arcillas meteorizadas. Lo anterior equivale a decir que la infiltración de las cenizas es muy baja y por lo tanto de un drenaje muy escaso.

La escoria, o ceniza de fondo (que se acumula al fondo de la caldera) tiene en cambio características de arena – gravilla, llegando a 2 y 3 cm de tamaño máximo que puede reducirse por trituración. Se debe tener en cuenta que ambos materiales se manejarán mezclados y que el porcentaje de cenizas es muy superior al de la escoria, por lo que predominarán masivamente las características de las cenizas.

Es importante considerar que el material debe colocarse (en el depósito) con una humedad cercana al 25%. Esta humedad corresponde a la humedad óptima que debe ser verificada posteriormente con ensayes de laboratorio.

La humedad será aportada por agua a la salida del silo respectivo.
Esta adición de agua cumple la finalidad de reducir las emisiones durante el manejo y compactación en el depósito.

Las cenizas que se producen como subproducto de la generación de energía de la Central Termoeléctrica se disponen en un depósito de cenizas.

Para el primer año de operación del proyecto, se dispondrá de un área de 73,000 m2 consistente en una plataforma rectangular de 108m de ancho por 677m de largo, dentro del área de la planta; con una profundidad de 6m.

Para la disposición de cenizas de los años posteriores, el PROPIETARIO dispondrá de un área, fuera del sitio de la planta, para estos fines.

12.1 PRODUCCIÓN DE CENIZAS

Las cenizas se comienzan a generar el año 2016 con el inicio de funcionamiento de la Central. Hasta el año 2036 se genera un volumen total de 18, 921,600 millones de m3. El volumen anual de generación de cenizas a partir del año 2016 es de 946,080 m3.

12.2 MEDIDAS A IMPLEMENTAR

Humectación de patios de acopio de carbón

La humectación de las pilas de carbón, es un método efectivo para evitar la emisión de partículas por la acción del viento, Sin embargo la humectación genera lixiviados, erosión y arrastre de partículas en las pilas, por lo que se requiere que la humectación sea calculada para mantener una húmeda constante sin excesos de agua.

Aislamiento de pilas de carbón

Es necesario aislar las pilas de la acción viento, construyendo barreras artificiales (como en nuestro caso) o naturales constituidos por franjas de vegetación.

Humectación de escombreras de ceniza

Las cenizas dispuestas en capas en las pilas de acopio en la escombrera serán regadas para evitar su resecamiento y mayor volatilidad, teniendo cuidado de no exceder la cantidad de agua que se aplique, en un volumen tal que no se produzca escurrimiento y erosión del material apilado.

Revegetalización de escombrera de cenizas

En la escombrera de ceniza, ya conformada por vía seca, por lo menos cada año, se deberá redistribuir una capa de suelo sobre la pila, para realizar la revegetalización con el fin de minimizar la emisión de partículas de polvo por la acción del viento.

12.3 OPERACIÓN Y CIERRE DEL DEPÓSITO

12.3.1 SECUENCIA CONSTRUCTIVA DEL DEPÓSITO

Las cenizas se dispondrán en capas horizontales de 4 m de alto, de una superficie variable en cada capa o banco.

Al momento de ser transportada al depósito, se humedece hasta que tenga una humedad de por lo menos un 12%, con lo cual, debido a la fuerza capilar del agua, se evita que se provoque dispersión de éstas por acción del viento. Por otra parte, al llegar al depósito, la ceniza se esparce y se compacta con un rodillo para que se endurezca, evitando de esta manera que la ceniza

depositada quede expuesta a la erosión del viento y se levante polvo. La superficie expuesta al viento no podrá ser mayor a 4.000 m2.

El material será transportado en camiones tolva, los cuales pesan entre 1,2 y 1,5 t/m3 cargados con cenizas. Antes de ser transportado, el material se humidificará agregándosele agua de mar en un 25% de su peso, con el objeto de simplificar el trabajo de terreno y no tener que transportar agua especialmente en camiones aljibe para agregarla en terreno.

Este proceso de humidificación se realizará dentro del área del Proyecto, donde se mezclará adecuadamente el material seco con el agua en las proporciones indicadas y luego se cargará en los camiones que llevará el material húmedo al vertedero para su colocación.

Se deberá verificar visualmente la humedad en el momento de colocarse los rellenos. En los casos en que la humedad no cumpla con la uniformidad esperada y se aprecien sectores más secos, se deberá efectuar el riego necesario de manera de producir humedades uniformes antes de la colocación.
La construcción de las celdas será secuencial. El llenado del depósito se hará rellenando desde los puntos más bajos a los más altos.

12.3.2 PROTECCIÓN AL MOMENTO DEL CIERRE

Para el saneamiento superficial del depósito sólo se considera cubrirlo con un relleno en base a material existente de 0,3 m de espesor en toda la superficie que queda expuesta a la acción del clima.
Cuando el depósito quede sin operar durante un tiempo prolongado, se cubrirá con un relleno de tierra transitorio de 0,3 m de espesor. De esta forma se evitará que durante estos periodos se provoque el secado superficial de las cenizas y la posterior suspensión de ellas producto del viento.

4.0 TERMINOS Y DEFINICIONES

1) **Objetivo de Calidad de la Empresa (OCE):** Compromiso general del CONSORCIO para demostrar el cumplimiento con los requisitos del cliente, buscando la eficiencia y efectividad de nuestros proceso internos.

2) **Objetivo Ambiental de Empresa (OAE):** Compromiso general del CONSORCIO para demostrar el cumplimiento con la prevención de la contaminación.

3) **Meta Ambiental de Empresa (MAE):**indicador de medición de actividades enfocadas al logro del Objetivo Ambiental

5.0 ANEXOS

5.1 PROGRAMA DE OBJETIVOS Y METAS AMBIENTALES

5.2 REPORTE GERENCIAL DE OBJETIVOS Y METAS AMBIENTALES

6.0 RESPONSABILIDADES

De acuerdo a la siguiente tabla:

Actividad / Área responsable de la acción	SGAC/ SSMA y CC	DP
Identificación y propuesta de metas	X	
Validación de metas		X
Generación de reportes mensuales	X	X
Toma de acciones en caso de incumplimiento de las metas		X
Emisión de acciones correctivas en caso de tendencias negativas de las metas	X	
Retroalimentación de las metas para el siguiente año	X	

Nota:

SGAC: Subgerencia de Aseguramiento de Calidad

SSMA y CC: Gerencia de Seguridad, Salud y Medio Ambiente y Control de Calidad

DP: Director de Proyecto

7.0 PROCESO

Las metas ambientales específicas del proyecto deberán tomar en cuenta:

- Aspectos ambientales significativos del proyecto,
- Tendencias de generación de residuos en proyectos anteriores o similares,
- Opciones tecnológicas de construcción,
- Necesidad de recursos financieros de proyecto,
- Puntos de vista de terceras partes o del cliente.

Las metas ambientales específicas del proyecto deben ser cuantificables y enfocadas al logro del objetivo ambiental del CONSORCIO y al Programa de Manejo y Adecuación Ambiental aprobado por el Ministerio Ambiente.

Una vez definidas las metas ambientales se deberá elaborar el programa de seguimiento a las actividades ambientales, así como, el personal responsable de su cumplimiento o seguimiento. Para esto se sugiere el registro del programa en el Anexo 5.1.

Para el cumplimiento de las metas ambientales se revisarán mensualmente con el Gerente de Proyecto conforme al programa establecido y se deberán tomar las acciones que sean necesarias cuando se detecten irregularidades o incumplimientos. El reporte deberá ser emitido mensualmente por el personal de medio ambiente en el Anexo 5.2 con el visto bueno del Director del proyecto.

Cuando se identifiquen meses con una generación superior a la meta ambiental del proyecto se deberá medir y analizar si la tendencia trimestral presenta un aumento en la generación estimada, ya que, puede ser un evento puntual del proyecto; las acciones a tomar serán el reajuste de la meta de acuerdo con el comportamiento desde los 6 meses anteriores al aumento en la generación de residuos. La evidencia de cumplimiento de los objetivos de calidad y ambientales en proyectos y áreas funcionales será de acuerdo a las tablas siguientes:

8.0 PROYECTO

OBJETIVO	ALCANCE	META	REGISTRO/REPORTE/ PERIODICIDAD	TENDENCIA NEGATIVA
1. Cumplir con los requisitos de costo y plazo de ejecución, de acuerdo al contrato	Calidad y Proyectos	Mantener el costo y el plazo de ejecución dentro de lo establecido en el contrato	Reporte gerencial de revisión de proyectos	Falta de entrega del reporte en 3 meses.
2. Cumplir con los requisitos de protección ambiental, de acuerdo al contrato	Ambiental y Proyectos	100% de cumplimiento de los requisitos ambientales legales aplicables al proyecto	Reporte gerencial de revisión de proyectos	Incumplimientos ambientales por 2 meses consecutivos, por razones atribuibles a la falta de información del proyecto
3. Asegurar confiabilidad y consistencia en los proyectos	Calidad, Ambiental y Proyectos	Iniciar el proyecto con el Manual de Procedimientos (MP), Plan de Calidad y	MP y PC y MA del proyecto	No tener aprobados estos documentos a los 3 meses de la firma del contrato.

		Medio Ambiente (PC y MA) y mantenerlos actualizados con base en los resultados de auditorías y monitoreos	
4. Mantener la generación de residuos peligrosos	Ambiental y Proyectos	Mantener la generación de residuos peligrosos por debajo de la meta aplicable al proyecto	Indicador por arriba de la meta por 3 meses, sin tener evidencias de acciones de ajuste
5. Reducir la generación de residuos no peligrosos	Ambiental y Proyectos	Mantener la generación de residuos sólidos por debajo de la meta aplicable al proyecto	Indicador por arriba de la meta por 3 meses, sin tener evidencias de acciones de ajuste

AREAS FUNCIONALES

OBJETIVO	ALCANCE	META	REGISTRO/REPORTE/ PERIODICIDAD	TENDENCIA NEGATIVA
Asegurar confiabilidad y consistencia en los proyectos	Calidad, Gerencia y funcionales	Mantener actualizados los procedimientos del área	Programa de actualización de procedimientos	**No cumplir con el programa de actualización en menos del 70% por 3 meses.**

Cuando se presenten tendencias negativas en el cumplimiento de las metas de calidad y medio ambiente se deberá emitir la acción correctiva a la gerencia funcional responsable del proceso.

9.0 SEGURIDAD Y PROTECCIÓN AMBIENTAL

No aplica.

1.0 ALCANCE

El alcance de este plan es definir la estructuración, organización y la planificación de la Gestión de Salud y Medio Ambiente – SMA; métodos aplicables y directrices para prevenir , identificar y controlar los riesgos que puedan afectar a las personas, a las instalaciones y al medio ambiente durante las actividades del proyecto Termoeléctrico Punta Catalina, a la par de atender a los requisitos legales, contractuales,asegurando con ello, el cumplimiento de los requerimientos del CLIENTE y requerimientos legales de SMA en Republica Dominicana.

También tiene el alcance para asegurar la consolidación de los equipos que componen el CONSORCIO, que promuevan la cultura de seguridad, salud en el trabajo, respeto por la cultura local y aspectos ambientales, proyectando una imagen positiva para todas las partes interesadas.

Todos los subcontratistas que lleven a cabo actividades en el proyecto Termoeléctrico Punta Catalina, deben cumplir las directrices establecidas en el Plan de forma obligatoria.

EL plan debe ser revisado y actualizado cuando sea necesario o cuando se pase de una fase de trabajo a otra, incorporando todos los cambios en requerimientos legales y contractuales.

Durante la fase de ejecución de la obra, cualquier cambio debe ser autorizado por la administración del CONSORCIO de la obra. Todas las partes deben ser informadas de las revisiones subsecuentes.

En caso de que las actividades sean realizadas por los miembros del CONSORCIO, la supervisión quedara bajo responsabilidad del CLIENTE, como asistencia de Arranque, y pruebas de Desempeño, este procedimiento debe ser utilizado solo como referencia para los elementos no cubiertos por los documentos de SMA de las partes Responsables.

2.0 CAMPO DE APLICACIÓN

Este plan debe ser aplicado por todos los miembros del CONSORCIO, sus subcontratistas, Proveedores y Vendedores presentes en la obra, en cualquier fase de ejecución del proyecto: Construcción, Pre-Comisionamiento y Puesta en Marcha.

3.0 REFEREANCIAS

El programa integrado de Salud, Seguridad en el Trabajo y Medio Ambiente se fundamenta en los requisitos de las siguientes normas internacionales:

- Norma ISO 14001 (NBR ISO 14001- Edición 2004) - Sistema de Gestión Ambiental, especificación y directivas de uso.
- Normas OHSAS 18001 (Edición 1999) – Sistemas de Gestión de Seguridad y Salud Ocupacional.
- Norma "British Standard" - BS 8800 (Edición 1996) - Guía para Sistemas de Gestión de la Seguridad y Salud en el Trabajo.
- Decreto Núm. 522-06, REGLAMENTO DE SEGURIDAD Y SALUD EN EL TRABAJO

4.0 POLÍTICA CORPORATIVA DE SALUD Y MEDIO AMBIENTE (SMA)

El pilar fundamental del Programa Integrado de SMA y del sistema de gestión y manejo ambiental para el proyecto "Termoeléctrico Punta Catalina" está conformado por las Políticas Integradas de Salud y Medio Ambiente de los integrantes del CONSORCIO.

4.1 POLÍTICA INTEGRADA DE SALUD Y MEDIO AMBIENTE (SMA)

El CONSORCIO, ha establecido una Política Integrada de Salud y Medio Ambiente (SMA) fundamentada en los siguientes principios:

- Cumplir con la normativa legal y los demás requisitos aplicables;
- Supervisión y administración adecuada de los aspectos ambientales y la salud, con objetivos y metas definidos para cada emprendimiento;
- Mejorar continuamente los resultados, dando prioridad a la prevención en lo que concierne a la Salud Ocupacional y el Medio Ambiente;
- Desempeñarse empresarialmente de forma responsable en términos sociales y ambientales.
- La responsabilidad de llevar a la práctica el Programa Integrado de SMA, mediante la delegación planificada y la concientización de las personas, corresponde:
  - Responsabilidad Institucional Estratégica: del Presidente (Líder Empresarial) y del Directorio (Directores Superintendentes y Organización Dinámica del Líder Empresarial);
  - Responsabilidad Empresarial: de los Directores de Contrato en los emprendimientos /contratos;
  - Responsabilidad Operativa: de cada Integrante ejecutor directo de las tareas en todas las áreas de trabajo en los contratos.

El área de Salud y Medio Ambiente (SMA), será responsable de difundir y supervisar la implementación del Sistema de Gestión y Manejo Ambiental (SGMA); actuando como activador y facilitador de la implementación, brindando apoyo a los equipos que dirigen la obra en las acciones proactivas y reactivas que correspondan.

4.2 OBJETIVOS

El SMA presenta los siguientes objetivos centrales:

- Garantizar resultados competitivos y continuidad operativa de los Proyectos/ Contratos a través del buen desempeño en SMA;
- Consolidar SMA como valor agregado para la actividad y activo tangible e intangible;
- Establecer Directrices Institucionales para SMA, respetando el concepto de la Delegación Planificada;
- Fomentar el respeto por las características ambientales y culturales en la implementación de los Proyectos/ Contratos;
- Mantener la buena reputación de la empresa proyectando una imagen cada vez más positiva ante las Partes Interesadas;
- Definir un estándar integrado en SMA de forma didáctica y estructurado en el concepto de Pilares de Sustento;
- Definir componentes mínimos integrantes de este proceso a través la estandarización de herramientas y procedimientos técnicos asegurando así una nivelación de las mejores prácticas de gestión de SMA;
- Optimizar la priorización en la asignación de recursos, dimensionamiento de equipos y previsión de retorno de inversiones, contemplando todas las etapas de los Proyectos / Contratos desde la "preparación del presupuesto" hasta la "desmovilización";
- Asegurar la generación de informaciones operativas, gerenciales de SMA, a través de Indicadores de Desempeño;
- Subsidiar el cumplimiento de los requerimientos para obtención de financiamientos y otras operaciones ante las Instituciones Financieras / Aseguradoras;
- Fomentar el intercambio de informaciones y lecciones aprendidas en SMA entre los Proyectos/ Contratos.

4.3 DOCUMENTOS Y PROCEDIMIENTOS EN REFERENCIA

I. Documentos

- Índice de Documentos Corporativos del Programa Integrado de SMA

- Manual del Programa Integrado de SMA
- Plan general de Salud, Seguridad en el trabajo, y Medio Ambiente
- Preparación y Respuesta a Emergencias
- Capacitación para el Trabajo
- Mejora Continua
- Auditorías internas del Programa Integrado de SMA
- Normas Internacionales de Gestión de Salud y Medio Ambiente
- Requisitos Contractuales de Salud Ocupacional y Medio Ambiente.
- Reglamento de Salud y Medio ambiente de Republica Dominicana

II. Procedimientos que Integran El Plan

- Manual del programa integrado SMA
- Plan de Gestión de Salud y Medio Ambiente
- Capacitación en general
- Charla diaria de Salud y Medio Ambiente
- Plan de emergencia y contingencia general de SMA
- Cualimetria (control de SMA de los lideres)
- Uso de Ambulancia
- Pergo-Ergonomía
- Salud Colectiva

5.0 DEFINICIONES Y ABREVIATURAS

I. Definiciones

Se aplican términos y definiciones establecidas en los documentos siguientes:

- **Accidente:** Incidente que tuvo como resultado lesión, enfermedad o muerte o daño material.

- **Accidente Grave:** Evento que tuvo como resultado muerte o incapacidad permanente total o parcial del Integrante, Prestador de Servicios o Subcontratista, o daño material de gran magnitud o degradación de la calidad ambiental a gran escala.

- **Acción Correctiva:** Acción adoptada por el Proyecto / Contrato para eliminar la causa básica o raíz de una Disconformidad identificada, previniendo su recurrencia.

- **Acción Preventiva:** Acción adoptada por el Proyecto / Contrato para eliminar la causa básica o raíz de una potencial Disconformidad identificada, previniendo su ocurrencia.

- **Entorno de Trabajo:** Cualquier ambiente físico en que se realicen actividades relacionadas con el trabajo bajo control de los Proyectos/ Contratos. Considerar como actividades relacionadas con el trabajo, aquellas realizadas por los Integrantes en tránsito, de viaje o donde un cliente actuando en nombre de la empresa.

- **Áreas Degradadas:** Aquellas que después del trastorno resultante de procesos naturales o antrópicos hayan perdido o reducido sus medios de regeneración natural o algunas de sus propiedades, tales como la calidad o la capacidad productiva, presentando baja resistencia, siendo necesaria la acción antrópica para su recuperación.

- **Áreas Perturbadas:** Área que sufrió trastorno pero mantiene sus medios de regeneración biótica.

- **Áreas de Residencia:** Áreas destinadas a suplir las necesidades básicas humanas de alimentación, higiene, descanso, esparcimiento y convivencia, físicamente separada de los entornos de trabajo.

- **Aspecto Ambiental:** Elemento de las actividades, productos o servicios del Proyecto / Contrato que puede interactuar con el medio ambiente y generar un impacto ambiental.

- **Actividad:** Operación o conjunto de operaciones realizadas en las diversas áreas de los Proyectos/ Contratos.

- **Auditoría:** Proceso sistemático, documentado e independiente, para obtener evidencia de la auditoría y evaluarla objetivamente para determinar la extensión en la cual se cumplen los criterios de auditoría.

- **Auditoria sistemática**: Proceso independiente y documentado que se realiza para obtener evidencia y evaluarla para determinar en qué medida los criterios auditables son cumplidos.

- **Causa Básica / Raíz:** Causa de ocurrencia de una Disconformidad obtenida mediante un proceso de investigación consistente, global y registrado, a partir del cual pueden establecerse acciones preventivas o correctivas.

- **Centro de Trabajo:** Cualquier localización física en donde se realicen actividades de trabajo bajo el control de la organización.

- **Concepto 5W+2H:** Concepto empleado para preparación de Programas de Gestión de SMA que define: Dónde, Qué, Por qué, Quién, Cuándo, Cómo y Cuánto.

- **Contaminación:** Presencia en el ambiente de elementos nocivos para la salud o para organismos del ecosistema por encima de los estándares ambientales o límites de tolerancia, tales como organismos patógenos, sustancias tóxicas o radioactivas.

- **Control Operativo / Procedimiento:** Documentos del Programa Integrado de SMA, que describen "Qué" debe hacerse para la ejecución de determinado proceso / actividad considerando los requerimientos de prevención en SMA.

- **Control Operativo / Instrucción de Trabajo**: Documentos resultantes de Procedimientos del Programa Integrado de SMA a ser preparados en cada Proyecto / Contrato, que contienen rutinas específicas y mayor detalle, según sea necesario, que describen "Cómo" debe realizarse la ejecución de determinado proceso / actividad considerando los requerimientos de prevención en SMA.

- **Cuasi Accidente:** Incidente en el que no ocurre lesión, enfermedad ni fatalidad.

- **Daño**: Consecuencia / severidad causada por la ocurrencia de peligro.

- **Disconformidad:** Incumplimiento de un requerimiento especificado en el Programa Integrado de SMA, como por ejemplo, incidentes, accidentes, procedimientos, prácticas, requerimientos legales, etc.

- **Documento :** Información y su sustento

- **EIA PMAA:** estudio de impacto ambiental y respectivo informe de impacto al medio ambiente y plan de manejo y adecuación ambiental,

- **Enfermedad:** Condición mental, física o social adversa identificable que surgió y/o se agravó debido a una actividad ocupacional o relacionada con el trabajo.

- **Equipo Dirigente:** Grupo de representantes o responsables de las Gerencias / Áreas de un Proyecto, responsables de la gestión de los procesos.

- **Escenario / Situación de Emergencia:** Eventos o condiciones no planeadas e identificables, con potencial de causar polución o riesgos para la seguridad laboral y salud ocupacional, que implican un estado de perturbación parcial o total del Proyecto / Contrato y requieren, dependiendo de su magnitud y grado, procedimientos especiales y/o ayuda externa.

  Normalmente son ejemplos: incendios, explosiones, fugas de equipos y/o de líquidos peligrosos y/o inflamables, accidentes de transporte, derrame de combustibles, accidentes de trabajo, intoxicación alimentaria, falla y/o colapso de estructuras y de sistemas de control ambiental, etc.

- **Estándares Ambientales:** Valor límite adoptado como requerimiento normativo de un parámetro de Calidad Ambiental, pudiendo dividirse en: Estándar de Calidad, de Emisión / Vertido o de Condicionamiento y Diseño.

- **Evaluación de Riesgos:** Proceso de evaluación del riesgo generado de un peligro que tomando en cuenta la adecuación de los controles existentes y decide si el riesgo es aceptable o no.

- **Evento de Crisis:** Ocurrencia de un evento o serie de eventos no planeados con potencial significativo para provocar impactos en la continuidad operativa y reputación del Proyecto / Contrato como resultado de la imposición de responsabilidades legales, económicas, ambientales, o para afectar la salud y el bienestar de los Integrantes o de la Comunidad. Son eventos que extrapolan el ámbito de actuación de SMA.

- **Evidencia Objetiva:** Hechos, Declaraciones, Informaciones, Constataciones que sean verificables.

- **FISPQ:** Ficha de Informaciones de Seguridad de Productos Químicos.

- **GHE:** Grupo Homogéneo de Exposición / Grupo de Similitud de Riesgo, corresponde a un grupo de integrantes que experimentan exposición semejante, de modo que el resultado proporcionado por la evaluación de la exposición de cualquier componente del grupo sea representativo de la exposición del universo total de integrantes del mismo grupo.

- **Identificación de peligros:** Proceso de reconocimiento de un peligro existente y de definición de sus características.

- **Impacto Ambiental:** Cualquier modificación en el Medio Ambiente, adversa o benéfica, que resulte, en su totalidad o en parte, de los temas ambientales identificados.

- **Incidente:** Evento relacionado con el trabajo en el cual podría haber ocurrido una lesión o una enfermedad, independientemente de su gravedad / severidad / consecuencia (magnitud del daño).

- **Integrante:** Corresponde al trabajador del Proyecto / Contrato.

- **Medición:** Actividades de seguimiento de determinado parámetro, a lo largo del tiempo, cuyos resultados obtenidos son cuantificados y comparados con referencias establecidas de carácter legal, de buenas prácticas o contractual del Cliente.

- **Medio Ambiente:** Inmediaciones en las que el Proyecto / Contrato opera, incluyendo aire, agua, suelo, recursos naturales, flora, fauna, seres humanos y sus interrelaciones.

- **Mejora Continua:** Proceso recurrente de progreso del Programa Integrado de SMA, con el fin de alcanzar el perfeccionamiento del Desempeño en SMA general del Proyecto / Contrato, del mercado de actuación y de la empresa como un todo, de forma alineada con la Política Integrada de SMA del CONSORCIO.

- **Meta de SMA:** Requerimiento de Desempeño detallado aplicable al Proyecto / Contrato como un todo o parte de éste, resultante del desdoblamiento de un objetivo y establecido para permitir, cumplir / alcanzar tal objetivo.

- **Miembros Contratistas** – Tecnimont –Italy, Odebrecht e Ingeniería Estrella

- **Monitoreo:** Actividades de seguimiento de determinado parámetro, a lo largo del tiempo, cuyos resultados obtenidos puedan cuantificarse o calificarse sirviendo de base de análisis para interpretación y verificación del comportamiento o tendencia de dicho parámetro, variable o práctica.

- **MSDS:** Material Safety Data Sheet – Sigla inglesa correspondiente a Hoja de Datos de Seguridad del material.

- **No conformidad:** Un elemento necesario/obligatorio no cumplido.

- **Objetivo de SMA:** Propósito de SMA resultante de la implementación de la Política de SMA que el Proyecto / Contrato se propone alcanzar.

- **Otro Contratista:** se refiere a otro contratista, consultor, artista, persona de negocios o cualquier otro individuo o empresa contratado por el CLIENTE para realizar trabajo relacionado con el Proyecto diferentes del Contratista y Sub Contratista.

- **Otros Requerimientos:** Documentos asociados a Normas Técnicas, Requerimientos Contractuales de Clientes, Términos de Ajuste de Conducta, Convenios o Acuerdos Colectivos, etc., relacionados con Seguridad, Salud y Medio Ambiente aplicables a los Proyectos/ Contratos.

- **Planificación/Programa de Salud, Seguridad en el Trabajo y Medio Ambiente P-SMA**: documento que define las prácticas, recursos, actividades y medidas de control relativas a la Seguridad, Salud, Trabajo y Medio Ambiente bajo directrices del CONSORCIO.

- **Partes Interesadas:** Individuo o grupo interesado o afectado por el Desempeño en SMA del Proyecto / Contrato.

- **Pasivo Ambiental:** Situación de plan ambiental a realizarse para mitigación / remediación de impactos ambientales generados como resultado de prácticas anteriores que hayan causado degradación ambiental (ejemplos: residuos sólidos enterrados, áreas con erosión o degradadas).

- **Peligro:** Fuente, situación o acto con potencial de daño respecto a lesión o enfermedad o, daños materiales o una combinación de éstos.

- **Polución:** La degradación de la calidad ambiental resultante de actividades que directa o indirectamente:
  - Perjudiquen la salud, la seguridad y el bienestar de la población;
  - Creen condiciones adversas para las actividades sociales y económicas;
  - Afecten desfavorablemente la fauna y flora;
  - Afecten las condiciones estéticas o sanitarias del medio ambiente;
  - Generen materia o energía en contravención de los estándares ambientales establecidos

- **Prestador de Servicios:** Empresa externa contratada para prestación de servicios asociados a una actividad fuera del alcance del Proyecto / Contrato.

- **Prevención en SMA:** Uso de procesos, prácticas, técnicas, materiales, productos, servicios o procedimientos para evitar, reducir o controlar la ocurrencia de cualesquier incidentes, accidentes, lesiones, exposiciones o la generación de un impacto ambiental adverso.

- **Prevención Primaria – Inmunización**: Plan de inmunización que contempla una serie de vacunas administradas conforme el programa de vacunación oficial, así como el regional y estacional, en los Proyectos/ Contratos.

- **Prevención Primaria – Promoción de la Salud:** Métodos de ayudar a las personas con el fin de modificar sus hábitos y estilo de vida, orientado a la prevención de enfermedades degenerativas, metabólicas, etc., originadas de estos factores causales con reflejos sobre la calidad de vida y productividad de los Integrantes.

- **Procedimiento:** Forma especificada para ejecutar un Proceso o una Actividad.

- **Proceso:** Conjunto de actividades interrelacionadas que transforman insumos (Entradas) en Productos / Servicios (Salidas) realizados en las diversas áreas de los Proyectos/ Contratos.

- **Programas de Acción – PA**: Denominación que trata de un Programa de Acción con metas acordadas entre el Director del Contrato, las Gerencias y los demás niveles de jefatura del Proyecto / Contrato.

- **Programa de Gestión de SMA:** Documento que contempla el conjunto de Acciones / Medios, Plazos y Responsables de la consecución de los Objetivos / Metas de SMA del Proyecto / Contrato y, eventualmente, del propio PA, en general preparado en base al concepto de 5W+2H.

- **Proyecto / Contrato:** Empresa constituida como persona jurídica, incluso bajo el régimen de CONSORCIO, que posea funciones y administración propias y tenga por objeto la ejecución de actividad empresarial de las Áreas Comerciales: Ingeniería y Construcción etc.

- **Rehabilitación de Área Degradada:** Retorno de la función productiva del área o de los procesos naturales, para efectos de adecuación de uso futuro.

- **Recuperación de Área Degradada:** Recomposición del área degradada para el establecimiento de organismos originalmente presentes, sin el estrecho compromiso ecológico, aunque sobre todo el ambiental, para una estabilidad del medio ambiente.

- **Restauración de Área Degradada:** Reposición de las exactas condiciones ecológicas de área degradada, siendo justificable para ambientes raros.
- **Registro:** Documento que presenta los resultados obtenidos de la aplicación de determinado procedimiento o brinda evidencia objetiva de cumplimiento de requerimientos del Programa Integrado o de actividades realizadas.
- **Requerimientos Legales:** Actos emanados de los Poderes Legislativo y Ejecutivo en los ámbitos Federal, Estadual y Municipal o de la estructura propia de cada país, que especifican requerimientos relacionados con Seguridad, Salud y Medio Ambiente aplicables a los Proyectos / Contratos, tales como: Leyes, Decretos, Directivas, Instrucciones Normativas, etc.
- **Riesgo:** Combinación de la probabilidad de ocurrencia y de la consecuencia / severidad (magnitud del daño) que pueda causar un evento o exposición a determinado peligro.
- **Riesgo Aceptable:** Riesgo que haya sido reducido a un nivel que puede ser tolerable por la Empresa considerando los requerimientos legales aplicables y la Política Integrada de SMA del CONSORCIO.
- **Saneamiento**: Conjunto de medidas para preservar o controlar las condiciones del medio ambiente, orientado a la promoción de la salud y la prevención de enfermedades causadas por degradación ambiental.
- **Seguridad Laboral y Salud Ocupacional:** Condiciones y Factores que afectan o pueden afectar la Salud y/o la Seguridad de los Integrantes, Subcontratistas, Prestadores de Servicios, Temporales, Visitantes o cualquier otra persona en el entorno de trabajo.
- **Subcontratistas:** Empresas externas contratadas para la prestación de servicios asociados a la actividad prevista dentro del alcance del Proyecto / Contrato.
- **EDT:** Entrenamiento Diario de Trabajo, herramienta de concientización que también incorpora temas de salud y medio ambiente.
- **Tratamiento Físico de Efluentes Líquidos:** Método de separación de contaminantes existentes en los efluentes, que no involucre interacciones químicas ni biológicas.
- **Tratamiento Químico de Efluentes Líquidos:** Método de remoción de contaminantes a través de procesos que involucran interacciones químicas entre sus componentes.
- **Uso racional de agua y energía eléctrica:** Uso de procesos, prácticas, técnicas, materiales, productos, servicios o procedimientos para evitar, reducir o racionalizar el consumo de agua y/o de energía eléctrica en los Procesos / Actividades de los Proyectos / Contratos.

II. Abreviaturas

- **APR:** Análisis Preliminar de Riesgos
- **APNR** Análisis Preliminar Niveles de Riesgo
- **ASO:** Atestado de Salud Ocupacional
- **DC:** Director del Contrato
- **EPC:** Equipos de Protección Colectiva
- **EPI:** Equipo de Protección Individual
- **GP:** Gerente de Producción
- **MA:** Medio Ambiente
- **PSE:** Procedimiento para Servicio a Emergencias
- **PCMSO:** Programa de Control Médico de Salud Ocupacional
- **PI:** Programa Integrado
- **PPPA:** Plan de Prevención de Pérdidas Auditivas
- **G-SMA:** Gerente de Salud, Seguridad y Medio Ambiente
- **SMA:** Salud y Medio Ambiente
- **Charla:** Entrenamiento Diario de Seguridad y Salud
- **INEA:** Instituto Nacional de Estándares Americanos
- **ARE:** Análisis de Riesgo Energético
- **PIR:** Plan de Identificación de Riesgos (y Aspectos Ambientales)
- **OP** Oficina Principal
- **OEI** Organización de Estándares Internacionales
- **ART** Análisis de Riesgo en el Trabajo
- **HDSM** Hoja de Datos de Seguridad del Material
- **SSO** Salud y Seguridad Ocupacional
- **JP** Jefe de Proyecto
- **EPP** Equipo de Protección Personal
- **PT** Permiso de Trabajo
- **SBC** Seguridad Basada en la Conducta
- **RS** Responsabilidad Social
- **AST** Asignación de seguridad en el trabajo
- **JA** Jefe de Área
- **RET** Reuniones Específicas de Seguridad
- **EDRT** Evaluación Diaria de Riesgo en la Tarea
- **PC y C** Pre-comisionamiento y comisionamiento
- **WC** Water Closet
- **CPA** Caja de primeros auxilios

6.0 CARACTERISTICAS DEL AREA

El proyecto está ubicado una llanura costera en la región Sur-Oeste de la isla, en Punta Catalina, Paya, Municipio de Bani, Provincia Peravia.

El Proyecto Punta Catalina será dividido en 4 áreas durante la fase de construcción:

- Isla de Potencia
- Puerto Y Patio de Carbón
- Sub Estación eléctrica
- Instrumentación y Control
- Sistemas auxiliares
- Edificios auxiliares

Cada Área tendrá integrada una organización que hará cumplir los requerimientos de SMA.

7.0 ALCANCE DEL PROYECTO

El proyecto consiste en el desarrollo de la ingeniería, procura y construcción (EPC) de 2 unidades Termoeléctricas en base a Carbón Mineral con una potencia bruta de 360 MW c/u, así como todas las facilidades necesarias para el buen funcionamiento de las mismas como son:

- Calderas, Turbinas de vapor, generador eléctrico y todos los equipos auxiliares asociados.
- Puerto Marítimo
- Cancha de almacenamiento de Carbón
- Subestación eléctrica
- Depósito de Cenizas
- Edificios auxiliares

El alcance del Proyecto incluye, además, el Pre-comisionamiento y Comisinionamiento de todas la utilidades.

8.0 LENGUAJE

El lenguaje del proyecto es español, para Planos y cualquier otro documento relacionado con SMA.

Comunicación multilingüe debe ser prevista para el entendimiento básico de los aspectos principales de SMA, así como sus reglas, reglamentos y prácticas.

Las funciones básicas de cada organización en la obra, hasta Supervisores de Disciplina, deben ser posibles de comunicarse tanto en inglés como en español.

Los procedimientos de operación que deben de ser ejecutados durante el proyecto serán en Inglés y en español.

9.0 POLITICA DE SMA

La política de SMA del CONSORCIO, deberá ser divulgada a todos los accionistas del proyecto y considerada como valor del proyecto. La misma contempla la implementación de medidas para prevenir, controlar, mitigar y/o compensar los impactos generados por las actividades de construcción y operación del proyecto en los aspectos: Salud y seguridad en el trabajo.

OBJETIVOS:

- Sensibilizar al personal del proyecto en sus diferentes etapas sobre la Política de Salud, y Medio Ambiente, de manera que les permita desarrollar actitudes positivas hacia cada una de las áreas señaladas, tanto al interior del proyecto como hacia afuera de este.
- Capacitar al personal de la obra (Profesionales y trabajadores) sobre temas de salud, seguridad en el trabajo y medio ambiente (SMA).
- Dar a conocer al personal involucrado en las diferentes etapas del proyecto el Programa de Manejo y Adecuación Ambiental (PMAA) y los compromisos adquiridos en la Licencia Ambiental y Permisos Ambientales ante la autoridad ambiental y que deberán cumplirse durante la ejecución del proyecto.
- Tener personal entrenado y equipado para reconocer, evaluar y controlar escenarios de riesgo durante el desarrollo de los trabajos.

MEDIDAS A TOMAR: La implementación del Subprograma de Salud y Seguridad Laboral (SSL) involucrará el entrenamiento, definición de roles y responsabilidades, así como el desarrollo de un plan de emergencia para enfrentar circunstancias puntuales asociadas al proyecto. Todos los

aspectos relacionados con la salud de los trabajadores cumplirán como mínimo con los estándares de República Dominicana y también estará sujeto a los lineamientos del CONSORCIO.

Con la finalidad de implementar sistemas y métodos de trabajo libres de riesgos, orientados hacia la salud y el medio ambiente, se debe tener un personal entrenado y equipado para reconocer, evaluar y controlar escenarios de riesgo durante el desarrollo de los trabajos, se procederá a implementar medidas siguientes:

Al inicio, todas las áreas de trabajo, los caminos utilizados como acceso, deberán ser demarcados y señalizados con un adecuado sistema de señalización, de fácil interpretación y visualización tanto para el personal que trabajará en la obra como para el público en general.

Otras medidas son:

- Cumplir con todas las leyes y reglamentos aplicables.
- Capacitar en temas referidos a salud y protección del ambiente a técnicos, operarios y obreros.
- Todos los trabajadores recibirán entrenamiento sobre: el uso de equipo de protección personal, conducción segura de vehículos, peligros de incendio y sofocación del fuego, procedimientos para responder a emergencias primeros auxilios básicos.
- Se realizarán registros de entrenamiento firmados por los empleados para verificar recepción y fecha del entrenamiento.
- Establecimiento de una unidad de primeros auxilios (botiquín) en cada uno de los campamentos de obras.
- Como parte del contrato las compañías Subcontratistas deberán comprometerse a implementar las medidas formuladas en este Subprograma y en el Programa de manejo ambiental en general.
- Se realizarán registros de entrenamiento firmados por los empleados para verificar recepción y fecha del entrenamiento.
- Será obligatorio para todo el personal en los sitios de construcción el uso de Equipo de Protección Personal, como zapatos de seguridad, cascos, gafas, en caso necesario el uso de protección respiratoria y auditiva.
- En todos los sitios de trabajo se dispondrán equipos para primeros auxilios y atención de emergencia con señales claras indicando su presencia.
- Los niveles de ruido en los sitios de trabajo serán monitoreados por los inspectores de seguridad y se fomentará el uso de protección auditiva, si es requerido.
- Todas las lesiones de los trabajadores serán documentadas. Será investigada la causa del incidente y se identificarán posibles medidas de prevención o cambios a los procedimientos de seguridad.

Como medidas de control para evitar la transmisión de enfermedades contagiosas, entre los trabajadores y la población local y viceversa, se recomiendan las siguientes medidas:

- A la contratación del personal, se recomienda solicitar certificados de salud
- Se realizarán controles médicos periódicos a fin de diagnosticar enfermedades en sus primeras manifestaciones y poderles dar un tratamiento adecuado y así evitar un contagio masivo y/o propagación de la misma.

Otras medidas:

- Considerar criterios de salud, seguridad, y medio ambiente al otorgar subcontratos.
- Dotar de capacitación apropiada a los empleados, contratistas y subcontratistas para asegurarse que todo el personal esté capacitado en temas referidos a salud, seguridad, y protección del medio ambiente.
- Evaluar el avance en pos de sistemas de seguridad y ambiente de trabajo seguro y saludable.
- Diseñar instalaciones con altos estándares de seguridad, y operar instalaciones con las mejores prácticas de salud y seguridad.
- Cumplir a cabalidad con todas las leyes y reglamentos de salud y seguridad aplicables.
- Disponer de personal profesional calificado para desarrollar y apoyar el manejo de las actividades de riesgo e imponer el cumplimiento de las normas y reglamentos de seguridad.
- Adoptar métodos de seguridad y salud que permitan evitar pérdidas humanas y proteger los recursos físicos y financieros del proyecto.
- Valorar salud y seguridad tanto como los objetivos económicos.
- Limitar el paso de moradores y transeúntes al área de construcción para evitar el peligro de accidentes que podrían ocasionar las maquinarias.

10.0 EDUCACION Y CAPACITACIÓN EN AMBIENTE Y SEGURIDAD AL PERSONAL

MEDIDAS A TOMAR:

- El contratista de obra debe diseñar y desarrollar un programa de capacitación para el personal que labore en el proyecto; la implementación de este programa puede contribuir al desarrollo del mismo bajo el concepto de sostenibilidad ambiental y social.
- El diseño y desarrollo de las inducciones y la capacitación deberán considerar los siguientes aspectos: tema, duración, fecha, hora, ayudas audiovisuales, lugar y población objetivo.

- Para el personal que trabajará en la Ingeniería de detalle y la construcción, se realizarán inducciones previas al ingreso; estas inducciones incluirán temas de salud, seguridad en el trabajo y medio ambiente, así como también temas de relevancia social en el área de trabajo.
- El programa de capacitación deberá implementarse periódicamente y distribuirlo a lo largo de las diferentes etapas del proyecto.

Entre los temas a incluir en el programa, lo cual no exime de incluir otros temas que se consideren necesarios, se encuentran los siguientes:

ASPECTOS AMBIENTALES:

- Política de Salud y Medio Ambiente establecida para el proyecto.
- Programas que componen el Programa de Manejo y Adecuación Ambiental, medidas y acciones de manejo a aplicar de acuerdo con la actividad contratada.
- Importancia de los recursos naturales y su manejo adecuado.
- Conceptos sobre el sistema de áreas protegidas y desarrollo sostenible.
- Preservación de los recursos naturales, con énfasis en especies endémicas y en peligro de extinción.
- Protección de la fauna silvestre en la zona del proyecto.
- Divulgación de la legislación ambiental aplicable al proyecto y sus actividades.
- Preservación de la vegetación.
- Prohibiciones sobre caza y retiro de elementos de la flora.
- Autoridades y documentos ambientales que regulan el desarrollo del proyecto (Licencia Ambiental, permisos y Programa de Manejo y Adecuación Ambiental).

MANEJO DE ACTIVIDADES DE CONSTRUCCIÓN:

- Manejo de escombros, residuos reciclables y domésticos.
- Manejo de materiales de construcción y obras de concreto.
- Manejo y protección de aguas superficiales y subterráneas.
- Manejo de residuos líquidos.
- Manejo de Actividades de Mantenimiento durante construcción
- Control y manejo de derrames de aceites y lubricantes.
- Manejo de señalización y tráfico.
- Protección del Patrimonio Arqueológico.

ASPECTOS SOCIALES:

Salud y Protección Laboral:

- Relaciones con la Comunidad
- La importancia del uso y mantenimiento de Elementos de Protección Personal (Casco protector, botas de seguridad, mascarillas, protectores auditivos).
- Capacitación sobre los programas de medicina preventiva.
- Capacitación sobre los programas de medicina del trabajo.
- Prevención de Riesgos.
- Primeros Auxilios – Las brigadas de trabajo deben recibir, constante entrenamiento en atención de emergencias, ya que serán, en caso de un incidente, las personas que prestarán ayuda inmediata en lo que llegan los equipos de socorro.
- Manejo de emergencias, se debe incluir como realizar la coordinación de una emergencia con los organismos especializados.
- Uso y mantenimiento de EPP (Elementos de Protección Personal).
- Procedimientos de trabajo seguro.
- Manejo de herramientas menores.
- Y demás temas obtenidos del panorama de factores de riesgo, o condiciones específicas que se presenten durante el desarrollo de las actividades de obra y aquellos temas que el Especialista en SMA considere necesarios.

11.0 PROGRAMA DE SALUD

El Programa de Salud para el Trabajador deberá ser desarrollado para satisfacer las necesidades previstas y de emergencia de todo el personal del proyecto durante la construcción.

Proporcionará una guía para el mantenimiento de la salud, cuidado de lesiones menores y de emergencia de todos los trabajadores.

Se realizarán exámenes de ingreso a cada trabajador; así como exámenes ocupacionales, tales como: audiometrías, visiometrías, espirometrías, vacunas contra enfermedades específicas etc. que garanticen que las condiciones de salud sean las adecuadas conforme a las labores específicas que vayan a desempeñar.

Se prestará especial atención a aquellas situaciones que no pueden tratarse en los campamentos como: fracturas, cortes y quemaduras graves, insolación, deshidratación, enfermedades, mordeduras de animales, descargas eléctricas y otros peligros para la salud que requieran cuidados médicos especializados, para esto se realizó un mapeo de los principales Centros de Salud del área; a fin de elaborar un plan de atención a emergencias. (VER DOCUMENTO PLAN DE ATENCION A URGENCIAS MÉDICAS Y PRIMEROS AUXILIOS)

En los campamentos se establecerá un puesto médico para la atención de lesiones menores y afecciones de los trabajadores. Este puesto deberá contar con todo el material médico para la atención de accidentes menores y contará con un profesional médico entrenado en salud ocupacional.

En los puestos médicos se harán todos los arreglos necesarios para disponer de ambulancias durante la construcción del proyecto en caso de emergencias que requieran hospitalización inmediata.

En los lugares visibles de campamentos, puestos médicos, frentes de trabajo, se dispondrá de una lista de los hospitales y puestos de salud a los que se puede acudir en caso de lesiones menores y emergencia. Estos centros estarán clasificados de acuerdo a:

- Tipos de atención en caso de lesiones o emergencias
- Proximidad a la región
- Número de médicos y camas disponibles
- Servicios de emergencia

La lista de todos los hospitales incluirá números telefónicos de atención regular y de emergencia, direcciones con planos de ubicación, especialidades médicas y recursos del sitio.
El encargado del PSST deberá evaluar regularmente las condiciones del campamento e instalaciones para determinar si existen riesgos a la salud como: aguas estancadas, disposición no sanitaria de aguas residuales, almacenamiento inseguro de equipo y otros aspectos que merezcan atención.

El encargado del PSST será responsable de realizar la vacunación completa de todos los trabajadores involucrados en la construcción del proyecto.

Las tarjetas válidas de inmunización o vacunación serán los únicos documentos para eximir a cualquier trabajador de esta actividad preventiva. La lista de enfermedades y vacunas se extraerá de publicaciones de la Organización Mundial de la Salud (OMS) y de la entidad estatal de Salud en República Dominicana.

12.0 CADENA DE RESPONSABILIDAD

La implementación de todas las practicas se SMA, según descritas en este y otros documentos se SMA, son responsabilidad de toda la Cadena de Trabajo de la empresa.

La participación Activa es requerida de todo el personal involucrado en la organización, debido a que la SMA es parte de la ejecución del trabajo.

La Cadena se refiere a la Gerencia, Representantes de Área, Superintendentes, Supervisores, Contratistas y Trabajadores en general: la responsabilidad principal de la SMA de la fuerza de trabajo, radica en la Administración.

Todos los integrantes de la Cadena están profundamente involucrados en la planeación diaria del trabajo, porque se encuentran en la mejor posición para identificar y manejar riesgos.

La organización del SMA debe asistir a los Gerentes de la Cadena y trabajar junto con ellos para ejecutar el Plan de SMA en su totalidad.

En este contexto la Gerencia del CONSORCIO es el principal responsable de la implementación del Plan de SMA, y sus revisiones periódicas y eventuales; además es responsable de que el trabajo del proyecto se efectué con la máxima calidad y de su terminación según programado. La Gerencia del CONSORCIO debe coordinar el trabajo de sus grupos de trabajadores y subcontratistas para evitar cualquier interferencia durante la ejecución del trabajo.

En ningún momento, el desempeño y consideraciones de la SMA estarán subordinados a la calidad, costo u horarios. La seguridad es un valor primordial de la Gerencia del CONSORCIO.

13.0 REPORTES DE AUDITORIA

Proveer Protocolos de auditoría contra los cuales medir la implementación del sistema de gestión de SMA, al igual que sus prácticas y procedimiento de apoyo.

14.0 REQUERIMIENTOS LEGALES

Este documento debe ser actualizado y mantenido al corriente con los requerimientos legales; gubernamentales, estatales y municipales que sean aplicables en Republica Dominicana.

El impacto de los cambios, debido a nuevos o actualizados requerimientos legales, debe ser evaluado para poder proveer los recursos necesarios para actualizar el sistema.

Existe un procedimiento que permite la evaluación del cumplimiento legal, a través de la implementación del sistema de SMA en sus diferentes etapas del proceso de construcción.

En caso de haber obligaciones legales no completadas, u omitidas, el CLIENTE deberá ser notificado inmediatamente.

OBJETIVOS:

Identificar y Cumplir con la legislación de SMA aplicable a las actividades del Proyecto y adaptar el Plan de SMA para que cumpla con los nuevos requerimientos y obligaciones.

15.0 MEJORA CONTINUA

- Buscar la Mejora Continua usando métodos proactivos y reactivos al través de revisiones, análisis de eventos, inspecciones y auditorias.
- Actualizaciones periódicas de planes y procedimientos de SMA de acuerdo con los cambios presentados en los requerimientos legales y contractuales.

16.0 MANEJO DE PELIGROS EN SMA

- Identificar peligros, evaluar riesgos y establecer los controles operacionales necesarios para llevar a cabo las actividades de manera segura y evitar eventos indeseados.
- Cumplir con los requerimientos de uso del Equipo de Protección Personal.
- Atención a eventos indeseados para evitar situaciones de emergencia. La respuesta a emergencia debe ser planeada, estructurada, asignadas sus prioridades y definida la forma de contención del impacto antes de los eventos.

Tecnología

- Proveer las Instalaciones y Equipos para completar las tareas, asegurar la inspección y mantenimiento necesario, usar la aplicación de SMA de las Tecnologías de Información por la Gerencia del CONSORCIO

Comunicación

- Implementar un sistema eficiente y efectivo de comunicación para la Gestión del Sistema de SMA.

- Proactivamente crear un ambiente de trabajo que sea capaz de establecer una mentalidad y actitud de seguridad en el trabajo.

Revisión de las Partes Interesadas

- Revisar cuando sea requerido el Plan de SMA de la Obra con el CLIENTE.

Medio-Ambiente

Para disminuir el impacto y deterioro del medio-ambiente y a las comunidades cercanas:

- Disminuir la generación de desperdicios peligrosos y no peligrosos.
- Optimizar los el consumo de energía y recursos.

17.0 METAS DE SMA

Las Metas comunes que la Gerencia del CONSORCIO, Subcontratistas y Proveedores deben de cumplir en todo momento y en todo lugar, son los siguientes CEROS. Con tareas principales para todo el personal involucrado:

- CERO Lesiones
- CERO Enfermedades Ocupacionales
- CERO Emisiones o Derrames al ambiente
- CERO Impacto Adverso a la Comunidad
- CERO Incidentes en los Procesos.

18.0 INDICADORES DE DESEMPEÑO Y OBJETIVOS DE SMA

Indicadores de desempeño y objetivos de SMA específicos han sido identificados para este proyecto y deberán ser divulgados y monitoreados por la Gerencia del CONSORCIO. Dichos Indicadores tienen el alcance para darle seguimiento a los niveles de implementación y desempeño de cada proceso de Sistema de Gestión de SMA del proyecto.

Están divididos en indicadores Líderes, asociados a actividades preventivas e Indicadores de Retraso asociados a las consecuencias y eventos negativos. Entre los Indicadores Lideres el más relevante es que tan preventivo es el Sistema de SMA seleccionado.

19.0 DOCUMENTOS ESTÁNDARES DEL CLIENTE

Este Plan y Procedimientos de SMA serán revisados con relación al Manual de Calidad, Seguridad, Salud y Medio-ambiente del CLIENTE, para asegurar el cumplimiento de los requerimientos del contrato.

La Gerencia del CONSORCIO y Subcontratistas deben estar relacionados con todos los procedimientos de SMA que serán usados durante la ejecución del proyecto incluyendo los del contrato.

20.0 IDENTIFICACIÓN DE RIESGOS Y SISTEMA DE GESTIÓN DE SMA

20.1 SISTEMA DE SMA DE LA OBRA

El Sistema de Gestión específico de SMA del proyecto es descrito y aplicado a través de los siguientes documentos juntos con los requerimientos contractuales de SMA:

- Plan de SMA de la Obra (Este Documento)
- Plan De Atención En Urgencias Medicas Y Primeros Auxilios

Estos documentos establecen el sistema de gestión de SMA para el proyecto Termoeléctrico Punta Catalina, de acuerdo con los requerimientos de la norma OSHA 18001, basada en el modelo establecido por la Gerencia del CONSORCIO y estableciendo los controles operativos establecidos par a las actividades del proyecto, aplicando las mejores prácticas de seguridad, de acuerdo con los requisitos legales de Republica Dominicana así como los requerimientos contractuales.

20.2 ANÁLISIS PRELIMINAR DE LOS NIVELES DE RIESGOS (APNR)

El análisis de riesgos es hecho en dos etapas: una identificación inicial de aspectos ambientales y de riesgo, y un AST (Asignación de seguridad en el trabajo)

En este documento son recolectados todos los datos de la Identificación Inicial de riesgos y Aspectos ambientales. Referirse a este documento para las particularidades de la Obra, tareas críticas y fases, directrices de la Identificación de Riesgos de SMA y Análisis general de Riesgos.

20.3 MANEJO DEL CAMBIO

Consiste en administrar cualquier cambio o alteración (incluso temporal) de personas (organización), tecnología (equipo y maquinaria), construcción (diseño de lugar de trabajo e instalaciones), legales y requerimientos contractuales y de los establecidos en la identificación de riesgos para actualizar los controles necesarios para reducir la posibilidad de un incidente, enfermedad o impacto al Medio-ambiente.

Cualquier cambio debe ser claramente definido en su objetivo, su evaluación de riesgo e impacto en el Medio-ambiente involucrado e interacción con otros cambios y partes interesadas deben ser documentadas, al igual que los permisos, aprobaciones, habilidades de aquellos involucrados, y su verificación y monitoreo hasta la conclusión del cambio.

20.4 CICLO ADMINISTRATIVO DE SMA

Provee el apoyo y retroalimentación para establecer la coordinación de todos los aspectos de SMA en el proyecto a través del Diagrama de Flujo del Ciclo Administrativo de SMA que será implementado en el proyecto.

21.0 EVALUACIÓN INICIAL DE SMA Y MONITOREO

21.1 GENERAL

El trabajo será ejecutado por la Gerencia del CONSORCIO de acuerdo a los procedimientos establecidos en el Sistema de SMA del Proyecto Termoeléctrico Punta Catalina. Una parte del Alcance del trabajo será realizada por Subcontratista de Construcción asignados.

Cada Subcontratista es inicialmente evaluado en SMA. De acuerdo con el desempeño esperado, la evaluación puede indicar un programa específico de apoyo de SMA a ser adoptado por el Subcontratista en la Obra.

Cualquier solicitud particular o adicional proveniente del subcontratista, deberá ser Claramente especificada en el contrato.

El subcontratista deberá ser monitoreado durante la ejecución del trabajo y la evaluación final de desempeño de SMA deberá ser regresada al CLIENTE.

21.2 PLAN DE SMA DEL SUBCONTRATISTA

Cada Subcontratista debe preparar su propio plan SMA para la construcción, y actividades de procura relacionadas con el alcance de trabajo, coherente con las reglas y procedimientos establecidos por el Plan de SMA del Proyecto Termoeléctrico Punta Catalina.

El Plan de SMA del contratista debe ser presentado a la Gerencia del CONSORCIO para su revisión y aceptación, máximo 30 días antes del inicio de Actividades o movilización de la obra.

El plan de SMA del subcontratista debe como mínimo, cubrir los requerimientos del Plan de SMA, Leyes y regulaciones Locales, y el Plan de SMA del proyecto Termoeléctrico Punta Catalina y documentos de referencia.

Es la responsabilidad de las compañías involucradas de entender completamente y aplicar en todo momento los requerimientos generales de SMA del proyecto.

Es de particular importancia que el subcontratista le reporte a la Gerencia del CONSORCIO cualquier riesgo conocido que este, traiga a la Obra.

El subcontratista puede añadir Practicas Laborales de SMA de acuerdo al alcance de trabajo o para operaciones no estándares. Cualquier Practica Nueva de trabajo de SMA debe ser entregada a la Gerencia del CONSORCIO, para su revisión, antes de ser aplicada.

La desviación de las reglas escritas solo será permitida en circunstancias excepcionales donde medidas alternativas de SMA deban ser aplicadas. Dichas desviaciones requerirán una evaluación de riesgos que deberá ser turnada a la Gerencia del CONSORCIO antes del inicio de cualquier actividad.

21.3 INGRESO DE SUBCONTRATISTAS

La Gerencia del CONSORCIO debe realizar una precalificación y selección de sus propios subcontratistas para asegurar que son competentes y organizados para cumplir con las expectativas de SMA de la Obra.

El Subcontratista debe recibir los requerimientos de SMA en por la Gerencia del CONSORCIO, incluyendo el desempeño de SMA esperado.

Los subcontratistas deberán ser informados y tienen la oportunidad de participar en actividades de SMA requeridas por le gerencia del CONSORCIO y en las cuales el subcontratista está obligado a dar conformidad al Contratista.

La gerencia del CONSORCIO debe revisar regularmente el cumplimiento de SMA de sus subcontratistas; debe ser responsable de asegurar que todos los subcontratistas y su personal entiendan y operen de acuerdo con el sistema de gestión de SMA, desempeño y estándares en uso del proyecto.

La gerencia del CONSORCIO debe promover reuniones frecuentes con sus subcontratistas, para presentar resultados de desempeño del sistema de gestión de SMA, los subcontratistas con desempeño positivo serán reconocidos.

22.0 ORNANIZACION, ROLES Y RESPONSABILIDADES DE SMA

22.1 GENERALIDADES

Las actividades a ejecutar en la obra deben ser coordinadas y supervisadas por la gerencia del CONSORCIO bajo la dirección general del CLIENTE.

Lo siguiente es incluido en la organización general de SMA; el subcontratista debe detallar en su propio plan de SMA las responsabilidades y organización de la obra, especificando los intercambios con la organización especifica de la gerencia del CONSORCIO previstos.

Por lo tanto, el subcontratista debe proveer una gráfico organizacional con los roles y responsabilidades asignadas al personal indicados en el grafico.

Cada organización dentro de la obra es responsable de respetar las leyes y reglas de SMA locales. La gerencia del CONSORCIO tiene la responsabilidad final de sus propios subcontratistas con respecto a los requerimientos y prácticas de SMA.

Este plan de SMA no limita ni excluye las responsabilidades contenidas dentro de la legislación de SMA de República Dominicana.

Administración de la Cadena de trabajo, es aquel personal que planea y dirige el trabajo, es responsable de proveer un lugar de trabajo lo más seguro y saludable posible, operando de manera ambientalmente amigable.

En caso de peligro inminente todos deben inminentemente pedir la suspensión de actividades y avisar al supervisor o sobrestante responsable.

23.0 ROLES Y RESPONSIBILIDADES

23.1 EQUIPO DE ADMINISTRACIÓN DEL CONSORCIO

Se refiere al grafico de organización de obra (Organigrama)

23.1.1 Director/Gerente de Proyecto

El director o gerente de proyecto representa el máximo nivel de administración del proyecto; es el responsable final de todos los aspectos de gestión y desempeño de SMA en el proyecto y es el responsable directo de las actividades siguientes:

- Implementar la política de la gestión de SMA del CLIENTE en todo el proyecto, proveyendo los recursos necesarios para la adecuada implementación del Sistema de gestión de SMA.
- Comunicando a las partes involucradas los valores de SMA del proyecto, establecer los objetivos, metas e indicadores de SMA, asegurando el desempeño y responsabilidad de su organización.
- Demostrar visiblemente a la organización que el compromiso a SMA es prioridad número uno.

23.1.2 GERENTE DE ÁREA

El administrador de área es el primer responsable del respeto general de leyes, reglamentos, procedimientos e implementación del plan de SMA del área por todo el personal involucrado. Entre sus obligaciones se encuentran:

- Establecer y mantener la conciencia de SMA, demostrando activamente compromiso y liderazgo de SMA al personal de gestión y organizaciones de Subcontratistas, implementando y obedeciendo todas las regulaciones y promoviendo una conducta de seguridad.
- Asegurar que un proceso de AST adecuado esta efectuándose en el área
- Liderar e inspirar el proceso de SBC (Seguridad Basada en la Conducta) en el área.
- Asegurar que el Plan de Emergencia está en su lugar, cubriendo el rol especifico de líder de equipo.

- Asegurar que métodos y procesos adecuados están en su lugar con respecto a: requerimientos de salud, servicios médicos, gestión de la seguridad, plan de tránsito, autorizaciones de vehículos, equipo contra-incendios.

- Ser la conexión principal entre el CLIENTE, la gerencia del CONSORCIO y partes externas para compromiso de SMA.

- Revisar periódicamente información estadística de SMA, objetivos, metas, indicadores, desempeño, sistema de SMA del área y liderar el comité de dirección de SMA del área hacia la mejora continua del desempeño.

- Evaluar y proponer los recursos necesarios para la implementación y control de SMA, proveyendo también EPP (Equipo de Protección Personal).

- Participar en la selección y organización del personal de SMA.

- Participar en las reuniones de arranque del área y coordinar al comité de dirección de SMA, manteniendo comunicación abierta con el Administrador de área de SMA.

- Mencionar la SMA en todas las reuniones de planeación/coordinación y comunicación, involucrando lo máximo posible al administrador de SMA de área en esos procesos.

- Promover y participar en iniciativas de incentivos y respeto de esquemas de disciplina, manejando el presupuesto.

- Asegurar la ejecución de sesiones de entrenamiento adecuadas para todo el personal involucrado como parte del alcance del trabajo de gerencia del CONSORCIO.

- Participar activamente en la inspección del área y definición y ejecución de auditorías, interviniendo para corregir comportamientos inseguros y condiciones, liderando con el ejemplo.

- Promover el reporte final de SMA como parte del reporte final de construcción de la obra.

23.1.3 GERENTE DE CONSTRUCCIÓN

El gerente de construcción se reporta con el gerente de área; participa y vigila la implementación del plan de SMA de la obra, particularmente en la coordinación de actividades de campo, para minimizar las interferencias y riesgos.

Deberá:

- Darle seguimiento a la implementación de los requerimientos de SMA de la gerencia del CONSORCIO, según los documentos contractuales empezando desde la reunión de arranque.
- Liderar con su ejemplo, involucrando a su cadena, a la cadena de gerencia del CONSORCIO y al personal de SMA en un efectivo equipo de trabajo de gestión de SMA.
- Participar como sea necesario en las siguientes actividades de SMA: pláticas semanales de SMA, aplicación de esquemas de incentivos y disciplinarios, recorridos, etc.
- Participar en la implementación del proceso de observación de SBC (Seguridad Basada en la Conducta).
- Participar en la implementación de provisiones de tránsito, contención de incendios, ambientales, seguridad y salud según asentados en este documento.
- Participar en el proceso de AST para determinar las precauciones necesarias a ser implementadas.
- Seguir cualquier recomendación hecha por SMA para constatar que está siendo implementada.
- Asistir en el desarrollo de reglas de SMA, procedimientos de trabajo y la implementación de actividades y programas de SMA.
- Participar en la inspección y auditoria del área e intervenir activamente para corregir conductas inseguras y condiciones. Detener trabajo cuando existan riesgos inminentes.
- Reportar a la gerencia de obra del CONSORCIO, supervisor/sobrestante de Obra y Gerente de Área de SMA cualquier situación insegura.
- Asegurarse que los incidentes (incluyendo Casi-incidentes) sean correctamente reportados y participar que el análisis apropiado sea realizado.
- Participar en la aplicación de los Planes de emergencia de acuerdo al rol previsto.
- Participar en revisiones periódicas de desempeño, y en el Comité de dirección de SMA.

23.1.4 GERENTE DE PC Y C

El gerente de PC y C participa y evalúa activamente en la implementación del Plan de SMA, siendo el primer responsable de las partes relevantes de PC y C.

En particular deberá:

- Demonstrar compromiso y liderazgo de SMA, con el personal de PC y C construcción y subcontratistas, mediante la implementación y seguimiento de todos los reglamentos, manteniendo reuniones de concientización y promoviendo conductas seguras.
- Asegurar que el proceso adecuado AST es aplicado a las actividades de PC y C.
- Asegurar el correcto sistema de coordinación entre las actividades de PC y C, construcción y CLIENTE.
- Asegurar que el plan de emergencia es consistente con la fase de PC y C y ser un miembro activo del Plan de Emergencia.
- Liderar las reuniones de arranque de PC y C, hacer arreglos para la reunión de SMA
- Entrega de Arranque y participar regularmente en el comité de dirección de SMA.
- Mantener también comunicación abierta con el gerente de SMA de la Obra y con el Coordinador de SSA de las Oficinas Principales.
- Manifestar la SMA en todas las reuniones de planeación/coordinación, involucrando al máximo al Gerente de SMA de la Obra en esos procesos.
- Asegurar que el entrenamiento adecuado sea ejecutado para todo el personal para proveer la concientización y competencia para una ejecución segura de las actividades de PC y C
- Participar activamente en la inspección y auditoria del área, interviniendo para corregir conductas inseguras y condiciones, liderando con el ejemplo.
- Asegurar que todos los accidentes/incidentes relevantes de actividades de PC y C sean investigados y reportados de acuerdo con las prácticas de reportes de incidentes del proyecto.
- Participar en la investigación de accidentes y casi-accidentes serios.

En la última fase del proyecto, el Gerente de PC y C puede cubrir también el rol de Gerente de Área. En esos casos, cubrirá todas las responsabilidades descritas anteriormente.

23.1.5 SUPERINTENDENTES Y SUPERVISORES DE DISCIPLINA

Participaran en le implementación del Plan de SMA del área y cooperan con el personal de SMA en el monitoreo continuo de que todas las regulaciones de SMA estén en su sitio y sean implementadas: instruyen a la gerencia del CONSORCIO de observar los procedimientos y suspender trabajo en el evento de daño inmediato al personal, deberán:

- Demonstrar actitud de SMA, liderazgo y conciencia a la organización de Gestión de SMA, liderar con el ejemplo hacia una constante conducta de seguridad, apoyando iniciativas de incentivos y disciplina; participar directamente en la reunión inicial de arranque de SMA y otras reuniones de coordinación.

- Asegurar que el personal de área reciba la información apropiada de SMA y entrenamiento que ha sido diseñada para la ejecución del trabajo; participar particularmente en las actividades de entrenamientos y pláticas semanales de SMA.

- Asegurar que el proceso de AST sea realizado e implementado en las áreas que le corresponde y que las reuniones de seguridad diarias sean conducidas regularmente. Participar también en los procesos de PT (Permiso de Trabajo) cuando sea solicitado en los procedimientos del área.

- Monitorear continuamente sus áreas y trabajar para corregir cualquier discrepancia de SMA del proceso de ATS. Participar si es solicitado en los recorridos semanales e inspección de equipos.

- Participar en los procedimientos de respuesta a emergencias de acuerdo con el rol asignado y monitorear que las áreas y el personal bajo su control están listos para la respuesta apropiada.

- Colaborar con actividades de SMA, si fuera necesario (investigación de incidentes, análisis de riesgos, proceso de observación de SBC etc.) y el desarrollo de reglas de SMA y prácticas.

23.1.6 GERENTE DE ÁREA DE SMA

El gerente de SMA de área es responsable de la organización de las actividades de SMA y recursos proveídos por la Gestión de Proyecto, según descrito en el Plan de SMA y derivados emitidos para el Proyecto.

El gerente de SMA de área se reportara directamente con el Director de Proyecto.

El gerente de SMA de la obra apoyara la gestión de la cadena; en particular tendrá los siguientes deberes:

- Preparar y emitir el programa de actividades de SMA (reuniones, entrenamiento, inspecciones, etc.) a todas las partes involucradas en la gestión de obra.
- Coordinar las reuniones de SMA del área (arranque, semanales, mensuales, etc.) y participar en la reunión de coordinación de construcción y PC.
- Mantener una comunicación abierta con el coordinador de SMA de las Oficinas Principales, Gerencia de revisión del CONSORCIO y los planes de SMA de los subcontratistas, y realizar el monitoreo y seguimiento de los planes de SMA de los subcontratistas. Revisar, aprobar y evaluar la asignación de personal de Administración de SMA del CONSORCIO y de subcontratistas.
- Dirigirse a la organización de la orientación y entrenamiento en SMA de la Obra, y seguimiento, incluyendo participación en pláticas semanales de SMA y entrenamientos de actualización de la administración de SMA de la Obra.
- Promover el involucramiento, los incentivos, la aplicación del esquema de Disciplina y la administración.
- Monitorear la implementación de los requerimientos de salud de la obra, trabajando de cerca con el personal médico, y asegurando que la estructura necesaria, medios y comunicación estén disponibles.
- Mantener una base de datos de HDSM (Hoja de Datos de Seguridad del Material), comunicando información relevante a todas las partes involucradas en la obra.
- Supervisar la definición continúa de los EPP (Equipo de Protección Personal) por la administración de Obra.
- Monitorear la gestión de la seguridad evaluando su función y posible mejora.

- Dirigirse al Plan de Tránsito, su terminación y comunicación, autorización de vehículos de supervisores de la obra.
- Asegurar que el Proceso de AST sea aplicado y revisados los procedimientos y ARTs (Análisis de Riesgo en el Trabajo).
- Participar y verificar que el proceso de observación de SBC (Seguridad Basada en la Conducta) sea aplicado y preparar las estadísticas relevantes.
- Participar en desarrollar reglas y prácticas de SMA.
- Asegurar el monitoreo y control de medidas ambientales.
- Actuar como Jefe de Contraincendios, organizando entrenamientos, ejercicios e inspecciones específicos.
- Dirigirse al Plan de Emergencia para obtener un proceso general de emergencia de toda la Obra. Colaborar, en caso de emergencia, de acuerdo a su rol predeterminado, generalmente Coordinador de Campo.
- Participar en análisis de Incidentes como experto técnico y metodológico.
- Dirigirse al seguimiento e inspección del plan y proceso de SMA de la obra (inspecciones diarias, evaluaciones semanales y mensuales, etc. incluyendo cualquier participación necesaria.
- Organizar y administrar el registro de documentos de SMA.
- Emitir un reporte mensual de SMA y el Reporte final de SMA.
- Colaborar con el Gerente de Área para establecer y mantener un vínculo los representantes del CLIENTE, y autoridades nacionales y locales con funciones en SMA.

23.1.7 COORDINADOR DE PC Y C DE ÁREA

Aproximadamente un mes antes del inicio de cualquier actividad de PC y C, incluidas PC de subestaciones eléctricas, la organización de gestión de SMA debe ser integrada con un coordinador de PC y C de SMA así como el Gerente de Seguridad, para asistir y apoyar al Gerente de SMA de la Obra en la gestión de todos los aspectos relevantes de SMA de ejecución de actividades de PC y C y su posible superposición con restantes actividades de construcción y operaciones del CLIENTE.

El personal de gestión de SMA de obra y el Coordinador de SMA de PC y C se reportan directamente con el Gerente de SMA de la Obra.

El coordinador de SMA DE PC y C debe ser introducido a los métodos y prácticas antes de la movilización de la Obra.

El coordinador de SMA de PC y C deberá:

- Atender y coordinar el trabajo de los especialistas de SMA de PC y C.
- Promover la coordinación entre la construcción y PC y C buscando minimizar las interferencias y riesgos.
- Promover la coordinación entre las actividades de subcontratistas, terceras personas involucradas en el trabajo y CLIENTE buscando minimizar interferencias y riesgos.
- Promover la comunicación preventiva a todas las partes involucradas, sobre riesgos adicionales introducidos en la obra por próximas actividades de PC y C y precauciones relevantes a aplicar.
- Actuar como un consejero de SMA, asegurar apoyo competente al Gerente de SMA de la Obra, al Gerente de Arranque y al personal de PC y arranque para la preparación de la documentación de SMA, de PC y C tales como procedimientos específicos, plan de emergencia y Análisis de Riesgos en el Trabajo.
- Conducir inspecciones regulares de la Obra para monitorear el cumplimiento de los requerimientos y estándares de SMA de PC y C; sugerir y promover acciones correctivas que eventualmente sean necesarias.
- Tomar parte de todas las reuniones de planeación/coordinación de PC y C.
- Cuando sea delegado por el Gerente de SMA de la Obra, actuar como representante de gestión de SMA del CONSORCIO frente al cliente.
- Apoyar con la identificación y administración de cualquier necesidad adicional de entrenamiento de PC y C de SMA.
- Participar en investigaciones de incidentes (incluyendo Casi-incidentes), cuando sea requerido.

- Mantener un canal de comunicación abierto con la Oficina Principal.

23.1.8 ESPECIALISTA DE SMA DE PC Y C

Basado en el total de personas involucradas en el proyecto y en su complejidad (requisitos, procedimientos, logística, subcontratistas, magnitud de sobre posición de diferentes fases etc.) un adecuado número de especialistas de SMA de PC y C serán asignados para apoyar al coordinador de SMA de PC y C.

En caso de sobre posición relevante entre actividades de PC y C y del CLIENTE, mas especialistas de SMA de PC y C serán previstos para manejar este aspecto especifico.

El especialista de SMA de PC y C deberá:

- Participar en la preparación de Documentos de SMA de PC y C tales como procedimientos de seguridad y Análisis de Riesgo en el Trabajo.
- Participar activamente en el proceso de comunicación preventiva de SMA de PC y C mediante la ayuda en la preparación de la notificación de alerta, campañas de concientización, reuniones de seguridad, etc.
- Mantener actualizada y compartir periódicamente con todas las organizaciones de la obra la lista de sistemas y áreas restringidas donde los PT (Permiso de Trabajo) son requeridos debido a actividades de PC y C.
- Monitorear diariamente la correcta implantación de los procedimientos de PT y Candadeo, Etiqueteo y Despeje.
- Actuar como Revisor de PT de SMA para actividades a ser realizadas dentro de sistemas o áreas con PT requeridos por razones de PC y C.
- Diariamente supervisar la aplicación correcta en campo del sistema de identificación y los requerimientos de segregación del área.
- Diariamente supervisar el cumplimiento pleno de los subcontratistas con requisitos específicos de SMA de PC y C, sugiriendo y promoviendo acciones eventuales necesarias correctivas.

- Diariamente supervisar el cumplimiento pleno de los subcontratistas de PC y C con las normas de SMA del sitio, sugiriendo y promoviendo acciones eventuales necesarias correctivas.
- Tratar con los subcontratistas para resolver los asuntos diarios de SMA.
- Administrar entrenamientos de SMA de PC y C y mantener el registro de la capacitación.

23.1.9 SUPERVISORES DE SMA

El número de asistentes de SMA será definido considerando aspectos como: número total de personas, complejidad del proyecto (requerimientos, procedimientos logística y subcontratistas de la Obra, etc.) y fase del proyecto (construcción, pre- comisionamiento y comisionamiento).

Los supervisores de SMA apoyan al gerente de SMA de la obra con la implementación del Plan de SMA en su área asignada y coordinar las actividades de los oficiales de SMA.

Para los asuntos diarios de SMA, los supervisores de SMA lidian con la organización del CONSORCIO y supervisores de disciplina para resolver problemas, asegurar que la administración de obra adopte, implemente y mantenga el proceso de SMA de acuerdo al plan de SMA y documentos relacionados, y monitorear el desempeño de la gerencia del CONSORCIO.

El deber del supervisor ambiental debe ser asignando a un elemento del personal. Suficientes supervisores de SMA de PC y C deberán ser identificados para asistir a los especialistas de PC y C en el monitoreo diario de actividades de campo y respecto a los requerimientos mínimos de SMA.

23.1.10 OFICIALES DE ADMINISTRACIÓN DE CAMPO DE SMA DEL CONSORCIO

Los oficiales de administración de campo de SMA del CONSORCIO deberán ser contratados en una proporción que satisfaga los requerimientos y las necesidades específicas de cada uno de los frentes de trabajo.

Antes del inicio de actividades de PC y C la administración de obra deberá signar un representante de de SMA de PC y C para manejar y coordinar a los Oficiales de administración de campo de SMA del CONSORCIO y lidiar directamente con los coordinadores/especialistas de PC y C.

La administración de obra deberá asignar a oficiales de campo de SMA de PC y C para cubrir actividades y personal de PC y C, aumentando la cantidad prevista en caso de que fuera necesario.

El representante de SMA será movilizado solamente al área después de la aprobación de la gerencia del CONSORCIO. Personal adicional considerado necesario para la ejecución segura del trabajo puede ser solicitado, tales como andamiaje, levantamientos, grúas, etc.: por el Contratista y solo será movilizado después de la aprobación de la gerencia del CONSORCIO.

23.1.11 EXPERTO EN APLICACIÓN DE LEYES Y REGULACIONES

Como parte de la organización de SMA de la obra, el gerente de proyecto de la Obra deberá asignar un experto profesional que será responsable por el manejo de la información de leyes y reglamentos relacionada con aspectos de SMA del proyecto.

Este profesional deberá:

- Formar parte del personal de SMA de la obra y reportar al Gerente de SMA de la Obra.
- Mantener contacto con las autoridades locales de SMA para estar al corriente de las nuevas y revisadas procedimientos legislativos que tengan que ver con la gestión de SMA e la obra; también actuara como vinculo con dichas autoridades con respecto a visitas e inspecciones.
- Mantener los archivos de SMA de la obra completos y actualizados en dichos aspectos.
- Proveer notificaciones de cambios o nuevas regulaciones y deberá ser responsable del desarrollo e implementación del plan para ellos.

23.2 SUBCONTRATISTA

23.2.1 REPRESENTANTE DE OBRA

El Gerente de Construcción o representante de Obra del subcontratista es el primer representante en la implementación del plan de SMA de la obra en su organización., administrando y asegurando que el compromiso de SMA es evidente en el lugar de trabajo.

El gerente de construcción del contratista (o equivalente) es responsable de todos los aspectos se SMA del su alcance.

El gerente de construcción del subcontratista debe, en cooperación con los empleados de Contratista, representantes y supervisores de SMA, desarrollar medidas para prevenir incidentes y lesiones dentro de su área de responsabilidad .Particularmente deberá:

- Asegurar el manejo de los recursos para la implementación efectiva de SMA, proveyendo los medios y EPP necesarios.
- Proveer la emisión y terminación de los documentos y plan de SMA
- Participar en la reunión de arranque de SMA, reuniones de coordinación, reuniones del comité de dirección de SMA y el proceso de implementación de SBC (Seguridad basada en conducta).
- Organizar el entrenamiento de orientación de SMA de la compañía (también para sus visitantes) y platicas semanales de SMA.
- Colaborar en el involucramiento, incentivos, esquema de disciplina, liderando con el ejemplo.
- Asegurar el cumplimiento de las prescripciones de salud de la obra, proveyendo servicios médicos para su organización.
- Organizar su propia seguridad, plan contra-incendios, manejo de emergencias y de transito, colaborando con la aplicación de procesos similares previstos para toda la obra.
- Asegurar la emisión de procedimientos y ART en tiempo, ejecuciones de la reuniones de seguridad, para compartir con los trabajadores los resultados y para la terminación y aplicación de los procesos de ATS (Análisis de Riesgo en el Trabajo).
- Respetar el proceso de PT actuando como solicitante, emisor y receptor de acuerdo a procedimientos específicos.
- Preparar, comunicar y seguir planes de manejo de desperdicios, y recolección de datos, asegurando también cualquier control ambiental solicitado.
- Participar en el desarrollo de reglas y prácticas de SMA.

- Proveer equipo contra-incendios, asegurando entrenamiento, inspección y ejercicios.
- Colaborar en la gestión de emergencias según su rol indicado.
- Asegurar la detección, manejo, análisis de incidentes, y reporte de incidentes, en particular, transmitir información regularmente relacionada con casos de primeros auxilios.
- Asegurar el proceso de inspección y mantenimiento para los equipos y estructuras.
- Participar en inspecciones y recorridos de SMA, indicando y siguiendo el plan de acción correctiva, presionando para su terminación dentro de su tiempo límite.

23.2.2 REPRESENTANTES DE SMA DEL SUBCONTRATISTA

El subcontratista deberá nombrar un representante de SMA antes de inicio de actividades, para que sea posible preparar a tiempo los planes y documentos de SMA necesarios.

El representante de SMA debe estar presente constantemente en la obra donde la mano de obra del subcontratista es numerosa. La cantidad de supervisores deberán ser contratados en una proporción que satisfaga los requerimientos y las necesidades específicas de cada uno de los frentes de trabajo.

La relación de supervisor de campo de SMA del subcontratista se incrementará durante la fase de arranque y en cualquier otra fase antes de cualquier proyecto de introducción de hidrocarburos.

El representante de SMA será movilizado solamente al área después de la aprobación de la administración del CONSORCIO.

Personal adicional estimado necesario para la ejecución segura de trabajos específicos podría se solicitado, (tales como andamiaje, levantamiento, grúas, etc.) y solo será movilizada al área después de la aprobación de la administración del CONSORCIO.

La administración del CONSORCIO, después del período de prueba, tiene el derecho de solicitar al subcontratista el remplazo de cualquier personal de SMA que no cumpla con las expectativas del proyecto.

El representante del subcontratista esta directamente involucrado en implementar el plan de SMA del proyecto de subcontratista. En esto, trabajo en conjunto con el gerente de proyecto.

Él es responsable y tiene la autoridad de aconsejar y vincular con el gerente de SMA de la obra y con el personal de supervisión en todos los aspectos relacionados con SMA en el lugar de trabajo y colaborar con el Gerente de SMA del CONSORCIO en planear e implementar todas las actividades de SMA de la Obra, particularmente en su organización deberá:

- Participar en la terminación del Plan y documentos de SMA de la obra, reuniones de arranque de SMA; gestionar la orientación y entrenamiento de SMA, pláticas semanales de SMA, participación, involucramiento e incentivos del Esquema de Disciplina.
- Supervisar el respeto a los requerimientos de salud y mantener servicios médicos en su lugar, respeto a los planes de seguridad y Tránsito; proveer HDSM (Hoja de Datos de Seguridad del Material) y documentos de comunicación de la obra; participar en la definición continua del EPP (Equipo de Protección Personal).
- Participar en el proceso de aplicación de AST (Asignación de seguridad en el trabajo), revisar los procedimientos de ART /PT presentados por la organización y asegurando la ejecución de reuniones especificas de seguridad; verificar la implementación de los procedimientos de APNR.
- Verificar las actividades relacionadas con el proceso de SBC (Seguridad basada en conducta); participar en el desarrollo y aplicación de reglas y prácticas de SMA.
- Asegurar control ambiental y manejo de desperdicios.
- Actuar como jefe de contraincendios, realizando entrenamientos, ejercicios e inspecciones; colaborando para la terminación y aplicación de la administración de emergencias.
- Asegurar y participar en la detección, manejo, reporte y análisis de incidentes, participar en las inspecciones, recorridos y seguimiento de SMA de la obra; monitorear que su organización este aplicando un programa e inspección de equipos y administrar el archivo de documentos de SMA.

23.2.3 SUPERVISOR / SOBRESTANTE

Es responsable de la salud y seguridad de los trabajadores y del respeto al medio- ambiente. El rol del supervisor incluye:

- Entender completamente los requerimientos del plan de SMA de la obra.
- Planear y liderar las actividades de la obra considerando siempre los aspectos de SMA; implementar y asegurar los ART (Análisis de Riesgo en el trabajo), prever y aplicar/recibir todos los PT (Permiso de Trabajo) necesarios; liderar reuniones diarias de seguridad para discutir los aspectos de SMA del trabajo a ser realizado con los trabajadores y Practicas de trabajo de SMA; Promover la disponibilidad y uso de los EPP (Equipo Personal de Protección).
- Promover la prevención de accidentes y planeación y preparación del trabajo; revisar todos los equipos para verificar las condiciones normales de trabajo; demostrar su compromiso con SMA mediante el monitoreo del lugar de trabajo y corregir cualquier discrepancia; reportar y corregir cuando algún trabajador no cumple con los requerimientos de seguridad de la Obra.
- Solicitar y motivar a los empleados que reporten peligros y accidentes; investigar y reportar Casi-accidentes; participar en inspecciones de SMA. Actuar como observador de SBC (Seguridad Basada en la conducta) y participar en las reuniones y entrenamientos relevantes.

23.2.4 EMPLEADOS DE PROYECTO EN GENERAL

Todo el personal tiene la obligación de trabajar con respeto de los principios y prescripciones de SMA: no solo trabajar con cuidado y consideración propia, sino también para la salud y seguridad de otros.

En particular todo el personal debe:

- Cumplir con todas las prácticas y procedimientos de SMA que sean adoptadas, desarrolladas, designadas e implementadas en el área de trabajo.
- Usar el EPP (Equipo Personal de Protección) como fue instruido; usar los materiales y equipo de manera segura y los métodos de trabajo correctos; estar presente en el entrenamiento de SMA y reuniones de seguridad y cumplir con los procedimientos y prácticas descritas.

- Operar solo de acuerdo a las prescripciones del PT (Permiso de Trabajo), cumplir los deberes de inspección relacionados con el APNR (análisis preliminar de niveles de riesgo); participar, como sea requerido, en la observación del proceso de SBC (Seguridad basada en Conducta).

- Ser responsable del uso correcto de todo el equipo e seguridad, materiales y ropa, con el propósito que han sido distribuidos.

- Ocuparse del orden y limpieza del área de trabajo ; desarrollar atención personal por el medioambiente , propia seguridad y salud y de sus compañeros ; hacerse cargo de que todos los desperdicios del área sean puestos y separados en los contenedores correctos; reportar al supervisor inmediato cualquier riesgo potencial en el área de trabajo o cualquier incidentes o lesiones que hubieran ocurrido durante el trabajo; Inmediatamente reportar defectos observados en instalaciones y equipos , a su supervisor ; evitar improvisar procedimientos.

- Apagar equipos y asegurar materiales al final del trabajo.

- Detener las actividades cuando haya un peligro inminente al personal, equipo, obra o ambiente.

23.2.5 PROVEEDORES Y VENDEDORES

Proveedores y vendedores no serán permitidos en la obra a menos que hayan recibido el entrenamiento necesario de SMA. Todos los especialistas de los vendedores deberán cumplir con todas las reglas y prácticas de trabajo seguro de SMA de la Obra.

23.2.6 VISITANTES

Todos los Visitantes de la Obra deberán:

- Estar siempre acompañados en el campo y vestir EPP (Equipo de Protección Personal) designados ;

- Recibir el entrenamiento requerido por la Gerencia de Obra antes de entrar a las instalaciones (riesgos, comportamiento de emergencia y de seguridad, responsabilidades propias etc.).

23.3 ORGANIZACIONES DE SMA

23.3.1 ORGANIZACIÓN DE SMA PARA SITUACIONES PARTICULARES

Si durante la ejecución del proyecto son requeridos cambios de turnos y operaciones en áreas fuera de la obra, la administración de SMA deberá asegurar específico apoyo de SMA:

- Para dos o tres turnos, más apoyo disponible que el usual (médico, seguridad, etc.) también más cobertura del personal de SMA: si el turno extraordinario es suficiente, entonces SMA de tiempo completo no será necesario. A alguien del turno le deberá ser dado la responsabilidad de SMA. Si el turno continúa creciendo, un plan debe ser hecho para agregar a una persona para proveer cobertura constante de SMA.

- Para cantidades significativas de trabajo realizadas fuera de la obra, será considerado un plano de área será previsto que incluya talleres; y presencia de SMA deberá ser considerada, con el mismo rol de la obra Principal.

23.3.2 COMITÉ DE SMA

De acuerdo con la subdivisión del proyecto, para cada área operacional se deberá instituir un comité de SMA. Los siguientes grupos:

- Administración del CONSORCIO y representantes de SMA, supervisores y oficiales.

- Administración de Subcontratistas y representantes/oficiales de campo de SMA.

- Representantes de los trabajadores en el área de trabajo (si existiera).

Deberá formar y actuar como equipo de SMA en la Obra. El propósito del comité de SMA es incrementar la capacidad del trabajo de la organización de SMA en la obra, para implementar el Plan de SMA (necesidades y acciones que deben ser implementadas, el desempeño de vigilancia de SMA, el análisis de incidentes).

En particular, durante esas reuniones deberá ser revisada la implementación y resultados del sistema de SBC (Seguridad Basado en la Conducta) de la obra.

El hecho de trabajar como un comité no relevara de sus respectivas responsabilidades a la administración del CONSORCIO y de los subcontratistas, ni de las leyes locales o responsabilidades contractuales.

23.3.3 COMITÉ DE DIRECCIÓN DE SMA

Cada mes los gerentes y representantes de las distintas áreas de la administración del CONSORCIO y subcontratistas se deberán encontrar un comité de dirección para realizar una evaluación general del estado de SMA en la obra y para tomar acción inmediata, según requerido. El gerente o representante de SMA atenderá para proveer su apoyo y habilidades especializadas.

24.0 COMUNICACION, PARTICIPACION Y CONSULTA

La comunicación dentro del Proyecto Termo RD será una herramienta de diseminación de conocimientos y participación.

La comunicación será conducida a través de medios electrónicos, letreros, posters, pláticas de orientación para todo el personal y visitantes de la obra. La comunicación con todo el personal, contratistas visitantes será la clave para fortalecer el sistema de SMA en la Obra para actuar de manera segura durante la ejecución del proyecto. Se debe implementar:

- Comunicación interna en SMA y reuniones de comunicación.
- Comunicación externa de la Obra.
- Comunicación de la Oficina de SMA.
- Comunicación de partes externas relacionadas.
- Comunicación de Eventos Graves
- Comunicación de Eventos de Crisis
- Comunicación de Emergencia
- Participación y consulta.

Una matriz de SMA general de la Obra deberá ser actualizada y compartida en la obra. El proyecto deberá asegurar que toda la información esté disponible y presentada en lugares visible (boletines de trabajo seguro, posters de SMA, planes de respuesta a emergencias, rutas de evacuación, comunicación de incidentes, seguridad y Salud.

24.2 REUNIONES DE COMUNICACIÓN INTERNA DE SMA

Las siguientes reuniones con tópicos específico de SMA son usuales durante el periodo de construcción:

- Reuniones de Arranque
- Reuniones Semanales del comité de SMA
- Reunión mensual del comité de dirección de SMA
- Reunión de Arranque de PC y C
- Reunión de Coordinación de PC y C y construcción.
- Reunión de Concientización de PC y C
- Reunión de arranque de Entrega

Todas las reuniones regulares de la obra deberán iniciar con un tópico de SMA, problemas u observación relevante del tipo de reunión.

24.3 REUNIONES DE ARRANQUE DE OBRA

Antes del inicio de la ejecución del trabajo en la obra, una reunión de arranque local deberá realizarse, atendida por la administración del CONSORCIO y el representante del subcontratista en la obra.

El propósito de esta reunión es de proveer al subcontratista con toda la información necesaria para poner las condiciones de acceso a la obra e iniciar las actividades en completo acuerdo con las leyes locales y reglas de SMA de la Obra.

La agenda de SMA de la reunión de arranque incluye: Aspectos destacados del plan de SMA, entregando la información, instrucciones y documentos relevantes, desarrollados y usados en la Obra (ej. Folletos, procedimientos, programa de inspección, programa de actividades de SMA de la obra).

El subcontratista debe proveer una descripción de la organización, nombramientos de SMA, logística, etc.

En el reporte de la reunión deberá ser señalado que el subcontratista ha recibido y conoce los requerimientos y el Plan de SMA y otros documentos relevantes mencionados anteriormente.

24.3.1 REUNIONES SEMANALES DEL COMITÉ DE SMA

Reuniones de seguridad en el área de trabajo y comité de salud deberán ser realizadas semanalmente. Estas reuniones deberán ser conducidas por el gerente de SMA de la Obra (quien actuara también como secretario de la reunión.)

Estas reuniones deberán ser atendidas por la administración del CONSORCIO y los representantes de campo de los subcontratistas y el supervisor /superintendente del área relacionada. El personal de SMA y representantes de trabajadores deberán participar en dichas reuniones.

El numero de total de asistentes (nombres, compañía y roles) deberá ser registrado con la minuta de la reunión que el gerente de SMA de la obra emitirá a la administración de obra de cada compañía.

Durante la reunión semanal, se tomara tiempo para revisar elementos de SMA asociados con el Contratista y subcontratista.

Una de los alcances más importantes es coordinar las varias fases de construcción y actividades de los varios Contratistas y Subcontratistas, para minimizar las interferencias y riesgos.

Atención particular debe ser dada al proceso de implementación de SBC (Seguridad Basada en la Conducta) y a las estadísticas de los indicadores positivos de SMA.

24.3.2 REUNIONES DEL COMITÉ DE DIRECCIÓN DE SMA

Las reuniones del comité de dirección de SMA serán realizadas mensualmente en la obra; sin embargo la frecuencia de las reuniones aumentara o disminuirá, si se estima necesario por el Gerente del CONSORCIO.

Los asistentes serán la administración del CONSORCIO, los miembros del comité de Salud y Seguridad (equipo de SMA), Gerencia de Obra, Gerencia de PC y C y representantes del Subcontratista

El gerente de SMA de la obra actuara como secretario del comité de dirección de SMA de la obra.

Los nombres, compañías y roles de los asistentes deberán ser registrados en la minuta de la reunión que el Gerente de SMA emitirá a la administración de Obra de cada compañía.

24.3.3 REUNIÓN DE ARRANQUE DE SMA DE PC Y C

Deberá ser realizada por el gerente de PC y C antes de ser iniciada cualquier actividad de PC y C de campo. La administración del CONSORCIO, la administración de Construcción, la administración de SMA y el representante de los subcontratistas de construcción atenderán a la reunión.

Los siguientes elementos deberán ser discutidos: riesgos y peligros asociados con las fases de PC y C, procedimientos de Coordinación con las actividades de construcción restantes, requerimientos adicionales de SMA (matiz de entrenamiento actualizada, nueva organización de SMA de la obra, etc.) campañas específicas de concientización, programas de incentivos específicos, revisión del plan de emergencia y medios disponibles necesarios, revisión de los medios de primeros auxilios.

Cuando sea necesario un plan de acción especifico será originado e incluido en la minuta de la reunión. El gerente de SMA de la Obra estará a cargo del seguimiento de la implementación de dicho plan de acción.

24.3.4 REUNIONES COORDINACIÓN DE PC Y C Y CONSTRUCCIÓN

Los superintendentes de PC y C y construcción se reunirán para coordinar las actividades del siguiente día. Esto servirá como medio de comunicación entre los dos equipos para que no se pongan en riesgo entre ellos, compitiendo en la misma área de trabajo. Estas reuniones deberán ser realizadas en el marco de reuniones de construcción previas con una frecuencia que puede variar de acuerdo al progreso de las actividades de la obra, pero no deberán ser menos de una semana.

24.3.5 REUNIONES DE CONCIENTIZACIÓN DE PC

Antes de iniciar una actividad de PC y C, introducir un nuevo riesgo significativo en la obra o requerir algún cambio significativo en los procedimientos y prácticas de SMA (como soplado de vapor, entrada de nitrógeno, entrada de hidrocarburos, etc.) una reunión específica deberá ser realizada por el Gerente de PC y C para informar completamente a las otras organizaciones operando en la obra. La admistración del CONSORCIO y los representantes de los Subcontratistas deberán atender a esta reunión.

El CLIENTE o representantes de otras organizaciones relacionadas con las actividades deberán ser invitados a participar.

En el reporte de actividades deberá ser subrayado que todas las partes interesadas han sido informadas y entendido los riesgos adicionales introducidos en la obra y de los procedimientos de SMA a ser aplicados.

24.3.5.1 REUNIONES DE ARRANQUE DE ENTREGA

Una reunión de arranque deberá ser realizada antes del inicio de cualquier entrega de sistema al CLIENTE, apuntando la discusión y definición de procedimientos y prácticas que serán implementadas para manejar la sobre posición entre próximas actividades de arranque, realizadas por el CLIENTE y restantes actividades de construcción y de PC y C.

La reunión deberá ser atendida por la administración del CONSORCIO, gerencia de SMA de PC y C y representantes del CLIENTE.

Los acuerdos tomados deberán ser comunicados formalmente a las organizaciones del subcontratista.

24.3.6 FRECUENCIAS Y REPORTES

La frecuencia de las reuniones anteriores deberán ser modificadas si es acordado; reportes escritos de todas las reuniones deberán ser preparados y distribuidos a todas las partes involucradas. El presidente de cada reunión es responsable de preparar las minutas relevantes.

24.4 COMUNICACIÓN EXTERNA DE LA OBRA

El gerente de Obra es el principal responsable de comunicación externa de la organización, incluyendo autoridades locales. El gerente de PC y C deberá ser requerido para asistir o puede ser delegado por el Gerente de Obra, para la comunicación externa de SMA relevantes de actividades de PC y C.

Una comunicación preventiva abierta acerca de actividades previstas que puedan tener impacto externo podría ser útil para una buena relación.

El proyecto debería comunicar efectivamente información relacionada con riesgos de SMA, situaciones de emergencia, y eventos de crisis que involucren a partes externas (clientes, proveedores, visitantes, subcontratistas, empresas cercanas, comunidades, medio-ambiente, salud, autoridades laborales, protección civil, etc., y vice versa para los riesgos generados por partes relacionadas al proyecto.

24.5 COMUNICACIÓN CON LOS OFICIALES DE LA OFICINA PRINCIPAL DE SMA

La administración de obra de y las oficinas centrales de SMA mantendrán un línea de comunicación directa con la obra, a través de la administración del CONSORCIO, el gerente de PC y C del CONSORCIO y el Gerente de SMA de la obra serán informados acerca de la ejecución general e implantación de la SMA. Ellos deberán mantener una comunicación periódica con la obra compartiendo aspectos destacados de SMA. El gerente de SMA de la obra deberá facilitar estas actividades dando en detalles la información solicitada.

24.6 COMUNICACIÓN DE EVENTOS GRAVES

Las lecciones aprendidas de los eventos del proyecto deberán ser diseminadas para fortalecer y corregir las acciones que surjan de la investigación de incidentes.

24.7 COMUNICACIÓN DE LOS EVENTOS DE CRISIS

La comunicación de los eventos de crisis será tratada considerando todos los aspectos relevantes de los eventos, no solo aspectos de SMA sino también de trabajo, financieros o relaciones sociales, así como acciones bajo responsabilidad de otras aéreas o disciplinas de la compañía.

24.8 COMUNICACIÓN EN EMERGENCIAS

La comunicación en eventos de emergencia en un requerimiento básico para asegurar el éxito de la implementación de las acciones de control y mitigación.

El plan de respuesta a emergencias del proyecto deberá ser comunicado a través de sesiones de entrenamiento, campañas de publicidad y anuncios que indiquen rutas de evacuación, puntos de reunión, mapas de localización información de servicio médico, salidas de emergencia, extintores, localización de equipos contra-incendios, dispositivos de control de derrames, HDSM (Hoja de Datos de Seguridad del Material). Boletines y lecciones aprendidas deberán ser diseminadas y aplicadas en la obra como medidas preventivas.

La ocurrencia de situaciones de Emergencia como fuegos, terremotos, inundaciones, vientos y tormentas, etc., pueden presentar un evento de crisis potencial (eventos identificados el plan de respuesta a Emergencia de Termo RD).

24.9 PARTICIPACIÓN Y CONSULTA

La admistración del proyecto está comprometida fuertemente a involucrar a todo el personal en una consulta constante y activa del desempeño de sistema de SMA:

- Involucramiento de los responsables por la construcción, PC y C en la realización de los APNR.
- Involucramiento de los responsables de la construcción, PC y C en la investigación de incidentes.
- Involucramiento en la gestión de Cambios.

El proceso de participación y consulta debe informar a todas las partes interesadas que:

- Existen cambios en los planes de emergencia del proyecto.
- Existen riesgos que pueden afectar a la comunidad y viceversa.
- Existen cambios en los requerimientos legales aplicables al proyecto.

La comunicación debe ser establecida con las comunidades locales para informarles acerca de las actividades del proyecto y recibir sus solicitudes y quejas. Sus actividades de participación y consulta serán definidas a detalle en el Plan Social de Proyecto.

30.0 RECLUTAMIENTO, ORIENTACION Y ENTRENAMIENTO

Todo el personal del proyecto deberá ser capaz de realizar sus actividades de acuerdo los requerimientos legislativos, profesionales y de SMA, para lo que se llevará un registro que será un prerrequisito obligatorio para accesar a las aéreas de construcción y operación del proyecto. Trabajadores menores de Edad no están permitidos (menos de 18 años).

La administración del CONSORCIO, después de un periodo de prueba, se reserva el derecho de reemplazar al personal que en su opinión no cumple con las expectativas de SMA del Proyecto.

30.1 PERSONAL GENERAL

Cada empleado, incluyendo supervisores e ingenieros, antes del inicio del trabajo deberá atender a los siguientes cursos:

- Entrenamiento de Orientación del Proyecto.
- El entrenamiento de orientación especifico del proyecto , incluirán:
  - Familiarizar a los empleados, con la obra, la naturaleza del trabajo, los riesgos que se puedan encontrar, y los equipos, reglas y prácticas seguras que serán usadas para minimizar accidentes y en el Proceso de ART (Análisis de Riesgo en el trabajo).
  - Explicar las acciones a tomar en caso de emergencia.
  - Describir los arreglos de seguridad.
  - Revisar los planes y procedimientos de seguridad y salud, destacando las secciones aplicables a los empleaos y sus trabajos.
  - Política Disciplinaria.

- La obligación para seguir e implementar las directrices de seguridad, de salud y medioambiente del CONSORCIO que cumplan con los requerimientos legales de Republica Dominicana.

Como parte de la orientación, cada empleado debe ser informado que fallar en el trabajo seguro, seguimiento de las prácticas de seguridad serán resultantes en acciones disciplinarias incluyendo en la expulsión de la obra.

Adicionalmente, cada trabajador sebera tener una discusión de seguridad con su supervisor después de 2-3 semanas de empleo cuando el trabajador ya se encuentre familiarizado con el trabajo.

Todos los visitantes deberán tener una reunión específica de SMA en la obra antes de entrar al área de trabajo. Normalmente deberán ser acompañados por personal calificado de la obra.

Dr. Ramón Ma. Urbáez Marte, Abogado Notario Público, Santo Domingo, R.D., Mat. 8512

30.2 PERSONAL COMPETENTE Y APTITUDES BÁSICAS DEL PERSONAL DE SMA DE LA OBRA

Persona competente es una persona con experiencia, entrenamiento y conocimiento del trabajo y los riesgos potenciales y prácticas de trabajo relacionadas con las actividades de trabajo.

La Administración del CONSORCIO y los subcontratistas deberán contratar a personas competentes según las leyes Dominicanas, para los sig. Roles: andamiaje, soldadura, operadores de grúa electricistas, operadores de aparatos pesados; choferes de vehículos, camiones excavadoras etc.

Asistencia a los entrenamientos específicos podrán ser requeridos también para roles específicos (supervisores de Candadeo-Etiqueteo-despeje, personas autorizadas de PT).

30.3 APTITUDES DEL PERSONAL DE SMA DE LA OBRA

El personal de SMA de la obra deberá poseer las aptitudes mínimas de SMA especificadas anteriormente.

- **Gerente de SMA / Representante de SSTMA:** diploma técnico. Experiencia de al menos 5 años en la industria en administración de SSTMA incluyendo actividades de campo , conocimiento de estándares y prácticas de SSTMA , habilidades y aptitudes especificas de SMA , habilidades de comunicación y persuasión , buen nivel de Inglés hablado y escrito.

- **Supervisor/oficial/asistente de campo de SSTMA**: diploma técnico, 5 años de experiencia en la industria con al menos 1 año de experiencia en actividades de campo de STMA, conocimiento en estándares y prácticas de SSTMA, aptitudes y habilidades de SSTMA (ej. Excavación, andamiaje en Alturas, seguridad eléctrica, grúas, etc.), habilidades de comunicación y persuasión, conocimiento de Ingles.

- **Supervisor de SSTMA de PC y C:** diploma técnico, experiencia de 5 años en PC y C con 1 año de experiencia en actividades de SSTMA , conocimientos de estándares y prácticas de SMA particularmente relacionados con trabajo en espacios confinados , prueba de gases, protección respiratoria , seguridad eléctrica, manejo de materiales peligrosos y químicos, prevención y combate de incendios, familiarizado con los PT y procedimiento de Candadeo, Etiqueteo y despeje, habilidades de comunicación y persuasión , ingles hablado y escrito.

- **Experto de aplicación de leyes y reglamentos**: deberá tener habilidades de comunicación y persuasión, buen nivel de Inglés, hablado y escrito y estar disponible tiempo completo en la obra.

30.4 ESQUEMA DE ENTRENAMIENTO DE LA OBRA

Cada organización involucrada en las actividades del proyecto Termoeléctrico Punta Catalina es responsable por:

- La información y entrenamiento de su propio personal

- El entrenamiento especifico relacionado con la ley y las actividades y organización de la obra, incluyendo certificación necesaria cuando sea requerida.

La administración del CONSORCIO deberá asegurar que las sesiones de entrenamiento y orientación sean realizadas para todo los empleados, evaluando el curso de entrenamiento de SMA y revisando su ejecución.

Cada organización (CONSORCIO y subcontratistas) involucrados en la ejecución de las actividades, debe poner a disposición los recursos necesarios para la implementación del programa de entrenamiento para sus propios empleados.

El esquema básico de entrenamiento de la obra previsto es:

Entrenamiento General de Orientación	El personal de trabajo en área. - Por la organización del CONSORCIO
Entrenamiento de Orientación de SMA	El personal de trabajo en área – por la organización asignada de cada área.
Ent. de Orient de int de PCyC .	Al personal ya presente en la obra- – por la organización asignada de cada área.
Entrenamiento de Orientación de ind. de PC Y C de SMA	Al personal directamente involucrado en actividades de PC y C (seguridad incluida), supervisores de toda la obra –por cada organización en sus áreas designadas.
Orientación de SMA de visitas.	Todas las visitas- por cada organización en sus áreas designadas.
Entrenamiento especifico de SMA	Trabajo en altura, uso de plataformas móviles, etc – por un cuerpo de entrenamiento responsable oficial.
Entrenamiento de SMA adicional a supervisores de Obra.	Entrenamiento de orientación de SMA anterior– por cada organización en sus áreas designadas.
Entrenamiento de SBC	Todo el personal de gestión/observación – por cada organización en sus áreas designadas
Reunión de EDRT	Entrenamiento contínuo de SMA de campo por el supervisor/sobrestante y trabajadores para tareas especificas activas (proceso de AST) – por la gestión del CONSORCIO y subcontratistas.
Sesiones adicionales de entrenamiento especifico etc.	Entrenamiento continúo de SMA para el personal sobre tareas y actividades: Contraincendios, emergencias, primeros auxilios, etc. Sesiones realizadas para tareas específicas /ART Ej: espacios
Platicas semanales de salud, Seguridad y medioambiente.	Entrenamiento de campo contínuo por supervisores/sobrestantes y trabajadores sobre tópicos de SSMA específicos (recomendada la participación de la administración del CONSORCIO– por la administración del CONSORCIO y subcontratistas en campo.

Una matriz especifica de Entrenamiento y horario será desarrollada en el área y deberá de ser actualizada.

Registros de entrenamiento deberán ser mantenidos por la organización de SMA del CONSORCIO y subcontratista y hacerlos disponibles cuando solicitados.

1711

Cursos de entrenamientos deben ser desarrollados durante la planeación de SMA para que estén listos cuando el personal arribe a la obra. Material de entrenamiento y cursos deben ser multilingües de acuerdo a la audiencia.

30.4.1 ENTRENAMIENTO DE ORIENTACIÓN SMA DEL PERSONAL DE OBRA Y VISITANTES

Existen tres diferentes sesiones de entrenamiento de orientación SMA:

- Entrenamiento de orientación de SMA del dueño – es la orientación necesaria para tener acceso a la propiedad del dueño;
- Entrenamiento de orientación de SMA del proyecto - es la orientación necesaria para realizar actividades incluidas en el alcance del proyecto;
- Entrenamiento de inducción de SMA de PC y C – es la inducción necesaria para realzar actividades de PC y C incluidas en el alcance del trabajo.

30.4.2 ENTRENAMIENTO DE ORIENTACIÓN DE SMA DEL CLIENTE (SI EXISTIERA) ENTRENAMIENTO DE ORIENTACIÓN DEL PROYECTO

El entrenamiento de orientación del proyecto es organizado por la administración del CONSORCIO para instruir a todo el personal arribado a la obra acerca de la información principal relacionada con el proyecto, y entregada por cada organización (CONSORCIO y subcontratistas) a sus respectivos empleados. Está compuesta por una orientación de SMA que informa acerca de la política de SMA, objetivos, reglas y riesgos principales presentes en la obra y una inducción general dirigida información social y general acerca del proyecto Tremo RD.

Cada persona antes del inicio del trabajo deberá atender al entrenamiento de orientación del proyecto (duración 8 horas). Este entrenamiento es prerrequisito para recibir una Etiqueta Nominal que pegada al casco de seguridad permite a la persona a trabajar en el área.

Un examen es requerido para comprobar la comprensión de la sesión de entrenamiento.

1712

Como parte del entrenamiento de orientación, los empleados deberán ser informados de la importancia de no romper las reglas de SMA y de los riesgos que los actos inseguros podrían crear en el área y a otros trabajadores.

La administración distribuirá a todos, después de la sesión de orientación, un folleto para reforzar el entrenamiento de orientación que será realizada en la obra.

También, la administración de obra deberá comunicar las prácticas de trabajo de SMA y reglas de los diferentes niveles de la organización (supervisores, trabajadores, etc.) por entrenamientos específicos y materiales.

El entrenamiento de orientación de SMA de proyecto deberá ser actualizado y modificado de acuerdo al estatus de las actividades, con referencia particular al inicio de actividades de PC y C.

Para todo el personal de construcción ya presente en la obra antes de inicio de actividades de PC y C una nueva sesión de entrenamiento de orientación actualizada deberá ser realizada.

El personal que entre a trabajar al proyecto recibirá una orientación de SMA, que estará integrada por los siguientes Tópicos (pero no limitada a estos):

- Bienvenida (presentación de la compañía, beneficios del sistema de SMA)
- Tipos y características de la industria de la Construcción, actividades de riesgos elevados
- Regulaciones de SMA ,Política de SMA
- Control de accesos y salidas
- Entrenamiento de SMA
- Equipos de Protección Personal
- Señalizaciones y barricadas
- Permisos de trabajo con altos riesgos y AST
- Procedimiento de respuesta de Emergencia
- Rutas de evacuación
- Puntos de reunión

1713

- Activación del plan de respuesta a emergencia del proyecto
- Servicio médico
- Revisión de higiene en el proyecto
- Campanas de salud ocupacional, pruebas de alcohol, y uso de sustancias prohibidas
- Protección ambiental
- Materiales peligrosos (Identificación, transporte, manejo y almacenamiento)
- HDSM (Hoja de Datos de Seguridad del Material) y comunicación de riesgos
- Residuos peligrosos (clasificación, manejo y disposición)
- Orden y limpieza
- Consecuencias de no seguir el sistema de SMA (lesiones, enfermedades laborales, muerte, heridas, quemaduras, etc.)
- Requerimientos contractuales de SMA del cliente (si existieran)
- Relaciones laborales (departamento de personal)
- Entrenamiento de inducción de SMA de PC y C

Un entrenamiento de inducción mas especifico deberá ser asistido por aquellos trabajadores que estén directamente involucrados en la ejecución de actividades de PC y C. La asistencia a este entrenamiento deberá ser considerada como obligatoria. Personal de seguridad deberá asistir también al dicho entrenamiento antes, para estar calificado para cubrir actividades de PC y C y personal.

Así también todos los supervisores de PCC están requeridos a atender este entrenamiento para incrementar la concientización de riesgos adicionales introducidos a la obra por actividades de PCC próximas.

Este entrenamiento deberá incluir los siguientes tópicos: riesgos y precauciones de PC y C , riesgos de ruido, riesgos de equipos rotatorios, temperaturas altas y riesgos de presión, identificación y separación de sistemas activos , seguridad eléctrica, manejo de sustancias peligrosas , espacios confinados , trabajo en alturas , riesgos de fuego/explosión , prevención y combate a incendios , prácticas de PT, prácticas de Candadeo, Etiqueteo y despeje , protección ambiental , emergencia.

Los contenidos del entrenamiento deberán ser moldeados para la actividad específica a la que el trabajador será asignado (mecánico, eléctrico, instrumentos, etc.)

30.4.3 ENTRENAMIENTO DE ORIENTACIÓN DE SMA DE VISITANTES

Todos los visitantes a la obra de trabajo deberán recibir entrenamiento de orientación sin importar su organización, alcance de su visita o duración de su periodo en la obra. Los visitantes deberán ser acompañados en todo momento y vestir el EPP. Durante el entrenamiento deberá ser subrayado la importancia de no romper las reglas de SMA y los riesgos de actos inseguros creados en la obra. Dicho entrenamiento deberá ser actualizado considerando las condiciones de la obra antes del inicio de las fases de PCC.

30.4.4 ENTRENAMIENTO DE SUPERVISORES/SOBRESTANTES

Los supervisores y sobrestantes de tareas son figuras esenciales, debido a sus conocimientos, poder y proximidad a la mano de obra: un esfuerzo particular deberá ser hecho para entrenar y motivar a estas personas.

Sesiones adicional de entrenamiento (aprox. 2 horas) deberán ser ejecutadas directamente para los supervisores sobre temas específicos de SMA para completar su orientación al principio de las actividades de la obra; e incluirá los siguientes temas:

- Responsabilidad y liderazgo, SMA y el supervisor, concepto de riesgo, identificación y corrección de riesgos, planeación de tareas, análisis de riesgo en al trabajo, prácticas de SMA en el trabajo y permisos, pláticas y comunicación de seguridad, cambio de actitudes y trabajos inseguros.
- Una sesión específica es prevista para la implementación de SBC.

Ya que los supervisores de PC y C del CONSORCIO usualmente participan directamente en la ejecución en campo de PC y C y trabajan en proximidad con la mano de obra de los subcontratistas, ellos también están requeridos a atender esta sesión de entrenamiento.

30.4.5 SEGUIMIENTO DE LOS TRABAJADORES DE NUEVO INGRESO

El personal Nuevo es el más expuesto a accidentes. Todos los nuevos trabajadores deberán ser cuidadosamente entrenados por su supervisor por 2 o 3 semanas de trabajo (entrenamiento de orientación, etc.) para corregir su conducta y mejorar su actitud de SMA.

30.4.6 ENTRENAMIENTO CONTINUO DE SMA

La orientación no es una actividad de una sola ocasión, sebera ser realizada durante todo e periodo de empleo. Los típicos entrenamientos continuos son:

- Reuniones de Inicio de Seguridad diarias –por la línea operativa
- Platicas semanales de SMA – por la línea operativa con presencia del personal de supervisión.
- Platicas de concientización de SMA –por la línea operativa con la presencia de la administración de construcción y PC y C.
- Entrenamiento adicional organizado por el equipo de SMA sobre temas específicos.

30.4.7 REUNIONES DE INICIO DE SEGURIDAD

Una discusión de seguridad a ser organizada e implementada para cada tarea o supervisor cada día.

La reunión deberá ser realizada cerca del área de trabajo, para planear tareas o discutir asuntos de los supervisores o del personal.

Las reuniones de inicio de seguridad diarias deberán ser dirigidas a todos los empleados de la administración del CONSORCIO y subcontratistas con sus supervisores facilitando las reuniones. El gerente de SMA de la obra y otros gerentes podrían participar si necesario.

Esta actividad es un paso fundamental del proceso de AST. Deberá contener la siguiente información:

- Revisión del ART (Análisis de Riesgo en el Trabajo) de las actividades
- Realizar el EDRT (Evaluación Diaria de Riesgo en la Tarea)
- El plan de trabajo diario

- Trabajos que están siendo realizados cerca
- Consideraciones ambientales
- Actualizaciones de procedimientos

Para actividades de PCC ejecutadas bajo supervisión del CONSORCIO, la reunión de inicio de seguridad, será realizada por el supervisor del CONSORCIO del área.

30.4.8 PLÁTICAS SEMANALES DE SMA

Los supervisores del CONSORCIO y de los subcontratistas deberán conducir reuniones semanales de 20 min. con los trabajadores para discutir y reforzar las prácticas de SMA y para enfatizar los riesgos del trabajo. Los supervisores deberán participar y supervisor esta reunión para colaborar y mostrar su compromiso.

Los temas de discusión deberán ser preparados por el supervisor en colaboración con el equipo de SMA, tomando en cuenta los resultados de las inspecciones y reuniones periódicas de la obra.

La reunión deberá ser realizada cerca del área de trabajo para planear tareas y discutir asuntos de los supervisores y personal. La copia de los tópicos discutidos, participantes y comentarios, etc. deberán ser trasmitidos al gerente de SMA de la obra a lo largo del día de la reunión.

30.4.9 PLÁTICA DE CONCIENTIZACIÓN DE SMA

Antes de realizar actividades de PC y C que introduzcan nuevos riesgos a la obra o requieran nuevos procedimientos de SMA (tales como soplado de vapor, introducción de nitrógeno, introducción de Hidrocarbonos, etc.,) una plática de concientización de SMA deberá ser realizada para avisar al personal de la obra sobre el. Los supervisores de construcción y PC y C del CONSORCIO deberán de estar presentes para colaborar y mostrar su compromiso.

Estas pláticas pueden ser incluidas en las reuniones semanales de SMA.

El gerente de SMA de la obra recibirá copia de los temas discutidos, participantes, comentarios, etc., durante el día de la reunión.

Apuntando a reforzar el mensaje que cambios críticos están ocurriendo en el campo, un paro temporal de todas las actividades de la obra justo antes de la ejecución de actividades relevantes de

1717

PC y C puede ser también considerado, en este caso la plática de concientización de SMA deberá ser realizada durante este paro temporal.

30.5 ENTRENAMIENTO ADICIONAL DE SMA

Los empleados de la administración del CONSORCIO y de subcontratistas están también requeridos a atender a ciertas sesiones adicionales de entrenamiento presentadas por el Cliente o solicitadas por la administración del CONSORCIO.

Tomar en cuenta las diferentes fases de trabajo que traigan determinados temas de SMA, a continuación son presentados los asuntos que deberán ser tomados en consideración:

- **Fases especificas de trabajo (generalmente para supervisión):** reforzar los aspectos de SMA en lo referente trabajo y sobre posición entre las diferentes disciplinas, sistemas y unidades, etc.

- **Empleados entrenados para aptitudes especificas / implementación de plan y tareas:** proceso de observación de SBC , permisos de trabajo , miembros de equipo de emergencia ;entrada en espacios confinados; Candadeo,Etiqueteo,Despeje , trabajo en alturas , acceso a áreas restringidas, trabajo con sustancias peligrosas (HDSM, etc.) , primeros auxilios , contraincendios, medidor de gas , protección respiratoria , plan de emergencia, etc.

La administración del CONSORCIO deberá monitorear el desempeño general y desarrollo del sistema de entrenamiento a través de la ejecución del trabajo.

Todo el personal deberá participar en cualquier entrenamiento adicional solicitado y realizado por la administración del CONSORCIO.

30.6 PAROS TEMPORALES DE SEGURIDAD

Si la administración del CONSORCIO determina que el nivel de concientización se ha deteriorado significativamente (ej. Incremento de condiciones inseguras, casi- accidentes, acciones disciplinarias etc.) Se realizara paros temporales de seguridad para corregir la situación y problemas de SMA.

El gerente de Obra del CONSORCIO coordinara la organización del paro temporal de seguridad de todo el equipo del proyecto, en caso de que sea necesario.

Sin embargo el gerente de obra del CONSORCIO puede sentir necesario que un subcontratista en particular (o en casos extremos, todos) pueden necesitar organización dicho paro para su organización. En este caso, el subcontratista a su propio costo, deberá presentar un plan para aprobación y organización de su ejecución del trabajo.

30.7 ENTRENAMIENTO DE ACTUALIZACIÓN DEL EQUIPO DE AUDITORES E INFORMACIÓN DE AUDITORIAS

El equipo de auditores junto con el gerente del CONSORCIO, organizará sesiones de entrenamientos de actualización, al menos para el personal de administración, después de un sistema de auditoría. El propósito principal de estas sesiones de actualizaciones son: informar acerca de los resultados de las auditorias y reforzar la mentalidad de SMA antes del inicio de trabajo intensivo.

30.8 REGISTRO DE ENTRENAMIENTO

Un registro de todo el personal que ha llevado la orientación inicial o ha recibido entrenamiento adicional o reentrenamiento deberá ser mantenido por todas la organizaciones de la Obra..

Dicho registro debe permitir una actualización regular de la situación del entrenamiento de la obra. Un sumario debe ser preparado al menos 1 vez al mes para que los resultados puedan ser incluidos en el reporte mensual de SMA.

31.0 MOTIVACION, INCENTIVOS Y ESQUEMA DE DISCIPLINA

La motivación positiva del empleado y conversación positiva de campo ayuda a desarrollar los hábitos y condiciones correctas. La comunicación de abajo hacia arriba debe der facilitada en la obra, por ejemplo durante las pláticas semanales de SMA. Cada organización debe estar involucrada en estas campañas. La motivación del personal debe ser apoyada con las siguientes prácticas:

31.1 PIZARRÓN PRINCIPAL DE SMA DE LA OBRA

El pizarrón principal de SMA debe ser colocado de manera visible en la entrada de la obra y debe ser actualizado mensualmente.

31.2 PUBLICIDAD DE SMA

Anuncios visuales deben ser una parte integral de mantener y promover la concientización de SMA. Los siguientes ejemplos son herramientas que serán empleadas:

- Posters ej.: Panfletos de inspección laboral y publicaciones pueden ser dispuestos en muchos lugares de la obra, como en los baños, oficinas de campo, almacenes, pizarra de boletines etc.

- Pizarra de boletines: serán usadas para presentar posters de seguridad, boletines de SMA, compartir información, lecciones aprendidas, etc. la información deberá ser actualizada cada mes o 2 semanas. Los pizarrones deberán ser puestos en oficinas, campo, ITC, áreas de descanso, etc.

- La pizarra de boletines deberá también contener información tales como número telefónicos, graficas de organización del proyecto, asuntos específicos de SMA y situaciones inseguras especificas.

- Señalizaciones de Peligro hechos de materiales que resistan condiciones del clima, serán dispuestas por toda la obra donde existan riesgos latentes; señalizaciones especiales tales como "Hombres trabajando", o "caída de materiales" o uso de barreras de exclusión y cintas, estas últimas será removidas del área cuando termine el trabajo.

- Seguridad fuera del trabajo deberá ser parte de la campaña de comunicación, publicando los riesgos de transportarse a y del trabajo.

Es la responsabilidad de la administración del CONSORCIO de proveer y presentar material de información de SMA bajo la coordinación del Gerente de SMA.

31.3 ESQUEMA DE INCENTIVOS

La Gerencia del CONSORCIO desarrollará e implementará planes de incentivos para promover conductas positivas y proactivas de SMA.

El plan de incentivos será desarrolladlo y gestionado por la administración del CONSORCIO basado en el presupuesto definido y los costos relevantes serán compartidos por todas las partes involucradas.

Instrucciones específicas clarificando el esquema de incentivos serán emitidas y compartidas por las partes involucradas.

El plan de incentivos será basado en recompensar las conductas positivas y proactivas de SMA y podrá tener las iniciativas siguientes:

- Reconocimiento del mejor desempeño de SMA de un área o equipo mediante auditoria – evaluación.
- Celebración de alcance de un Objetivo/Hito de SMA de la obra.
- Sistema de premio de SMA.

31.4 PROCESO DE DIÁLOGO COMPORTAMENTAL

El Proceso de diálogo Comportamental está basado en la filosofía de SMA que promueve y espera que cada miembro de la línea de gestión participe en el proceso para valorar la conducta segura y corregir actos inseguros.

Los supervisores de obra deberán implementar el sistema bajo la coordinación del gerente de SMA y el liderazgo del gerente de Obra.

La administración del CONSORCIO y de los subcontratistas son parte del sistema y deberán participar en la implementación del proceso.

El proceso de Dialogo Comportamental desarrolla una metodología que permite la identificación de peligros y riesgos de comportamiento y las consecuentes acciones de prevención con un enfoque positivo de la observación y la interacción entre el equipo de la construcción / inicio, respeto a las prácticas y posiciones de funcionamiento y el comportamiento durante la ejecución de actividades de los miembros y sub-contratistas.

31.5 ESQUEMA DE DISCIPLINA DEL SITIO

El hecho de ignorar la violación envía un "mal" mensaje de que está bien violar las normas de SMA, ya que no son tan importantes. Un sistema de disciplina se llevará a cabo para desalentar la violación de las reglas y las situaciones de riesgo innecesarias del sitio SMA.

1721

Cada organización en el sitio tendrá la obligación y la responsabilidad de detectar violaciones de SMA y situaciones de riesgo y ofrecer medidas para su corrección. Cada organización debe mejorar la disciplina "interna" de acción de acuerdo con sus procedimientos internos.

Cada vez que el CLIENTE de la planta /personal del CONTRATISTA detecte violación de las reglas y normas, las medidas disciplinarias deben ser solicitadas y tomadas por los miembros del Contratista involucrados, dependiendo de la naturaleza de la infracción.

Advertencias verbales /escritas pueden ser dadas en función de la instancia. Las medidas a tomar van desde la amonestación verbal hasta la denegación de entrada a la planta por un período específico de tiempo o para siempre.

El Administrador SMA del Sitio deberá mantener un registro de las acciones de disciplina, por escrito requerido directamente por el Director de proyecto/Contratista, con el correspondiente seguimiento.

La organización involucrada deberá proporcionar por escrito la garantía de que las medidas correctoras requeridas han sido implementadas.

La seguridad, la salud y la regulación de medio ambiente del proyecto, se publicará como una guía de bolsillo que se entregará a cada persona que entra en el sitio durante la orientación SMA. En este documento se presentan las reglas que deben ser considerados como vinculantes de acuerdo al REGLAMENTO DE SEGURIDAD Y SALUD EN EL TRABAJO (Decreto Núm. 522-06, del 17 de octubre de 2006) del Ministerio del Trabajo aplicable en el Proyecto Termoeléctrico Punta Catalina.

En este folleto se definen claramente las sanciones que se aplicarán en caso de incumplimiento en el sistema de SMA se indica como sigue:

- Provisiones Generales
- Comisión de Seguridad e Higiene
- Prevención y Protección contra incendios
- Salud y Medio Ambiente de trabajo
- Uso de equipo de protección personal
- Reglas de Seguridad

- Uso apropiado de protección y vestimenta de trabajo
- Protección de Medio Ambiente
- Conducta
- Sanciones por falta de cumplimiento de normas y reglas de SMA
- La falta de cumplimiento de cualquiera de los artículos de esta regulación, por parte del trabajador, será sancionada de la siguiente manera:
- Llamada de atención
- Suspensión del trabajo de uno a ocho días sin goce de sueldo.
- Terminación del contrato de trabajo

En cualquier caso, la suspensión del el trabajo puede exceder de 8 días y el caso debe ser adecuadamente investigado antes de aplicar la suspensión.

Todas las sanciones se harán por escrito, enviando el original al departamento de personal para proceder con el caso y registrar la sanción en el caso de los trabajadores.

Las faltan deben ser como se indican abajo:

- Llamada de atención: cuando la ausencia se compromete por primera vez.
- Suspensión: de 1 a 4 días, al cometer falta por segunda vez.
- Suspensión: de 2 a 8 días, cuando se comete falta por tercera vez.
- Terminación del contrato: cuando el acto de negligencia realizada por el trabajador o el supervisor ha puesto en peligro su vida o la de sus compañeros de equipo

31.5.1 CLASIFICACIÓN DE LAS VIOLACIONES

Los siguientes son algunos comportamientos básicos del personal del proyecto que no serán tolerados y se espera que inicie el proceso disciplinario correspondiente:

- **Comportamiento Intolerable:** Cualquier violación al comportamiento no clasificado como intolerable; es decir:

- Nula utilización de los EPP prescritos, la presencia no autorizada en zonas distintas de las áreas de trabajo designadas, altercado, juego, con los compañeros de trabajo o la supervisión; Superación del límite especificado de velocidad del sitio, caso omiso de las barreras de entrar en un área marcada como no seguro, incumplimiento de los requisitos de sitio de SMA, el tráfico y las reglas del campo, in cumplimiento de los requisitos de trabajo SMA; no notificar los incidentes de inmediato a la supervisión, fumar en áreas diferentes de los permitidos.

- **Comportamientos Graves Intolerables:** El comportamiento arriesgado poniendo su vida o la vida de otras personas en peligro inminente, sin razón, es decir:

  - Trabajar sin permiso cuando sea requerido o la violación a las condiciones del permiso de trabajo; no cumplir con la protección contra caídas cuando sea necesario; fumar/fuego gratuito en zonas peligrosas; energizar o des energizar una fuente de poder sin la debida autorización, no respetar el procedimiento de aislamiento, el uso incorrecto de las herramientas y equipo; operar o causar que opere un equipo que no esté en condición de hacerlo; modificar andamios sin autorización;

    quitar la plataforma, rejas y barandas sin autorización o sin barreras /signos en su lugar; no acordonar correctamente el suelo /piso vacío; no controlar las chispas; velocidad excesiva de vehículos, el acceso no autorizado a un área restringida, la posesión /consumo de bebidas alcohólicas o drogas, daños ambientales voluntarios.

- **La insubordinación:** abusar de los demás, la negativa a seguir las instrucciones de supervisión / acoso / robo / vandalismo / falsificación de documentos / informes / etc.

32.0 SALUD OCUPACIONAL Y SERVICIOS MÉDICOS

Cada organización del sitio es responsable de la salud de sus propios empleados y los empleados de sus sub-contratistas. Nada de lo contenido en este Plan SMA del CONTRATISTA del sitio exime a cualquier organización de su responsabilidad. No malestares endémicos se prevén en el sitio.

32.1 EXÁMENES MÉDICOS Y SERVICIOS

Los empleados del CONTRATISTA y del Subcontratista deberán ser sometidos a un examen médico antes de empezar a trabajar en el sitio, para comprobar que se encuentran en forma para el trabajo

que van a realizar. En algunos casos, para trabajos de periodos cortos, un certificado médico comprobando que la persona es adecuada para el trabajo puede ser aceptado.

Si se detecta que el personal sufre de enfermedades contagiosas, su ingreso al sitio tiene que ser evitado hasta que la enfermedad es tratada adecuadamente y deje de ser contagiosa.

32.1.1 SERVICIOS MÉDICOS

Los servicios médicos del sitio (por ejemplo, lugar principal de primeros auxilios, ambulancias, la disposición para el tratamiento profesional, asistencia médica) estarán a cargo de la coordinación del CONTRATISTA.

Información y comunicación sobre el hospital más cercano se dará en el sitio.

Acuerdos por escrito se harán con las estructuras médicas disponibles. Un chequeo se debe hacer en la preparación y el calendario necesario.

32.1.2 INSTALACIONES DE PRIMEROS AUXILIOS

Las instalaciones médicas siguientes tienen que ser proporcionados por el CONTRATISTA y adaptadas a las condiciones locales siguientes:

- Instalaciones de primeros auxilios con enfermeras y paramédicos certificados
- Cajas de Primeros Auxilios (CPA) y camillas deberán estar siempre presentes y de acuerdo al número de empleados
- CPA deberán estar siempre señalizadas y localizadas en lugares accesibles

El contenido debe, al menos en mínimo, tener el contenido en las leyes de República Dominicana, e integrado según sugerido por el CLIENTE. Personas designadas deberán:

- Estar a cargo como personal entrenado de Primeros Auxilios
- La capacidad de comunicación deberá estar garantizada con los servicios médicos garantizados en la Clínica de Primeros Auxilios de la Obra y en las instalaciones del Hospital Local: acuerdos y arreglos deberán ser tomados para transporte inmediato y tratamiento, si requerido.

- Los trabajadores será entrenados en la manera más rápido de llamar a la salas de Primero Auxilios.
- Todo el personal lesionado deberá ser acompañado al centro médico local por su supervisor directo o su delegado.

32.2 ENTRENAMIENTO DE SALUD

32.2.1 INFORMACIÓN Y ENTRENAMIENTO PARA EMPLEADOS

El CONTRATISTA y el personal de sub-contratistas deben recibir información básica de primeros auxilios orientada a la construcción industrial para el tratamiento de emergencias o de lesiones que amenacen la vida de los trabajadores (sangrado arterial, quemaduras, traumatismos, accidentes cerebro vasculares, shock, estrés por calor) o enfermedad y los principios básicos y habilidades de primeros auxilios (fracturas, torceduras, esguinces), así como la difusión de la conciencia entre la fuerza de trabajo y administración concerniente a ciertos riesgos de salud relacionados con el trabajo en si o la edad del individuo.

La siguiente es la información y el entrenamiento que el Contratista y sus sub-contratistas deben dar a sus empleados:

- "Qué hacer" y "Qué no hacer" en caso de accidente;
- Las condiciones y actitudes higiénicas;
- Manejo de alimentos en la cocina, en comedores y en el frente de trabajo;
- Enfermedades Contagiosas y Ocupacionales
- Estrés por calor
- Factores de stress climático
- Mantenimiento de la condición "adecuada para el trabajo"

Esta capacitación puede ser proporcionada en:

- Capacitación de Orientación
- Reuniones diarias de Seguridad Industrial y Salud

- Pizarrones y Carteles del Sitio
- Brigadas de entrenamiento de Primeros Auxilios

32.2.2 SOCORRISTAS CALIFICADOS Y ENTRENAMIENTO

Los Capataces y la línea de supervisión deben tener un certificado estándar válido de primeros auxilios.

32.2.3 DOCUMENTACIÓN MÉDICA

El asistente médico del Contratista deberá registrar todos los casos vistos o tratados por él, incluyendo:

Nombre del empleado, el número de placa y la empresa, fecha de la lesión, la naturaleza de la lesión o enfermedad y si fue enviado a casa o a otro lugar, el tratamiento proporcionado y el cuidado profundo recomendado, cualquiera de las restricciones laborales impuestas la herida y/o tratamiento.

Copia de estos documentos serán adjuntados por el Contratista para el informe del accidente.

Para casos fatídicos, casos que requieran hospitalización, o posibles lesiones que tomen tiempo en sanar, el CONTRATISTA será notificado de inmediato; e informará inmediatamente al CLIENTE de la planta.

32.3 SANEAMIENTO DE ICT, ALOJAMIENTO, DESCANSO/ÁREAS DE DESCANSO

Todos los edificios e instalaciones temporales, áreas de almacenamiento, de trabajo y vivienda, equipos y herramientas deben mantenerse en buenas condiciones higiénicas.

Descontaminación /control de vectores infecciosos en las instalaciones /suelo se debe hacer necesariamente para prevenir la reproducción de los insectos.

Campañas de fumigación deben llevarse a cabo periódicamente a través de una calendarización anual.

Todas las organizaciones del Sitio deben:

- Proporcionar suficientes contenedores de basura cubiertos en los lugares apropiados para asegurar la capacidad de almacenamiento adecuada y evitar contaminación por basura de "libre" y acumulada
- Recolección y eliminación de basura y desperdicios en una base diaria de una manera aceptable para el CONTRATISTA.

Para la clasificación de residuos no peligrosos los contenedores serán identificados de acuerdo a los colores del código siguiente:

- Gris: Desechos en general
- Naranja: Orgánica
- Verde: Vidrio
- Amarillo: Plástico y metales
- Azul: Papel/ cartón
- Rojo: Hospitalario/ infeccioso

La higiene y la limpieza son la base de un entorno de salud. Inspección tendrá en cuenta dichos aspectos como una primera condición para inspeccionar.

32.3.1 INSTALACIONES DE CONSTRUCCIÓN TEMPORAL (ICT)

El CONTRATISTA y Subcontratista deberán proporcionar las oficinas, almacenes, áreas de descanso, comedores, baños y otras instalaciones, la ubicación y disponibilidad deben ser aceptables para el CONTRATISTA, de acuerdo a las regulaciones Dominicanas.

Planos de la disposición propuesta de estas instalaciones (incluyendo todos los servicios necesarios, etc.) deberán ser entregados al CONTRATISTA para su revisión y autorización antes de que cualquier actividad de instalación comience.

32.3.2 WC EN SITIO

WC y lavamanos en todos los lugares de trabajo se proveerán en números proporcionales a la cantidad de personal.

Las instalaciones sanitarias deberán ser proporcionadas a los empleados a razón de un WC por cada 20 empleados. Los baños portátiles serán ubicados estratégicamente en zonas de sombra con el fin de proporcionar una cobertura adecuada para todas las áreas de trabajo activo. Las letrinas no son aceptables.

Todos los servicios sanitarios del sitio de trabajo deberán ser revisados y limpiados de manera regular, tan a menudo como sea necesario de acuerdo a la cantidad de uso y temporada. Proporcionar una limpieza 1 por día.

32.4 ALCOHOL/DROGAS Y TABACO

32.4.1 ALCOHOL/DROGAS

El uso, posesión, distribución o venta de drogas o alcohol está estrictamente prohibido. Cada trabajador en el sitio tiene la responsabilidad de trabajar en condiciones físicas y mentales adecuadas para llevar a cabo sus funciones asignadas.

En caso de duda debido a la conducta impropia de un empleado, el CONTRATISTA puede solicitarle someterse a una prueba (con el analizador de aliento y/o análisis de orina).

Las medidas de prevención para el consumo de drogas y alcohol, el uso de sustancias prohibidas y el abuso de alcohol es un problema importante es que las acciones para la mitigación de esta práctica a través de la aplicación de pruebas de detección, estas medidas se incluyen en el proceso de reclutamiento, inducción y SMA para hacer esta política efectiva se aplica a todo el personal del proyecto.

32.4.2 FUMAR EN EL SITIO – ÁREAS PARA FUMADORES

Fumar se debe hacer en las áreas específicas para ello (cubiertos del sol /lluvia) en donde es proporcionado un cenicero (cubo de basura con arena).

32.5 INSTALACIONES DE DESCANSO Y COMEDORES

Los alimentos no pueden ser consumidos en el lugar de trabajo excepto en las zonas acordadas con el CONTRATISTA.

Los empleados deberán tomar descansos y comer en las áreas designadas. Estas áreas deberán estar libres de materiales peligrosos o de otros posibles contaminantes. Las área de almuerzo y descanso deberán estar retiradas de las áreas de trabajo activo donde los empleados se verían expuestos a seguir trabajando mientras se comen o toman un descanso.

El comedor /cafetería deberá ser una estructura sana con asientos suficientes y las instalaciones necesarias (por ejemplo, instalaciones de lavado, cubos de basura, recipientes de basura, aparte de la sala que debe limpiarse con frecuencia, áreas de no fumar, etc.)

Cuando así se prevea, la cocina para preparar las comidas principales, deberá estar situada fuera de las áreas de actividades del sitio, separado de otros locales y fuentes insalubres.

Cocina debe estar totalmente amueblada para garantizar las condiciones de higiene (por ejemplo, iluminación, puertas, lavaderos adecuados con agua fría y caliente, refrigerador con termómetro para la comida; sala dedicada para el almacenamiento de alimentos, materiales de limpieza; lugares segregados para almacenar alimentos y productos químicos, sin área de fumadores; con un sistema contra incendios, etc.); el CC se asegurará de que toda la basura, escombros y residuos de alimentos se limpien al final del descanso, por lo que el área se mantendrá limpia.

32.6 HIGIENE DE ALIMENTOS

Los servicios de alimentos deberán cumplir con los requisitos legales locales para el manejo de alimentos, siguiendo los más altos estándares de higiene. Los alimentos y bebidas que se ofrecen deben asegurar la salud y ser aceptable para los diferentes grupos étnicos.

Para los servicios principales, la periódica evaluación de salud o verificación de certificados se llevará a cabo para verificar el nivel de higiene y condición del personal.

Todo el personal que trabaja en los comedores y las cocinas del proyecto, sin excepción, se presentará a exámenes médicos para determinar su estado de salud actual. Por todo esto el personal estará presente en el sitio los resultados de las pruebas de laboratorio pertinentes.

Análisis bacteriales de bebidas y alimentos se realizan de forma cuatrimestral por una empresa certificada.

Todo el personal que trabaja en la cocina y área de comedor, deben usar cofia, delantal y cubre bocas.

32.7 CONDICIONES DE CALOR – ESTRÉS POR CALOR

Se establecerán descansos específicos en condiciones climatológicas muy duras para el descanso necesario de los trabajadores y de la información dada para mantener una condición saludable para trabajar.

Un programa permanente de hidratación del trabajador debe ser implementado en el sitio, de modo que, contenedores con agua deben ser instalados en las diferentes áreas del proyecto, a fin de que los trabajadores estén hidratados en todo momento.

32.8 SUMINISTRO DE AGUA

El suministro de agua potable para el consumo humano y preparación de alimentos debe ser garantizado para la salud y el bienestar de los trabajadores. Todo el personal deberá contar con un acceso razonable al agua y descanso, suficiente para prevenir el estrés por calor.

Un suministro adecuado de agua potable fría se proporcionará en los lugares de trabajo en las áreas de descanso con sombra. Los contenedores deberán estar claramente etiquetados en cuanto a la naturaleza de su contenido y la fecha de envasado, y no serán utilizados para ningún otro propósito. No están permitidos los vasos comunes y no se permite beber directamente del contenedor o manosearlo.

Estarán disponibles en los contenedores apropiados de agua suficientes vasos limpios para su consumo. Es necesario un análisis mensual del contenedor de agua para detectar el número de coliformes totales y cada 6 meses para la detección de los contaminantes máximos permisibles por metales pesados.

Lavados de ojos se proporcionan para los trabajadores que lo necesiten, (cuando sea requerido).

32.9 PROTECCIÓN AUDITIVA

Deben practicarse los métodos apropiados para reducir los niveles peligrosos de ruido, pero cuando éstos siguen siendo excesivos, debe utilizarse protección auditiva. La protección auditiva no es un sustituto para los controles de ingeniería o administrativos de las fuentes de ruido peligroso.

En general, las siguientes acciones se pueden tomar en función del nivel de ruido y de acuerdo con las leyes y regulaciones locales: educación del empleado, la distribución y uso obligatorio de dispositivos de protección y vigilancia sanitaria.

El Contratista es responsable de determinar si el área alrededor del equipo que se está utilizando está generando un nivel peligroso de ruido, en este caso, el área afectada será debidamente aislada y señalada. Se espera que todas las partes implicadas proporcionen y mantengan en todo momento sin costo alguno para los empleados, equipo adecuado de protección auditiva.

32.10 ORDEN Y LIMPIEZA DE LA OBRA

Todas la áreas de trabajo de la obra deberán ser mantenidas limpias y en buen orden. Antes de iniciar las actividades el sobrestante con su equipo deberán revisar el estado del orden y limpieza del área, eliminar todos los riesgos de tropiezo/deslice y asegurar que todos los medios de acceso están libres y en buenas condiciones.

Al final del turno cada equipo de trabajo deberá remover las sobras, desechos y basura producida durante las actividades colocándolas en los recipientes de basura. Todas las herramientas y equipo de trabajo deberán ser dejados en orden y en su lugar correcto.

Campañas de orden y limpieza serán organizadas periódicamente en la obra, para incrementar el nivel de atención y concientización de las buenas prácticas de orden y limpieza.

32.10.1 USO DE CONTENEDORES/RECIPIENTES

Cada contenedor/recipiente deberá ser apropiado para cada sustancia/material que debe contener y deberá ser etiquetado con el nombre de las substancias/materiales que está diseñado para contener.

32.11 ORDENAMIENTO DE CABLEADO

El ordenamiento de cableado deberá ser implementado en la obra, colocando loas cables eléctricos temporales de acuerdo a rutas preestablecidas, y preferiblemente alzándolos del suelo con soportes y ganchos.

32.12 CONDICIONES DE HIGIENE INDUSTRIAL

Las condiciones de higiene del ambiente de trabajo deberá ser monitoreado constantemente para reducir los riesgos a corto y largo plazo de enfermedades que podrían surgir debido a exposición a actividades repetitivas, contaminación ambiental, ambiente de trabajo en mala condiciones, etc. Tales riesgos deberán ser mitigados a través de las siguientes actividades:

- **Evaluación del ruido:** evaluación de exposición a altos niveles de riesgo, definición de medidas preventivas y aplicación de controles y EPP. Los niveles de ruido deberán ser medios donde el riesgo este presente y un mapa de la obra donde el riesgo es alto deberá ser emitido y actualizado durante la ejecución del proyecto.

- **Ergonomía:** la evaluación del riesgo de actividades repetitivas y de una postura errónea durante el trabajo deberá ser realizada para cada actividad y medir apropiadamente para mitigar el riesgo.

- **Protección respiratoria:** evaluación de riesgo de agentes químicos y biológicos deberán ser realizados y medidas de control colectivos e individuales serán definidas para mitigar el riesgo.

- **Inclusión de personas con discapacidad y movilidad reducida /rehabilitación para el trabajo:** se centra en la integración de las personas en el lugar de trabajo sin discriminación y el reconocimiento de sus características especiales, las previsiones y la disponibilidad de los puestos vacantes.

- **Vibraciones:** riesgos de vibración deberán ser evaluados para todas las actividades que requieran uso de maquinas determinadas y las medidas de mitigación establecidas.

- **Contaminantes:** la evaluación del riesgo de presencia de contaminantes en el aire deberá ser hecho y dispositivos de monitoreo de contaminantes en el aire serán puestos en lugar si requeridos.

- **Temperatura:** la temperatura del área de trabajo deberá ser tal que el trabajo pueda ser realizado de manera cómoda y segura. El riesgo de altas o bajas temperaturas deberá ser evaluado y medidas de mitigación apropiadas deberán ser establecidas y modificadas.

- **Condiciones de iluminación:** el ambiente de trabajo deberá estar iluminado con el nivel de luz suficiente para realizar las actividades de forma segura.

- **Orden y limpieza:** es esencial para tener un área de trabajo segura; todas las áreas de trabajo e instalaciones temporales

Dr. Ramón Ma. Urbáez Mancebo ABOGADO NOTARIO PUBLICO Santo Domingo, R.D., D.N. Mat. # 2570

33.0 MEDIO AMBIENTE

Actividades del sitio se llevarán a cabo con el mínimo impacto sobre el medio ambiente y de acuerdo con las leyes aplicables (Ley 64-00), los permisos, la regulación contractual y las normas del sitio.

El CONTRATISTA deberá aplicar y cumplir con los requisitos de gestión ambiental y las prácticas de ejecución del trabajo de una manera ambientalmente responsable.

Cada organización del sitio es responsable de su infracción legal ambiental o daños. Durante la ejecución de un trabajo de análisis de riesgos, todos los peligros del medio ambiente deberán ser considerados a fin de identificar las medidas correctivas adecuadas que deben adoptarse.

33.1 ASPECTOS AMBIENTALES

El grupo del proyecto ha identificado y evaluado la importancia de los aspectos ambientales directos e indirectos relacionados con el sitio durante la ejecución del trabajo.

El análisis deberá tener en cuenta, especialmente, las condiciones locales, tales como: Derecho, límites, requisitos, situación en y alrededor del sitio, etc. y, en general, la gravedad y frecuencia de los aspectos relacionados con la sensibilidad del medio ambiente local.

Los aspectos ambientales identificados e importantes se gestionan como sigue en esta sección.

33.1.1 REPORTE DE DATOS AMBIENTALES

Los datos de gestión ambiental se van a generar y recolectar mensualmente por el SUBCONTRATISTA y el CONTRATISTA, como parte del reporte mensual.

33.2 PERMISOS Y APROBACIONES

Todos los permisos, licencias y aprobaciones son responsabilidad del CLIENTE, salvo los permisos municipales; son de carácter obligatorio y deben cumplirse en su totalidad.

33.3 EMISIÓN Y CONTROL DE GAS, VAPOR Y POLVO

Las prácticas como la restricción de velocidad del vehículo, o humedecimiento de los caminos de acceso al sitio se aplicarán cuando sea necesario. Todos los motores deberán ser mantenidos apropiadamente para evitar: la excesiva producción de escape no combustible, el consumo excesivo de combustible, posible derrame de lubricante.

33.3.1 CONTROL DE POLVO

Las emisiones de polvo se deben minimizar en todo momento en el sitio.

- El CONTRATISTA seleccionará el equipo diseñado para reducir al mínimo las emisiones no controladas de polvo
- En caso de fuertes vientos, las actividades con un potencial significativo de emisiones de polvo se controlarán para evitar una excesiva difusión del polvo
- Las emisiones de polvo que presentan un peligro inmediato o importantes molestias a los trabajadores del sitio, público en general o el medio ambiente circundante estarán limitadas (por ejemplo, la preparación del material de aislamiento e instalación, materiales con tratamiento de calor para soldadura, limpieza abrasiva, movimiento de tierras, preparación de terreno, excavación, polvo que forma la carga de catalizador, etc.)
- Caminos provisionales de obra serán elaborados al principio del programa. El personal deberá estacionarse en lugares designados.

- La aspersión por pipas de agua se utiliza para suprimir el polvo del camino. La aspersión se llevará a cabo con frecuencia para mantener la humedad y las superficies de impedir la generación de polvo fugitivo.

- Cuando operaciones de limpieza abrasiva sean necesarias, se ubicarán a fin de minimizar el impacto del ruido y el polvo en las áreas de trabajo adyacentes (el uso de arena con silicato está prohibido).

- El CONTRATISTA deberá cumplir con las normas aplicables en materia de camiones abiertos que transportan arena, grava o tierra entre en el lugar y áreas fuera del sitio. La carga deberá ser cubierta y las llantas limpiadas cuando sea necesario para reducir el polvo y la difusión de la tierra fuera del sitio.

33.4 USO DEL AGUA Y AGUAS RESIDUALES

La minimización del uso del agua y su reutilización, el impacto de la minimización de aguas residuales controladas desde el sitio al suelo, aguas subterráneas o de superficie, son los principales objetivos.

Las aguas residuales sanitarias del área de servicios de las ICT (Instalaciones de Construcción Temporal) se reunirán para el tratamiento autorizado o fosa séptica para ser vaciado en forma regular. Bajo ninguna circunstancia las aguas residuales se desviarán a los sistemas de alcantarillado, las vías de drenaje, sedimentación o lagunas de pulimento sin la aprobación del CONTRATISTA.

El agua que se extrae durante la excavación (deshidratación) se eliminará de conformidad con la reglamentación local. Los sistemas temporales de drenaje se utilizarán cuando sea necesario a fin de controlar y capturar el escurrimiento.

Un procedimiento específico deberá ser desarrollado en el sitio para pruebas hidráulicas, limpieza, productos químicos de limpieza y cocción de las calderas para evitar posibles problemas en el sistema central de alcantarillado.

Durante la fase de PC y C, el líquido de aguas residuales debe ser adecuados para el tratamiento biológico de aguas residuales de lo contrario deben ser eliminado como residuo peligroso /no peligroso; deben ser descargadas en el sistema de alcantarillado sanitario, salvo autorización del CLIENTE de la planta.

33.5 PLAN DE GESTIÓN DE RESIDUOS

El CONTRATISTA y Subcontratista debe definir su propio plan de gestión de residuos (tipo y cantidad de la disposición, los envases, la organización, transportistas registrados de residuos y destino final de los residuos).

Para disponer de sus propios residuos, el CONTRATISTA debe: informar a la autoridad local, valorar la calidad (código) y cantidad de residuos, el contrato a una empresa con licencia de transporte y la disposición final, mantener registros de los residuos depositados, y cada mes se elaborará un informe de la eliminación residuos.

El CONTRATISTA deberá registrar todos los envíos de desechos para su eliminación (indicando el tipo, volumen /peso, destino, otra información relevante) antes de ser expulsado del sitio. Los registros deben presentarse cuando se soliciten.

Dr. Ramón Ma. Urbáez Mancebo
ABOGADO NOTARIO PÚBLICO
Mat. # 2570
Santo Domingo, R.D., D.N.

33.6 GESTIÓN APROPIADA DE LOS RESIDUOS

El CONTRATISTA en el sitio deberá administrar y disponer de sus propios residuos de acuerdo con las leyes y reglamentos aplicables y la política y los objetivos del proyecto.

Durante la Reunión de inicio, el SUBCONTRATISTA presentará al CONTRATISTA una estimación del inventario de su producción de residuos propios, de acuerdo a la escala de su trabajo.

El gerente de SMA del CONTRATISTA del sitio, a partir de los inventarios de los desechos del sitio previstos, deberá verificar la posibilidad local para aplicar un proceso de reciclaje. En ese caso, las oficinas y el sitio deben estar provistas de diferentes contenedores para residuos reciclables, como por ejemplo:

- Residuos de oficina: papel, plástico, tóner, chatarra electrónica, etc.
- Los materiales de desecho del sitio y residuos: metales, madera, cables, baterías, aceites y lubricantes, plásticos y papel.

La limpieza del sitio se mantendrá en todo momento y la basura removida de manera oportuna. Si el sitio no se mantiene en buenas condiciones de limpieza, el CONTRATISTA tiene el derecho, pero no la obligación, para limpiar la zona de trabajo y de cargar los costos al subcontratista de acuerdo con el contrato.

33.6.1 CLASIFICACIÓN DE RESIDUOS, RECOGIDA, ALMACENAMIENTO, TRANSPORTE, ELIMINACIÓN

Los residuos deben ser recogidos y clasificados, por lo menos, como: residuos peligrosos, no peligrosos /inertes y Municipal:

- **Residuo Municipal /Urbano** (residuos de alimentos, desechos de oficina, etc., que deben mantenerse sellados y transportados para su eliminación frecuentemente)
- **Residuos inertes /No peligrosos** (materiales resultantes de la excavación - para verificar, dependiendo de la zona - restos de demolición de concreto, vidrio, cortes de madera, trozos de metal, etc.)
- **Los residuos peligrosos** (productos químicos peligrosos, baterías, aceites, lubricantes, suelos contaminados, etc.) se eliminarán en áreas específicas

Los residuos serán primero clasificados, antes de ser eliminados o reciclados. Todas las partes involucradas deberán utilizar a los transportistas de residuos autorizados y las instalaciones de eliminación o tratamiento autorizado por las leyes Dominicanas. El CONTRATISTA supervisará la correcta aplicación de este proceso en el sitio.

Un mapa de las áreas autorizadas para depositar diferentes tipos de residuos y desechos en el sitio se emitirá tan pronto como sea posible, por el Administrador de SMA del Sitio. Los materiales de escombros de construcción, desechos, residuos y demolición deberán ser recogidos por el CONTRATISTA y trasladados de forma regular a las áreas designadas, con los recipientes adecuados.

El almacenamiento temporal de residuos será dentro de las áreas de almacenamiento dedicadas, seleccionadas, designadas y gestionadas para prevenir la acumulación que podría crear riesgos para la salud y/o incendios para los trabajadores o los miembros del público, o una molestia para la comunidad cercana.

Todos los residuos serán recogidos y almacenados en contenedores adecuados para garantizar que la contaminación del suelo sea evitada. Los envases deberán ser etiquetados, almacenados, segregados basados en su compatibilidad e inspeccionados de forma rutinaria por los daños o fugas.

33.6.2 MANEJO GENERAL DE RESIDUOS SÓLIDOS Y RECICLAJE EN EL SITIO

Los residuos municipales, residuos industriales no peligrosos y residuos inertes deberán estar separados en todo momento, la quema abierta de residuos está prohibida.

Un número adecuado de contenedores deberán ser colocados estratégicamente a lo largo de las áreas de construcción e instalaciones temporales por cada parte involucrada en las actividades del lugar de trabajo.

Los residuos sólidos ligeros no peligrosos, papel, bolsas de plástico o material de embalaje ligero que puede ser movido o volar con facilidad por el viento, no podrán ser eliminados desordenadamente en los contenedores descubiertos.

33.6.3 MATERIAL SOBRANTE INERTE DE REHÚSO

La reutilización de los materiales excavados se potenciará al máximo, por ejemplo, el relleno siempre que sea posible.

Cualquier excedente o material contaminado deberá ser comunicado al CONTRATISTA y será objeto de desecho según lo autorizado por la ley y las regulaciones locales.

33.6.4 MATERIALES Y RESIDUOS PELIGROSOS

Los materiales peligrosos tienen las características de explosivos, inflamables, combustión espontánea, peligroso cuando está mojado, oxidantes, peróxidos orgánicos, tóxicos (aguda), sustancias infecciosas, sustancias corrosivas, la liberación de gases tóxicos en contacto con el aire o el agua, tóxicas (con efectos retardados o crónicos), el peligro eco-tóxico, de riesgo secundario o radiactivos.

Los materiales peligrosos deberán ser inventariados y controlados.

Para los desechos peligrosos del sitio, las partes involucradas se refieren a la enseñanza de los diferentes métodos de eliminación locales. Las áreas de almacenamiento deberán ser cuidadosamente seleccionadas. Los residuos peligrosos deberán ser gestionados y almacenados de conformidad con lo dispuesto en el siguiente párrafo.

Las baterías, envases, productos abrasivos, aceites, etc. deberán ser devueltos para su reciclaje a empresas especializadas o proveedores, si no es posible, deberán ser desechados como residuos peligrosos. La HDSM debe ser consultada cuando sea posible.

33.6.5 PREVENCIÓN DE LA CONTAMINACIÓN DEL SUELO Y GESTIÓN DE MATERIALES PELIGROSOS

La Introducción de materiales peligrosos en el lugar deberá ser previamente comunicada al CONTRATISTA. Los materiales peligrosos incluyen residuos peligrosos.

Los contenedores de materiales peligrosos deberán estar diseñados y construidos con materiales adecuados para contenerlos sin fugas /derrames.

Los contenedores deberán estar en condiciones y se colocan en las almohadillas sustanciales, la zona tendrá un sistema de contención para evitar la propagación del derrame /fuga de materiales.

Las áreas de almacenamiento deberán estar bien cercadas para evitar la entrada de personas o vehículos. Materiales incompatibles, no se colocarán en las zonas de contención común o en los mismos contenedores.

El área de almacenamiento de materiales peligrosos no debe estar conectada a una alcantarilla o sistema de drenaje.

Todas las partes involucradas se asegurarán de que el lavado del equipo no cause contaminación del suelo. Una acción típica para ser gestionada es el lavado de la máquina de concreto, que se gestiona adecuadamente en un área específica designada.

Así como para la limpieza abrasiva, pruebas hidrostáticas, lavado, limpieza química, etc. Las medidas deberán ser establecidas para evitar la perturbación del suelo y subsuelo.

33.7 PREVENCIÓN Y REACCIÓN DE DERRAMES

33.7.1 PREVENCIÓN DE DERRAMES

Los siguientes procedimientos deben llevarse a cabo para reducir la posibilidad de un derrame que puede ser perjudicial para el medio ambiente o la salud y la seguridad del personal y forma parte de un plan:

El almacenamiento de diesel estacionario y el área de distribución tendrán un doble forro bajo el área de contención de tanques alrededor de ella y ser lo suficientemente grande para contener el volumen del contenido(s) del tanque(s).

Una lista de verificación y registro de inspección de los tanques, contención secundaria, y los materiales de contención (por ejemplo, almohadillas, cortina de limo) se mantendrá como parte de la inspección mensual.

Uno o más drenajes cubiertos deben ser instalados en las cuencas de recolección utilizados como contención secundaria. Los drenajes deben estar provistos de medios para vaciar eventualmente la contención dentro de un tanque autorizado para el transporte de la deposición o sistema de drenaje autorizado.

- Todos los equipos deberán ser inspeccionados para detectar fugas y reparados cuando sea necesario, antes de entrar en el proyecto del sitio. Se programarán inspecciones periódicas para el equipo ya una vez en el sitio.

- El uso de tanques estacionarios de combustible en el sitio del proyecto se reducirá al mínimo y sólo entonces con el permiso del CONTRATISTA. Todos los tanques estacionarios de combustible deberán estar equipados con una contención secundaria.

- Tanques limpios, latas de gasolina y solventes deben ser almacenados en la contención de la prueba secundaria de fugas.

- Almohadillas absorbentes u otros métodos de contención se deberán usar según lo requerido por los cambios de aceite y mantenimiento para evitar derrames.

- El Contratista deberá mantener un adecuado equipo de emergencia para derrames en el sitio.

33.7.2 REACCIÓN A DERRAMES

En el caso de un escape de petróleo o productos químicos, las siguientes acciones se deberán llevar a cabo (nota: la magnitud del derrame /descarga determinará el alcance de las acciones que habrá que realizar):

- Cualquier derrame ocurriendo en vehículos será recogido por las instalaciones adecuadas de eliminación fuera del sitio.

- Sólo se podrá intentar la contención y operaciones de limpieza por una descarga accidental de productos derivados del petróleo /desechos, solo si se puede realizar de forma segura.
- Si el material es inflamable, eliminar las fuentes de ignición cerca de la zona del derrame.
- Cuando pueda llevarse a cabo de forma segura, detenga la fuente del derrame y contenga el material derramado usando almohadillas absorbentes en la zona, lo más pequeño posible. El derrame no puede ser lavado.
- Hacer una barricada o aislamiento alrededor de la zona de derrame con cinta roja "Peligro No Pasar"
- Tapar /cubrir las reservas de materia contaminada para evitar la dispersión de la misma, la zona de reserva estará revestida para proteger las aguas subterráneas.
- Suelos contaminados y materiales de limpieza de estos derrames se deben manejar adecuadamente, almacenando en un recipiente adecuado, que luego se etiquetará y se almacenará en la ubicación adecuada para su disposición final posterior.

Medidas de Gestión:

- Notificar al administrador de SMA del sitio inmediatamente.
- El administrador de SMA del sitio coordinará el aseguramiento del área y establecer el control del perímetro a una distancia segura del derrame.
- Los derrames no se consideran "cerrados" hasta que un representante del CONTRATISTA/CLIENTE de la Planta apruebe la limpieza.

33.7.2.1 PRESENTACIÓN DE REPORTES

Cualquier derrame será documentado y denunciado.

La información básica deberá incluir: fecha, hora, lugar, tipo y cantidad de material derramado, la descripción y la causa del incidente, las medidas adoptadas, nombre de la persona que reportó el incidente así como las medidas recomendadas para asegurar que el incidente no se repita.

Cabe señalar que si el incidente tenía el potencial de contaminar el medio ambiente, aunque no lo haya hecho, entonces esto se seguirá grabando para permitir la identificación de incidentes

potencial graves para ser identificado en una etapa temprana e implementadas las acciones correctivas apropiadas.

33.7.2.2 ENTRENAMIENTO DE REACCIÓN A DERRAMES

El personal deberá estar capacitado en el mantenimiento y uso de materiales de respuesta a derrames.

El CONTRATISTA es responsable de proporcionar todos los materiales de respuesta a derrames, equipos y servicios. Todos los derrames relacionados con el Proyecto deben ser reportados inmediatamente.

33.8 RUIDO

El flujo de tráfico de los vehículos de sitio en el interior y/o fuera del sitio estará limitado si el ruido alcanza un nivel significativo. Otras medidas para minimizar el ruido pueden ser: la selección de maquinaria de bajo nivel de ruido; el mantenimiento efectivo de la maquinaria, el uso de amortiguación acústica /atenuación, la programación de actividades.

La operación que podría generar un alto nivel de ruido, (ejemplo: limpieza con chorro abrasivo, etc.), pero principalmente durante las fases de Pre-Arranque y Arranque, deben ser comunicadas con antelación y planificadas de tal manera, el día y hora, para reducir al mínimo la perturbación dentro y fuera del sitio.

Hay algunas actividades de corta longitud peculiar de la fase, de tal manera que pueden aumentar el nivel de ruido existente en los alrededores, como: aire y vapor de soplado / ruptura de disco /PSV apertura /quema /hervir las calderas, etc. Para reducir al mínimo el nivel de ruido, las siguientes medidas deben ser consideradas si aplica:

Silenciadores temporales deben ajustarse durante las actividades de vapor soplado, si es necesario para alcanzar los límites especificados de ruido, las actividades ruidosas que se llevarán a cabo en horas específicas para minimizar los trabajadores afectados y/o alteración del orden público, una instrucción adecuada debe darse a los trabajadores; si una inaceptable y emisión de ruido no previsible ocurre, éstas deben ser eliminadas o al menos minimizarse lo más pronto posible.

33.9 MATERIALES RESTRINGIDOS Y GESTIÓN DE LA RADIACIÓN

En el sitio se prohíbe el uso de: los productos de asbesto; arena de silicato para limpieza abrasiva, los clorofluorocarbonos (CFC) y halones y otras sustancias definidas en el Protocolo de Montreal (y sus posteriores modificaciones), que podría agotar la capa de ozono estratosférico.

El subcontratista deberá informar y requerir la autorización al CONTRATISTA para presentar los materiales radiactivos en el sitio. Dicha autorización sólo será concedida después de la revisión de los recursos (principalmente competente / personas especializada / equipo) y prácticas de trabajo seguras para el almacenamiento y uso.

No está previsto el desecho de material radiactivo: todos los materiales radiactivos deberán ser retirados de sitio por la empresa que los trajo, de acuerdo con las leyes aplicables.

33.10 PAISAJE Y SUS ALREDEDORES

Impacto insignificante en alcance del proyecto de trabajo.

Dr. Ramón Ma. Urbáez Marte
ABOGADO NOTARIO PUBLICO
Mat. # 2570
Santo Domingo, R.D.

33.10.1 CONSUMO DEL SITIO - REDUCCIÓN AL MÍNIMO DEL USO DE RECURSOS NATURALES

Toda la organización del sitio y el personal deberá minimizar el uso de combustibles, agua y energía, así como la producción de residuos.

Los datos sobre el consumo de energía /agua /combustible /lubricantes /suelo y consumibles serán registrados por cada organización del sitio en los indicadores de SMA del procedimiento de desempeño.

33.10.2 RECOPILACIÓN DE DATOS AMBIENTALES

El subcontratista debe mantener y transmitir en forma mensual al administrador de SMA del CONTRATISTA del sitio, una colección de datos básicos ambientales.

Asimismo el administrador de SMA del sitio debe insertar la colección de datos ambientales como parte del reporte de SMA mensual.

10.0 ANEXO II CHEQUEO MECANICO AMBULANCIA 14
11.0 ANEXO III CHEQUEO EQUIPOS AMBULANCIA 15

1.0 OBJETIVO

Este procedimiento organiza y sistematiza las acciones del equipo de Salud en situaciones de Urgencias Médicas (casos de peligro para la salud por accidentes y/o enfermedad aguda), para de esta forma poder proporcionar una atención de Primeros Auxilios de forma que permita aumentar la sobrevivencia de la víctima, minimizando las secuelas y reducir la duración del tratamiento médico.

Abarca los casos de peligros a la salud por accidente o enfermedad aguda ocurrida en el ámbito de operaciones de la Empresa.

2.0 DEFINICIÓN DE LAS SITUACIONES QUE GENERAN URGENCIAS

2.1 HECHO DE PEQUEÑA GRAVEDAD

Accidente o Enfermedad en la cual no supone riesgo de muerte o secuela, no requiere la intervención inmediata del médico (a) y puede resolverse en el lugar (Puesto Médico de la Empresa).

Por ejemplo: contusiones leves, excoriaciones, pequeñas heridas cortantes, quemaduras de 1er grado, irritación ocular, picaduras de insectos, diarreas leves, cefaleas, náuseas, dolor de dientes y muelas además de otras situaciones definidas por el Personal de Salud.

2.2 HECHO DE MEDIANA GRAVEDAD

Accidente o Enfermedad en la cual se modifica el estado de salud, pero sin riesgo inminente de muerte o de secuela permanente, la cual se puede solucionar en un primer momento en el lugar con la ayuda del personal de Salud. Sin embargo se hace necesaria una atención médica complementaria a cargo del (la) Médico(a) del Trabajo de la Empresa.

Por ejemplo: esguinces o contusiones medias con y sin sospecha de fractura, corte y laceraciones con necesidad de sutura, cuerpo extraño ocular, quemaduras de 2º grado, dolor abdominal y fiebre, vómitos, desmayos, crisis hipertensiva, cólicos o dolores más intensos, falta de aire.

2.3 HECHO DE GRAVEDAD SEVERA

Accidente o Enfermedad en la cual se modifica de forma importante el estado de salud con riesgo inminente de muerte o de secuela permanente, requiriendo una acción en el lugar de todo el

Sector Médico de la Empresa para estabilizar el cuadro y remover inmediatamente al paciente a un Establecimiento de Salud de Mayor Complejidad.

Por ejemplo: paro cardiorrespiratorio, traumatismos de cráneo o columna, convulsiones o inconsciencia, lesiones oculares graves, fracturas abiertas, amputaciones traumáticas, aplastamiento,

1748

hemorragias, quemaduras de 3er grado o de 2º grado extensas, quemaduras eléctricas, accidentes con animales venenosos o intoxicaciones.

3.0 RESPONSABILIDADES

3.1 GERENCIAS (CONTRATO Y ADMINISTRATIVO FINANCIERO)

- Asegurar la efectiva implementación del Plan de Atención a Urgencias Médicas, proporcionando los recursos necesarios.

3.2 MÉDICO(A) DEL TRABAJO COORDINADOR

- Responsable de la elaboración, actualización y seguimiento del Plan de Atención a Urgencias Médicas.
- Identifica y capacita al equipo del Sector de Salud para atender Urgencias y mantiene actualizado el Organigrama de Entrenamientos Periódicos para el Equipo de Urgencias.
- Coordina el Equipo de Salud.
- Estructura el Tópico Medico y la Ambulancia con los equipos y medicamentos para poder atender las Urgencias.
- Clasifica la gravedad del caso y decide sobre la remoción del paciente para que reciba atención hospitalaria externa.

3.3 LICENCIADO(A) EN ENFERMERÍA DEL TRABAJO

- Responsable de la prestación de primeros auxilios a la víctima (bajo la orientación del médico coordinador).
- Inspecciona semanalmente la sala de emergencia y la ambulancia para controlar las condiciones de los equipos y la disponibilidad de medicamentos y materiales de urgencias.
- Imparte Entrenamientos Periódicos de Primeros Auxilios con el Equipo Médico para la Brigada de Urgencias.
- Coordina el Equipo de Rescate en el caso de ausencia del médico.
- Conoce los recursos médicos y hospitalarios de apoyo.
- Realiza el contacto telefónico previo y comunica el traslado y estado de salud de la víctima al servicio médico correspondiente.
- Realiza el seguimiento del transporte de la víctima, cuando se hace necesario.

3.4 TÉCNICO(A) DE ENFERMERÍA DEL TRABAJO

- Se encarga de prestar los Primeros Auxilios a la víctima de un accidente de trabajo o de un mal súbito. (bajo la orientación del médico coordinador).

- Actúa bajo la orientación directa del(a) Licenciado(a) en Enfermería del Trabajo y del(a) Médico(a) del Trabajo.
- Se encarga, bajo la orientación del(a) Licenciada en Enfermería del trabajo, de Inspeccionar, semanalmente, la sala de emergencia y la ambulancia para comprobar las condiciones de los equipos y la disponibilidad de medicamentos y materiales de urgencias.
- En el caso de ausencia del(a) Médico(a) del Trabajo y del(a) Licenciada en Enfermería del trabajo, coordinará el Equipo de Rescate al accidentado o a la víctima del mal súbito y Realizará el seguimiento del transporte de la víctima.

3.5 SOCORRISTA

- Administra los Primeros Auxilios a la víctima de accidente de trabajo o de mal súbito, bajo la orientación directa del(a) Licenciada en Enfermería del trabajo y del (a) Médico(a) del Trabajo.
- Se encarga de inspeccionar, bajo la orientación, del(a) Licenciado(a) en Enfermería del trabajo semanalmente, la sala de emergencias y la ambulancia para comprobar las condiciones de los equipos y la disponibilidad de medicamentos y materiales de urgencias.
- Se encarga de impartir entrenamiento periódicos de Primeros Auxilios junto con el Equipo Médico a la Brigada de Urgencias y de Combate a Incendios y Rescate de Víctimas, así como también a la Brigada de Combate a Incendios.
- En caso de ausencia del(a) Médico(a) del Trabajo y del(a) Licenciada en Enfermería del trabajo, coordinará el Equipo de Rescate al accidentado o a la víctima de mal súbito.
- Efectuará el seguimiento del transporte de la víctima, cuando el(a) Médico(a) Coordinador(a) lo considere necesario.

3.6 CONDUCTOR DE LA AMBULANCIA

- Es responsable de la segura conducción de la víctima.
- Inspecciona semanalmente las condiciones del vehículo y le pone combustible siempre que el nivel del tanque esté en 3/4.
- Mantiene el vehículo limpio y organizado, realiza el cambio de las sábanas de la camilla interna siempre que sea necesario.
- Conoce las rutas para los servicios médicos externos de apoyo.
- Esta función la podrá desempeñar el Bombero Socorrista (cuando estuviera presente), el(a) Licenciado(a) o Técnico(a) de Enfermería del Trabajo, siempre y cuando estén capacitados para tal por el Curso de Dirección Defensiva.

3.7 QUIPO DE RESCATE O BRIGADA DE EMERGENCIA

- Equipo formado por colaboradores de los Sectores de Seguridad del Trabajo, Producción y Administración, debidamente entrenados y capacitados para la Atención Inicial de Urgencias.
- Solicita la presencia del Equipo de Salud para atender a la víctima.

1750

- Se encarga de proceder a una inspección inicial de la víctima y del local del accidente.
- Efectúa el aislamiento del área donde ocurrió y ayuda al Equipo de Salud a prestar los primeros auxilios a la víctima.

4.0 RECURSOS

4.1 EQUIPO DE SALUD

Equipo formado por 2 Médicos, por 4 Licenciadas de Enfermería del Trabajo, por 2 Técnicos de Enfermería del Trabajo, por 4 Conductores Socorrista con experiencia en manipulación de equipos y medicamentos usados en urgencias médicas y 50 Socorristas en primeros auxilios.

4.2 AMBULANCIAS

Contamos con 2 ambulancias ubicadas en el puesto médico del campamento principal, se colocan en algunas ocasiones en los frentes de trabajo dependiendo del nivel de riesgo del trabajo que se va a realizar, son tipo Furgón equipadas: con Desfibrilador, Oxímetro de Pulso, Respirador Mecánico, Cilindro de Oxigeno, Flujómetro, Humedecedor de Oxígeno, Aspirador, Camilla con Ruedas y Conjunto de Inmovilización; además de Botiquín con Medicamentos de Urgencias y de material de Intubación Endotraqueal.

Dos Puestos Médicos

- Compuestos por una Sala de Emergencias con entrada exclusiva
- Ducha de Emergencia y Lavaojos
- Sala de curaciones
- Sala de Observación y de Reposo
- Consultorio Médico (2)
- Consultorio de Inmunizaciones
- Sala de Esterilización
- Sala de Espera

Materiales disponibles en el puesto medico para atención de urgencias:

- Esfigmomanómetro
- Estetoscopio
- Termómetro Clínico
- Linterna Clínica
- Conjunto de Collarines Cervicales
- Camilla larga para rescate
- Conjunto de Inmovilización de Columna
- Conjunto de Inmovilizadores
- Laringoscopio con conjunto de láminas rectas y curvas
- Cánulas de Guedel

- Cánulas / tubos endotraqueales
- Respirador Manual con Máscara (AMBU)
- Guía de Intubación
- Sondas de Aspiración Endotraqueal
- Aspirador de Secreciones
- Conjunto para Nebulización
- Jeringas de 20 ml
- Jeringas de 10 ml
- Jeringas de 5 ml
- Jeringas de 3 ml
- Equipos para Venoclisis
- Catéteres Endovenosos
- Agujas descartables
- Guantes de Procedimiento
- Cabos para Bisturí y láminas descartables
- Hilos de Sutura
- Gasa Hidrófila Estéril
- Algodón
- Compresas Quirúrgicas
- Solución Antiséptica
- Autoclave para Esterilización
- Equipo de Cirugía Menor
- Campos Quirúrgicos
- Hemoglucotest
- Vendas de Yeso

Medicamentos de Urgencias disponibles en el Tópico Médico de la Empresa y en la Unidad Móvil

- Caja de Captopril 25 y 50 mg en Comp.

5.0 COMUNICACIÓN

- Se tendrán habilitadas varias líneas para la eficaz comunicación tanto a lo interno de la obra como con los organismos de ayuda externos.
- Radio para Comunicación frecuencia 5 en ambulancias y Campamento Principal y frecuencia 11 en las Ambulancias, el personal Médico de la Obra tiene asignado un equipo de Radiocomunicación Móvil con todas las frecuencias para coordinar las urgencias.

En los hechos **DE PEQUEÑA Y MEDIANA GRAVEDAD,** el Equipo de Salud deberá ser informado, ya sea vía radio o personalmente. La víctima será transportada al Ambulatorio Médico por la Brigada de Emergencia, por el Equipo de Emergencia, por el Encargado/Responsable del sector en donde trabajaba la víctima o Deambulando Activamente, luego de haberse comunicado el hecho al Responsable/Líder.

En los hechos **DE GRAVEDAD SEVERA,** el Equipo de Salud será llamado por radio, en frecuencia predeterminada o por una extensión especial del teléfono.

Al llamar al Equipo de Salud deben transmitirse las informaciones exactas, tales como: localización del hecho, Número de víctimas, tipo de hecho, equipo/máquina involucrada, y quien reporta el suceso.

Para permitir una **COMUNICACIÓN DISCRETA**, a fin de preservar la Ética Médica y no causar una movilización Innecesaria y generalizada de curiosos al local de los hechos, se adoptará el siguiente código:

	Código	Tipo de accidente Laboral	Movilizado
a)	AMARILLO	Suceso de Pequeña Gravedad	Auxiliar de Enfermería
b)	AZUL	Suceso de Mediana Gravedad	Técnico(a) de Enfermería + Socorrista
c)	ROJO	Suceso de Gravedad Severa	Médico(a) + Licenciado(a) de Enfermería + Socorrista

Obs.: El(a) Técnico de Enfermería, cuando esté presente todo el Equipo Médico y salvo en caso de un código ROJO, deberá permanecer en el puesto médico con la finalidad de preparar el Material, las

Medicinas y los Equipos que serán necesarios para atender al hecho – siguiendo siempre la orientación del Médico y del(a) Licenciado(a) de Enfermería.

6.0 PROCEDIMIENTO

En **HECHOS DE PEQUEÑA Y MEDIANA GRAVEDAD** se deberá informar al Equipo de salud y acompañar al trabajador al puesto Médico para que éste reciba la atención adecuada.

Los de pequeña gravedad se resolverán en nivel local y los de mediana gravedad podrán necesitar atención complementaria en un centro de mayor capacidad resolutiva.

En **HECHOS DE GRAVEDAD SEVERA** el Equipo de Salud deberá ser avisado vía radio y después de recibir la llamada, el(a) Médico(a) del Trabajo, el Bombero Socorrista y el(a) Licenciada(o) de Enfermería, acudirán con la Ambulancia al local de los hechos.

El Bombero Socorrista (cuando esté presente) y el Equipo de Seguridad, estudiarán el local donde ocurrió el accidente para tratar de identificar situaciones de riesgo y aislarán el área, reportándose siempre al(a) Médico(a) Coordinador(a) y al personal de Salud para iniciar las **MANIOBRAS DE SOPORTE BÁSICO DE VIDA** acordándose siempre de mantener las vías aéreas previas y realizar masaje cardíaco externo, siempre que sea necesario.

Se deberán tratar de controlar las hemorragias externas por compresión. Para mover y retirar a las víctimas se debe proteger la columna vertebral utilizando el equipo de inmovilización adecuado y camillas respectivas.

Al transportar a la víctima al puesto médico, se deberá entrar exclusivamente por la sala de emergencia, donde el(a) Médico(a) Coordinador(a) evaluará la situación y donde se realizarán los procedimientos para estabilización hemodinámica y preparación para el traslado de la víctima a un Establecimiento de Mayor complejidad.

Habrá que transportar a la víctima con seguridad en la ambulancia acompañada por el equipo médico, con los componentes que el(a) Médico(a) del Trabajo considere necesarios.

La ambulancia debe tener conectada la Señal Luminosa, ser conducida en velocidad compatible con las condiciones de circulación, sin poner en riesgo a sus pasajeros. Solamente se deberá usar la Señal Sonora/Sirena cuando sea absolutamente necesario, en lugares de tránsito intenso.

En caso de ser necesario, ante la complejidad de la lesión de la víctima, la urgencia de atención especializada o por la distancia excesiva a un centro especializado, se realizara la coordinación para proceder a la evacuación por vía Aérea en una unidad acondicionada especialmente para ello.

1754

El miembro del Sector Médico que se quedara en el Centro de operaciones de la obra completará los impresos y registros del Accidente/Mal súbito.

7.0 SERVICIOS MÉDICOS DE APOYO PARA LA TERMOELECTRICA

Se determinarán varias opciones de traslado según lo siguiente:

- **HECHOS DE PEQUEÑA GRAVEDAD**
  - ✓ Pueden ser atendidas dentro del área médica del proyecto

- **HECHOS DE MEDIANA GRAVEDAD:**

1era Opción: INSTITUTO REGIONAL MATERNO INFANTIL Y ESPECIALIDADES (IRMIE)

- ✓ **Tipo de Centro:** Privado
- ✓ **Teléfonos:** (809) 898-7300
- ✓ **Dirección:** Calle Presidente Padre Billini # 48, Bani
- ✓ **Tiempo de la obra:** 10 min
- ✓ **Punto de Referencia:** Frente al telecable de Bani hacia Santo Domingo
- ✓ **Persona Contacto:** Dr.Jiménez

2da Opción: CENTRO MÉDICO REGIONAL AGUASVIVAS

- ✓ **Tipo de Centro:** Privado
- ✓ **Teléfonos:** (809) 346-4400
- ✓ **Dirección:** Calle Presidente Padre Billini # 48, Bani
- ✓ **Tiempo de la obra:** 10 min
- ✓ **Punto de Referencia:** Frente a la Estación de gasolina Shell Hacia Santo Domingo
- ✓ **Persona Contacto:** Dr. Aguasvivas – Director.

- **HECHOS DE GRAVEDAD SEVERA:**

1ra Opción: HOSPITAL GENERAL PLAZA DE LA SALUD

1755

- ✓ **Tipo de Centro:** Semiprivado
- ✓ **Teléfonos:** 829) 565 -7477
- ✓ **Tiempo de la obra:** 90 min (Considerar ambulancia aérea)
- ✓ **Dirección:** Calle Pepillo Salcedo con Ortega y Gasset, Ensanche la Fe
- ✓ **Punto de Referencia:** Complejo Plaza de Salud
- ✓ **Persona de Contacto:** Dr. Hernández (Director de Emergencias).

2da Opción: HOSPITEN SANTO DOMINGO

- ✓ **Tipo de Centro:** Privado
- ✓ **Teléfonos:** 809-541-3000
- ✓ **Dirección:** Calle Alma Máter, esquina Bolívar, Santo Domingo. R.D.
- ✓ **Tiempo de la obra:** 90 min (Considerar ambulancia aérea)
- ✓ **Punto de Referencia:** Frenta al antiguo Quisqueya park
- ✓ **Persona de Contacto:** Dr.Jose Aponte (Traumatologia).

3ra Opción: AEROAMBULANCIA

- ✓ **Teléfonos:** 809-826-4100
- ✓ **Dirección:** Aeropuerto la Isabela, Santo Domingo
- ✓ **Persona de Contacto:** Sr. Castillo Junior- Vicepresidente

8.0 SEGUIMIENTO Y EMISIÓN DE ATR2

Todos los eventos de urgencias que involucren a cualquier trabajador de la Empresa los tendrá que seguir el Equipo de Salud.

El seguimiento del accidentado o de la víctima de mal súbito que esté ingresado en el Hospital de Apoyo deberá será diario y lo realizará el (a) Médico (a) Coordinador (a), en conjunto con los (as) Médicos (as) del Equipo Médico del nosocomio.

En casos de Accidentes del Trabajo, el Equipo de Salud juntamente con el Equipo de Seguridad realizará la investigación de las circunstancias implicadas o que contribuyeron para provocar el referido accidente, y llenarán la INVESTIGACION DE INCIDENTES Y ACCIDENTES y la ATR2 (Comunicación de Accidente del Trabajo) como está previsto en la legislación. Después de los hechos,

1756

el equipo de salud se reunirá para evaluar la atención prestada con el fin de mejorar sus procedimientos de manera continua.

1.0 SUSTENTABILIDAD Y RESPONSABILIDAD SOCIAL EN EL CONSORCIO PUNTA CATALINA

Para el CONSORCIO, la Responsabilidad Social consiste en contribuir a satisfacer nuestro Cliente con servicios y bienes que den como resultado la mejora de la calidad de vida de las personas, en la comunidades cercanas al área de influencia del proyecto, contribuyendo con su desarrollo social, económico, tecnológico, y cultural, al crear oportunidades de educación, facilitar el acceso a servicios de salud, generar puestos de trabajo e ingresos, y asegurar el respeto al medio ambiente y la valorización de la cultura a través de nuestras acciones.

Nuestros programas sociales serán implementados con un abordaje integral, que favorecerá la articulación social con los principales actores de la comunidad.

2.0 ENTORNO SOCIAL DEL PROYECTO TERMOELÉCTRICO PUNTA CATALINA

En la provincia de Peravia, habitan aproximadamente 185 mil personas. El Proyecto Termoeléctrico Punta Catalina, tendrá una mayor presencia constructiva en la provincia de Baní, y en particular en los distritos municipales de Paya, El Carretón y Catalina que aglutinan a cerca de 23 mil habitantes.

Las comunidades de la zona de influencia del Proyecto se caracterizan por ser comunidades rurales y sub-urbanas de bajos ingresos, con un aporte valioso de mano de obra para la agro-industria, la pesca, las zonas francas, el sector de la construcción y otras empresas de servicios.

Los datos más recientes de la Oficina Nacional de Estadística (ONE), hacen referencia a indicadores sociales de pobreza en la provincia de Peravia, de un (40%) de los hogares, con elevado porcentaje de hogares en extrema pobreza (7%), indicándonos serias limitaciones estructurales de la zona para su desarrollo humano.

En el mismo documento de la ONE, los indicadores de seguimiento destacan importantes desafíos en los aspectos de alfabetización, educación primaria, sostenibilidad ambiental, empleo juvenil y acceso a tecnologías de la información (computadoras e internet).

Sin embargo, queremos hacer notar, que los territorios de muchas limitaciones socio-económicas también tienen grandes potencialidades y fortalezas. Algunas de estas la representa la presencia de instituciones de respetada solvencia social en la zona, tales como la Escuela Vocacional de las Fuerzas Armadas y el Instituto de Formación Técnica y Profesional (INFOTEP), entre otras.

3.0 INDICADORES DE DESARROLLO EN LOS MUNICIPIOS BANÍ Y NIZAO DE LA PROVINCIA PERAVIA, REPÚBLICA DOMINICANA

EDUCACIÓN		
INDICADORES	BANÍ	NIZAO
Tasa de analfabetismo población >15años	15.5%	9.7%
Tasa de analfabetismo población joven entre 15 y 24 años	6.1%	2.8%

Hogares sin sistema de recolección de basura	27.4%	15.6%
Hogares sin abastecimiento de de agua por la red pública	63.6%	61.9%
Hogares sin inodoro en la vivienda	37.4%	44%

DESARROLLO SOCIO – ECONÓMICO		
INDICADORES	BANÍ	NIZAO
Población en edad de trabajar	125,298	21,328
Población económicamente activa	48,127	9,265
Población desocupada	3,428	528

4.0 PROGRAMA DE SOSTENIBILIDAD Y RESPONSABILIDAD SOCIAL

Tomando en cuenta los desafíos de la provincia Peravia, en los cuales hay también convergencia con las necesidades de las comunidades cercanas al Proyecto Termoeléctrico Punta Catalina,

nuestros programas de Sostenibilidad y Responsabilidad Social Empresarial, estarán orientados a contribuir con el desarrollo sostenible de las comunidades del entorno del proyecto, promoviendo su capital social al crear puestos de trabajo sustentables, y favoreciendo el aumento de sus capacidades de producción para la generación de ingresos, haciendo énfasis en apoyar el sector educativo formal y la formación para el trabajo de las actuales y futuras generaciones, con foco en la educación ambiental, el apoyo al deporte y la salud, y la generación de riqueza material mediante el trabajo solidario y asociativo, a través de la integración de los siguientes ejes:

- Educación
- Generación de trabajo e ingresos
- Medio Ambiente: reciclaje

4.1 EDUCACIÓN

Nuestro programa tiene un enfoque en el fortalecimiento de la educación pública y vocacional, así como en la contribución para la erradicación del analfabetismo, con un conjunto de acciones que abarcan también la educación para la salud y la educación ambiental, mediante las siguientes iniciativas:

- **Alfabetización** de adultos integrantes y comunitarios, implementada en el marco de la lucha nacional por la erradicación del analfabetismo en la República Dominicana para el año 2014, mediante la utilización de una sencilla metodología, en convenio con Alfalit International, que combina la visualización de imágenes comunes y de fácil identificación, asociada a letras o símbolos, y se desarrolla en cinco meses con una dedicación promedio de 4 horas semanales por cada estudiante, agotando un programa de formación que consta de:

  1) Módulo Preparémonos
  2) Modulo Nuestras Necesidades
  3) Matemática 1
  4) Módulo Nuestro Entorno
  5) Matemática 2
  7) Tres libros de lectura general: "Mi casa", "Cuentos y Dichos" y "VIH/SIDA".

- **Alfabetización digital** de integrantes y comunitarios: "Entre en la Red", para garantizar un mayor y eficaz acceso de los habitantes a los servicios digitales.

- **Capacitación de Maestros** mediante los Cursos Virtuales de Actualización de Maestros (AME), en convenio con la Fundación Cisneros, abarcando las temáticas:
    - Enseñanza de las Matemáticas
    - Tecnologías de la Información y Comunicación (TIC)
    - Ética Escolar
    - Educación para la Paz
    - Enseñanza de la Educación Ambiental
    - Organización y Comunicación Escolar

- **Mejora de Acceso a las Tecnologías de la Información** (TIC's), con la finalidad de contribuir a aumentar el porcentaje de hogares de la provincia Peravia, con acceso a Internet, que en la actualidad se reduce a un 0.9 %.

- **Formación técnico – profesional para el trabajo productivo**, auspiciando la capacitación de jóvenes para garantizar mayores oportunidades de acceso a empleos relacionados al desarrollo del proyecto Termoeléctrico Punta Catalina, en colaboración con la Escuela Vocacional de las Fuerzas Armadas de Baní y el Centro Regional Sur del Instituto de Formación Técnico – Profesional (INFOTEP), con sede en Baní, **con énfasis en las áreas de soldadura y electromecánica**.

- **Implementación del programa CREER:** este programa tiene como objetivo la formacion de personal en distintas áreas y con esto contribuir al desarrollo de la empleomanía Dominicana a la par de mejorar la calidad de los servicios prestados por estos al proyecto.

- **Apoyo al Deporte Asociado al Desempeño Escolar**, impartiendo formación y práctica deportiva en las disciplinas de futbol y beisbol, a estudiantes del nivel básico de la enseñanza, con el objetivo de contribuir con la mejoría del desempeño en sus estudios, el fomento de la disciplina personal, y la disminución de la deserción escolar.

- **Educación Ambiental**, a través de un conjunto de actividades formativas para profesores, estudiantes y dirigentes comunitarios, sobre medio ambiente, recursos naturales y mecanismos participativos de la gestión ambiental comunitaria, promoviendo las experiencias de reforestación y promoción de la flora endémica, y reciclaje y recogida de basura.

- **Educación para la Salud,** realizando acciones preventivas en apoyo a las políticas nacionales de promoción de la salubridad, para contribuir a evitar la propagación de enfermedades comunes y de alta incidencia en las zonas rurales, como son el dengue y el cólera, y promover la salud bucal y visual, con especial utilización de la difusión de

informaciones mediante encuentros comunitarios educativos y distribución de materiales informativos y de cuidado personal (brochures, afiches, cepillos dentales, pasta dental, jabón líquido, etc.), a través de:

- Charlas de Prevención del Dengue
- Charlas de Prevención del Cólera
- Charlas de Salud Bucal
- Promoción de la Salud Visual

4.2 GENERACIÓN DE TRABAJO E INGRESOS

Nuestro programa tendrá como propósito contribuir para promover el desarrollo sostenible de las comunidades en el entorno del área de influencia del Proyecto Termoeléctrico Punta Catalina, considerando sus recursos y potencialidades, a fin de favorecer la dismimución de los índices de pobreza y pobreza extrema en la provincia, aumentando su capital social y sus capacidades de producción, con foco en la generación de riqueza material mediante el trabajo solidario y asociativo, haciendo énfasis en el fortalecimiento de la estructura familiar y la formación de cooperativas, a través de estas iniciativas, y de otras que deberán ser propuestas a partir de las necesidades encontradas:

- **Agricultura Familiar Sostenible**, facilitando materiales y capacitación para el cultivo y comercialización de hortalizas de calidad, así como de compost elaborado a partir de desechos orgánicos sólidos generados en el Proyecto, para satisfacer la demanda de insumos de alimentación de este rubro dentro del Proyecto, así como para suplir las necesidades de estos productos en mercados potenciales identificados dentro y fuera de la provincia.

- **Apoyo para la producción de uniformes para uso en el Proyecto Termoeléctrico Punta Catalina, y elaboración de piezas artesanales de costura con tela reutilizada de uniformes usados,** a fin producir los implementos de vestimenta necesarios en el Proyecto, así como otros artículos de uso común a partir de la tela reutilizada, como por ejemplo carteras, mochilas, alfombras, entre otros.

- **Apoyo para la producción de plantas endémicas de la zona,** para ser compradas por el Proyecto Termoeléctrico Punta Catalina y utilizadas dentro de sus programas de reforestación, y para ser colocadas dentro del mercado local.

4.3 MEDIO AMBIENTE: RECICLAJE

Para contribuir a garantizar la Sostenibilidad dentro del Proyecto, implementaremos una serie de prácticas encaminadas a hacer un uso eficaz y racional de diferentes recursos e insumos generados a partir de los procesos de producción, permitiendo a la vez generar ingresos y disminuir costos. Entre estas pueden mencionarse:

- Reutilización de la tela de los uniformes usados en el Proyecto Termoeléctrico Punta Catalina, para la elaboración de piezas artesanales de costura para venta y generación de ingresos.
- Recolección de aguas pluviales para reutilización en labores de limpieza de instalaciones y vehículos.
- Recolección de papel usado en el Proyecto para venta a empresas recicladoras de dicho material y generación de ingresos.
- Recolección de desechos orgánicos sólidos para la elaboración de compost para la producción de renta.

1.0 PROGRAMA DE SEGURIDAD EN EL TRABAJO

El presente Programa en líneas generales comprende el planeamiento, organización, dirección, ejecución y control de las actividades encaminadas a identificar, evaluar, y controlar todas aquellas acciones, omisiones y condiciones que pudieran afectar a salud o la integridad física de os trabajadores, daños a la propiedad, interrupción de los procesos productivos o degradación del ambiente de trabajo.

2.0 ALCANCE

El Programa de Seguridad en el Trabajo esbozará los procedimientos de seguridad que se emplearán e implementarán durante la construcción del proyecto Termoeléctrico Punta Catalina. Algunos componentes de este programa señalarán procedimientos específicos, mientras que otros constituirán especificaciones técnicas.

El Programa de seguridad en el trabajo deberá estar compuesto por los siguientes elementos:

- Instrucciones Generales
- Responsabilidades
- Programa de Seguridad durante la Construcción para Contratistas y Subcontratistas
- Prevención de Accidentes
- Información de Peligros
- Capacitación y Educación sobre Seguridad
- Equipo de Protección Personal
- Primeros Auxilios
- Reglas de Buen Orden y Limpieza
- Agua Potable
- Sanitarios
- Exposición al Ruido
- Iluminación
- Gases, Vapores, Humos Polvos y Emanaciones
- Ventilación
- Protección con Respiradores
- Protección y Prevención de Incendios
- Líquidos Combustibles e Inflamables
- Letreros, Señales y Barricadas

- Herramientas Operadas a Mano y con Energía
- Voladura y el Uso de Explosivos
- Soldadura
- Equipo de Aparejos para el Manejo del Material
- Equipo Automotor
- Equipo de Manejo de Materiales
- Trabajo en o cerca al Agua
- Reglamentos para la Construcción
- Respuesta en Caso de Derrames

3.0 REFEREANCIAS

El programa de Seguridad en el Trabajo se fundamenta en los requisitos de las siguientes normas:

- Normas OHSAS 18001 (Edición 1999) – Sistemas de Gestión de Seguridad y Salud Ocupacional.
- Decreto Núm. 522-06, REGLAMENTO DE SEGURIDAD Y SALUD EN EL TRABAJO

4.0 POLÍTICA DE SEGURIDAD

El CONSORCIO, ha establecido una Política de Seguridad en el Trabajo fundamentada en los siguientes principios:

- Cumplir con la normativa legal y los demás requisitos aplicables;
- Supervisión y administración adecuada de los peligros y riesgos de la seguridad, con objetivos y metas definidos para cada emprendimiento;
- Mejorar continuamente los resultados, dando prioridad a la prevención de accidentes en lo que concierne a la Seguridad en el Trabajo

El área de Ingeniería, será la responsable de planificar y garantizar la prevención mediante la:

- Identificación previa de los riesgos e impactos. Define la planificación y los métodos constructivos, tomando en cuenta las medidas preventivas y de protección de SGMA.
- Comunicación actualizada y continua con el área de SGMA en lo que se refiere a la planificación y al cronograma de ejecución de la obra.
- Las áreas de Producción y de Equipos, serán las responsables de implementar efectivamente en los frentes de obra el SGMA y sus elementos, orientados hacia la prevención y en caso necesario a la implementación eficaz de medidas correctivas.
- Las áreas de Administración y Comercial, brindarán el soporte logístico y financiero para el funcionamiento orgánico del nivel operativo en la implementación del SGMA.

5.0 OBJETIVOS

El plan de Seguridad tiene como objetivos:

- Garantizar la Seguridad y salud en el trabajo para contribuir con el desarrollo del personal, para lo cual se fomentara una cultura de prevención de riesgos mecánicos, físicos, químicos, ergononómicos y psicosociales.
- Empresarial mediante la prevención de incidentes, pasivos y demandas de carácter legal;
- Apoyar el proceso de consolidación y difusión de la cultura de seguridad laboral;
- Proveer un ambiente seguro de trabajo mediante e establecimiento de políticas claras y metas alcanzables y cuantificables que logre eliminar y/o reducir a probabilidad de ocurrencia de accidentes; induciendo a persona hacia una participación plena en el desarrollo de presente Programa.
- Mantener e Índice de Frecuencia Anual de Accidentes Incapacitantes en 0,0 y e Índice de Severidad Anual de Accidentes Incapacitantes en 0,0.
- Controlar a ocurrencia de Accidentes Mecánicos, Eléctricos y/o de tránsito, a través de a difusión de las técnicas de Manejo Defensivo y Programas de Reemplazo y Mantenimiento preventivo de los diversos Equipos.
- Llevar un Registro adecuado de os Accidentes e Incidentes de seguridad y las medidas correctivas para evitar que se repitan.

6.0 PROGRAMAS A DESARROLLAR

Con el objetivo de mater la de seguridad y salud en el trabajo, se desarrollaron y seguirán desarrollándose durante todo el proceso constructivo, las siguientes actividades:

6.1 ANÁLISIS DE RIESGO

Un minucioso y detallado análisis se realizó a fin de identificar los posibles riesgos relacionados al Proyecto (riesgos durante la construcción, montaje etc.) con el fin de diseñar una estrategia enfocada en evitar y minimizar la ocurrencia de estos y a la vez elaborar un plan de acción en caso de que ocurriera un accidente.

6.2 PROGRAMA DE SEGURIDAD Y SALUD EN EL TRABAJO

El presente documento de Seguridad y salud en el trabajo, es nuestra principal herramienta de gestión en lo referente a seguridad e incluye todas las actividades que el CONSORCIO ejecutará con el fin de alcanzar los objetivos y metas propuestos.

6.3 REGLAMENTO INTERNO DE SEGURIDAD Y SALUD EN EL TRABAJO

El reglamento interno de seguridad es un manual que dictamina cuales son las normas y los procedimientos a seguir para cada una de las actividades durante el proceso constructivo a fin de minimizar la ocurrencia de accidentes.

6.4 PLAN DE CONTINGENCIAS CONTRA DESASTRES

Se tiene previsto un plan de acción contra desastres; estos deben de ser de conocimiento para todas las personas que laboran en el CONSORCIO así como los Sub-Contratistas.

6.5 PLAN DE SIMULACROS

El Programa de Simulacros comprende ensayos de cómo se debe proceder en caso de emergencias, siguiendo un plan previamente establecido basado en procedimientos de seguridad y protección

7.0 MEDIDAS A IMPLEMENTAR

- Los trabajadores nuevos recibirán entrenamiento en:
  - a) Uso de equipo de protección personal
  - b) Conducción segura de vehículos
  - c) Peligros de incendio y sofocación del fuego
  - d) Procedimientos para responder a emergencias
  - e) Primeros auxilios básicos
  - f) Identificación y manejo de materiales peligrosos
  - g) Conocimiento de sensibilidad ambiental.

- El uso de equipo de protección personal, incluyendo zapatos de seguridad, cascos, gafas, protección respiratoria y auditiva, será requerido para todo el personal en los sitios de construcción.

- En todos los sitios de trabajo se dispondrán, apropiadamente, extinguidores de incendio, suministros para primeros auxilios y atención de emergencia con señales claras indicando su presencia.
- En el sitio de trabajo se mantendrá una o más ambulancias equipadas apropiadamente y con personal entrenado para responder a emergencias.
- Los niveles de ruido en el sitio de trabajo serán monitoreados por los inspectores de seguridad y se fomentará el uso de protección auditiva, si es requerido.
- El CONSORCIO y sus contratistas se asegurarán que las señales de seguridad sean visibles en todos los lugares apropiados, incluyendo las señales de ubicación de las salidas de emergencia, primeros auxilios, equipo contra incendios y equipos de emergencia, no fumar y otras señales de advertencia de peligro y control de tráfico.
- Control de acceso a algunas áreas de producción y/o construcción.

8.0 CONTROL Y PREVENCION DE ACCIDENTES

8.1 CONTROL DEL TRÁFICO

El aumento temporal del flujo vehicular debido a los trabajos relativos a la construcción será mitigado creando un (1) Camino de Acceso externo provisional, una (1) Vía de Acceso externa definitiva con las características geométricas, estructura de pavimento, drenaje, señalización, seguridad vial, paisajismo y otros elementos y/o soluciones necesarias, respetando los parámetros mínimos necesarios exigidos por las leyes dominicanas y normas del MOPC.

Este subprograma contempla la implementación de medidas para prevenir, controlar, mitigar y/o compensar los impactos generados por las actividades de construcción operación del proyecto en el aspecto: Seguridad vial.

OBJETIVO: Prevenir la ocurrencia de posibles accidentes, tanto en el área de trabajo como en el entorno inmediato a moradores y al equipo de trabajo en general.

MEDIDAS A TOMAR:

- Al inicio, todas las áreas de trabajo, caminos utilizados como acceso, deberán ser demarcados y señalizados con un adecuado sistema de señalización, de fácil interpretación y visualización tanto para el personal que trabajará en la obra como para el público en general.
- Todas las vías de acceso que utilizará el proyecto, principales y secundarias serán señalizadas adecuadamente para informar al público y a los trabajadores del proyecto sobre su uso y restricciones durante la obra.

- La señalización al público en los caminos de acceso, deberá ser instalada de manera tal que advierta a una distancia prudente los trabajos o actividades que se desarrollan sobre la vía. Así mismo, esta señalización deberá permanecer continuamente y durante 24 horas por todo el tiempo que se realice la intervención en la vía.
- Diseñar un sistema de señalización de acuerdo con el siguiente tipo de señales:

  - **Preventivas:** Advierten al personal de la obra y al público en general, la existencia de un peligro y la naturaleza de éste.
  - **Reglamentarias:** Indican limitaciones, prohibiciones o restricciones.
  - **Informativas:** Identifican y guían al usuario, proporcionándole información que pueda necesitar, así como las direcciones que debe seguir.

- Colocar una persona con banderola en cada una de las intersecciones de los caminos utilizados como accesos al área en construcción, los campamentos, sitios de botes de materiales sobrante y las áreas de préstamo para dirigir el transito durante se ejecuten las actividades constructivas.
- Se colocarán señales especiales las intercepciones de los caminos utilizados como accesos para indicar el peligro de accidente por paso de vehículos pesados.
- Establecer límites de velocidad para el tránsito de todo tipo de vehículo por las calles y caminos utilizados como accesos al área de construcción para evitara la ocurrencia de accidentes a moradores.
- Asegurar que los camiones que transiten por la ruta predeterminada, estableciendo un control de la velocidad de los mismos.
- Cubrir con lonas los camiones para evitar la caída de materiales que puedan causar accidentes a los transeúntes y moradores.
- Todas las áreas a ocupar serán debidamente demarcadas para evitar la intervención innecesaria de áreas, utilizando para ello señales como banderines y estacas pintadas con colores vistosos, cinta de seguridad u otras señales apropiadas para tal fin.

9.0 CONTINGENCIAS

Una contingencia es una situación eventual y transitoria cuando se presenta o se prevé con base en el análisis objetivo o en el monitoreo de la contaminación ambiental, una concentración de contaminantes o un riesgo ecológico derivado de las actividades humanas o fenómenos naturales que afectan a la salud de la población o el ambiente.

El PMAA incluye un plan de prevención y manejo de contingencia. Este programa se desarrolla en el marco de las reglamentaciones legales vigentes, en el ámbito nacional y provincial, que regulan

en materia de riesgos del trabajo, seguridad e higiene laboral, y regímenes laborales de los obreros de la construcción.

9.1 OBJETIVO GENERAL

Diseñar las estrategias que permitan tomar las medidas necesarias para preservar las vidas humanas, los bienes materiales y los componentes del proyecto Termoeléctrico Punta Catalina.

9.2 OBJETIVOS ESPECÍFICOS

Los objetivos específicos del Subprograma de Contingencias son:

- Establecer una lista de acciones operativas / administrativas para responder ante una emergencia de forma oportuna, adecuada y efectiva.
- Planificar y disponer de recursos necesarios para el control de emergencias.
- Asegurar un mecanismo para identificar periódicamente situaciones de emergencias en el desarrollo de las actividades de rehabilitación/ampliación y operación del Proyecto.
- Evaluar periódicamente mediante el desarrollo de simulacros, las operaciones de control de emergencia, actividades prevención, los medios y recursos establecidos para las situaciones de emergencia identificadas.
- Prevenir, detectar, evaluar y controlar los agentes de riesgo que generen posibles accidentes de trabajo, daños y/o pérdidas en el proyecto.

MEDIDAS A TOMAR: Para dar respuestas de manera oportuna, adecuada y efectiva a los estados de emergencias que podrían presentarse durante la fase de construcción se establecen los procedimientos siguientes:

- Se mantendrá una coordinación permanente con los Organismos Gubernamentales encargados de enfrentar situaciones de riesgos (Defensa Civil, la Cruz Roja, Ministerio de Salud Pública, el Cuerpo de Bomberos, Comité de Operaciones de Emergencia, Instituto Sismológico de la Universidad Autónoma de Santo Domingo, Comité de Operaciones de Emergencia, y la Oficina Nacional de Meteorología.
- Todo personal que sea contratado debe recibir un entrenamiento previo sobre las normas contempladas en la Política de Salud, Seguridad Laboral y Ambiente del Proyecto.
- Capacitar al personal sobre primeros auxilios y rescates.
- Mantener las instalaciones, equipos y a los trabajadores libres de riesgos laborales.

- Actualizar periódicamente el Panorama de Riesgos según requerimientos.
- Establecer controles a los riesgos identificados, actuando en la fuente, en el medio y el trabajador.
- Evaluar periódicamente los métodos de control.

10.0 RESPUESTAS A EMERGENCIAS

10.1 CAPACITACIÓN DEL PLAN DE EMERGENCIA

Todo personal debe ser capacitado en respuesta ante una Emergencia durante el primer mes de trabajo. Cada vez que un trabajador es cambiado de actividad debe ser capacitado en respuesta ante el riesgo de Emergencia correspondiente a su nueva ubicación.

El personal del CONSORCIO debe ser capacitado en respuestas que debe dar, desde su actividad específica, en caso que sea activada la Alarma de Emergencia. Este programa de capacitación a lo menos debe comprender:

- Reconocimiento de las señales de Alarma (acústica)
- Vías de escape y ubicación de Zonas de Seguridad

10.2 EN CASO DE OCURRIR ACCIDENTES

- Rescatar al trabajador sometido al trauma
- Aplicar los primeros auxilios in situ
- Aplicar atención primaria en el área destinada a salud y seguridad laboral
- Comunicarse con la agencia de atención de emergencias
- Trasladar al trabajador al hospital más cercano

10.3 OCURRENCIA DE INCENDIO

- **Instituciones de apoyo:** Mantener comunicación permanente con los Organismos Gubernamentales (Defensa Civil, la Cruz Roja y los Cuerpos de Bomberos)
- **Simulacro:** Realizar simulacros cada seis meses de cómo enfrentar un incendio con todo el personal en coordinación con el Cuerpo de Bomberos

ANTES: En todos los sitios de trabajo se dispondrán, apropiadamente, extinguidores de incendio, suministros para primeros auxilios y atención de emergencia con señales claras indicando su presencia.

- Dotar al personal de equipo de protección personal, incluyendo zapatos de seguridad, cascos, gafas, protección respiratoria y auditiva, será requerido para todo el personal en los sitios de construcción.
- Dotar de trajes para protección de incendio para los obreros que estén más expuestos en caso de la ocurrencia de un fuego.
- En el campamento principal se mantendrá una ambulancia equipada apropiadamente y con personal entrenado para responder a emergencias.
- Establecer un programa de señalización, en los campamentos, plantas industriales y en los frentes de obras que incluya:
    - Almacenamiento de Materiales.
    - Herramientas manuales y eléctricas.
    - Limpieza y Mantenimiento.
    - Prevención contra incendios.

Dr. Ramón Ma. Urbáez Marcelo ABOGADO NOTARIO PÚBLICO Mat. # 2570 Santo Domingo, R.D., D.N.

10.4 RESPUESTAS A SISMOS

MEDIDAS A TOMAR: Diseñar las estrategias que permitan tomar las medidas necesarias para preservar las vidas humanas, los bienes materiales y los diferentes componentes de la obra de los daños que podrían ocasionar las eventuales ocurrencia de sismos.

Un sismo es la liberación súbita de energía generada por el movimiento de grandes volúmenes de rocas en el interior de la tierra, entre su corteza y manto superior, y se propagan en forma de vibraciones a través de las diferentes capas terrestres, incluyendo los núcleos externo e interno de la Tierra.

Para dar respuestas de manera oportuna, adecuada y efectiva a la ocurrencia de sismos que pudieran presentarse durante la fase de reconstrucción de los diferentes componentes del Proyecto, se establecen los procedimientos a ser implementados:

ANTES:

- Establecer relaciones con los representantes municipales del Comité de Operaciones de Emergencia.
- Establecer relaciones con los representantes del Instituto Sismológico de la Universidad Autónoma de Santo Domingo, para mantener un canal de información sobre los microsismos que se registran en el área.

DURANTE:

- Conservar la calma, infundir serenidad y ayudar a los demás.
- Si no se puede evacuar el lugar, ubicarse en las zonas de seguridad.
- Alejarse de de cualquier utensilio o artefacto caliente y de objetos que pueden rodar o caer. Si el sismo lo sorprende cerca de taludes con presencia de inestabilidad, alejarse de inmediato e impedir que otras personas ingresen al área.
- Si está en la vía buscar protección lejos de edificios, árboles, cables y vehículos en marcha.

10.5 RESPUESTAS A HURACANES

OBJETIVOS:

- Diseñar las estrategias que permitan tomar las medidas necesarias para preservar las vidas humanas, los bienes materiales y los diferentes componentes del proyecto de los daños que podrían ocasionar las eventuales ocurrencias de fenómenos hidro-meteorológicos.
- Proteger la vida del personal involucrado en las actividades de construcción.
- Capacitar al personal responsable sobre los aspectos preventivos para este tipo de evento.
- Crear mecanismos de respuesta eficientes y planes de respuesta y evacuación en caso de desastres naturales.
- Proporcionar orientación a los responsables sobre lo que se debe y no se debe hacer antes, durante y después del paso de un huracán
- Ubicar lugares de refugio temporal

MEDIDAS A TOMAR: Para dar respuestas de manera oportuna, adecuada y efectiva a los estados de emergencias por el paso de vaguadas, tormentas y huracanes durante el proceso de construcción del proyecto se establecen los procedimientos a ser implementados:

- Elaborar un Plan de Emergencia y un Plan de acción para la temporada ciclónica
- Asegurarse de que el Plan de Emergencia y el Plan de acción para la temporada ciclónica estén actualizados y disponibles para los responsables de los diferentes Departamentos.
- Organizar los diferentes Comités de Preparación, Evaluación y Recuperación para tomar acción antes, durante y después del fenómeno atmosférico.
- Coordinar las reuniones de los diferentes Comités antes citados para analizar el plan de acción, definir responsabilidades específicas y en qué momento se pondrá el plan a trabajar.

- Tomar las debidas precauciones para proteger los diferentes componentes del proyecto a fin de minimizar el daño en las instalaciones y edificaciones.
- Mantener comunicación permanente con la Oficina Nacional de Meteorología responsable de hacer las comunicaciones de advertencia a través de boletines del desarrollo de cualquier fenómeno atmosférico que pueda impactar nuestro país.
- Mantener comunicación permanente con los Organismos Gubernamentales (Defensa Civil, Comité de Operaciones Emergencias y la Cruz Roja) para saber el desarrollo del fenómeno.
- Verificar que todas las áreas tengan una lista de prioridades antes de pasar el huracán y que sea conocida por los técnicos, operadores y obreros.
- Seleccionar el personal de apoyo que se quedará en los frentes de obras en las áreas identificadas como seguras y asegurarse de que está debidamente entrenado.
- Mantener al personal informado de la evolución del huracán o del fenómeno atmosférico que ofrece peligro para el área.
- Gestionar los materiales, equipos y herramientas necesarios para ser utilizados en las diferentes áreas del proyecto.
- Evaluar e identificar los riesgos en función de su importancia para cada actividad que se esté ejecutando al momento de presentarse el aviso de la posible ocurrencia del fenómeno.
- En las áreas de campamentos hacer un inventario de aquellos materiales y equipos que requieran de mayor protección, como es el caso de Computadoras, UPS, impresoras,Fotocopiadoras, documentación, alimentos u otros.
- Identificar personal dentro de su área con las aptitudes requeridas para colaborar con el plan de emergencia.
- No dejar acopiado aquellos materiales que pudieran resultar peligrosos para la población ubicada en el área de influencia directa del proyecto como son restos de maderas, hojas de zinc, escombros.
- Trasladar los equipos a lugares seguros para evitar daños materiales.
- El Comité se organizará y se entrenará tan pronto se inicie la contratación del personal de forma que está preparado para actuar ante cualquier tipo de amenaza natural que pueda presentarse en las instalaciones.
- Debe asegurarse de mantener un control de los diferentes riesgos presentes en las instalaciones y que puedan ser afectados ante la ocurrencia de un huracán.
- Identificar los lugares seguros dentro de las instalaciones para las personas que se quedarán durante la ocurrencia del fenómeno.
- Determinar los equipos de comunicación interna y externa que serán utilizados tanto para las personas responsables en cada frente de obra así como la

comunicación con el medio exterior para estar informados de la forma en qué evoluciona el fenómeno atmosférico.

- Inspeccionar el perímetro de toda el área de influencia del proyecto y tomar las medidas de lugar ante los riesgos que puedan ser eliminados tales como acopio de materiales de construcción, equipos y maquinarias mal ubicado.

DESPUÉS DEL PASO DEL FENÓMENO ATMOSFÉRICO:

- Evaluar los daños y hacer estimados de los costos de reparación y reposición.
- Tomar fotografías y videos de las estructuras, equipos y objetos afectados. Comunicarse con las aseguradoras.
- Tomar las medidas pertinentes para evitar posibles daños y accidentes posteriores que puedan ocurrir de acuerdo a los riesgos que puedan presentarse luego de ocurrido del fenómeno.
- Notificar a las Autoridades u Organismos correspondientes de daños causados por accidente del personal, daños a los diferentes componentes del proyecto y /o servicios en los campamentos e instalaciones auxiliares.

11.0 SEGURIDAD EN EL TRABAJO

La ejecución de la actividad del proyecto del Sitio para el proyecto Termoeléctrico Punta Catalina debe hacerse dentro de una zona "limpia", con todas las obras de movimiento de tierra ya terminadas.

Las áreas involucradas deben ser:

Áreas comunes abiertas a todas las organizaciones y personas que operan en el sitio de la planta.

Zonas destinadas exclusivamente para los Contratistas/sub-contratistas para ejecutar las obras de construcción.

En general:

- Todas las actividades llevadas a cabo cerca o dentro de las áreas de PC y C se llevarán a cabo sólo después de la emisión de un permiso adecuado para el trabajo;
- Las actividades realizadas dentro de las áreas exclusivamente asignadas pueden llevarse a cabo (si está previsto) sin un permiso de trabajo cuando las áreas están

debidamente aisladas (por la distancia o la barrera adecuada) de los componentes operativos.

- La coordinación del Contratista en el campo, debe ser promovida y regulada con la ejecución del proceso de trabajo seguro siempre y un permiso de trabajo adicional cuando sea necesario. Así, el contratista pondrá en marcha siempre un proceso de AST.

11.1 EL PROCESO DE ASIGNACIÓN DE SEGURIDAD EN EL TRABAJO (AST)

La Información para obtener una comprensión inicial y rápida de los riesgos asociados con las categorías del sitio de trabajo está contenida en la identificación de peligros, evaluación y control de riesgos por parte del Plan SSTMA del Contratista y sus sub- contratistas.

La identificación del peligro, se completará con otros documentos disponibles del sitio SSTMA (métodos de declaración, las prácticas de trabajo del sitio SSTMA, el procedimiento, HDSM, etc.) y con estudios de campo específicos para llevar a una evaluación completa de los riesgos que deben gestionarse.

El Proceso de Ejecución de Trabajo Seguro en el Sitio se compone de los siguientes pasos:

- La evaluación inicial del Plan(es) de Identificación de Peligros y la Declaración de método pertinente;
- Análisis de Riesgos de Trabajo, teniendo en cuenta la salud, Seguridad y Riesgos Ambientales específicos;
- El Permiso del sitio de trabajo, cuando y/o donde sea necesario;
- Comunicación por la Junta de Seguridad Industrial y Salud con todo el personal involucrado del ART/PT y prácticas seguras de trabajo/métodos definidos;
- Ejecución EDRT (Evaluación Diaria de Riesgo en la Tarea)
- Supervisión: inspecciones periódicas para mantener las condiciones definidas. El proceso arriba mencionado siempre debe ser aplicado.

11.2 ANÁLISIS DE RIESGOS DEL TRABAJO (ART) Y DECLARACIÓN DE MÉTODO RELEVANTES

El Contratista espera que los trabajos planeados identifiquen a tiempo las actividades a realizarse, para la ejecución de ART en tiempo y forma, la identificación de riesgos para la salud, seguridad y medio ambiente y las medidas correspondientes que deben aplicarse.

Un ART específico siempre es necesario cuando una o más de las siguientes condiciones existan:

- Todas las tareas con la posibilidad de lesiones graves / consecuencia
- Tareas nuevas o revisadas
- Cuando la tarea no es de rutina
- Cuando no se ha llevado a cabo algún ART para la tarea
- No existe Instrucción de SSTMA específica para la tarea
- Tareas bajo permiso
- Trabajo en solitario
- Diferentes actividades en curso en la misma área o diferentes sub-contratistas.

El ART y la declaración de Método relevante serán revisados por el CONTRATISTA antes de su implementación. (El análisis inicial genérico de Riesgos de Trabajo para las actividades típicas del sitio suele ser desarrollado por el Contratista y emitido con los planes de SSTMA).

Aunque un genérico ART puede estar disponible, siempre es requerido un ART más específico y personalizado para el sitio antes de comenzar nuevas tareas o revisadas o fuera de rutina.

Un completo y preciso ART es generalmente desarrollado por la línea de Supervisión del Contratista y representantes de SSTMA, con aquellos individuos que tienen mayor conocimiento de la tarea.

El CONTRATISTA deberá recibir el ART al menos 3 días antes de que el trabajo comience.

El personal de supervisión junto con el personal de SSTMA recibe y revisa el ART.

El CONTRATISTA no debe involucrarse en el proceso de aprobación del ART, pero si asegurarse de que el proceso correcto del ART y la Ejecución del trabajo seguro es completamente aplicado por

el Contratista. Es responsabilidad del Contratista de proveer entrenamiento y recursos para llevar a cabo del ART para cada tarea desarrollada.

Las actividades de PC y C no incluidas en el alcance del trabajo del Contratista de Construcción u otorgado a otras empresas especializadas, pueden ser supervisadas directamente por el equipo del CONTRATISTA. Sólo en esos casos, el ART será desarrollado por los supervisores del CONTRATISTA y el especialista de SSTMA en PC y C y aprobado por el administrador del CONTRATISTA.

11.2.1 CÓMO LLEVAR A CABO UN ART

El ART se llevará a cabo entre la línea de Supervisión del Contratista y representantes de SSTMA. El ART se desarrolla con las personas que tienen más conocimiento de la tarea y son los más afectados por la misma.

El ART suele abordar las actividades asociadas con un grupo de trabajadores. Un Análisis de Riesgos de Trabajo se desarrolla con el fin de:

- Proporcionar una secuencia de eventos o actividades que siga la tarea
- Especificar los riesgos de salud, seguridad y medio ambiente asociados con cada paso de la etapa, evento o actividad
- Prescribir las medidas de control que abordarán el riesgo máximo que un riesgo en particular identificado podría plantear
- Entregar el ART para control
- Antes de la ejecución discutir el ART ejecutivo con los empleados que van a ejecutar el trabajo a través de una reunión diaria de Seguridad Industrial y Salud o de una sesión especial.

El ART también identificará cualquier permiso de trabajo que se necesite como un control adicional a los peligros identificados (ver el párrafo siguiente).

11.2.2 PERMISO DE TRABAJO EN EL SITIO (PT)

El procedimiento de PT se aplicará a los trabajos de construcción de alto riesgo (incluso dentro de áreas para futuras expansiones), que se definen de la siguiente manera:

- Instalaciones de Construcción Temporal (ICT), incluyendo la instalación temporal de utilidades y desmovilización del sitio (Ej ,desconexiones);
- Espacios confinados;
- Trabajos con riesgos eléctricos (ej: trabajos que requieran control/aislamiento, incluyendo trabajar cerca de líneas o equipos de alto voltaje, etc.);
- Trabajos con calor en ambientes de posible riesgo;
- Cierre o interrupción sistemática de caminos;
- Levantamiento con grúa que requiera un estudio especifico, o para un peso de más de 50 tons , o cerca de sistemas o plantas activas , o arriba del 80% en la grafica de seguridad de la grúa;
- Excavaciones que involucren condiciones del subsuelo desconocidas o peligrosas (ej: posible presencia de líneas/tuberías/cables activos, etc.);
- Andamios que requieran estudios específicos y andamios suspendidos;
- Trabajo en las alturas sin condiciones apropiadas de límites de seguridad (ej.: trabajos en techos, etc.);
- Trabajos que involucren materiales peligrosos.
- Trabajos en áreas ambientales sensibles , o que pudieran daña al medioambiente inmediatamente;
- Trabajos nocturnos
- Cualquier otra actividad no rutinaria que cree riesgos a aquellos no ejecutando dicha actividad o a áreas no involucradas aparentemente en al trabajo (EJ: pruebas de presión, limpieza abrasiva, soldadura química, actividades de PC tales como limpieza, soplado, presión de agua, etc.).

11.2.3 FORMATOS DE PT Y PROCEDIMIENTO DE EXPEDICIÓN

Para el permiso de trabajo del Sitio en el área durante la construcción y las fases de PC y C referirse al "Permiso de trabajo con alto riesgo".

El procedimiento expedido debe ser específicamente de común acuerdo en el Sitio.

11.2.4 EMISIÓN DE ACTIVIDADES /ROLES PT

El CONTRATISTA garantiza que se está aplicando el procedimiento correcto para su ejecución, requerido para un trabajo seguro (en conjunto con la planta en su caso) revisando el PT, según sea necesario.

Para los sistemas /áreas bajo el Pre-Arranque, el CONTRATISTA garantizará la adecuada coordinación de campo entre las actividades de construcción y las actividades de Pre-Arranque con la utilización del proceso de revisión de los PT.

Para los sistemas /áreas bajo la fase de Arranque y hasta su entrega al CLIENTE, el CONTRATISTA, en el papel de emisor de permisos, se asegurará de que área en donde el trabajo tiene que ser hecho está y será mantenido en las condiciones de seguridad que permitió el inicio de la obra.

Para responder a estos principios, los siguientes papeles clave PT deben ser básicamente identificables:

- Solicitante: la parte ejecutante, en general el CONTRATISTA que quiere ejecutar la obra y debe iniciar el PT, presentando toda la documentación necesaria (ART, PT forma inicial, etc.) La solicitud deberá presentarse a más tardar el día anterior a empezar el trabajo (a menos que se especifique lo contrario).

- Crítico: la parte concurrente. Esta función adicional será cubierta por el CLIENTE/CONTRATISTA de la planta (la organización encargada de la zona) para comprobar que el sistema va a ser activado por el CONTRATISTA según se requiera. Para las actividades a realizar en los sistemas o áreas interiores bajo la fase de Pre-Arranque, el CONTRATISTA también actuará como revisor técnico para mejorar la coordinación del sitio.

- Emisor: la parte operativa, que acepta el trabajo a realizar y/o da la autorización para el trabajo. Es la persona responsable de OPERACIÓN en el área. El PT generalmente será válido para la duración de un turno o del período establecido y aceptado en él.

- Receptor: la parte ejecutora - por lo general el Supervisor /Capataz del equipo de trabajo que debe ejecutar la obra y reconocer todas las condiciones establecidas para la ejecución segura del trabajo. El receptor debe estar siempre presente en el sitio durante la ejecución del trabajo y garantizará la implementación del PT. El área del trabajo debe quedar en perfectas condiciones de limpieza después de la interrupción del trabajo o la terminación. La terminación de las obras deberá ser certificada a la autoridad emisora y al CONTRATISTA.

Algunas de las actividades de PC y C, no incluidas en el alcance del trabajo de cualquier sub-contratista, pueden ser ejecutadas bajo la supervisión directa CONTRATISTA. En este caso, el personal de PC y C del CONTRATISTA puede cubrir, de acuerdo a las diferentes situaciones, el papel de solicitante PT, emisor o receptor. En cualquier caso, el papel de emisor y receptor nunca debe ser cubierto por la misma persona.

Todas las personas involucradas deben ser competentes y capacitadas en su deber y función: capacitación sobre el procedimiento del permiso específico del trabajo, deberán superar una prueba específica en el sitio, su nombre y la firma se debe mantener en un registro específico, éstas deberán ser fácilmente identificados en el sitio mediante la emisión de una tarjeta específica /placa, etc.

NOTA: Antes de iniciar las actividades de PC y C en un sistema o parte del mismo, el CLIENTE del sistema correspondiente será nombrado dentro de la organización PC y C del CONTRATISTA.

11.2.5 PT EN ÁREAS ASIGNADAS

La Solicitud de permiso de trabajo se presentarán en tiempo al CONTRATISTA para su revisión, a más tardar el día anterior (24 horas) al trabajo (a menos que se especifique lo contrario) y será válido para la duración de un turno o el período establecido y aceptado en el permiso.

No habrá variación para o de la autorización concedida y autorizada sin el consentimiento del CONTRATISTA.

Todos los permisos, a menos que se indique lo contrario, tendrán un Análisis de Riesgos de Trabajo específico adjunto y serán operables después de haber tenido reuniones específicas de Seguridad Industrial y Salud y un relevante nivel de Evaluación de Riesgos en la Tarea - EDRT.

11.2.6 EVALUACIÓN DIARIA DE RIESGO EN LA TAREA-EDRT

La evaluación de riesgos en la Tarea (EDRT) es un proceso sistemático llevado a cabo en el día a día, en base de turno a turno de base, inmediatamente antes de iniciar un trabajo (y cuando se cambia de puesto de trabajo) para identificar y controlar los riesgos específicos.

El proceso se llevará a cabo por un número importante de empleados que utilizan una lista de control dedicado, el documento se llevará a cabo por el empleado durante toda la duración del turno actualizado, si es necesario (nuevos riesgo que surja: por ejemplo, el polvo ocasionado por el viento).

Al final del turno los formatos de EDRT se recogerán; regularmente el contratista debe analizar los resultados de estas inspecciones ya que se presentan para detectar problemas específicos que hay que resolver de antemano.

11.2.7 REUNIÓN DE SEGURIDAD INDUSTRIAL Y SALUD (RSI)

Una discusión de seguridad será organizada e implementada por cada equipo de trabajo o supervisor del equipo todos los días laborales.

La reunión se llevará a cabo en o cerca del lugar de trabajo para planificar las tareas del plan de trabajo y discutir asuntos de interés para los supervisores y los miembros del equipo de trabajo.

Las reuniones diarias de seguridad industrial y salud se dirigen a todos los empleados de cada uno de los Supervisores /Capataces del CONTRATISTA para facilitarlas. El Gerente del Sitio de SSTMA y otra gestión de proyectos pueden participar, según sea necesario.

El tema de las reuniones será el trabajo /tarea específica a tratar y contendrá la siguiente información:

- Revisión del análisis de riesgos del trabajo (ART) de las actividades
- El Plan de Trabajo Diario

- El trabajo que se desarrolla en áreas cercanas
- Consideraciones ambientales
- Actualización de Procedimientos

Para las actividades de PC y C ejecutadas bajo la supervisión directa del CONTRATISTA, el RSI se llevará a cabo por el supervisor del contratista a cargo.

11.2.8 CAMPO DE CONTROL DE EJECUCIÓN Y SEGUIMIENTO

La Línea de supervisión deberá realizar un reconocimiento del sitio periódico durante la ejecución del trabajo para evaluar e inmediatamente corregir cualquier discrepancia de los definidos ART /PT, prácticas de SSTMA y métodos de trabajo.

11.3 UTILIDADES DE INSTALACIÓN TEMPORAL Y EL PLAN DE DESMOVILIZACIÓN

Plano del terreno /servicios de instalación temporales, tales como el cable eléctrico subterráneo, el recorrido del cable eléctrico, central eléctrica, agua y suministro de aire, etc., se deben preparar y compartir en el lugar para evitar incidentes; el CONTRATISTA colaborará para dar y compartir información en el sitio.

11.4 EQUIPO DE PROTECCIÓN PERSONAL (EPP)

Cada organización en el sitio es responsable de proveer a su personal con cualquier de equipo de protección personal o colectiva necesario para realizar el trabajo de acuerdo con el análisis de identificación de peligros o se considere necesario para controlar los peligros causados por las condiciones del sitio en general o la ejecución simultánea de las actividades, aún cuando no estén bajo su control directo

El EPP deberá cumplir con las normas y requisitos de la norma Dominicana. El Personal presente en el sitio (empleados, contratistas, visitantes y proveedores) debe usar el EPP previsto.

Esto debe ser considerado para la selección de la utilización de los EPP, la selección de proveedores, para asegurar la adquisición en virtud de los requisitos de las especificaciones basadas en los resultados de la identificación de peligros, evaluación y control de riesgos.

El mínimo EPP requerido para todo el personal en el sitio son: casco de seguridad, gafas de seguridad, botas de seguridad (de suela de acero y protección del tobillo), guantes de seguridad, ropa adecuada para el trabajo y chaleco de trabajo de alta visibilidad (cuando sea necesario).

La ropa debe ser "overoles ignífugos (NOMEX o su equivalente)"con mangas largas. Para facilitar su identificación, la ropa de personal del CONSORCIO debe tener una etiqueta con el logotipo de la empresa.

Un EPP adicional debe ser solicitado en función de las actividades de trabajo específicas y/o un área específica de trabajo, y debe ser especificada por el ART y/o PT, HDSM, etc., tales como: protección auditiva, arnés de seguridad, chaleco de alta visibilidad o bandas reflectantes; protección de soldadura, protección respiratoria, máscaras de escape; detectores de gas Portable Personal, máscara con filtro de cartucho, etc. El personal debe recibir formación específica en todas las circunstancias reportadas anteriormente.

En las áreas de trabajo que requieren el uso de otros EPP diferentes al obligatorio deben ser instalados los señalamientos específicos.

El uso de estos equipos debe ser alentado a través de programas de motivación en su uso, cuidado, almacenamiento y eliminación.

Las necesidades de las instalaciones o dispositivos de protección colectiva deben ser identificados, sobre la base de los estudios de riesgos e impactos.

Se debe tener precedencia para el uso de dispositivos de protección colectiva basado en el análisis de la ingeniería en relación con el uso de EPP, cuando las condiciones del lugar de trabajo lo permitan.

11.5 HOJA DE DATOS DE SEGURIDAD DEL MATERIAL

Cualquier material peligroso llevado al Sitio deberá ir acompañado de sus HDSM, por escrito de acuerdo con ANSI Z 4001:1998 o una norma equivalente reconocida.

Una copia del HDSM se debe entregar al administrador de SSTMA del CONTRATISTA del Sitio, que remitirá la información a todas las partes involucradas, según sea necesario y siempre una copia a los Servicios Médicos. Todos las HDSM se deben mantener en un registro del sitio.

Tomar el entrenamiento a las partes involucradas en el manejo, transporte, uso, almacenamiento y eliminación de residuos peligrosos, debe ser considerado en la identificación de peligros, evaluación y control de riesgos.

Todo el personal involucrado en la manipulación de productos químicos o potencialmente expuestos a materiales peligrosos deberá ser informado de los riesgos relacionados tal como se describe en el HDSM.

11.5.1 MANIPULACIÓN /ALMACENAMIENTO DE MATERIALES PELIGROSOS

Deberá prestarse especial atención a:

- Material de recepción y almacenamiento (incluyendo también los riesgos del equipo de inertización con nitrógeno interno, etc.)
- Material de protección durante el almacenamiento y la construcción (teniendo especial cuidado también de las sustancias no compatibles que no se deben almacenar juntas, etc.)

Los materiales no deberán almacenarse o utilizarse dentro de las áreas restringidas donde no hay extintores o EPPs disponibles como es requerido por el HDSM. La cantidad de materiales peligrosos almacenados en el sitio se debe mantener en el nivel más bajo posible.

Señales específicas /información de seguridad se proporcionará en el lugar donde los productos químicos son generalmente cargados /descargados a granel /tanque/banda.

El personal debe llevar ropa adecuada EPP como se muestra en el HDSM. Carga /descarga no se hará solo por los trabajadores, sino bajo la supervisión específica.

11.6 PELIGROS PARA LA RESPIRACIÓN - APARATO DE PROTECCIÓN

Los riesgos respiratorios en el sitio deben ser identificados. Si se da el caso, empezando con el HDSM, otra información disponible y los procedimientos específicos, los siguientes temas deberán ser tratados:

- La información específica /entrenamiento necesarios y la evidencia de la información /entrenamiento realizado
- El requisito mínimo de SSTMA para trabajar en áreas como, por ejemplo, la presencia del stand en la persona, la disponibilidad de equipos de respiración al lado del lugar de trabajo, etc.

1797

En el caso de una posible solicitud para utilizar equipo de protección respiratoria, se debe prever:

- Formación específica adicional registrada como simulacro práctico sobre cómo usar y utilizar estos aparatos. El entrenamiento /ejercicio se realiza en el inicio de los trabajos en el sitio (o en la posición específica del papel /posición) y se debe actualizar por lo menos dos veces al año.
- El control de equipos de respiración (presión, estado, etc.) como por las instrucciones del fabricante.

11.7 ESPACIO CONFINADO

Los casos de espacios confirmados y riesgos deben ser identificados en el sitio. En ese caso, un entrenamiento adicional específico debe ser realizado. El bajo voltaje de los equipos y el aislamiento positivo de fuentes de energía peligrosa, en su caso, se aplicará. Provisiones deben ser hechas para la evacuación de emergencia del personal herido.

Un Permiso Específico de Trabajo (PT) es obligatorio siempre.

11.8 PROTECCIÓN CONTRA CAÍDAS

Donde la distancia de caída sea superior a 1.80 metros; andamios y/o plataformas de captura, deberán estar disponibles.

La protección contra caídas se dispondrá obligatoriamente también cuando hay un peligro especial en el área de trabajo (ejemplo: construcciones o productos químicos que pueden causar lesiones).

Arneses de seguridad con cuerdas y amortiguadores unidos a líneas de vida, las capturas de seguridad u otros objetos importantes son obligatorios y deben ser usados.

El personal que trabaja en altura debe estar debidamente capacitado en el uso correcto de los arneses de seguridad.

Si el uso de andamios y/o plataformas de captura es poco práctico, las redes de seguridad deberán ser instaladas.

Sólo el personal profesional habrá de realizar la instalación de andamios, el desmantelamiento y autorizar su uso. Copias de las certificaciones se mantendrán en el lugar de trabajo por el andamio y puestos a disposición bajo petición.

Todo el personal que trabaje en altura (más de 1.8 m) en presencia de un riesgo de caída, será provisto de un sistema completo de arneses de seguridad, 100 % ajustado; en la mayoría de los casos la implementación del 100 % de ajuste de arneses implica el uso de 2 lanzaderas.

Todo andamiaje deberá tener los certificados de inspección de andamios. Los andamios deberán ser revisados en todas las inspecciones de seguridad regularmente. Todos los defectos deben ser anotados en el documento de inspección.

Los andamios deberán ser manejados de acuerdo al procedimiento de "Manejo de Andamios" suministrado por el fabricante. Los trabajos en altura deberán ser manejados de acuerdo al "Trabajos en Altura y Protección contra Caídas"

El sub-contratista de andamios deberá realizar la inspección técnica y el CONTRATISTA (comprador de andamio) aceptar la idoneidad de andamios para la operación. Todos los diferentes grupos de usuarios son responsables de verificar que los andamios sean adecuados para el trabajo antes de acceder a ellos.

Las escaleras no deben utilizarse como un trabajo de base. Las escaleras se utilizarán tan sólo como forma temporal en la zona de trabajo, para fijar y separar el equipo del aparejo y de otros trabajos similares a corto plazo.

Las escaleras deben colocarse en una base sólida y nivelada. Deben estar estables durante todo el tiempo del trabajo. La parte superior o inferior de las escaleras se debe sujetar con clip de seguridad o equipados o utilizarse con otros procedimientos similares realizados.

11.8.1 ANDAMIOS

Todos los andamios construidos en la obra deberán ser estables y seguros de usar. La compañía que fabrique los andamios deberá entregar a la Gerencia del CONSORCIO un Plan de Manejo de Andamios, antes de iniciar actividades. El Plan de Manejo de Andamios es un documento mediante e cual el subcontratista de andamios describe como los andamios son manejados en la Obra. Deberá incluir al menos los temas siguientes:

- Descripción del sistema de andamios (Manual del Fabricante)
- Estándares e ingeniería de andamios
- Organización y responsabilidades

- Competencia y certificación
- Procedimiento de Instalación/modificación/desmontaje de andamios.
- Sistema de Inspección (para material de andamios y andamios)
- Acceso al andamio (sistema de Etiquetado de Andamios)
- Medidas de control y prácticas seguras de SSTMA.

11.9 OPERACIONES DE LEVANTAMIENTO

Todos los equipos llevados a la obra deberán estar en condiciones seguras de operación en todo momento. Grúas y todo el equipo provisto con aparatos de levantamiento deberán ser provistos de un certificado de una 3ra parte; este certificado deberá mantenido durante las inspecciones anuales de la 3ra parte.

Todos los accesorios de levantamiento (cadenas, ganchos, grilletes, poleas, etc.) deberán ser mantenidos en buenas condiciones en todo momento y también certificados por la tercera parte con una validez por un año.

Ningún levantamiento puede ser realizado con equipos no provistos con el certificado de 3ra persona.

11.10 ESTRUCTURAS Y MONTAJE DE APOYOS

Cada estructura de soporte parcial o totalmente construida en un lugar de trabajo, incluyendo su cimentación, será capaz de soportar con seguridad cualquier carga que pueda ser impuesta durante la construcción o desmantelamiento de la estructura de soporte.

Será el deber de la administración del CONSORCIO asegurarse de que ninguna estructura de la pared, chimenea u otro, o alguna parte de una estructura en el lugar de trabajo, se deje insegura o no apuntalada en condiciones tales que se pueda caer, desplomarse o debilitar la presión del viento, las vibraciones o cualquier otro trabajo que se lleve a cabo en el lugar de trabajo o en las proximidades del lugar de trabajo.

11.11 SEGREGACIÓN DE LA ZONA PELIGROSA DURANTE LA CONSTRUCCIÓN

Los peligros relacionados con las diferentes actividades del sitio pueden ser indicados a través de la segregación apropiada del área. Ejemplos de estas actividades durante la construcción son: la zona alrededor de cargas pesadas o por debajo de las obras con material de posible caída, la construcción y el desmantelamiento de andamios, excavaciones, obras viales, etc. En todos estos casos, las barreras rígidas (tablas, etc.) es preferible que se plastifiquen, cuyo uso no se recomienda dentro de las instalaciones del proyecto.

Para la actividad de construcción en general, la segregación del área se puede hacer con una barrera de color rojo /blanco y/o red de plástico naranja y/o signos habituales de aviso, siempre que su integridad se verifique periódicamente y los medios serán reemplazado según sea necesario.

Todas las personas deberán respetar la segregación de área y supervisores deberán comprobar que solo la gente autorizada entre en el área.

11.12 ACTIVACIÓN DE SISTEMAS/EQUIPOS

Estando cada vez más cerca de la finalización de la construcción, el sistema /equipos será temporal o permanentemente activado con el fin de realizar las actividades PC y C.

Es posible hacer referencia a estos sistemas también como sistemas "vivos".

Activación permanente o temporal, se llevará a cabo bajo el permiso de trabajo.

Con el objetivo de promover la coordinación sobre el terreno entre las actividades PC y C y las actividades restantes de construcción, la aplicación continua del proceso de ejecución segura del trabajo se integrará con las siguientes precauciones adicionales:

- Comunicación avanzada para las organizaciones en otro sitio de las próximas actividades de PC&C.
- Aislamiento de Sistemas Vivos
- Identificación de Sistemas Vivos
- Segregación de áreas peligrosas de PC y C

11.13 COMUNICACIÓN AVANZADA DE LAS PRÓXIMAS ACTIVIDADES DE PCYC

Por lo menos 24 horas antes de la activación temporal o definitiva de un sistema o parte del mismo, un aviso de alerta se enviará a todas las organizaciones del sitio (Gerencia del CONSORCIO, contratista de construcción, CLIENTE, etc.).

La notificación de alerta deberá contener como mínimo: descripción del sistema /parte que se activará, alcance de activación, correspondientes riesgos específicos, las medidas de control establecidos, áreas del sitio que se prohíben /restringen, así como las medidas de seguridad adicionales que se aplicarán

La Organización del sitio a cargo de la actividad deberá proporcionar al CONTRATISTA toda la información necesaria para enviar el aviso de alerta en el momento oportuno.

El aviso de alerta se considera un requisito previo para la emisión de cualquier permiso de trabajo para la activación del sistema.

Cada organización del sitio se encarga de asegurar que el contenido de las comunicaciones anteriores fluya totalmente como cascada a todo su personal. El contenido incluirá esta información en la RSI diaria.

Una lista actualizada de los sistemas "vivos" y un mapa actualizado de las áreas restringidas para PC y C estará disponible en el sitio. Un resumen semanal será expedido por el administrador de SSTMA a todas las organizaciones del sitio.

11.13.1 AISLAMIENTO DE SISTEMAS VIVOS

Antes de ser temporal o permanentemente activado, el sistema /equipo serán aislado positivamente del resto de la planta aún en construcción.

El Método apropiado de aislamiento (los puntos de aislamiento, dispositivos de aislamiento y pasos secuenciales de aislamiento) se definen por personal competente perteneciente a la organización del sitio a cargo de la ejecución de la actividad PC y C. Método definido de aislamiento se presentará al Gerente del CONSORCIO para revisión y aprobación por lo menos 3 días de la activación.

El aislamiento físico del sistema, de acuerdo con el método de aislamiento aprobadas por el CLIENTE del sistema, será implementado y certificado por la organización del sitio a cargo de la

ejecución de la actividad PC y C (por lo general para las actividades de PC). Este certificado deberá ser considerado como un requisito previo para la emisión de cualquier permiso de trabajo con la activación del sistema.

Los dispositivos de aislamiento deberán ser cerrados y etiquetado con "NO OPERAR" para que sean fácilmente identificables en el campo y evitar la eliminación de aislamiento no autorizado. Los dispositivos de aislamiento pueden ser removidos exclusivamente por la persona que los instaló.

Una lista de todos los puntos de aislamiento y dispositivos instalados (lista ciega, registro de candadeo, etiqueteo y despeje) se mantendrá actualizada por las organizaciones de sitio a cargo de implementar físicamente los aislamientos y puestos a disposición del CONTRATISTA según la demanda.

11.13.2 IDENTIFICACIÓN DE SISTEMAS VIVOS

La organización de la obra a cargo de las actividades de PC y C (normalmente del CONTRATISTA para las actividades de PC) pondrá claramente reconocibles en el campo de los sistemas /equipos en PC y C enrollando una cinta de advertencia y/o colocación de letreros de advertencia en las partes accesibles de los sistemas (tentativamente cada 8 m).

Cuando el número de sistemas afectados crece, la segregación de las áreas en general con barricadas rígidas o vallas puede sustituir sistema de identificación de uno por uno. El acceso a la zona segregada se limitará a sólo personal autorizado.

El Permiso específico para el trabajo se obtendrá para llevar a cabo cualquier tipo de actividad en los sistemas vivos (sistema bajo PC y C).

Barricadas, cintas y señales de advertencia de color se diferencian de las utilizadas durante las actividades de construcción. Generalmente de color negro y amarillo indican PC, mientras que las de rojo y blanco indican Construcción. Las señales de peligro deben ser capaces de resistir a las condiciones climáticas, por lo general plastificado. Éstas se fijarán y estarán visibles para todos los trabajadores.

11.13.3 SEGREGACIÓN DE ÁREA PELIGROSA DURANTE PC Y C

La organización del Sitio a cargo de las actividades de PC y C (por lo general del CONTRATISTA) para las actividades de PC) es responsable de identificar y segregar las áreas del sitio peligrosas debido a las actividades PC y C en curso.

1803

En función de los riesgos que implica el acceso a la zona de segregación puede ser completamente prohibida o restringida a sólo el personal autorizado.

El acceso a áreas restringidas será objeto de adecuado permiso de autorización de trabajo. Permisos especiales (insignias, etc.) puede ser emitidos a un número limitado de personal que se autoriza a entrar en el interior de determinadas áreas restringidas sólo para llevar a cabo visita /encuesta o inspección visual del sitio.

La segregación de la zona por razones de PC y C se llevará a cabo mediante el uso de barricadas, cercas, cadenas o cintas y las señales de advertencia. Las cintas de advertencia o las cadenas pueden ser utilizadas solamente para las áreas que necesitan ser segregadas por un breve período de tiempo, como puntos de motores en marcha para correr una prueba.

Para las zonas de alto riesgo una guarnición humana se utiliza para tener una regulación estricta del acceso. Si es necesario se puede llevar una señal de registro de entrada /salida de todas las personas autorizadas entrando / saliendo de la zona restringida.

11.13.4 BLOQUEO/ ETIQUETADO

Nadie tiene autorización para realizar trabajos en circuitos o equipos que son o podrían ser potencialmente afectados por la activación inesperada, puesta en marcha o liberación de energía almacenada capaz de causar lesiones a los empleados.

Prácticas de candadeo, etiqueteo y despeje se deben aplicar para desactivar, aislar y asegurar todas las fuentes de energía peligrosa del equipo/circuitos antes de trabajar en él, y para protegerlo de la activación inesperada durante el trabajo.

Cualquier actividad que se realiza bajo la protección de candadeo, etiqueteo y despeje deberá ser previamente autorizada por el adecuado permiso de trabajo.

Cada organización del sitio es completamente responsable de evaluar todos los riesgos relacionados con la ejecución de sus propias actividades, identificar correctamente que pudieran ver afectadas por la liberación de energía peligrosa y, cuando sea necesario, requerir prácticas candadeo, etiqueteo y despeje.

En el caso de que la aplicación candadeo, etiqueteo y despeje fuera necesaria, el método apropiado de aislamiento (los puntos de aislamiento, dispositivos de aislamiento y pasos secuenciales de aislamiento) se deben definir por personal competente perteneciente a la

organización del sitio a cargo de la fuente de energía peligrosa. Un método definido de aislamiento se presentará al CONTRATISTA relevante por lo menos 3 días antes para revisión y aprobación.

El Contratista será el encargado de definir el método apropiado de aislamiento, implementarlo y certificar su eficacia para todos los aislamientos eléctricos necesarios hasta el momento de la subestación eléctrica esté bajo su propio cuidado y custodia; así como todos los aislamientos mecánicos requeridos en un sistema hasta que el sistema esté bajo su propio cuidado y custodia o no todavía; bajo Puesta en marcha o fase de Arranque.

El certificado de aislamiento se considera un requisito previo para la emisión de cualquier permiso de trabajo autorizando actividades bajo la protección de aislamiento de energía.

Los dispositivos de aislamiento deberán ser cerrados y etiquetados con etiqueta de "NO OPERAR" para que sean fácilmente identificables en el campo y evitar que remuevan sin autorización el aislamiento. Dispositivos de aislamiento pueden ser removidos exclusivamente por la persona que lo instaló.

Una lista de todos los puntos de aislamiento y dispositivos instalados (lista ciega, registro candadeo, etiqueteo y despeje) se mantendrá actualizada por las organizaciones de sitio a cargo de implementar físicamente los aislamientos y puestos a disposición del CONTRATISTA a demanda.

11.13.5 CANDADOS ROJOS

Las espadas de aislamiento, que podrían conducir a incidentes importantes/catastróficos en caso de ser retiradas por personal no autorizado, se identificarán como "espadas de aislamiento crítico", y son clara e inmediatamente reconocibles en el campo por tener el mango pintado de rojo. (Espadas Rojas).

Las espadas críticas de aislamiento incluyen pero no están limitadas a:

- Espadas de aislamiento de sustancias altamente peligrosas (sustancias inflamables, tóxicas)
- Espadas instaladas en los límites de la batería para aislar a partir de fuentes externas de energía peligrosa.

En el caso de que la espada haya sido instalada con el propósito de aislar a partir de sustancias altamente peligrosas, además de la habitual etiqueta de "NO OPERAR", un reporte de Peligros y

riesgos que implica y precaución adicional debe ser instalado en la espada (por ejemplo, gas inflamable, gases tóxicos - protección respiratoria requerida para el trabajo).

Las Espadas Rojas serán exclusivamente removidas bajo la autorización y control del Permiso de Trabajo.

11.14 GESTIÓN DE LOS LÍMITES DE LA BATERÍA / TIE-INS

La parte de la planta donde el CONTRATISTA y el subcontratista trabajen, debe ser aislada positivamente de cualquier fuente externa de energía peligrosa, así como la alimentación de la corriente /energía eléctrica proporcionada por terceras entidades.

Los límites de la batería entre la parte de planta bajo el control del CONTRATISTA y las posibles fuentes de energía deben ser identificados y asegurados en la posición de apagado, desde el inicio de su construcción física. Los Tie-ins se consideran como límites de la batería.

Un procedimiento específico para la gestión de los límites de batería de dispositivos de aislamiento se acordará entre el CONTRATISTA y el CLIENTE. Los contenidos mínimos de este procedimiento serán los siguientes:

- Un sistema de bloqueo y etiquetado se hará cumplir. El CONTRATISTA deberá estar en la posición de bloquear y etiquetar de cada límite de batería
- Un registro de límite de batería debe mantenerse
- Los dispositivos de aislamiento de la batería (espadas, válvulas, etc.) deben ser pintados de rojo para ser fácilmente reconocibles
- La eliminación de aislamiento positiva debe estar sujeto al contrato por escrito del CONTRATISTA

Siempre que una parte de la planta (la puesta en marcha de paquetes, sistema, etc.) se entrega del CONTRATISTA al CLIENTE, los límites de batería pertinente, con la porción de la planta aún bajo la responsabilidad del CONTRATISTA, serán identificados, aislados cerrados, etiquetados y actualizados los registros del límite las baterías.

La gestión del límite de la batería se mantiene bajo control directo del CONTRATISTA y no se puede delegar al subcontratista.

11.15 SUBESTACIÓN ELÉCTRICA ENERGIZADA

El acceso total o parcial a la Subestación Eléctrica se regulará a través del Sistema de Permiso de Trabajo.

El equipo dedicado a patrullar se debe reforzar para asegurar el control de los accesos a la subestación eléctrica.

Sólo un electricista competente puede ser autorizado para entrar en el interior de la subestación sin ser escoltado. Todos los demás empleados deben ser autorizados a entrar sólo con la presencia y bajo el control directo de los electricistas competentes.

Ropa resistente al fuego se usa dentro de la subestación como mínima medida de precaución. Objetos conductores (joyas, relojes, etc.) No deben ser usados.

Los trabajadores a cargo de patrullar la subestación deben ser entrenados sobre qué hacer en caso de emergencia y la forma de activar /usar de los sistemas contra incendios disponibles.

Por lo menos un empleado bien informado y competente en los fundamentos eléctricos de primeros auxilios, incluyendo la resucitación, debe siempre estar presente en el interior de la subestación.

Un equipo de rescate de alta tensión (gancho de rescate telescópico, plataforma aislante, guantes aislantes) estará disponible en la subestación.

Tan pronto como los interruptores de control del motor comiencen a ser encendidos y los cables de distribución de campo eléctrico estén físicamente conectados a los interruptores de control de motores, consumidores eléctricos correspondientes, equipo eléctrico accionado y los cables de distribución eléctricos, deben ser considerados como encendidos, sin tener en cuenta el hecho de que el interruptor de control del motor ha sido positivamente aislado.

Un electricista competente y con experiencia, debe ser nombrado como administrador de subestación por la organización del sitio a cargo de la Subestación Eléctrica.

El Administrador de la subestación será la única persona en el turno con derecho de operar aparatos de conexión eléctrica y por lo tanto energía o aislar los circuitos de campo eléctrico y los consumidores. Él será también el encargado de certificar aislamientos eléctricos positivos según los requisitos de candadeo, etiqueteo y despeje y mantener actualizado el registro de candadeo, etiqueteo y despeje.

La comunicación escrita de esta persona nombrada deberá ponerse a disposición del CONTRATISTA quien debe aprobar o rechazar el nombramiento.

11.16 PORCIÓN DE LA PLANTA EN OPERACIÓN DENTRO DEL SITIO DE TRABAJO

Siempre que parte de la planta sea operada bajo la responsabilidad del CONTRATISTA, aún como un aspecto correlacionado de las actividades de PC y C, todas las medidas necesarias se lleven a cabo para garantizar la integridad de los equipos de la planta y la seguridad del personal de todo el sitio.

El sistema del Equipo en funcionamiento se determinará o, cuando sea posible, se segregará físicamente de la obra restante. El acceso a las áreas restringidas será controlado y limitado al personal autorizado.

La organización del sitio debe ser reorganizada integrándola con los supervisores de turno competente, los operadores del panel y los operadores de campo según sea necesario.

Un sistema escrito y claro de comunicación entre los diferentes turnos debe ser implementado.

Un sistema de comunicación por radio entre sala de control y el operador de campo se debe reforzar. Construcción, PC y la gestión de SSTMA también deben ser proveídos con radios con el fin de ser capaz de obtener información rápida en caso de emergencia. La posibilidad de dotar a los gestores del subcontratista con los radios deben ser también evaluados.

Un control de procesos críticos o dispositivos de seguridad deben ser regulados y sujetos a autorización por escrito por una persona competente que pertenezca a la organización del CONTRATISTA.

El siguiente paso deberá ser seguido antes de proceder con un proceso de controles críticos o dispositivos de seguridad:

- Identificación del proceso correlacionado y riesgos de seguridad
- Identificación de un adecuado respaldo de medidas de protección
- Identificación de las medidas de seguridad con el tiempo adicional que se utilizará durante el remplazo.

Un registro de anulación se mantendrá actualizado en la sala de control.

1808

11.16.1 REVISIÓN DE SEGURIDAD DE PRE-INICIO (RSPI)

La RSPI se llevará a cabo antes de la introducción de productos químicos altamente peligrosos (por ejemplo, líquidos y gases inflamables, sulfuro de hidrógeno, etc.) en las instalaciones nuevas o modificadas de manera significativa con el objetivo de prevenir o minimizar las consecuencias de los incidentes causados por el inadecuado, incompleto, no autorizado diseño, construcción, instalación y/o fase de Arranque.

El alcance de la RSPI confirma que:

- La construcción y el equipo están de acuerdo con las especificaciones de diseño;
- Los procedimientos de seguridad adecuados, operación, mantenimiento y emergencia están en su lugar. Todo el personal de sitio ha sido debidamente instruido sobre el mismo.
- Los equipos de seguridad (detectores de gas, extinción de incendios, duchas de seguridad, aparatos de respiración, etc.) están disponibles y en servicio
- El operador competente del proceso está disponible y bien entrenado
- Para las nuevas instalaciones, todas las recomendaciones como resultado del Análisis de Riesgos de Proceso (estudio de Hazop, etc.) han sido resueltas y ejecutadas.
- Las Instalaciones modificadas cumplen con los requisitos contenidos en la gestión del cambio

El RSPI incluirá una inspección de campo con el fin de garantizar que las condiciones del sitio en general (limpieza, la accesibilidad de instalaciones, la segregación de área, la implementación de prácticas de trabajo seguro) son satisfactorias.

La puesta en marcha temprana de sistemas individuales /circuitos que implican la introducción de sustancias que poseen propiedades tóxicas, reactivas, inflamables o explosivas, aún si para llevar a cabo actividades de Pre-Arranque (por ejemplo, introducción del combustible en el interior del sistema), será objeto de una revisión RSPI formal (simplificado).

11.16.2 ÁREAS DE ALTA TOXICIDAD

Áreas del sitio que podrían estar expuestos a emisiones de sustancias tóxicas deben ser identificadas y comunicadas a toda la organización del sitio y es probable que los empleados afectados sean físicamente segregados en el campo del resto del sitio.

En esas áreas lo siguiente debe ser implementado:

- Todas las actividades dentro de esas zonas se ejecutan bajo el control de Permiso de Trabajo.
- Todo el personal entrando en esas áreas debe ser profundamente informado y capacitados específicamente sobre las características de los materiales tóxicos, medidas de prevención y protección que deben adoptarse, procedimiento de emergencia;
- Si los equipos de protección colectiva, si existe alguno, están en servicio (por ejemplo, detectores de gases tóxicos y alarmas, cortinas de agua, etc.)
- Adecuados equipos de protección personal deben ser proporcionados a todo el personal (detector de gases personal, la máscara de escape, etc.)
- Las vías de escape de emergencia deben mantenerse identificables y libres.
- Equipo de rescate entrenados y equipados para intervenir en caso de que sustancias altamente tóxicas sean liberadas

12.0 EMERGENCIA

Este capítulo reporta los principales lineamientos; el documento del Plan de Emergencia del sitio debe desarrollar todos los detalles.

Cada organización del sitio es responsable de la salud y la seguridad de sus empleados y para la protección del medio ambiente, y nada relacionado con la gestión de emergencia del sitio se les exime de su responsabilidad.

13.0 POSIBLES EVENTOS DE EMERGENCIA

El sitio de la ejecución del proyecto está en el área del interior de la propiedad, que no está todavía en operación.

En general, prácticamente cada emergencia en las unidades cercanas tiene el potencial de involucrar a las instalaciones del proyecto. Además, las emergencias que surjan dentro de las instalaciones del proyecto pueden involucrar a las unidades operativas cercanas.

Por lo tanto, es de suma importancia coordinar la actividad de respuesta de emergencia del proyecto con la organización de la planta.

Los eventos de emergencia que deben considerarse son:

- De la Planta / Unidades cercanas (posibles situaciones de emergencia):
  - Fuego /explosión, gas y liberación de vapores, derrames de hidrocarburos, productos químicos y la liberación de otra sustancia peligrosa
- Desde el sitio de la ejecución del proyecto (posibles situaciones de emergencia):
  - Liberación de una lesión, incidente ambiental, derrames de hidrocarburos, productos químicos y otras sustancias peligrosas, el colapso de la estructura, el rescate en altura, rescate en espacios confinados, etc., el incidente de vehículos, incendio /explosión, gas y vapores de liberación o de otro gran incidente industrial menos probable que también podrían afectar el sitio, sabotaje, ataque, etc.
- Durante la puesta en marcha los siguientes eventos se considera también:
  - Fuego /explosión de gas y liberación de vapores, derrames de hidrocarburos, productos químicos y la liberación de otra sustancia peligrosa,

De Medio Ambiente

Los fenómenos meteorológicos extremos (huracanes)

13.1 INFORMACIÓN Y ENTRENAMIENTO

Todo el personal de ejecución y los visitantes que ingresen al sitio deberán recibir la información básica sobre el manejo de Emergencias del Sitio.

El personal que tiene funciones específicas en el Manejo de Emergencias del sitio deberá recibir una formación adicional específica sobre sus funciones. Información continua, la formación y actualización del programa de simulacros en relación con la administración de emergencias será desarrollado e implementado en el sitio por el administrador de SSTMA del CONTRATISTA del Sitio.

Simulacros de emergencia periódicos se llevarán a cabo en coordinación con el CLIENTE de la Planta en las áreas de construcción del proyecto y en la planta.

Por lo menos una evacuación completa del sitio del simulacro de emergencia se llevará a cabo antes de la primera introducción de sustancias peligrosas en el proceso.

Se establecerá la periodicidad incluyendo el simulacro de contingencia (esto puede ser de escritorio cuando las condiciones no lo permiten).

El objetivo de los ejercicios es comprobar la eficacia del plan. Este debe ser analizado después de la ejecución y la emergencia o plan de contingencia debe ser revisado.

Para las actividades llevadas a cabo por los proveedores de servicios (terceras personas), estos deben tener su plan de emergencia de respuesta y contingencia y deberá ser evaluado periódicamente.

13.2 PROCEDIMIENTO DE EMERGENCIA DEL PROYECTO

13.2.1 RECURSOS DE EMERGENCIA DEL SITIO

El CONTRATISTA organizará su propio equipo para estar preparados para manejar "pequeñas" situaciones locales de emergencia y colaborar con el Equipo de Respuesta de emergencia de la planta.

Todos los recursos de emergencia están definidos y disponibles tan pronto como se inicie la actividad del sitio.

13.2.2 ORGANIZACIÓN DE EMERGENCIA Y EQUIPO DE EMERGENCIA DEL SITIO

Toda la organización del sitio, debe adoptar una estructura específica en caso de emergencia. La estructura típica que se adopte se describe en esta sección y el CONTRATISTA debe colaborar, si así lo solicita y es factible, siendo responsable de su propio personal.

El siguiente es el equipo de emergencia del CONTRATISTA y sus funciones:

- Gerente del Sitio (Jefe de Equipo de Emergencia)
- Administrador de Construcción (Jefe Suplente del Equipo de Emergencia - Ingeniero de servicio)

- Administrador de SSTMA del Sitio (estudio de los sitios y Jefe de Bomberos)
- Administrador de Oficina /Oficial de Seguridad (personal y respuesta a los medios de comunicación)

Otros designados en el momento por el Líder del Equipo (Reporte de registro) en colaboración con:

- Representante de campo del CONTRATISTA (Coordinación de los medios de campo /recursos)
- Supervisores del CONTRATISTA/Personal de SSTMA (control de campo y colaboración)
- Servicios médicos y equipo contra incendios (si es necesario)
- Equipo de rescate para la construcción de escenarios de emergencia, es decir, de rescate en altura, en espacios confinados, etc.

Desde su llegada al sitio el Administrador de PC y C deberá ser parte del Equipo de Emergencia. Desde el inicio de las actividades PC y C de la fase de Arranque, el Administrador PC y C actuará como líder del equipo de emergencia, en caso de la ausencia del Gerente del Sitio, cuando sea delegado por el Gerente del Sitio para cubrir esta posición.

Además de lo anterior, el líder de respuesta de emergencias del CLIENTE siempre debe ser puntualmente informado sobre las novedades de emergencia.

El CONTRATISTA deberá estar preparado con los medios y recursos para colaborar en el sitio para corregir la situación de emergencia de la construcción, cuando se le solicite y cuando sea posible. La puerta de entrada deberá mantenerse libre cuando los vehículos y equipos de emergencia deban pasar durante la emergencia.

La implementación de un sistema de asistencia mutua entre las empresas de la región, que incluya al menos el conocimiento de los peligros del vecino y respuesta relacionada se debe llevar a cabo.

13.2.3 SISTEMAS DE COMUNICACIÓN

El sistema de comunicación, radio y teléfono, deberá ser claro, adecuado y disponible en caso de emergencia. Los números de emergencia se deben conocer y difundir ampliamente.

Toda la información básica de emergencia estará fácilmente disponible en el sitio, por ejemplo, folletos, volantes, carteles, preparados, distribuidos y/o publicados apropiadamente en el sitio.

La comunicación se debe incluir de manera formal a las partes interesadas y sus conocimientos sobre el Plan de Respuesta de Emergencia serán apoyo adecuado en una situación de emergencia, a las diferentes unidades: Defensa Civil, Cuerpo de Bomberos, Centros de Salud, Cruz Roja, Policía Nacional, etc.

13.2.4 ALARMAS DEL SITIO

Una alarma de sitio general estará dada por una sirena y/o altavoces locales de la zona.

Antes de iniciar las actividades de Inicio, la alarma de emergencia y sistema de comunicación deberá ser revisada para asegurar que sea adecuada para los escenarios de emergencia y la organización del sitio y sea compatible con la detección de incendios y de gas y sistemas de alarma actualmente en servicio.

El medio preferido para reportar emergencias, tales como el manual de activación de las alarmas, sistemas de megafonía, radio o teléfonos serán identificados y comunicados a toda la plantilla.

13.3 EVACUACIÓN DE EMERGENCIA

Algunos de los incidentes /eventos pueden requerir la evacuación parcial o total de un área de trabajo o del sitio del proyecto.

Los puntos de concentración se establecen en el sitio. Un recuento de los asistentes se dará por cada supervisor y si alguien falta se informará inmediatamente al líder del equipo de emergencia.

Antes de empezar las actividades de la fase del Arranque la salida de evacuación de emergencia, rutas y puntos de concentración deberán ser revisados para ser coherentes con los escenarios de emergencia.

En el caso de posibles liberaciones de gases tóxicos /inflamables deben ser considerados aspectos tales como la dirección del viento, la ubicación de las fuentes de fugas peligrosas y la principal fuente del incendio.

13.4 DESPUÉS DE LA EMERGENCIA / NOTIFICACIONES E INVESTIGACIONES

Situaciones de emergencia deben, inmediatamente, ser notificadas al Líder de Respuesta a Emergencias del CONTRATISTA /CLIENTE e investigarlo. Después de la emergencia es necesario asegurarse de que el equipo de seguridad /materiales utilizados sean devueltos y estén listos para usarse. El análisis post-emergencia e informe se hará de acuerdo con el párrafo siguiente.

14.0 TRATAMIENTO DEL INCIDENTE, REPORTE Y ANÁLISIS

Todos los eventos no deseados (incidentes - lesiones, equipo /vehículo /propiedad/daños al medio ambiente, etc., incidente – casi incidentes), se deben informar a la supervisión y gestión del sitio inmediatamente después de su detección para una debida investigación.

14.1 TRATAMIENTO DEL INCIDENTE

En el caso de que un incidente resulte en lesiones o daños a la propiedad o instalaciones, la escena debe ser cercada y preservada y nada debe ser movido o eliminado hasta que el equipo de investigación ha concluido la revisión de la zona(s).

En el momento de la ocurrencia del incidente, la persona que fue testigo del evento debe:

- En caso de lesión, proteger a la víctima y facilitar de inmediato ayuda especializada (llamar al centro de primeros auxilios)
- Eliminar cualquier fuente inmediata de peligro, para evitar la repetición inmediata del evento
- Recomendar a otros trabajadores que liberen el acceso al lugar y señalar la posición de la fuente de ayuda (ambulancia con enfermera)
- Informar a su capataz sobre el evento y proteger las condiciones del lugar del incidente

El personal deberá abstenerse de la prestación de ayuda a excepción de las que crea necesarias para evitar el empeoramiento de la condición de la persona lesionada.

Nadie debe intentar mover a una persona lesionada a menos que el individuo está en peligro inminente.

TODO el personal lesionado debe estar acompañado por su supervisor directo o el delegado para el Proyecto de Clínica de primeros auxilios o fuera de las instalaciones médicas (hospitales).

14.2 REPORTE INICIAL DEL INCIDENTE

El subcontratista Inmediatamente debe informar verbalmente al administrador del CONTRATISTA del sitio sobre cualquier evento no deseado

El Subcontratista confirma al CONTRATISTA el informe por escrito del incidente, deber ser mandado dentro de las 24 horas siguientes.

14.3 ANÁLISIS DE INCIDENTE, REPORTE FINAL Y SEGUIMIENTO

Cualquier incidente /accidente que deba ser estadísticamente clasificado, o que se considera lo suficientemente grave como para ser investigado, a solicitud del CONTRATISTA, serán analizados por un equipo de investigación formado por los siguientes y/o otras personas designadas por el Gerente del Sitio:

- Coordinador: administrador de SSTMA del CONTRATISTA del sitio - los Representantes de SSTMA del CONTRATISTA.
- Presidente: Responsable /Línea de Supervisión del CONTRATISTA involucrado
- Miembro(s): Administrador de Construcción /Supervisores y otro personal familiarizado con los procedimientos involucrados y que puedan contribuir a su análisis y formular recomendaciones para la acción de prevenir la recurrencia. Puede incluir a representantes del CONTRATISTA.

La investigación del incidente deberá identificar: las hipótesis de accidente (dónde, cuándo, quién, por qué, etc.); las causas inmediatas y de raíz del incidente y, en relación a la causa, las acciones que deben aplicarse para prevenir la recurrencia de incidentes.

En el caso de lesiones graves y muertes una audiencia con los testigos y el personal involucrado directo se llevará a cabo para determinar la causa y las acciones a seguir. Los informes de accidentes serán registrados y distribuidos a la administración del proyecto y de acuerdo con las leyes de la República Dominicana.

Resultados de la investigación y recomendaciones para las acciones preventivas / correctivas se deben presentar por escrito al Administrador del CONTRATISTA del Sitio dentro de los 5 días hábiles del incidente.

Después de completar el informe del incidente un boletín de Lección aprendida se distribuirá en el sitio.

El administrador de SSTMA del CONTRATISTA del Sitio, se encargará del seguimiento de las recomendaciones de cierre que se hicieron durante la investigación. La línea de Gestión de todas las organizaciones será la responsable de la implementación de las recomendaciones y acciones correctivas.

El administrador de SSTMA del CONTRATISTA del Sitio presentará reportes resumidos de todos los incidentes manteniendo una breve base de datos, la clasificación, la fecha, la empresa involucrada, breve descripción, el nivel de riesgo (alto, medio, bajo), las causas principales, principales acciones realizadas, incluida la comunicación hecha etc.

14.4 CLASIFICACIÓN DE INCIDENTES

Organizaciones de sitio deberán utilizar los términos del CLIENTE/CONTRATISTA y/o definiciones de accidentes /incidentes, según la norma internacional. Datos e información se efectuará de acuerdo con el procedimiento del CLIENTE / CONTRATISTA.

En el sitio, se llevará a cabo el análisis y la investigación de incidentes, casi-accidentes mayores, informe de la investigación de incidentes y connatos (grabación) y mayores en los siguientes casos:

- Los incidentes que por su magnitud se enumeran en la norma de la OSHA (tratamiento médico, trabajo restringido, Día de Trabajo perdido y fatalidad)
- Incidentes importantes relacionados con fugas, explosiones, derrames peligrosos o no peligrosos e incendios (aunque no hayan generado daños a los trabajadores).
- Casi-accidentes y eventos en los que una lesión puede ocurrir a los trabajadores o las instalaciones.

Dará a conocer al equipo del proyecto el plan de acciones correctivas establecidas para la prevención y recurrencia de incidentes, la comunicación será a través de las conversaciones de seguridad que se llevarán a cabo a diario antes del inicio de la actividad ya través de las reuniones del comité de seguridad.

14.5 COMUNICACIÓN DE INCIDENTES

Incidentes mayores y cualquier casi-accidente debe ser inmediatamente comunicado por el CONTRATISTA. Un reporte final también debe ser remitido al Cuerpo de SSTMA del CLIENTE.

Eventos menores que sucedieron y se analizaron en el sitio deben ser destacados en los informes mensuales de SSTMA por el administrador de SSTMA del Sitio, para obtener información y datos estadísticos.

El administrador de SSTMA del Sitio tomará las medidas necesarias para garantizar la distribución en el sitio y en las organizaciones del Cuerpo de SSTMA del CONTRATISTA del Sitio; las lecciones aprendidas de los incidentes que pudieran ocurrir, informar y compartir brevemente: La clasificación y el resumen del evento, el tratamiento de eventos, las causas inmediatas y de raíz; Lecciones aprendidas / Acciones llevadas a cabo.

El folleto de lecciones aprendidas están por lo general a la vista en el pizarrón de noticias y debe ser discutido con la fuerza de trabajo durante la Reunión de Seguridad y Salud.

14.6 PRIMEROS AUXILIOS Y ANÁLISIS DE CASI-INCIDENTES

Primeros Auxilios/ Análisis de Casi-incidentes deben ser hechos por el administrador de SSTMA del sitio por lo menos una vez al mes. Tendencias de casos de primeros auxilios homogéneos (problemas de los ojos, problemas de piernas, etc.), se comunicarán a la administración del sitio, por ejemplo, al Comité Directivo, con el fin de resolver las causas básicas.

Puntos importantes y datos deben ser publicados en los informes periódicos de Oficinas Centrales de SSTMA también.

15.0 SEGURIDAD DEL SITIO

El CONTRATISTA de la Planta establece las normas generales de seguridad para el acceso y salida del sitio y la medida preventiva para evitar eventos no deseados.

Está prohibido ir a las zonas que no forman parte del ámbito de trabajo.

El CONTRATISTA deberá constituir una garantía adicional si es necesario para proteger sus propias instalaciones y mano de obra dentro de las áreas del proyecto.

Un procedimiento debe ser preparado para el control de acceso y salida del sitio y se llevará a cabo por una compañía de especialistas de seguridad y supervisado por el administrador SSTMA durante la fase de construcción e inicio.

15.1 ORGANIZACIÓN DE LA SEGURIDAD DEL SITIO

a) **Seguridad de la Planta:** La planta está asegurada por una valla (tipo malla ciclónica) exterior que cercará todo el perímetro de ésta, y algunas áreas, donde amerite tener más protección, ya sea por seguridad física u operacional, se colocará un vallado adicional. Las puertas estarán custodiadas por personal de seguridad del CONTRATISTA.

   Todo el personal /vehículos /material llegando al sitio del proyecto sólo entrará por la puerta(s) controlada sólo después de obtener la autorización del CONTRATISTA.

   Esta autorización sólo puede garantizarse a través de la información oportuna del CONTRATISTA.

b) **Proyecto de Seguridad del CONTRATISTA:** Todas las áreas del proyecto están cercadas y vigiladas; el CONTRATISTA debe proporcionar sus propias cercas de acuerdo a sus necesidades.

   Todo personal /vehículo permanente que se acerque al sitio del proyecto deberá obtener una identificación permanente "insignia" /tarjeta de acceso expedida por el CONTRATISTA.

15.2 ADMISIÓN Y CONTROL DEL PERSONAL

A los empleados del sitio, se les expedirán tarjetas de identificación que se deben mostrar en todo momento y llevar junto con los documentos de identidad. La tarjeta permite a los empleados entrar en el sitio bajo control durante el tiempo normal de trabajo.

El Personal /visitantes deberán entrar y salir de los sitios de trabajo sólo a través de la puerta controlada(s) y ruta(s), siempre provistos con un número suficiente de controles.

El estado de registro de la insignia será mantenido por personal de la administración de cualquier organización del sitio y los cambios de estado deben ser presentados al CONTRATISTA /seguridad cada vez que un nuevo empleado comience o termine de trabajar.

Cualquier organización es responsable de comunicar por escrito al CONTRATISTA, la intención de cancelar el acceso de un trabajador, y dentro de 24 horas después del último día de trabajo del trabajador, la insignia deberá ser devuelta al CONTRATISTA.

Las visitas deben ser pre-agendadas y autorizadas, el personal de seguridad debe ser formalmente informado a tiempo, de preferencia días antes: el nombre de la persona, cédula de identidad o número de pasaporte, visa, título del trabajo, de persona a visitar, etc.

Todo el personal y los visitantes deben tener una orientación sobre la seguridad del sitio de antes de poder acceder en el campo. Cada organización, presentando la lista de aquellos que han recibido el entrenamiento, obtendrá una etiqueta del proyecto obligatoria.

15.3 VISITANTES

A los visitantes se les expedirá un pase para la puerta de visitantes y se deben reunir y ser acompañados durante su visita por una persona titular de una tarjeta de identificación válida del sitio. Los visitantes deben ser recogidos de la puerta de entrada y regresar ahí cuando termine su visita.

El CONTRATISTA debe informar a los superintendentes de los visitantes por lo menos 24 horas antes. Todos los visitantes del sitio deben asistir al curso de orientación SSTMA antes de ser recogidos en la puerta por su anfitrión.

15.3.1 MENSAJEROS Y VEHÍCULOS DE ENTREGA

Los procedimientos permiten mensajeros y vehículos de entrega a entrar en el sitio sin una orientación o un acompañante autorizado bajo determinadas condiciones. Ellos son necesarios para completar los datos de identificación en el salón de la entrada y respetar las reglas básicas de SSTMA (EPP, límite de velocidad, ruta autorizada, etc.)

15.4 CONTROL DE LA PUERTA GENERAL

El personal de seguridad podrá controlar /inspeccionar todas las personas y vehículos tratando de entrar o salir por la puerta del sitio. El nivel de control /inspección depende también de las condiciones locales en general.

15.5 CONTROL DE MATERIAL

El material que entra /sale del sitio de trabajo deberá estar acompañado por la documentación de Material de transporte y pase. Los materiales serán revisados también por Seguridad. Material, equipos o documentación no autorizada será remitida de inmediato al CONTRATISTA.

Las entregas, material y equipo de entrada debe estar autorizado por el CONTRATISTA y dirigido al almacén o áreas de almacenamiento. Recolección /remoción del material de esas áreas será sometida a la aprobación de una Pase de Material firmado por el "Gerente de Línea involucrado".

15.6 CONTROL DE VEHÍCULOS

Los pases para vehículos se expedirán sólo para los necesarios para trabajar: vehículos del CONTRATISTA; vehículos de trabajo del subcontratista y vehículos de servicio. Solo debe ser utilizada una puerta custodiada y la ruta indicada para conducción /entregas en/fuera del sitio. Cualquier vehículo que ingrese en las instalaciones industriales deberá tener una etiqueta que indique claramente el nombre de la empresa.

Los vehículos deberán ser inspeccionados en su entrada inicial y deben ser re- inspeccionados de manera regular: los vehículos ilegales, sin seguro o inseguros no se permitirán en el sitio. Todos los conductores deben estar en posesión del tipo correcto de permisos de conducción para el vehículo que conduce de acuerdo con la ley local.

16.0 TRANSPORTE Y TRÁFICO

Cada organización es responsable del transporte de su personal y material. Los conductores deberán estar en posesión de la licencia regular reconocida localmente. Es importante hacer conciencia de la importancia de una conducción segura. Las normas de tráfico para evitar eventos no deseados deben definirse. Motocicletas ("scooters") /bicicletas no están permitidos.

Los vehículos que entran al sitio deben contar con documentación válida (la circulación, la inspección y fiabilidad) y estará en condiciones de seguridad para operar; el CONTRATISTA deberá equipar todos los vehículos y equipos de construcción con un extintor de incendios. Los equipos de construcción deben contar con un beeper para la maniobra de reversa. Vehículos de servicio deben contar con botiquín de Primeros Auxilios y extintor de coche.

Todos los vehículos del Proyecto, tanto del CONTRATISTA, así como del subcontratista se deben mostrar visible, a ambos lados del vehículo /maquinaria, el logotipo de la compañía.

16.1 CAMINOS DEL SITIO Y REGLAS DE TRÁFICO

Se proporcionará un mapa del sitio que muestre los caminos temporales y zona de aparcamiento, puentes, etc., así como el mapa de tráfico; estos deben ser desarrollados distribuidos a la mayor brevedad posible.

Se proporcionarán señales de tránsito en todas las intersecciones de los diferentes caminos. Debe ser nombrado un equipo abanderado en el caso de tráfico intenso, que se encuentre en diferentes intersecciones y educado para hacerlo.

Todos los conductores deben obedecer las reglas de límites de velocidad, conducción y estacionamiento. Los caminos no deben utilizarse como almacén y/o áreas de trabajo.

La interrupción total del camino sólo se permite con un permiso específico por el CONTRATISTA de la planta. El cierre del camino deberá ser planificado de antemano en función de su duración e impacto en las actividades del sitio; y deberán plantearse vías de acceso alternativas provisionales.

El CONTRATISTA deberá mantener los caminos dentro de su área de trabajo y, además, deberá reparar cualquier daño a los caminos resultantes de sus actividades que están fuera de su área de trabajo. Los caminos que se corten por el CONTRATISTA deben ser reparados y garantizados por un año.

16.1.1 REGLAS GENERALES DE TRÁFICO

La circulación del Sitio está sujeta a las normas de la legislación Nacional de Tránsito y las normas del sitio más restrictivas.

Los conductores tienen prohibido el uso de teléfonos celulares mientras conducen el vehículo. La maniobra de reversa debe evitarse en lo posible, en todo caso, la alarma correspondiente se mantendrá en funcionamiento durante dicha maniobra. El abanderado se utilizará durante la

marcha atrás de los camiones y vehículos /equipo de construcción. El uso de cinturones de seguridad durante el viaje es obligatorio.

El uso de camiones como transporte para el personal no está permitido, a menos que se tomen las medidas y el vehículo esté adaptado para ese fin. En cualquier caso, el personal no debe generar amontonamiento. Los vehículos no pueden bloquear o dificultar las carreteras.

El manejar grúas, camiones de torno, tractores, etc. sólo está permitido cuando las disposiciones de seguridad son las adecuadas, tales como asientos, plataformas, rieles, etc., se proporcionan para los pasajeros.

16.1.2 LÍMITES DE VELOCIDAD

La velocidad máxima permitida en la carretera será 30 km/hora y en casos especiales, más bajos, según lo indicado por señales específicas. La velocidad máxima en el lugar de trabajos de construcción es de 20 Km/hora. La velocidad máxima para las grúas es de 15 Km/hora.

De cualquier forma, todos los conductores deben tomar en consideración la situación local, las señales adicionales de carreteras, etc., para garantizar la máxima seguridad para los vehículos de los peatones y otros. Se requiere precaución especial en los períodos de cambio de personal en turno.

16.1.3 REGLAS DE ESTACIONAMIENTO

El estacionamiento para el personal estará disponible los lugares designados. El personal deberá utilizar únicamente la ubicación aprobada estacionamiento. Ningún vehículo podrá ser estacionado en otro lugar, excepto los vehículos autorizados usados directamente en las actividades del sitio. Maquinaria pesada (grúas, camiones grandes, buldócer, etc.), deben ser estacionados, al final del día, en el taller de mantenimiento propio, a menos que se señale otro lugar de estacionamiento.

En el lugar, las llaves se quedan en el Stich de encendido de los automóviles estacionados y está prohibido estacionar en:

Frente a los tanques de agua, pistolas de agua, equipos de prevención de incendios o de otros equipos de seguridad (como el de emergencia y lavado de ojos, dispositivos de respiración) - dentro de un radio de 10 metros de cualquier hidrante, extintores, carrete de manguera o de otro equipo de emergencia - en el tráfico carreteras, frente a los casos de escaleras, salidas, entradas

de caminos a los equipos de seguridad, bajo las líneas eléctricas o bastidores de tuberías o en las áreas designadas de "No Estacionarse";

Todos los vehículos, tantos los del personal como los vehículos pesados, serán estacionados en reversa, para facilitar una unidad de emergencia directa.

16.1.4 ÁREAS RESTRINGIDAS

No se permitirán vehículos en las áreas de trabajo que son adyacentes o áreas de la planta sin un permiso especial del CONTRATISTA de la Planta. Fumar en el interior del vehículo no está permitido.

16.2 VEHÍCULOS DE CONSTRUCCIÓN Y EQUIPO DE ELEVACIÓN

Todo el equipo traído al sitio debe estar en condiciones seguras de funcionamiento. Vehículos para la construcción /equipo deberá estar equipado con alarma para la operación de reversa y la conducción.

Equipos motorizados (camiones, tractores, grúas, etc.), no deben quedar desatendidos.

Las grúas y otros equipos de elevación deberán estar en posesión de un certificado de inspección válido y un informe de operación, los dos para ser entregados antes de entrar al sitio.

Los operadores de equipos de construcción deberán ser competentes para la operación de dichos equipos.

Una Matriz de Certificación de Equipo y Documentos del Operario que indique las certificaciones mandatorias y documentos necesarios para cada tipo de equipo de construcción y sus operadores correspondientes debe ser emitida por el proyecto.

Cada equipo y operador debe obligatoriamente estar en posesión de los certificados y documentos descritos en la Matriz de Certificación de Equipo y Documentos del Operario.

Los equipos que se encuentren en la obra sin los documentos anteriores serán removidos inmediatamente de la obra.

Cada operador de vehículos de construcción deberá inspeccionar su equipo diariamente antes de iniciar operación.

Para grúas, camiones y equipos similares con plumas o cargas con más de 10 metros de exceso del equipo de frente o en la parte posterior, el presentará un "boom walker", además del operador de la grúa para ayudar en el despeje del tráfico y las obstrucciones.

El conductor de la grúa de elevación bajará el brazo de la grúa en un lugar conveniente y seguro, después de terminar las obras. En caso de que esto sea imposible, el brazo puede permanecer arriba, solo mediante la autorización del CONTRATISTA /CLIENTE de la planta.

16.3 EQUIPO Y MATERIAL DE TRANSPORTE

Transporte de los equipos / materiales debe realizarse teniendo en cuenta los siguientes puntos:

- Utilizar los vehículos diseñados para el fin: seleccionar el vehículo más apropiado y el remolque para la tarea para ayudar a reducir el número de viajes
- Los conductores deben ser informados sobre las disposiciones especiales aplicables a la carga y su comprensión de las disposiciones revisadas antes de ser trasladados
- Separar los equipos /materiales de los ocupantes del vehículo y segregar sustancias químicas potencialmente reactivas /materiales que no pueden ser puestos en contacto por accidente
- No sobrecargar los vehículos. La colocación de cargas pesadas o densas como para no sobrecargar o dañar cualquier parte del vehículo o afectar su estabilidad durante los viajes
- Fijar el material y el equipo antes de moverlo, la utilización de paletas, cadenas, cuerdas, redes, etc. Todos los vehículos deberán tener adecuados sistemas de cierre /seguridad en el marco, en particular para el transporte de material peligroso /pesado. La carga no deberá ser suspendida de un cable que permita columpiarse de lado a lado del camión o la grúa. El material que sobresalga por algún lado (por lo general más de 1 metro), se marcará de acuerdo con la legislación local. Equipo, por ejemplo, máquinas de soldar, bombas, etc., no deberán ser transportados trabajando.
- Arrastrar materiales u objetos a lo largo de los caminos de la planta está prohibido

16.4 TRANSPORTE ESPECIAL

Antes de la mudanza y de dimensiones excedidas, una autorización específica de la ruta propuesta deberá ser obtenida; la autorización deberá especificar las precauciones o restricciones que se han observado.

Está prohibido permitir que los equipos con mucha carga de inusual longitud, anchura o altura o con cadenas de oruga se muevan a través de cualquier camino de la planta o puente sin aprobación específica del CONTRATISTA, así como ninguna pieza del equipo debe ser conducido por cualquiera de las plataformas del CONTRATISTA sin la autorización debida.

16.5 CARGAR COMBUSTIBLE EN EL SITIO

Las operaciones de reabastecimiento de combustible en el interior /cerca (un radio de 10 metros) los componentes /circuitos de funcionamiento deben ser limitados a sólo a los equipos /máquinas que no se pueden mover con facilidad (por ejemplo: grandes grúas). Esta operación se puede hacer sólo después de la emisión y la recepción de un permiso de trabajo para "trabajo en caliente".

Contenedores /bombas portátiles utilizadas para el transporte o la transferencia de hidrocarburos deberán estar diseñados para tal fin. El camión de transporte de combustibles deberá estar equipado con un número suficiente de extintores de incendios de fácil acceso.

Los tanques de combustible en equipo motorizado no deberán ser llenados cuando el motor está en marcha o durante la soldadura u otro trabajo en caliente que se esté haciendo cerca. Soldadura o cualquier otra generación de chispa o llama debe ser detenido en un radio de 10 metros durante las operaciones de re abastecimiento. No se permite fumar. Un trabajador preparado con los extinguidores listos asistirá a las operaciones de carga de combustible.

Los tanques de almacenamiento de combustible, las mangueras de llenado y la distribución de vehículos o contenedores deberán estar debidamente conectados a tierra y estar equipados con extintores de incendios.

Los tanques de almacenamiento deben estar identificados con el nombre del Compañía, el contenido de líquido y las señales de no fumar. Las instalaciones de reabastecimiento se requieren con válvula de corte rápido en el extremo de distribución de las mangueras de combustible y las rejillas de seguridad.

Reabastecimiento en las instalaciones /medios no deben ser ubicadas en el área de planta viva y no a menos de 10 metros de edificios habitados o de otras instalaciones ya existentes. No se permite el abastecimiento de combustible en el área viva de la plantas.

16.6 PEATONES

Los peatones en el sitio deberán: caminar en el borde del camino (de preferencia a la izquierda); seguir caminos peatonales, si está indicado, evitar permanecer innecesariamente en los caminos, actuar de forma defensiva.

Todos los caminos de peatones deben ser definidos y marcados.

16.7 INCUMPLIMIENTO DE REGLAMENTO DE TRÁFICO

En caso de incumplimiento, una carta relativa deberá ser enviada a la persona o la empresa en cuestión. En caso de reincidencia, el signo y/o tarjeta de identificación se pueden retirar por un período variable. En caso de un incumplimiento especialmente grave, se puede tomar la decisión de prohibir definitivamente el acceso al sitio.

16.8 LIMPIEZA DE CAMINOS

El lugar de trabajo se debe mantener ordenado durante la ejecución de las obras. El camino de acceso no debe ser utilizado para el almacenamiento de materiales y equipos. El camino de acceso no será utilizado para la carga /descarga, estas operaciones deben también limitarse en cualquier otro camino.

El camino de acceso no debe ser obstruido por vehículos descompuestos o equipo. Es responsabilidad del CONTRATISTA quitar todos los materiales o sustancias que caen de sus vehículos y que hacen el camino inseguro o inaccesible.

Equipos usados o desmantelados, materiales, residuos, etc. debe ser despejados y almacenados diariamente de tal manera que no puedan dañar a alguien que esté cerca (los clavos que salen de las tablas, los obstáculos con los que se pueda tropezar, productos resbaladizos).

16.9 ACCIDENTES Y EMERGENCIAS DE VEHÍCULOS

Cualquier accidente /incidente será reportado al administrador del CONTRATISTA del sitio. Las malas tendencias de incidentes de tránsito deben ser tratadas con medidas correctivas adecuadas (reentrenamiento, revisión del plan de tráfico, etc.)

En general, en caso de emergencia:

- Mantener los caminos abiertos y despejados para el acceso de vehículos de emergencia
- Evitar el uso de los vehículos en presencia de las emisiones de hidrocarburos y en caso de evacuación
- Detener inmediatamente el vehículo fuera de la carretera, si se deja el vehículo, apagar el motor y dejar el coche abierto con la llave

17.0 PREVENCIÓN Y PROTECCIÓN CONTRA INCENDIOS

La actividad de la construcción se llevará a cabo dentro de una zona "limpia". Por lo tanto, en términos generales, los riesgos de incendio son limitados.

La prevención y protección contra incendios es obligatoria para todas las partes involucradas.

Durante la planificación de SSTMA del sitio, cada organización debe establecer la identificación específica de peligro de incendio, aclarando los métodos, prácticas, medios, organización, capacitación e inspección previstos en el lugar para gestionar el riesgo.

17.1 PRINCIPALES MEDIOS DE INCENDIOS

Los principales riesgos de incendio "típicos" durante las actividades de construcción en el sitio de trabajo son, pero no están limitadas a: almacenamiento y el uso de material inflamable (almacén, lugar de almacenamiento temporal, líquidos inflamables, cilindros de gas, de madera, etc.),

sistema eléctrico, las oficinas y la cantidad de papel, etc., trabajos en caliente u otra fuente controlada o no controlada de ignición (fuego, chispas, las partes calientes, cigarrillos, motores, aparatos eléctricos, etc.), incendios no controlados, no identificados y no trabajados de inmediato, etc.

El riesgo de incendio durante la fase de PC y C está claramente representado por la introducción de hidrocarburos y otras sustancias inflamables y explosivos en la planta. También la presencia de los nuevos sistemas eléctricos y sus pruebas crean otra posibilidad de ignición e incendios.

17.2 PREVENCIÓN Y LUCHA CONTRA INCENDIOS

Para la prevención y lucha contra incendios, las prácticas importantes a considerar y puesta en marcha en el sitio son, pero no están limitadas a:

- Todas las actividades que se realizan cerca /dentro de la unidad de operación se llevará a cabo sólo después de la emisión en implementación de las prescripciones reportadas en el permiso de trabajo;
- Las personas dedicadas (vigilantes del fuego) deben ser utilizados para verificar la correcta gestión de este aspecto de seguridad en el sitio;
- Disponer de instalaciones temporales debe considerar salidas de emergencia, alarmas, detectores de humo, protección y equipos contra incendios, en particular cuando documentos importantes /piezas de repuesto o material con\alto riesgo de incendio es almacenado (archivo, almacén, etc.);
- Carriles de fuego en el interior de los edificios /talleres o áreas congestionadas se deben mantener limpias y despejadas para la salida segura;
- Las mercancías peligrosas deben ser almacenadas en áreas destinadas de acuerdo con el administrador del CONTRATISTA del sitio. Combustibles, materiales inflamables /peligrosos deben ser gestionados según la HDSM;
- Utilice únicamente contenedores de seguridad para el manejo y almacenamiento de líquidos /combustibles. Las prácticas de seguridad de Reabastecimiento deben ser seguidas en todo momento.
- Los cilindros de oxígeno almacenados deben estar separados de cilindros de gas, ya sea por una partición de retardante de fuego de por lo menos 2 metros de altura o por una distancia mínima de al menos 6 metros.
- Los cilindros de gas inflamable deberán estar equipados con pararrayos de retroceso;
- La fuente de ignición se reducirá al mínimo, por ejemplo: la restricción de fumar, las prácticas de seguridad del trabajo en caliente, red /dispositivos de contención del fuego, la

aplicación de corriente estándar, etc. La quema de materiales de desecho está prohibida en el sitio;

- Los trabajadores que realizan trabajos en caliente deben ser instruidos sobre cómo minimizar el riesgo de incendio (área despejada alrededor o debajo de materiales inflamables, pruebas de gas si es necesario, la contención de las chispas y el control de otras partes calientes, protección contra el fuego, disponibilidad /uso de extintores, etc.) algunos materiales combustibles pueden estar presentes cerca /debajo, mientras el trabajo se está realizando, deberán estar protegidos adecuadamente;

- Inspecciones periódicas sobre el sistema de prevención y lucha contra incendios deberán tomarse para garantizar estándares de seguridad. Debe mantenerse un acceso claro a todos los equipos de protección contra incendios.

- Para evitar riesgos de ignición, los cables y equipos eléctricos deben ser instalados de acuerdo con el código de reconocido prestigio internacional para obras de construcción.

17.2.1 CORTE Y SOLDADURA

- Los extintores portátiles o instalados de manera permanente estarán disponibles a 15 metros de una fuerza de trabajo que esté llevando a cabo soldadura, quema o el uso de una llama abierta

- Cada soldador debe utilizar mantas de soldadura para contener salpicaduras.

- Protecciones para soldadura se utilizan para proteger al personal de los rayos ultravioleta (quemaduras).

- Se utilizan lonas contra incendios para conservar las chispas, pedazos de metal caliente para evitar el contacto con una sustancia inflamable, circuitos eléctricos, maquinaria, equipos o personas.

- Para la eliminación de posibles incendios en espacios confinados, como consecuencia de un escape de gas a través de fugas o válvulas mal cerradas, el suministro de gas a la antorcha debe ser apagado.

- Cada vez que la antorcha no esté en uso, la antorcha y la manguera se retiran del espacio confinado. El gas combustible y las mangueras de oxígeno se retirarán inmediatamente de los espacios cerrados cuando estén desconectados de la antorcha.

17.3 TRABAJOS EN CALIENTE EN ÁREAS DE HIDROCARBUROS

En principio los trabajos en caliente en las áreas de hidrocarburos, tales como áreas de proceso, deben ser evitados.

Antes de la introducción de hidrocarburos u otras sustancias explosivas /inflamables en la planta, las actividades de construcción de obras en caliente debe ser completada.

En el caso de que se deban llevar a cabo trabajos en caliente en un área de hidrocarburos un análisis previo debe ser realizado para determinar si:

- Existen alternativas para llevar a cabo actividades de trabajo en caliente (por ejemplo corte frío).
- El trabajo en caliente se puede mover a un área segura.
- Los peligros de incendio pueden ser removidos o mover el fuego inmediato en el trabajo en caliente.

Si el trabajo en caliente en la zona de riesgos de fuego es necesario, como mínimo, se aplicarán los siguientes requisitos:

- Trabajos en caliente realizados bajo control de PT.
- Prueba de Monitoreo preliminar y frecuente del gas para confirmar que la zona de trabajo está libre de sustancias explosivas /inflamables y no hayan fugas menores/ mayores en curso.
- Los materiales combustibles retirados del área de trabajo (11 metros a la redonda) o protegido con una lona contra fuego o por humedecimiento continuo.
- Los equipos de trabajo en caliente en condiciones satisfactorias de operación y en buen estado.
- El área de trabajo con buena ventilación para mantener un ambiente de trabajo no inflamable.
- Agujeros, grietas, pozos de alcantarillado, drenaje embudo en la zona de trabajo (11 metros) purgados o cubiertos /sellados.

- El trabajo en caliente confinado fabricado con materiales resistentes al fuego para contener chispas y aislar cualquier riesgo de incendio cerca de la operación de trabajo en caliente.

- Los sistemas de extinción de incendios disponibles y en servicio. Como mínimo un extintor de incendios en el lugar.

- El equipo observador de fuego en el lugar debe estar debidamente capacitado, entrenado y equipado.

17.4 EXTINTORES

Extintores no menores de 6 kg. ABC será el mínimo nivel general estándar del sitio de construcción. Extintores de tetracloruro de carbono están prohibidos.

Los extintores estarán ubicados en áreas fácilmente accesibles en caso de incendio. La ubicación de los extintores montados de forma permanente deberá ser marcada y mantener el libre acceso.

Extintores permanentes ABC son requeridos por lo menos en las siguientes ubicaciones:

- En los edificios de acuerdo con los Códigos Nacionales de Incendios, en todo caso por lo menos cerca de una puerta, y extintores adicionales montados a una distancia de 30 metros de cualquier punto dentro del edificio.

- Por lo menos uno en todos los vehículos y equipos, incluyendo camiones de toneladas, grúas, palas, máquinas de soldar y otros motores de combustión interna, en particular los utilizados para cargar combustible.

- En las fuentes de ignición, tales como soldadura, corte, quema o uso de llamas abiertas, ubicados a no más de 15 Mt.

- En las áreas de combustible o combustibles de almacenamiento de material, los extintores se deben ubicar a 15 metros de cualquier punto del perímetro del material almacenado.

- Un extintor de CO_2 se montará en cada gran instalación eléctrica, tales como una subestación, transformador, generador o motor del centro de control.

- A lo largo de las áreas de trabajo para el servicio de emergencia.

17.5 OTROS MEDIOS PARA EXTINGUIR EL FUEGO

El CONTRATISTA /CLIENTE de la Planta, en caso de incendio u otra emergencia no adecuadamente manejable por la organización del proyecto del sitio, pedirá la intervención del Cuerpo de Bomberos local.

17.6 PREVENCIÓN Y ORGANIZACIÓN CONTRA INCENDIOS

El Jefe de Fuego del Sitio del CONTRATISTA es el administrador SSTMA del sitio o alguien de su personal, debidamente identificado, si éste está ausente del sitio.

La administración del CONSORCIO nombrará a su propio jefe de incendios del sitio, con una formación adecuada y experiencia en la prevención y lucha contra incendios, para coordinar la prevención de fuego general y la organización de lucha, incluida la formación de los vigilantes de Incendios en el lugar de trabajo.

Todos los empleados deberán recibir una formación básica sobre extintores durante la orientación para nuevos empleados. Las prácticas básicas se actualizan periódicamente. La capacitación de este aspecto deberá ser registrado.

17.6.1 VIGILANTES DE INCENDIOS

Vigilantes de Incendios se requieren cuando se realizan trabajos en caliente en el sitio en zonas sensibles.

Los vigilantes de incendios deberán recibir una formación específica, deberán estar equipados y deben usar chaleco para su fácil identificación, todos los observadores de fuego son parte de los Equipos de Detección y Contención de Incendios en campo.

El conocimiento de los vigilantes de incendios debe incluir: comprender y ser capaz de reconocer los riesgos de incendio, siendo entrenados en la lucha contra el fuego incipiente, estar familiarizado con las instalaciones para hacer sonar una alarma, siendo capaz de comunicarse efectivamente con la fuerza de trabajo.

Su deber es exclusivo para vigilar los incendios, la prevención de incendios, apagar fuegos, y dar la alarma. Cada vigilante de incendios será el responsable de un área máxima que se evaluará en el sitio en función de la intensidad de las actividades en caliente y las características de las áreas en general a cubrir.

El Vigilante de incendios mantendrá una vigilancia por lo menos media hora después de terminar el trabajo en caliente para asegurar que el área esté libre de incendios o materiales incandescentes.

El personal de administración del CONSORCIO sólo llevará a cabo la lucha contra incendios incipientes. El Personal que solo ha tenido una formación específica sobre cómo luchar contra la etapa de incendios incipientes sólo podrá realizar esta actividad.

17.7 INSPECCIÓN DEL EQUIPO CONTRA INCENDIOS

El equipo de prevención /extinción de incendios será inspeccionado periódicamente para asegurarse de que están en buen estado y reparar /remplazar si falta o está dañado. La inspección deberá ser planificada y registrada por cada organización de acuerdo a la gestión de sus medios. Los registros deben estar disponibles cuando se requieran.

Los extintores deben ser inspeccionados para asegurarse de que no se han activado o alterado, y para detectar cualquier daño visible.

Las etiquetas de inspección se colocarán sobre ellos, indicando la fecha de la última inspección. Cada extintor deberá tener una etiqueta durable, bien adherida para mostrar la prueba de mantenimiento, la fecha de recarga y el responsable que realizó los servicios.

- Un extintor de incendios descargado deberá ser retirado del servicio inmediatamente y reemplazado.
- El siguiente equipo será también inspeccionado de manera regular y debe llevarse un registro de cada inspección.
- Trajes contra incendios y químicos - Compruebe si se dispone de equipo adecuado, de fácil acceso, y en buenas condiciones en caso de una emergencia.
- Sistemas de suministro de Aire - Inspeccione las mangueras, máscaras, sellos y el desgaste; verificar que el equipo está protegido de los elementos, comprobar que la botella de suministro de aire está lleno y la fecha de vencimiento no ha expirado.
- Estaciones Lavaojos / duchas de seguridad - Verifique que las alarmas instaladas en el equipo de seguridad están trabajando, el funcionamiento de prueba, y agua de lavado de cada estación.

- Señales de seguridad - Verificar por el deterioro y la visibilidad adecuada

18.0 INSPECCIÓN Y AUDITORIA

Cada organización que trabaja en el sitio tendrá su propio plan de inspección. Algunas inspecciones deben hacerse en conjunto en el sitio. Los siguientes tipos de inspecciones se esperan. El Gerente de Seguridad del Sitio emitirá un plano general de inspección de las actividades comunes.

18.1 EVALUACIÓN DEL NIVEL DE RIESGO EN EL CAMPO (ENRC)

Cada organización que trabaja en el sitio tendrá su propio procedimiento para la implementación ENRC, manteniendo siempre los lineamientos trazados por la Gerencia del CONSORCIO.

Las observaciones deben hacerse con regularidad (normalmente semanales), debidamente registradas, actualizadas durante todo el día - como se requiere - y debidamente analizados para detectar problemas recurrentes.

18.2 INSPECCIÓN DIARIA

El personal de SSTMA del sitio, tanto del CONTRATISTA y del Subcontratista hará inspecciones diarias de las áreas de trabajo y de la implementación de los procedimientos de trabajo el trabajo. Además, se espera que todos los representantes del campo, gerentes construcción / Pre-Arranque y supervisores también realizarán una inspección diaria de las áreas. Los problemas trabajo deben ser resueltos inmediatamente, o manejado o solucionados por las partes de vigilancia.

Cualquiera que observe que el trabajo que se realiza es inseguro, que podría conducir a una lesión o accidente, deberá suspender el trabajo, en espera de la corrección del problema de la supervisión de campo, e, informará inmediatamente al Superintendente del área correspondiente o al gerente de construcción /Pre-Arranque y el gerente de SSTMA del CONTRATISTA del Sitio.

Los siguientes son los elementos que los inspectores deberán verificar involucrando a los trabajadores (discusión y preguntas abiertas): permisos de trabajo y métodos de trabajo seguros, equipo personal de seguridad, las actividades de elevación, excavación, el apoyo temporal para tuberías, herramientas y equipos eléctricos, cilindros de gas e incendios; Trabajos en altura, andamios suspendidos de plataforma, la gestión de residuos y otros aspectos ambientales; Orden, limpieza, condiciones de salud, etc.

18.3 OBSERVACIONES DE DIALOGO COMPORTAMENTAL (DC)

Las observaciones DC deben ser hechas por los "Observadores de DC", según lo previsto en el procedimiento Diálogos Comportamentales, según corresponda.

Todas las observaciones realizadas, tanto positivas como negativas, deberán estar debidamente registrados y los resultados se suman para ser analizados en las correspondientes reuniones de SSTMA.

18.4 INSPECCIÓN DE SSTMA SEMANAL

En general, las inspecciones de campo colectivas de SSTMA se llevarán a cabo una vez por semana en el sitio, sin embargo la frecuencia se puede aumentar, si se considera necesario por el CONTRATISTA.

Los participantes deberán incluir al Gerente del CONTRATISTA, al Gerente de Construcción / PC y C, al Administrador de SSTMA del Sitio y los representantes del subcontratistas que participan en el campo, los gerentes de área y supervisores/oficiales de seguridad.

Los elementos a comprobar son los mismos de las inspecciones diarias. Lista de verificación /guía de inspección se debe utilizar para proporcionar datos homogéneos.

Este tipo de actividades se considera muy importante para demostrar el compromiso de la administración del sitio, por lo tanto, la participación constante de la gestión es obligatoria.

Una reunión informativa se llevará a cabo después de la inspección para registrar todas las observaciones y las medidas adoptadas o que deban adoptarse.

El gerente de SSTMA del CONTRATISTA del sitio emitirá el informe de las inspecciones a la administración del sitio, que incluyen: área, tiempo, resultados positivos y negativos, las medidas correctivas hechas o por hacer, responsable, tiempo establecido, lista y signos de los participantes.

Los archivos de los trabajos de inspección registrados son un documento válido como una observación del sitio y el Registro de Recomendación.

18.5 MÁQUINAS Y EQUIPO DE INSPECCIÓN

El deberá proporcionar y operar sus equipos de acuerdo con las instrucciones específicas de fabricación y la inspección obligatoria y los requisitos de mantenimiento. Máquinas y equipos deben ser verificadas a diario por el usuario y antes de cada uso. Además, el CONTRATISTA también deberá establecer el sitio específico del programa de inspección frecuente de los equipos y la maquinaria utilizada para el trabajo (es decir, sistema de código de color).

18.6 INSPECCIÓN PERIÓDICA DE SALUD, MEDIO AMBIENTE Y CAMPO

No se ha previsto ninguna gestión /instalación de campo

18.7 SISTEMAS DE AUDITORÍAS DE SEGURIDAD

Auditorías externas de SSTMA del sitio se llevarán a cabo por parte del CONSORCIO durante la fase de construcción para comprobar la implementación del Sistema de SSTMA.

El Gerente del Sitio es responsable de la ejecución de las acciones del sitio y de la comunicación al Auditor de SSTMA del seguimiento de las acciones realizadas, hasta la finalización de todas las mejoras acordadas.

18.8 AUDITORÍAS DE PERMISO DE TRABAJO (PT)

Se forman Auditorías de permisos de trabajo al azar incluido el lugar de trabajo periódico con el fin de identificar si fueron considerados o tomados en cuenta los controles operacionales para mitigar los riesgos de la actividad, que los implicados son conscientes de los peligros relacionados con la identificación de riesgos, del control de riesgos, la evaluación y la asignación de las tareas de seguridad.

19.0 DOCUMENTO, REGISTRO Y REPORTE

Los principales documentos de Seguridad del Subcontratistas y del CONTRATISTA serán archivados ordenadamente en las oficinas por personas a cargo, las cuales mantendrán toda la documentación debidamente identificada y organizada.

19.1 EXPEDIENTE SEGURIDAD DEL SITIO

La siguiente documentación se conservará como un expediente de SSTMA por el personal de SSTMA y estar disponible para su revisión por el CONTRATISTA y/o su retención en cualquier momento:

- El plan de sitio del CONTRATISTA y Subcontratista. y sus anexos, la Ley, normas, etc.;
- Normas de uso (ISO, ANSI, etc.), Organigrama, incluyendo la lista y las funciones del personal de SSTMA, la garantía de competencia, los registros de personal de certificación incluyendo el examen médico, el registro de acciones de disciplina, el registro del Programa de sensibilización, la comunicación de SSTMA, avisos, folletos, programas de capacitación y registros, incluyendo sesiones de entrenamiento específicas (espacios confinados, etiquetado / loqueo, etc.),
- Informe de las reuniones de SSTMA; informes mensuales /semanales; registro de monitoreo (aire, ruido, etc. resultados de la prueba); correspondencia de SSTMA por el Contratista, evaluación de riesgos, Análisis de Riesgos de Trabajo /PT, procedimiento quirúrgico y las prácticas de trabajo seguras; HDSM de los materiales peligrosos en uso en el sitio, el plan de elevación, andamios de diseño, etc.;
- Instrucción de maquinaria, instrumentos, etc. Control del instrumento, vehículos, maquinaria, etc., de inspección y resultados de la auditoría (descripción, la observación, las acciones correctivas, etc.).

Las estadísticas de SSTMA, tales como: días perdidos, índice total lesiones, lesiones con tiempo perdido, daños ambientales, accidentes, incidentes, connatos, el índice de seguridad, etc., las estadísticas ambientales, como el tipo y cantidad de residuos gestionados, etc., los registros de primeros auxilios, los informes de accidentes e incidentes, incluyendo los resultados de la investigación, medidas correctivas y el seguimiento en el lugar, etc.

La documentación deberá mantenerse actualizada, con la fecha de emisión y revisión, fácil de encontrar y cuando es necesario comunicar a quien corresponda.

Los certificados deben ser debidamente numerados y firmados. Los formularios que se utilizan de acuerdo con el CONTRATISTA /CLIENTE.

19.2 REGISTRO DE RECOMENDACIÓN

Todas las observaciones del sitio y las desviaciones (por inspección in sitio o por la actividad del sitio de vigilancia) se graban en un registro, bajo la responsabilidad directa del administrador de SSTMA del sitio.

El administrador de SSTMA del sitio hace hincapié en todas las partes implicadas a la resolución de las recomendaciones.

Este registro contiene toda la información necesaria para el seguimiento de la actividad.

19.3 REPORTES DE PROGRESO DE SSTMA SEMANAL Y MENSUAL

El CONTRATISTA del Sitio emitirá semanal y mensualmente informes de SSTMA.

Los Reportes de SSTMA Semanales deben ser preparados a medio día cada Lunes, cubriendo el trabajo de la semana anterior (de lunes a domingo)

Los Reportes de SSTMA mensuales deben ser preparados cada mes de acuerdo a la calendarización del Proyecto, cubriendo el trabajo del mes anterior.

19.4 REPORTE DE SSTMA FINAL

El administrador de SSTMA del CONTRATISTA del sitio preparará un Informe Final de SSTMA, como parte del informe final de la construcción bajo la responsabilidad del Gerente del Sitio.

La lista de temas a tratar que el Reporte Final de Construcción debe incluir:

- Lista de documentos y el procedimiento utilizado y desarrollado en el sitio (incluidas las copias),

- Programa de incentivos aplicados durante el proyecto (incluyendo los resultados y las copias), números y el tipo de ART preparado (incluidas las copias), número de lecciones aprendidas y emisiones incluyendo su tipo (copias),

- Lista y tipo de entrenamientos o capacitaciones de SSTMA del sitio, incluyendo el número de participantes siempre que sea posible; Las horas dedicadas a cursos de SSTMA y la formación;

- Todas las agencias de seguridad de datos estadísticos (tasa de LTI, Índice de Frecuencia, horas-hombre, mano de obra, etc.) mensuales y acumuladas, reuniones de SSTMA registradas del proyecto, incluyendo las horas dedicadas, el registro de la encuesta y las condiciones inseguras o peligrosas;

- Número de inspecciones internas y auditorías realizadas,

- Informe de inspecciones con la gestión de acciones de SSTMA / Número de seguimiento, la comunicación con las autoridades u organizaciones externas sobre SSTMA; fechas de gestión Ambiental / resultados: la gestión de residuos, etc.; medidas disciplinarias emitidas; pruebas de protocolo sanitario (, exámenes periódicos al ingresar / pre-empleo (sólo para el Cont.),

- Auditorías y seguimiento, una lista de incidentes / accidentes / connatos / análisis de tratamiento médico, medidas adoptadas.

Cualquier logro y adjudicación; sistema de base de datos de la certificación, capacitación, equipo, inspecciones, etc., cualquier evento significativo ocurrido durante el período del proyecto con respecto a SSTMA, la evaluación final del Personal de SSTMA (el rendimiento bajo, medio, alto), la evaluación final del Contratista (rendimiento bajo, medio, alto).

Dr. Ramón Ma. Ureña
ABOGADO NOTARIO PÚBLICO
Mat. # 2570
Santo Domingo, R.D., D.N.

1.0 OBJETIVO

Ese procedimiento tiene la finalidad de establecer el procedimiento para atender y garantizar el cumplimiento de los requisitos de Seguridad y Salud necesarios a la ejecución de trabajos en altura, con riesgo de caída de personas y/o materiales.

2.0 REFERENCIA

- Manual de Seguridad del Proyecto
- OHSAS 18001/2007 Sistema de Gestión de Seguridad y Salud Ocupacional-Especificación
- Decreto Núm. 522-06, REGLAMENTO DE SEGURIDAD Y SALUD EN EL TRABAJO

3.0 APLICACIÓN

Esta Norma se aplica a todas las áreas del emprendimiento donde sean ejecutados trabajos en altura, empleándose andamios, plataformas elevadoras, escaleras, servicios en tejados y otros dentro del Proyecto Termoeléctrico Punta Catalina.

4.0 DESCRIPCIÓN

Se considera trabajo en altura, toda la actividad que exponga al trabajador a riesgo de caída con altura superior a 1,80m y que necesita utilizar EPC´S y EPI´S específicos, tales como: cinturón de seguridad del tipo paracaidista, arnés de seguridad y cables guías de seguridad.

5.0 DEFINICIONES

ANDAMIOS: Plataforma para trabajos en alturas elevadas por estructura tubular y/o dispositivo de sustentación.

ANDAMIOS MECÁNICOS SUSPENDIDOS: Andamios que se proyectan hacia afuera de la construcción, son soportados por un entramado de vigas o estructuras que tengan su seguridad garantizada, ya sea por empotramiento u otro sistema de contrabalanceo en el interior de la construcción, pudiendo ser fijos o desplazables.

1844

CINTURÓN DE SEGURIDAD TIPO PARACAIDISTA: Equipo de Protección Individual que tiene tiras de tórax y piernas, con ajuste y presillas; en la espalda tiene una argolla para fijar la cuerda de sustentación.

ESCALERAS: Estructura constituida de pisos horizontales escalonados, soportado por dos piezas en sentido longitudinal que posibiliten alcanzar niveles diferentes de manera segura siendo necesario utilizar las manos para escalarla.

LÍNEA DE VIDA (CABLE GUÍA O DE SEGURIDAD): Cable anclado a la estructura, donde son fijadas las ligaciones de los cinturones de seguridad.

LISTA DE VERIFICACIÓN: Es una lista de ítems que deben ser verificados antes de la autorización o liberación del trabajo.

PERMISO DE TRABAJO ESPECIAL (PTE): Autorización escrita para la ejecución del trabajo, en que definen las condiciones de trabajo, lista de riesgos y establece la validez del permiso.

PROFESIONAL LEGALMENTE HABILITADO PARA DIMENSIONAMIENTO: Es el profesional que tiene habilitación exigida por la ley (registro en el CREA – Consejo Regional de Ingeniería, Arquitectura y Agronomía).

PROFESIONAL CALIFICADO PARA MONTAJE Y DESMONTAJE: Es el profesional que tiene capacitación mediante entrenamiento (en la empresa).

TALABARTE: Dispositivo de ligación, por medio de cuerda, al cinturón de seguridad utilizado, cuando el trabajador está realizando movimientos o actividades en altura.

ARNÉS DE SEGURIDAD: Dispositivo automático de trabado destinado sujeción del cinturón de seguridad al cable de seguridad o línea de vida.

6.0 CONDICIONES BÁSICAS

Solamente ejecutará trabajos en altura, el empleado que se encuentre apto mediante exámenes médicos específicos para la actividad y con un curso especifico para Trabajo en altura.

Para las actividades en altura deberá emitirse diariamente el PTA (Permiso Para Trabajo en Altura) y PTE (Permiso para trabajos especiales).

Es estrictamente prohibido que empleados hipertensos y diabéticos trabajen en altura;
Todo empleado autorizado a ejecutar actividades en altura tendrá un documento de identificación de autorización.

Los empleados que trabajen en altura, deberán alimentarse moderadamente para evitar somnolencias, cansancio y reflejos en la ejecución de la actividad.

Cualquier empleado, que no se sienta apto a ejecutar las actividades en altura deberá comunicar a su encargado y a Seguridad del Trabajo.

Corresponde al empleado, antes de iniciar su actividad en altura, inspeccionar todos los dispositivos de seguridad (cinturón de seguridad, arnés, cables guías).

Todo empleado ante una situación de grave e inminente riesgo, podrá negarse a ejecutar la actividad. Cabe a la administración del CONSORCIO en conjunto con el encargado de seguridad del trabajo, analizar si procede o no el derecho de rechazo.

No es permitido fumar al trabajar en altura.

Las áreas destinadas a trabajo en altura deberán ser señalizadas y aisladas

Para todo trabajo realizado en altura superior a 1,80m, el empleado deberá utilizar el cinturón de seguridad, fijado en estructura firmemente apoyado y usar cables guías de seguridad.

Las plataformas de trabajo deberán estar totalmente forradas, con baranda de 1,20m de altura, siendo 0,70m travesaño intermedio y 0,20m de zócalo.

El empleado debe hacer un check list de verificación del cinturón de seguridad.

Si no existe punto de amarre para el cinturón de seguridad, se debe instalar un cable guía o de seguridad o un ojal que servirá de soporte al cinturón de seguridad.

Trabajos en tejado y de pintura, tratamiento y limpieza de fachadas, entre otros, solamente podrán ser ejecutados con el uso de cinturón de seguridad tipo "paracaidista" fijo en el cable guía con arnés u otro sistema adecuado de protección contra caídas con comprobada eficiencia.

El personal y el material y el equipo necesarios para la ejecución de trabajos en tejado deben ser distribuidos sobre el mismo de acuerdo con su estructura y capacidad de soporte de carga.

El área inferior de donde se ejecuta el trabajo en altura o se iza y mueve el material, deberá ser señalizada y aislada.

Es prohibido usar cualquier tipo de equipo de izado como soporte/apoyo de elevación de personas para actividades de trabajo en altura.

En el cambio de turno/personal de trabajo, se debe cancelar los permisos de trabajo (PTE) relativos a las actividades de todo el personal/involucrados que están terminando su participación

 1846

y emitir nuevos permisos de trabajo (PTE) para la continuidad de los servicios o entonces revalidar las PTE iniciales.

Es prohibido usar cualquier tipo de cinturón de seguridad como base/apoyo de sustentación para realizar trabajos en altura.

Las líneas de vida deben tener protección contra fricción.
Los anclajes de la línea de vida deberán estar en un punto externo a la estructura de trabajo.

6.1 TRABAJO EN ALTURA UTILIZANDO ANDAMIOS

Sólo será permitido el uso de andamios del tipo tubular.

El acceso a los andamios en montaje debe ser delimitado solamente al personal de montaje.

Los andamios deben tener indicación de carga máxima de trabajo y señalización a través de una placa indicando su condición: "En montaje"; "Liberado" o "Cerrado"; con check list de liberación por los responsables del montaje.

Los andamios deben tener protección lateral, escaleras de acceso y cables guías para fijación del cinturón de seguridad.

Antes de iniciar la actividad sobre el andamio se debe proceder a una inspección visual realizada por el empleado, acompañado del encargado. Cuando existan ítems no conformes, la actividad no podrá ser realizada.

El andamio debe ser apoyado en base firme y rígida. No apoyarlo sobre terreno u objetos inestables como ladrillos, bloques o pedazos de madera.

Está prohibida la realización de trabajo en altura con efecto de alcohol y sustancias psicoactivas o medicamentos que causen disturbios del sistema nervioso central

Evaluar las condiciones del suelo y disponer una base de apoyo con placas y/o planchas de acero, con la finalidad de evitar el hundimiento y/o la inclinación del andamio.

La fijación o interconexión de las piezas de los andamios debe ser hecha con dispositivos propios (abrazaderas, guantes, pernos y contrapernos) siendo terminantemente prohibido improvisar con alambres, cuerdas o piezas que no forman parte de su composición.

Es prohibido el desplazamiento de la estructura de los andamios con los trabajadores sobre los mismos.

1847

La subida y bajada de las plataformas de los andamios solamente deben ser efectuadas utilizando escaleras del mismo.

Es prohibido usar escaleras o cualquier otro dispositivo sobre la plataforma del andamio para acceder un lugar más alto que el posibilitado con el andamio.

La estructura del andamio debe ser proyectada para soportar el peso de las personas que trabajarán sobre el mismo y las herramientas, equipos y materiales necesarios para la ejecución del servicio.

Conservar la plataforma del andamio limpio, libre de escombros, manteniendo solamente el material, máquinas y herramientas necesarias para el trabajo.

Solamente un profesional debidamente entrenado y habilitado (electricista) deberá hacerse cargo de la iluminación, instalación de máquinas y equipos eléctricos para utilizarlos en andamios.

Los cableados no podrán tener enmiendas y los focos de iluminación no deberán ofuscar y/o incomodar la visión de los usuarios.

No es permitida la existencia de espacios vacíos entre las planchas de la plataforma. Cuando sea necesaria la existencia de alguna abertura en la plataforma de servicio, ésta deberá ser provista de baranda;

Antes de cada nueva jornada de trabajo, se deben verificar las condiciones generales de los andamios (arriostres, tensores, planchas, plomada, nivel, entre otros), recuperando daños o alteraciones causadas por lluvias, vientos, vibración del equipo, acción predatoria entre otras;

Sólo es permitido el uso y construcción de vigas de izado (brazo palanca o mano francesa) para piezas o equipos, si el andamio es dimensionado para tal uso;

Los andamios deben tener sus cargas distribuidas de modo uniforme y sin obstruir el pase de personas;

Es obligatoria la fijación de los extremos de las planchas que forman el piso, cuando son apoyados en dos travesaños. Cuando son apoyados en tres travesaños, las planchas deben tener en los extremos dispositivos que eviten el deslizamiento;

Las planchas no deben tener más de 200 mm de balance;

Los andamios deberán ser inspeccionados y cuando las piezas se encuentren damnificadas deberán ser retiradas inmediatamente de los frentes de trabajo.

6.2 TRABAJOS EN TALUDES

Para realizar servicios en taludes de reforestación, deben seguirse las siguientes recomendaciones: Contar con equipos de protección individual de acuerdo con la actividad a ser desarrollada;

Inspección por profesional calificado de las condiciones del talud, verificando la estabilidad del mismo.

El desplazamiento de bajada y subida del talud, deberá ser de forma segura utilizando el cinturón de seguridad con talabarte doble y arnés o puntos de fijación.
La seguridad del trabajo deberá analizar las condiciones seguras del talud.

6.3 TRABAJOS EN ESCALERAS

Las escaleras de mano, deben tener su uso restricto para accesos provisionales y pequeños servicios.

El largo de una escalera móvil simple debe ser limitado a 7 (siete) metros.

La inclinación de una escalera móvil debe ser tal que la distancia de su extremo inferior al plano vertical de apoyo no sea mayor que 1/4 del largo de la escalera.

Las escaleras deben ser fijadas de modo seguro y tener zapatas antideslizantes.

Al utilizar una escalera próxima a las puertas, áreas de circulación, aberturas en el piso y vanos desprotegidos, se debe aislar y señalizar el área informando sobre el riesgo de accidentes, si es el caso, bloquear temporalmente la puerta y proteger/sellar la abertura en el piso y el vano.

Amarrar la parte superior de la escalera para evitar desplazamientos laterales.

Al utilizar escalera de mano para acceder a un local de trabajo más elevado, el extremo superior de la escalera debe sobrepasar por lo menos 1 metro el piso de este local.

Al utilizar escaleras de abrir, éstas deben estar totalmente abiertas y trabadas.
La escalera telescópica no debe ser extendida totalmente, debiendo permanecer una sobreposición de por lo menos 4 peldaños, debiendo ser trabada y amarrada.

No utilizar escaleras metálicas para trabajos en electricidad.

Al utilizar escaleras portátiles en trabajos próximos a las instalaciones eléctricas, barras colectoras, mantener distancia adecuada y segura.

Señalizar el área próxima al local de colocación de la escalera y si es necesario aislar el área. Solamente usar escaleras de largura suficiente, siendo prohibido agregar extensiones improvisadas.

Las escaleras del tipo marinero deberán tener jaula protectora a partir de 2,00m mayor que la base hasta 1m de la última superficie de trabajo cuando tenga más de 6m de altura.

Las escaleras del tipo tijera deberán tener largura máxima de 6,0m, no podrán ser pintadas y deberán tener señalización de carga máxima y zapatas antideslizantes.

6.4 TRABAJOS EN PLATAFORMAS ELEVADAS

Las actividades en plataformas elevadoras deberán atender los siguientes requisitos:

- Sistema de control de bajada de emergencia.
- Dispositivo antibasculante y limitador de carga.
- Fijaciones para cinturón de seguridad en la plataforma.
- Sistema de trabado/freno de las ruedas cuando está en operación.
- Sistema de estabilización automática a ser utilizada antes de la subida de la plataforma.

- Plataforma operacional con piso antideslizante.
- Indicación de la capacidad de carga y alcance máximo visible a distancia.
- Conos reflejantes para señalización horizontal de la localización de la máquina.

7.0 ATENCIÓN A EMERGENCIAS

Se considera una emergencia grave cuando ocurren accidentes resultantes de la caída en altura. El sector de medicina del trabajo deberá ser accionado inmediatamente a través del radio de comunicación para que sean tomadas las debidas medidas con relación a los primeros auxilios.

El área deberá ser aislada y señalizada.

La comunicación deberá ser rápida y precisa, informando el local exacto y el tipo de ocurrencia.

No permitir la presencia de curiosos en el local, solamente empleados que puedan ayudar y auxiliar en la prestación del socorro.

En caso de soterramiento, retirar la víctima e iniciar los primeros auxilios.

8.0 EPI – EQUIPO DE PROTECCIÓN INDIVIDUAL

Los Equipos de Protección Individual, deben ser inspeccionados diariamente y registrados en check list estándar y en caso de desgaste del cinturón, éste debe ser sustituido inmediatamente.

Todos los dispositivos de seguridad para trabajo en altura, deberán tener pruebas de capacidad de carga, solicitados en el proveedor.

Está prohibido el uso de Equipos de Protección Individual, que no atiendan las exigencias de seguridad.

Es expresamente prohibido el suministro y uso de cinturón abdominal.

9.0 RESPONSABILIDADES

Del Director del Contrato

- Hacer cumplir el contenido de esta Instrucción de Trabajo.
- Asegurar los recursos necesarios para su implementación.

Del Equipo Dirigente

- Cumplir y hacer cumplir el contenido de esta Instrucción de Trabajo y comprometerse en su implementación.

De los Supervisores, Encargados e Ingenieros

- Cumplir y hacer cumplir los requisitos aplicables.

De la Seguridad del Trabajo

- Orientar y asesorar a los equipos de trabajo respecto al correcto cumplimiento de esta Instrucción de Trabajo.

Del equipo Médico

- Realizar los exámenes médicos de liberación de trabajo en altura.
- Autorizar a los empleados a trabajar en altura.

De los Integrantes

Seguir las orientaciones de sus líderes para implementar esta Instrucción de Trabajo.

Anexo 2
Modelos de Check List de Andamio

	PROYECTO PUNTA CATALINA
CHECK LIST DE ANDAMIOS	Número: Hoja: 1/1 Revisión: 0

DATOS DEL ANDAMIO	
Modelo:	Tipo:
Área/Local:	Fecha:

Aspectos Observados	Estado			Observaciones
	S	R	I	
¿La base del andamio tiene zapatas adecuadas?				
¿Está trabando o atirantado (uso de cables) en estructura firme y resistente?				
¿El andamio tiene escalera de acceso con protección contra caídas (baranda o protector de caídas) y está colocada correctamente?				
¿Hay necesidad de utilización de línea de vida?				
¿La plataforma de trabajo está compuesta de baranda y rodapié?				
¿La plataforma de trabajo está completamente formada?				
¿Las tablas utilizadas están en buenas condiciones de uso, sin rajaduras y/o enmiendas y no son pintadas?				
¿Las tablas utilizadas están amarradas en ambos extremos?				
¿El andamio está montado a una distancia segura de cables eléctricos energizados?				

OBSERVACIONES:

- SI para algunos de los ítems es marcada la opción **INSATISFACTORIO,** la actividad no podrá ser liberada / iniciada.
- Después de la corrección de las anormalidades, deberá ser hecha nueva inspección para posterior liberación; (las dos liberaciones deben permanecer en el local de la actividad).
- Esta liberación no substituye los análisis de riesgo y el PTE (Permiso para Trabajos Especiales) que deben ser llenados y mantenidos en el frente de trabajo.
- Esta autorización / Liberación deberá permanecer en local visible durante la ejecución de la actividad y anexado el Análisis Preliminar de Tareas.
- Es condición fundamental para validez de esta liberación, la firma del Supervisor /Encargado de la Contratada.
- En la observación de actividades en andamios sin esta liberación, totalmente llenada y firmada por el responsable, la misma será paralizada y caracterizada como riesgo inminente.
- Este check-list deberá ser archivado por un período mínimo de 01 año.

PTE – Permiso Para Trabajos Especiales (Frente)

Proyecto Punta Catalina	**PROYECTO PUNTA CATALINA**	
PTE - PERMISO PARA TRABAJOS ESPECIALES		Número: PCM.GSM Hoja: Fecha:
PERMISO PARA TRABAJO EN ALTURA		RG 04 DCG Fecha 25/07/2007 Cod. Entren. 5QU0527 Resp. Tec. Fernando Lignani

Recomendaciones Generales

1 - Siga rigurosamente las recomendaciones relativas a las actividades / tareas a ser ejecutadas
2 – Antes de iniciar los servicios inspeccione el local, una APT y se cerciórese que fueron tomadas todas las medidas de seguridad.
3 – Esta PTE es válida solamente cuando es firmada por el Emisor.

CHECK LIST PRELIMINAR

S	NA	
		¿LOS EQUIPOS DE PREVENCIÓN DE CAÍDAS, ESTÁN EN PERFECTAS CONDICIONES? (Tales como: Cinturones de Seguridad / Arnés / Cable Guía, etc.)
		¿LOS INVOLUCRADOS FUERON ENTRENADOS EN LA FORMA DE PREVENCIÓN DE CAÍDAS?
		¿LOS INVOLUCRADOS ESTÁN EN PERFECTAS CONDICIONES FÍSICAS Y SICOLÓGICAS? (Evaluar superficialmente)
		¿EXISTE MEDIO DE COMUNICACIÓN DE EMERGENCIA (radio, celular, etc.)?
		¿EL ÁREA DE TRABAJO ESTÁ AISLADA?
		¿LAS CONDICIONES CLIMÁTICAS SON FAVORABLES (Ej.: Lluvias / Vientos fuertes, etc.)?

CHECK LIST PARA ANDAMIOS / PLATAFORMAS (Incluyendo montaje de andamio)

S	NA	
		¿PIEZAS DEL ANDAMIO ESTÁN EN PERFECTAS CONDICIONES Y TIENEN CONTROL DE INSPECCIONES (CHECK LIST)?
		¿EN EL MONTAJE DEL ANDAMIO FUERON SEGUIDAS FIELMENTE LAS EXIGENCIAS DE LA NORMA DE PREVENCIÓN DE CAÍDAS TALES COMO: Resistencia del piso / Nivelación / Diagonales / Trabado / Anclaje / Plataformas / Baranda y Capacitación de las Personas?
		¿LAS PLANCHAS UTILIZADAS ESTÁN EXENTAS DE GRIETAS, NUDOS, RAJADURAS, GRASAS Y NO ESTÁN PINTADAS?
		¿LAS PLANCHAS TIENEN TRABADO EN LAS PUNTAS PAR EVITAR EL DESPLAZAMIENTO?
		¿LOS ANDAMIOS, PLATAFORMAS, ESTÁN ALEJADOS DE LA RED ELÉCTRICA, EN CASO CONTRARIO LOS MISMOS SIGUEN LA NORMA DE PREVENCIÓN DE CAÍDAS?

CHECK LIST PARA EJECUCIÓN DE TRABAJOS ESPECIALES

(Tejados / Plataformas / Torres / Chimeneas / Cargador de Naves / Taludes / Recuperadora y Apiladora de Minerales y Otros conforme evaluación del responsable por el permiso)

S	NA

Dr. Ramón Ma. Urdaneta Mancebo, Abogado Notario Público, Mat. # 2570, Santo Domingo, R.D.N.

		¿HAY PROCEDIMIENTO O APT CONTEMPLANDO TODAS LAS ETAPAS DEL TRABAJO?
		¿HAY EQUIPO PARA IZADO Y MOVIMIENTO DE MATERIALES?
		¿FUE REALIZADA REUNIÓN DE ENTENDIMIENTO ENTRE EQUIPOS SOBRE EL TRABAJO?
		¿ES PREVISTO EL USO DE PLANCHAS DE MADERAS DISPUESTAS SOBRE EL TEJADO?
		¿HAY NECESIDAD DE BLOQUEO Y PRUEBA DE EQUIPO ROTATIVOS / ENERGIZADOS?

7.0 ANEXOS 24

7.1 ANEXO I 24

7.2 ANEXO II 26

Dr. Ramón Ma. Tejada Mancebo
ABOGADO NOTARIO PÚBLICO
Matr. # 2570
Santo Domingo, R.D., D.N.

1.0 OBJETIVO

Establecer requisitos y condiciones mínimas con la finalidad de implementar medidas de control y sistemas preventivos de seguridad y salud, para actividades en instalaciones eléctricas y servicios con electricidad.

2.0 APLICACIÓN

Se aplica a todo el personal, contratados y subcontratados de las instalaciones del Proyecto Termoeléctrico Punta Catalina, para las etapas de construcción, montaje, Pre-Comisionamiento y comisionamiento.

3.0 REFERENCIA

- Plan de la Calidad
- Análisis Preliminar de la Tarea - APT;
- SSTMA Manual del Programa Integrado de Salud, Seguridad del Trabajo y Medio Ambiente.
- Decreto Núm. 522-06, REGLAMENTO DE SEGURIDAD Y SALUD EN EL TRABAJO

4.0 DEFINICIONES

- Puesta a tierra Eléctrica Temporal: conexión eléctrica efectiva fiable y adecuada a tierra, destinada a garantizar la tencialidad equipo y mantenida continuamente durante la intervención en la instalación eléctrica.

- Alta Tensión (AT): tensión superior a 1000 voltios en corriente alterna o 1500 voltios en corriente continua, entre fases o entre fase y tierra.

- Barrera: Un dispositivo que impide cualquier contacto con partes energizadas de las instalaciones eléctricas.

- Bloqueo: acción de mantener, con uso de dispositivo de bloqueo y candado individual, un dispositivo de maniobra fijo en una determinada posición que garantice que no exista la re-energización del equipo, sistema o proceso.

- Desbloqueo: se considera desbloqueo la acción de retirar el dispositivo de bloqueo y candado individual, después de la conclusión de los servicios y verificación y aceptación de todos los ítems de seguridad y operación permitiendo la prueba de liberación del equipo, sistema o proceso en mención, para la respectiva operación.

- Des-energizado: Libre de cualquier conexión eléctrica con una fuente de diferencia potencial y de carga eléctrica, sin tener un potencial eléctrico diferente del potencial eléctrico de la tierra.

- Dispositivo de bloqueo: accesorios utilizados con intención de impedir el accionamiento indebido del dispositivo de maniobra (cadenas, cable de acero, garra de bloqueo de seguridad, entre otros).

- Dispositivo de maniobra: recursos fabricados conforme las referencias técnico-legales existentes en equipos, sistemas o procesos, instalados por los fabricantes o no (ejemplo: válvula mecánica, hidráulica o neumática, disyuntor, llave conmutadora, entre otros), que posibilita el seccionamiento o interrupción de las energías.

- Dispositivo Aislante de Energía: Un dispositivo físico que previene la transmisión o liberación de energía eléctrica.

- Distancia Mínima de Aproximación: La menor distancia permitida para la aproximación del objeto expuesto y energizado, tanto para personas calificadas, como para las no calificadas.

- Empleado autorizado: empleado formalmente autorizado por la gerencia, entrenado, capacitado y calificado, que permita la ejecución del bloqueo y desbloqueo de equipo, sistema o proceso de acuerdo con su competencia.

- Empleado calificado: Una persona reconocida por la administración del lugar como alguien formado, capacitado y experimentado en construcción, mantenimiento y operación de equipos de alta y baja tensión. Una persona calificada deberá saber de los riesgos involucrados, de las prácticas de seguridad que deben ser aplicadas en el trabajo y haber recibido capacitación específica de seguridad para la tarea.

- Empleado solicitante: empleado formalmente autorizado por la administración, debidamente entrenado y capacitado ha de solicitar el bloqueo y desbloqueo para inspección, mantenimiento y prueba del equipo.

- Energía peligrosa: son fuentes de energía, cuya activación inadecuada o indeseada puedan producir accidentes.

- Energía cero: es el estado ideal para el acceso de personas al equipo, sistema o proceso cuando todas las fuentes de energías peligrosas son efectivamente bloqueadas, agotadas, probadas e identificadas.

- Aislamiento Eléctrico: proceso destinado a impedir el pasaje de corriente eléctrica, por interposición de materiales aislantes.

- Instalaciones Provisionales: Se refiere a las instalaciones permitidas durante emergencias o etapas de construcción, mantenimiento, reparaciones o demolición de construcciones, estructuras, equipos o actividades similares. Las instalaciones provisionales deben ser retiradas inmediatamente después del término de la construcción o del propósito por el cual ellas fueron instaladas.

- Límites de Aproximación Controlada: Límite de protección contra choque eléctrico a ser sobrepasado solamente por personas calificadas. Este límite no es para ser sobrepasado por personas no calificadas, a no ser que ser que estén acompañadas por una persona calificada.

- Límite Prohibido de Aproximación: Es el área de protección contra choque eléctrico que debe ser accedida solamente por personas calificadas, las cuales, mismo con sólo una parte del cuerpo u objetos expuestos a esta área, son obligadas a utilizar la misma protección como si estuviesen en contacto directo con una parte energizada.

- Límite Restringido de Aproximación: Un área de protección contra choque eléctrico que debe ser accedida solamente por personas calificadas, las cuales, debido a la proximidad del riesgo de choque, es obligada a utilizar técnicas y equipos de protección contra choque eléctrico.

- Personal Afectado: Cualquier persona no calificada, no autorizada (empleado, visitante, contratado) que puede violar la regla de los tres metros.

- Procedimiento operacional de las etapas de bloqueo y desbloqueo: procedimientos preparados por la gestión del área responsable de aplicar el bloqueo y desbloqueo, contemplando las siguientes etapas: bloqueo - preparación, comunicación inicial, desconexión, aislamiento, bloqueo, señalización, liberación de energía residual, prueba de efectividad del bloqueo; desbloqueo - comunicación final, retirada del bloqueo, retirada de la señalización, reconexión y retorno a la operación.

- Procedimiento operacional específico de bloqueo y desbloqueo para equipo, sistema o proceso: procedimientos específicos preparados por la gestión del área, identificando claramente todas las fuentes de energía de cada equipo, todos los puntos de bloqueo, dispositivos necesarios, así como, el circuito o sistema sobre los cuales tales puntos de bloqueo tienen control directo, los pasos específicos para alcanzar el estado de energía cero y los métodos para ejecutar la prueba de efectividad del bloqueo. Este documento define directrices mínimas para preparar los procedimientos específicos de cada gestión de área donde es necesario aplicar cualquier bloqueo de energías.

- Prueba de efectividad de bloqueo: prueba realizada antes de iniciar la tarea, donde el responsable de la ejecución de la tarea debe cerciorarse de que el bloqueo esté debidamente efectuado. Este procedimiento es realizado a través del check list de verificación de la efectividad del bloqueo que es parte integrante de los ítems de verificación del Permiso de Trabajo - PT.

- Prueba dieléctrica: Un método controlado utilizado para probar la integridad del aislamiento eléctrico en la protección personal y en equipo aislado.

- Zona segura de trabajo: Un área donde todas las fuentes de energía fueron des-energizadas, bloqueadas, etiquetadas y probadas y si es necesario, con barreras instaladas.

5.0 RESPONSABILIDADES Y AUTORIDADES

5.1 GERENTE GENERAL

Garantizar la implementación y el cumplimiento de este documento por todos los empleados del CONSORCIO y de las empresas subcontratadas en el PROYECTO TERMOELECTRICO PUNTA CATALINA;

- Proporcionar y generar recursos materiales, financieros y humanos necesarios para la construcción del Proyecto
- Cumplir con todos los requisitos administrativos, de proyectos, de construcción, de mantenimiento y de documentación contenidos en este documento;
- Designar a una persona calificada para asumir la responsabilidad y garantizar el cumplimiento de los requisitos de este procedimiento para trabajos en instalaciones energizadas. El nombramiento de este responsable, que debe ser por escrito, permite a éste trabajar en nombre del gerente.

5.2 GESTIÓN DE SALUD, SEGURIDAD DEL TRABAJO Y MEDIO AMBIENTE (SSTMA)

El gerente de SSTMA debe aprobar cualquier trabajo en instalaciones energizadas o tendido de cables en bandejas energizadas y el Análisis de Seguridad de la Tarea, además de:

- Verificar en conjunto con los responsables la ejecución de este proceso, el cumplimiento de los requisitos de SSTMA contenidos en la política integrada, en las APT, Planilla de Identificación de Peligros y Evaluación de Riesgos de Seguridad y Salud Ocupacional.

- Especificar los Equipos de Protección Individual y los métodos de Protección Colectiva para realizar el trabajo que necesite de control del riesgo con base en criterios técnicos y que cumplan con lo especificado por el Ministerio de Trabajo;
- Es de responsabilidad del SSTMA mantener a los trabajadores informados sobre los riesgos a los que están expuestos, instruyéndolos respecto a los procedimientos y medidas de control contra los riesgos eléctricos que serán adoptados.
- Capacitar a los empleados involucrados en este documento;
- Cerciorarse de que todos los requisitos aplicables de este documento sean respectivamente seguidos;

5.3 GESTIÓN DE RECURSOS HUMANOS

- Garantizar y verificar que los profesionales contratados y subcontratados de las instalaciones del Proyecto Termoeléctrico Punta Catalina, que ejecutan actividades en instalaciones eléctricas, sean personas calificados, capacitados o habilitados conforme a los requerimientos para efectuar dichos trabajos.
- Asegurar la capacitación de todos los profesionales del CONSORCIO, que ejecutan actividades en instalaciones eléctricas y servicios con electricidad, tengan como mínimo las siguientes capacitaciones:
  - **Primeros Auxilios:**

    Público Objetivo: Para trabajadores autorizados

    Carga Horaria: 8 horas mínimas

    Contenido: Anexo 2

  - **Prevención de Riesgos en Instalaciones Eléctricas y Servicios con Electricidad;**

    Público Objetivo: Todos los profesionales que ejecutan trabajos en instalaciones eléctricas y servicios con electricidad.

    Carga Horaria: 8 horas mínimas

    Contenido: Anexo 2 - Incluye la presentación completa del RAC-11

  - **Seguridad en Sistemas Eléctricos de Potencia - SEP**

Público Objetivo: Para profesionales que ejecutan trabajos en instalaciones eléctricas y servicios con electricidad en sistemas energizados.

Carga Horaria: 30 horas mínimas

Contenido: Anexo 2 - Incluye la presentación completa del RAC-11

Verificar y validar la compatibilidad del contenido de la capacitación de Seguridad en Sistemas Eléctricos de Potencia - SEP, para profesionales que ya tienen capacitación en NR-10, Graduación en Ingeniería o equivalente. Todos los profesionales deberán llevar junto al carnet de identidad, la identificación de las capacitaciones recibidas o validadas y la validez de la capacitación.

5.4 GESTIÓN DE EQUIPO

- Verificar el cumplimiento de los procedimientos y requisitos de los equipos involucrados en los trabajos con electricidad y en el bloqueo y señalización de acuerdo con lo especificado en este documento;
- Verificar periódicamente el estado de los equipos y sus planes de mantenimiento.

5.5 GESTIÓN DE MONTAJE

- Verificar que los recursos del personal y equipos suministrados por las subcontratadas sean los adecuados para la realización de los servicios;
- Garantizar el cumplimiento de este procedimiento para todo equipo, sistema o proceso por todos los empleados bajo su coordinación;
- Verificar toda la documentación necesaria y suficiente para los trabajos con electricidad y de bloqueo y señalización;
- Verificar, participar en la preparación de los planes de bloqueo;
- Verificar periódicamente el estado de los equipos de las contratadas y sus planes de mantenimiento;
- Conocer los riesgos en potencial asociados a cada nivel de realización de la tarea y los procedimientos de seguridad específicos de la tarea en su área;
- No permitir cualquier trabajo hasta que las fuentes de energía estén identificadas, aisladas, des-energizadas y puestas en tierra;

- No permitir ejecutar trabajos en línea viva sin la aprobación del gerente general y SSTMA;

5.6 GESTIÓN DE LA CALIDAD

Seguir e Inspeccionar las actividades en ejecución, para que sean efectuadas de acuerdo con el Plan de Calidad y con base en los documentos del proyecto.

5.7 EMPRESAS SUB-CONTRATADAS Y EMPLEADOS

- Cumplir integralmente los requisitos relacionados en este procedimiento.
- Es responsabilidad de la Gerencia del CONSORCIO, ante el evento de accidentes de trabajo involucrando instalaciones y servicios en electricidad, proponer y adoptar medidas preventivas y correctivas;
- Conocer y entender los riesgos potenciales de choque eléctrico asociados a su trabajo.
- Velar por la seguridad y salud y la de otras personas que puedan ser afectadas por sus acciones u omisiones en el trabajo.
- Responsabilizarse ante la empresa por el cumplimiento de las disposiciones legales y reglamentarias, inclusive respecto a los procedimientos internos de seguridad y salud.
- Comunicar inmediatamente al responsable de la ejecución del servicio, las situaciones que consideren de riesgo para su seguridad y salud así como, de otras personas.
- Notificar al representante correspondiente del CONSORCIO sobre el cambio de las condiciones de trabajo que estén relacionadas con los riesgos potenciales de choque eléctrico.
- Capacitar a los empleados o subcontratados sobre las consideraciones de seguridad eléctrica aplicables conforme ésta u otras especificaciones.
- Validar, ante el representante de la Empresa, el Programa de Capacitaciones o adecuación de éste en conformidad para atender este Procedimiento.
- Entregar los EPI básicos y específicos para la ejecución de los trabajos con electricidad, en conformidad con las especificaciones del SSTMA;

- Suministrar el Disyuntor Interruptor Diferencial Residual, con corriente de fuga igual o menor a 30mA, para actividades en espacios confinados, áreas húmedas y donde sea necesario el uso de extensión eléctrica.

- Colocar a disposición equipos para pruebas eléctricas generales aprobado por el SSTMA;

- Mantener distancias mínimas de aproximación aplicables a las atribuciones de su tarea;

- No ejecutar cualquier trabajo hasta que las fuentes de energía estén identificadas, aisladas, des-energizadas y puestas en tierra;
- No ejecutar trabajo en línea viva sin la aprobación del Representante del gerente general y SSTMA;

6.0 PROCEDIMIENTOS TÉCNICOS

6.1 MEDIDAS DE CONTROL

- En todas las intervenciones en instalaciones eléctricas se deben adoptar medidas preventivas de control del riesgo eléctrico y de otros riesgos adicionales, mediante técnicas de análisis de riesgo, de forma que se garantice la seguridad y la salud en el trabajo.

- Las medidas de control adoptadas se deben integrar a las demás iniciativas de la empresa, en el ámbito de la preservación de la seguridad, salud y Medio Ambiente del trabajo.

- Es obligatorio mantener esquemas unifilares actualizados de las instalaciones eléctricas de sus establecimientos con las especificaciones del sistema de puesta a tierra y demás equipos y dispositivos de protección.

6.2 MEDIDAS DE PROTECCIÓN COLECTIVA

- En todos los servicios ejecutados en instalaciones eléctricas se deben prever y adoptar, prioritariamente, para las actividades que serán desarrolladas, medidas de protección colectiva aplicables mediante procedimientos, de forma que se garantice la seguridad y salud de los trabajadores.

- Las medidas de protección colectiva comprenden prioritariamente, la des-energización eléctrica conforme establece este procedimiento, ante su imposibilidad, el empleo de tensión de seguridad.

- Ante la imposibilidad de implementar lo establecido en el sub-ítem anterior se deben utilizar otras medidas de protección colectiva, tales como: aislamiento de las partes vivas,

obstáculos, barreras, señalización, sistema de seccionamiento automático de alimentación, bloqueo de reconexión automático.

- La puesta a tierra de las instalaciones eléctricas debe ser ejecutada conforme el reglamento establecido por los órganos competentes y en la ausencia de éste, debe cumplir las Normas Internacionales vigentes.

6.3 MEDIDAS DE PROTECCIÓN INDIVIDUAL

- En los trabajos en instalaciones eléctricas, cuando técnicamente las medidas de protección colectiva sean inviables o insuficientes para controlar los riesgos, se debe adoptar el uso de equipos de protección individual específicos y adecuados a las actividades desarrolladas en cumplimiento a lo dispuesto.

- Las vestimentas de trabajo deben ser adecuadas para las actividades, debiendo contemplar la conductibilidad, inflamabilidad e influencias electromagnéticas.

- Es prohibido el uso de adornos personales en los trabajos con instalaciones eléctricas o en sus proximidades.

6.4 SEGURIDAD EN PROYECTOS

- Es obligatorio que los proyectos de instalaciones eléctricas especifiquen dispositivos de desconexión de circuitos que tengan recursos para el impedimento de re-energización, para señalización de advertencia con indicación de la condición operativa.

- El proyecto eléctrico en la medida de lo posible, debe prever la instalación de un dispositivo de seccionamiento de acción simultánea, que permita impedir la re-energización del circuito.

- El proyecto de instalaciones eléctricas debe considerar el espacio seguro, respecto al dimensionamiento y localización de sus componentes e influencias externas, durante la operación y la realización de servicios de construcción y mantenimiento.

- Los circuitos eléctricos con finalidades diferentes, tales como: comunicación, señalización, control y tracción eléctrica deben ser identificados e instalados separadamente, salvo cuando el desarrollo tecnológico permita compartir, respetando las definiciones de los proyectos.

El CONSORCIO debe definir la configuración del esquema de puesta a tierra, la obligatoriedad o no de la interconexión entre el conductor neutro y el de protección y la conexión a tierra de las partes conductoras no destinadas a la conducción de la electricidad.

- Siempre que sea técnicamente viable y necesario, se deben proyectar dispositivos de seccionamiento que incorporen recursos fijos de equipo tencialización y puesta a tierra del circuito seccionado.
- Todo proyecto debe prever condiciones para adoptar la puesta a tierra temporal.
- El proyecto de instalaciones eléctricas debe estar a disposición de los trabajadores autorizados, de las autoridades competentes y de otras personas autorizadas por la empresa y debe mantenerse actualizado.
- El proyecto eléctrico debe atender a todo lo que disponen las Normas Reguladoras de Salud y Seguridad en el Trabajo, los reglamentos técnicos oficiales establecidos, además de ser firmado por un profesional legalmente autorizado.
- La memoria descriptiva del proyecto debe contener como mínimo los siguientes ítems de seguridad:

a. Especificación de las características relativas a la protección contra choques eléctricos, quemaduras y otros riesgos adicionales;

b. Indicación de posición de los dispositivos de maniobra de los circuitos eléctricos: Verde - "A", apagado y Rojo - "E", Encendido ("D" y "L", respectivamente, en español);

c. Descripción del sistema de identificación de circuitos eléctricos y equipos, incluyendo dispositivos de maniobra, de control, de protección, de interbloqueo, de los conductores y los propios equipos y estructuras, definiendo como tales indicaciones deben ser aplicadas físicamente en los componentes de las instalaciones;

d. Recomendaciones de restricciones y advertencias respecto al acceso de personas a los componentes de las instalaciones;

e. Precauciones aplicables ante influencias externas;

f. El principio funcional de los dispositivos de protección dentro del proyecto, destinados a la seguridad de personas;

g. Descripción de la compatibilidad de los dispositivos de protección con la instalación eléctrica.

Los proyectos deben garantizar que las instalaciones proporcionen a los trabajadores iluminación adecuada y una posición de trabajo segura, conforme reglamento establecido por los órganos competentes y en la ausencia de éste, debe atender las Normas Internacionales vigentes.

6.5 SEGURIDAD EN LA CONSTRUCCIÓN, MONTAJE, OPERACIÓN Y MANTENIMIENTO

- Las instalaciones eléctricas deben ser construidas, montadas, operadas, reformadas, ampliadas, reparadas e inspeccionadas de forma que se garantice la seguridad y salud de los trabajadores y de los usuarios, asimismo, deben ser supervisadas por un profesional autorizado, conforme lo dispone este manual.

- En los trabajos y en las actividades referidas se deben adoptar medidas preventivas destinadas al control de riesgos adicionales, especialmente respecto a la altura, confinamiento, campos eléctricos y magnéticos, explosividad, humedad, polvo, fauna y flora y otros agravantes, adoptándose la señalización de seguridad.

- En los locales de trabajo sólo se pueden utilizar equipos, dispositivos y herramientas eléctricas compatibles con la instalación eléctrica existente, preservando las características de protección, siempre respetando las recomendaciones del fabricante.

- Los equipos, dispositivos y herramientas que tengan aislamiento eléctrico deben estar adecuados a las tensiones involucradas y deben ser inspeccionados y probados de acuerdo con los reglamentos existentes o recomendaciones de los fabricantes.

- Las instalaciones eléctricas deben mantenerse en condiciones seguras de funcionamiento y sus sistemas de protección deben ser inspeccionados y controlados periódicamente, de acuerdo con los reglamentos existentes y definiciones del proyecto.

- Los edificios de servicios eléctricos, compartimentos y cubiertas de equipos e instalaciones eléctricas son exclusivos para esta finalidad, siendo terminantemente prohibido utilizarlos para el almacenamiento o protección de cualquier otro tipo de objeto.

- Para actividades en instalaciones eléctricas se debe garantizar al trabajador una iluminación adecuada y una posición de trabajo segura, de forma que le permita acomodar libremente los brazos durante la ejecución de las tareas.

- Los ensayos y pruebas eléctricos de laboratorio y de campo o puesta en marcha de instalaciones eléctricas deben cumplir el reglamento establecido en los ítems 6.6 y 6.7 y solo

pueden ser realizados por trabajadores que cumplan con las condiciones de calificación, habilitación, capacitación y autorización establecidas en este RAC.

6.6 HERRAMIENTAS ELÉCTRICAS PORTÁTILES

- Las herramientas eléctricas portátiles deben ser adecuadas a cada trabajo, ambiente y voltaje y deben ser certificadas por una organización de certificación y prueba de productos de seguridad. Si es posible, todas las nuevas herramientas eléctricas portátiles deben ser doblemente aisladas.

- Todas las herramientas eléctricas portátiles deben ser inspeccionadas visualmente antes de cada uso y los estuches y cables deben estar libres de riesgos contra choques eléctricos evidentes.

- Cualquier herramienta eléctrica portátil que esté damnificada debe ser retirada de uso inmediatamente.

- Cada herramienta eléctrica portátil debe ser probada regularmente o siempre que se tenga sospecha de daño. Un proceso debe ser creado e implementado para documentar estas inspecciones periódicas.

- Use Disyuntor / interruptor diferencial residual en herramientas eléctricas portátiles conectadas por cables.

6.7 EXTENSIONES ELÉCTRICAS

- Las extensiones eléctricas deben ser apropiadas al ambiente y voltaje involucrados, deben incorporar un dispositivo de protección de circuito y deben ser certificadas por una organización reconocida de certificación y pruebas de productos de seguridad.

- Las extensiones eléctricas deben estar protegidas contra daños mecánicos, aceite, solventes, abrasivos, pinzas y objetos puntiagudos, vehículos y peatones.

- Las extensiones eléctricas deben ser utilizadas de modo que no causen riesgos de deslizamiento, tropiezos o caídas.

- Las extensiones eléctricas cuando son fijadas o suspendidas, deben usar medios no conductores.

- Las extensiones eléctricas deben ser inspeccionadas periódicamente contra daños. Cualquier extensión eléctrica damnificada, desgastada, pelada, partida, comprimida, enmendada o con defecto debe ser retirada de uso inmediatamente.

- Las extensiones eléctricas no deben ser conectadas unas a las otras y utilizarlas en el tamaño adecuado con la finalidad de evitar bobinas que generen inducción.

- Cables de extensión no deben ser desconectados mientras los equipos estén en funcionamiento o cuando un interruptor esté cerrado.

6.8 HERRAMIENTAS MANUALES AISLADAS

- Todo empleado utilizará herramientas manuales aisladas, caso las herramientas puedan, accidentalmente, entrar en contacto con partes energizadas. Al manejar y cuidar de las herramientas manuales, los empleados deben:

- Inspeccionar visualmente las herramientas manuales aislantes contra defectos y contaminación antes de cada uso y cuando esté próximo a las partes energizadas.

- No colocar las herramientas donde ellas puedan contaminarse o damnificarse.

- Limpiar y secar las herramientas manuales que estén mojadas lo más rápido posible.

- Retirar inmediatamente de uso las herramientas manuales aislantes damnificadas.

- Almacenar las herramientas manuales aislantes adecuadamente para prevenir daños.

- Es prohibido el uso de cintas métricas, metros de acero u otro material conductor para tirar medidas cerca de equipos eléctricos. Use solamente material aislante.

6.9 APARATOS

- Los aparatos usados en el local, tales como microondas, radios, refrigeradores y cafeteras no deben presentar riesgos eléctricos y deben ser colocadas en lista por una organización de certificación y pruebas de seguridad para productos apropiados.

- El aparato debe ter una placa de identificación visible o fácilmente accesible.

- El cable de alimentación de energía debe estar en buenas condiciones y no debe estar desgastado, pelado, damnificado, partido o defectuoso.

- Se debe disponer de un método para desconectar el aparato.

- El área alrededor de un aparato no debe presentar riesgo de fuego.

- Cuando exista presencia de agua, el disyuntor / interruptor diferencial residual debe ser utilizado.

6.10 SEGURIDAD EN INSTALACIONES ELÉCTRICAS DESENERGIZADAS

- Solamente serán consideradas des-energizadas las instalaciones eléctricas liberadas para trabajo, mediante los procedimientos apropiados, obedeciendo la siguiente secuencia:
    - Seccionamiento;
    - Impedimento de re-energización;
    - Constatación de ausencia de tensión;
    - Instalación de puesta a tierra temporal con equipo tencialización de los conductores de los circuitos;
    - Protección de los elementos energizados existentes en la zona controlada (Anexo I);
    - Instalación da señalización de impedimento de re-energización.

- Se debe mantener el estado de instalación des-energizada hasta la autorización para re-energización, respetando la siguiente secuencia de procedimientos:

    - Retirada de las herramientas, utensilios y equipos;
    - Retirada de la zona controlada de todos los trabajadores no involucrados en el proceso de reenergización;
    - Retirada de la puesta a tierra temporal, de la equipo tencialización y de las protecciones adicionales;
    - Retirada de la señalización de impedimento de re-energización;
    - Desbloqueo, si hubiera, y reconexión de los dispositivos de seccionamiento.

- Las medidas constantes pueden ser alteradas, sustituidas, ampliadas o eliminadas, en función de las peculiaridades de cada situación, por profesional legalmente habilitado, autorizado y mediante justificativa técnica previamente formalizada, desde que se mantenga el mismo nivel de seguridad originalmente preconizado.

- Los servicios que serán ejecutados en instalaciones eléctricas desconectadas, pero con posibilidad de energización, por cualquier medio o razón, deben atender a lo que establece lo dispuesto en el ítem 6.11.

- Práctica de Trabajos Seguros:
  - Verificar el equipo de prueba para operación adecuada inmediatamente antes del uso;
  - Verificar si todas las fuentes de energía necesarias dentro de la zona están aisladas;
  - Constatar que no hay energía, por alguna inducción accidental de energía o resultante de tensión de retorno por interbloqueo.
  - Se prohíbe la utilización de escalera portátil metálica en servicios de electricidad;

6.11 SEGURIDAD EN INSTALACIONES ELÉCTRICAS ENERGIZADAS

- Las intervenciones en instalaciones eléctricas con tensión igual o superior a 50 Volts en corriente alterna o superior a 120 Volts en corriente continua solamente pueden ser realizadas por trabajadores que atiendan lo establecido por la normativa.

- Los trabajadores deben recibir capacitación de seguridad para trabajos con instalaciones eléctricas energizadas, con currículo mínimo, carga horaria y demás determinaciones establecidas en el Anexo II de este RAC.

- Las operaciones elementales como encender y apagar circuitos eléctricos, realizadas en baja tensión, con materiales y equipos eléctricos en perfecto estado de conservación, adecuados para operación, pueden ser realizadas por cualquier persona no advertida.

- Los trabajos que exigen el ingreso en la zona controlada deben ser realizados mediante procedimientos específicos respetando las distancias previstas en el Anexo I.

- Los servicios en instalaciones energizadas o en sus proximidades deben ser suspendidos de inmediato en la inminencia de evento que pueda colocar a los trabajadores en peligro.

- Siempre que se implementen innovaciones tecnológicas o para el inicio de operaciones de nuevas instalaciones o equipos eléctricos, previamente se deben elaborar análisis de riesgo, desarrollados con circuitos des-energizados y respectivos procedimientos de trabajo.
- El responsable de la ejecución del servicio debe suspender las actividades cuando verifique la situación o condición de riesgo no prevista, cuya eliminación o neutralización inmediata no sea posible.

6.12 TRABAJOS QUE IMPLICAN ALTA TENSIÓN (AT)

- Los trabajadores que intervengan en instalaciones eléctricas energizadas con alta tensión, que ejerzan sus actividades dentro de los límites establecidos como zonas controladas y de riesgo, conforme Anexo I, deben atender a lo dispuesto en este manual.

- Los trabajadores tratados deben recibir capacitación en seguridad, específicamente en seguridad del Sistema Eléctrico de Potencia (SEP) y sus proximidades, con currículo mínimo, carga horaria y demás determinaciones establecidas en el Anexo II de este documento.

- Los servicios en instalaciones eléctricas energizadas en AT, así como los ejecutados en el Sistema Eléctrico de Potencia - SEP, no pueden ser realizados individualmente.

- Todo trabajo en instalaciones eléctricas energizadas en AT, así como los que interactúen con el SEP, solamente puede ser realizado mediante orden de servicio específica para fecha y lugar, firmada por el superior responsable del área.

- Antes de iniciar trabajos en circuitos energizados en AT, el superior inmediato y el equipo, responsables por la ejecución del servicio, deben realizar una previa evaluación, estudiar y planificar las actividades y acciones que serán desarrolladas de forma que se cumpla con los principios técnicos básicos y las mejores técnicas de seguridad en electricidad aplicables al servicio.

- Los servicios en instalaciones eléctricas energizadas en AT solamente pueden ser realizados cuando existan procedimientos específicos, detallados y firmados por profesional autorizado del CONSORCIO.

- La intervención en instalaciones eléctricas energizadas en AT dentro de los límites establecidos como zona de riesgo, conforme el Anexo I de estedocumento, solamente puede ser realizada mediante la desactivación, también conocida como bloqueo de los conjuntos y dispositivos de reconexión automática del circuito, sistema o equipo.

- Los equipos y dispositivos desactivados deben ser señalizados con identificación de la condición de desactivación, conforme el procedimiento de trabajo específico estandarizado.

- Los equipos, herramientas y dispositivos aislantes o equipados con materiales aislantes, destinados al trabajo en alta tensión, deben ser sometidos a pruebas eléctricas o ensayos de laboratorio periódicos, obedeciéndose las especificaciones del fabricante, los procedimientos de la empresa y en la ausencia de estos, anualmente.

- Todo trabajador en instalaciones eléctricas energizadas en AT, así como los involucrados en actividades en el SEP deben disponer de equipo que permita la comunicación permanente con los demás miembros del equipo o con el centro de operación durante la realización del servicio.

6.13 HABILITACIÓN, CALIFICACIÓN, CAPACITACIÓN Y AUTORIZACIÓN DE LOS TRABAJADORES

- Es considerado trabajador calificado aquel que compruebe la conclusión del curso específico en el área eléctrica reconocido por el Sistema Oficial de Educación.

- Es considerado profesional legalmente habilitado el trabajador previamente calificado y con registro en el competente consejo de clase.

- Es considerado trabajador capacitado aquel que atienda a las siguientes condiciones, simultáneamente:
  - Reciba capacitación bajo orientación y responsabilidad de profesional habilitado y autorizado; y
  - Trabaje bajo la responsabilidad de profesional habilitado y autorizado.

- La capacitación sólo tendrá validez para la empresa que el capacitó y en las condiciones establecidas por el profesional habilitado y autorizado responsable por la capacitación.

- Son considerados autorizados los trabajadores calificados o capacitados y los profesionales habilitados, con anuencia formal del CONSORCIO.

- La empresa debe establecer un sistema de identificación que permita en cualquier momento conocer la amplitud de la autorización de cada trabajador.

- Los trabajadores autorizados a trabajar en instalaciones eléctricas deben tener esa condición consignada en el sistema de registro de empleado de la empresa.

- Los trabajadores autorizados a intervenir en instalaciones eléctricas deben ser sometidos a examen de salud compatible con las actividades que serán desarrolladas.

- Los trabajadores autorizados a intervenir en instalaciones eléctricas deben poseer capacitación específica sobre los riesgos derivados del empleo de la energía eléctrica y las

principales medidas de prevención de accidentes en instalaciones eléctricas, de acuerdo con lo establecido en el Anexo II de este documento.

- La empresa concederá autorización a los trabajadores capacitados o calificados y a los profesionales habilitados que hayan participado y recibido evaluación de los cursos que constan en el ANEXO II de esta RAC.

- Debe realizarse una capacitación de reciclaje bienal y siempre que ocurra alguna de las siguientes situaciones:
  - Cambio de función o cambio de empresa;
  - Retorno de licencia al trabajo o inactividad, por período superior a tres meses;
  - Modificaciones significativas en las instalaciones eléctricas o cambio de métodos, procesos y organización del trabajo.

- La carga horaria y el contenido programático de las capacitaciones de reciclaje deben cumplir con las necesidades de la situación que lo motivó.

- Los trabajos en áreas clasificadas deben ser precedidos de capacitación específica de acuerdo con el riesgo que conlleva.

- Los trabajadores con actividades no relacionadas a las instalaciones eléctricas desarrolladas en la zona libre y en la vecindad de la zona controlada, conforme define este documento, deben ser instruidos formalmente con conocimientos que permitan identificar y evaluar sus posibles riesgos y adoptar las precauciones adecuadas.

6.14 PROTECCIÓN CONTRA INCENDIO Y EXPLOSIÓN

- Las áreas donde existan instalaciones o equipos eléctricos deben estar dotadas de protección contra incendio y explosión,

- Los materiales, piezas, dispositivos, equipos y sistemas destinados a la aplicación en instalaciones eléctricas de ambientes con atmosferas potencialmente explosivas deben ser evaluados en lo referente a su conformidad.

- Los procesos o equipos susceptibles de generar o acumular electricidad estática deben disponer de protección específica y dispositivos de descarga eléctrica.

- En las instalaciones eléctricas de áreas clasificadas o sujetas a riesgo acentuado de incendio o explosiones, deben adoptarse dispositivos de protección, como alarma y

seccionamiento automático para prevenir sobretensiones, sobrecorrientes, fallas de aislamiento, calentamientos u otras condiciones anormales de operación.

- Los servicios en instalaciones eléctricas en las áreas clasificadas, solamente podrán ser realizados mediante permiso para el trabajo con liberación formalizada, conforme se establece en el reglamento.

6.15 SEÑALIZACIÓN DE SEGURIDAD

En las instalaciones y servicios en electricidad deben adoptarse señalizaciones adecuadas de seguridad, destinada a la advertencia y a la identificación, de forma a atender, entre otras, a las siguientes situaciones:

- Identificación de circuitos eléctricos;
- Trabados y bloqueos de dispositivos y sistemas de maniobra y comandos;
- Restricciones e impedimentos de acceso;
- Delimitaciones de áreas;
- Señalización de áreas de circulación, de vías públicas, de vehículos y de movimiento de cargas;
- Señalización de impedimento de energización;
- Identificación de equipo o circuito impedido.

6.16 PROCEDIMIENTOS DE TRABAJO

Los servicios en instalaciones eléctricas deben ser planificados y realizados en conformidad con los procedimientos de trabajo específicos, estandarizados, con descripción detallada de cada tarea, paso a paso, firmados por profesional que cumpla con lo que establece el procedimiento.

Los servicios en instalaciones eléctricas deben ser precedidos de órdenes de servicio específicas, aprobadas por trabajador autorizado, conteniendo, como mínimo, el tipo, la fecha, el lugar y las referencias a los procedimientos de trabajo que serán adoptados.

Los procedimientos de trabajo deben contener, como mínimo, objetivo, campo de aplicación, base técnica, competencias y responsabilidades, disposiciones generales, medidas de control y orientaciones finales.

Los procedimientos de trabajo, la capacitación de seguridad y salud y las autorizaciones deben contar con la participación, en todo el proceso de desarrollo, del Servicio Especializado de Ingeniería de Seguridad y Medicina del Trabajo - cuando exista.

Cada equipo debe tener a uno de sus trabajadores calificados para ejercer la supervisión y conducción de los trabajos;

Antes que sus miembros inicien los trabajos en equipo, juntamente con el responsable por la ejecución del servicio, deben realizar una evaluación previa, estudiar y planificar las actividades y acciones que serán desarrolladas en el lugar, de forma cumplir con los principios técnicos básicos y las mejores técnicas de seguridad aplicables al servicio.

La alternación de actividades debe considerar el análisis de riesgos de las tareas y la competencia de los trabajadores involucrados, de forma a garantizar la seguridad y la salud en el trabajo.

6.17 SITUACIÓN DE EMERGENCIA

Las acciones de emergencia que involucren las instalaciones o servicios con electricidad deben constar en el plan de emergencia de la empresa.

Los trabajadores autorizados deben estar aptos a ejecutar el rescate y prestar primeros socorros a accidentados, especialmente por medio de reanimación cardiopulmonar.

El CONSORCIO debe poseer métodos de rescate estandarizados y adecuados a sus actividades, colocando a disposición a los medios para su aplicación.

Los trabajadores autorizados deben estar aptos para manipular y operar equipos de prevención y combate a incendio existentes en las instalaciones eléctricas.

6.18 DISPOSICIONES FINALES

Los trabajadores deben interrumpir sus tareas ejerciendo el derecho de rechazar o rehusar, siempre que consten evidencias de riesgos graves e inminentes para su seguridad y salud o la de otras personas, comunicando inmediatamente el hecho a su superior jerárquico, que diligenciará las medidas apropiadas.

Tanto el CONSORCIO como los Sub-Contratistas deben promover acciones de control de riesgos originados por otros en sus instalaciones eléctricas y ofrecer, de inmediato, cuando sea apropiado, denuncia a los órganos competentes.

La documentación prevista en este manual debe estar permanentemente a disposición de los trabajadores que actúan en servicios e instalaciones eléctricas, respetadas las coberturas, limitaciones e interferencias en las tareas así como estar, permanentemente a disposición de las autoridades competentes.

7.0 ANEXOS

7.1 ANEXO I-ZONA DE RIESGO Y ZONA CONTROLADA

Tabla de radios de delimitación de zonas de riesgo, controlada y libre.

*Rango de tensión **Nominal** de la **instalación** eléctrica en kV*	*Rr - Radio de delimitación entre zona de riesgo y controlada en metros*	*Rc - Radio de delimitación entre zona controlada y libre en metros*

ABOGADO NOTARIO PÚBLICO
Mat. # 2570
Santo Domingo, R.D.N.

Figura 1 - Distancias en el aire que delimitan radialmente a las zonas de riesgo, controlada y Libre

Figura 2 - Distancias en el aire que delimitan radialmente las zonas de riesgo, controlada y libre, con interposición de superficie de separación física adecuada.

ZL = Zona libre

ZC = Zona controlada, restricta a trabajadores autorizados.

ZR = Zona de riesgo, restricta a trabajadores autorizados y con la adopción de técnicas, instrumentos y equipos apropiados al trabajo.

PE = Punto de la instalación energizado.

SI = Superficie aislante construida con material resistente y dotada de todos los dispositivos de seguridad.

7.2 ANEXO II-CAPACITACIONES

CAPACITACIONES

1) PREVENCIÓN DE RIESGOS EN INSTALACIONES ELÉCTRICAS Y SERVICIOS CON ELECTRICIDAD

Todos los trabajadores autorizados que ejecutan trabajos en instalaciones eléctricas y servicios con electricidad en sistemas des-energizados

Carga horaria mínima - 08h:

Programación Mínima:

1) Presentación del RAC-11
2) Introducción a la seguridad con electricidad.
3) Riesgos en instalaciones y servicios con electricidad:
   - El choque eléctrico, mecanismos y efectos;
   - Arcos eléctricos; quemaduras y caídas;
   - Campos electromagnéticos.
   - Accidentes de origen eléctrico
4) Técnicas de Análisis de Riesgo.
5) Medidas de Control de Riesgo Eléctrico:
   - Desenergización.
   - Puesta a tierra funcional (TN / TT / IT); de protección; temporal;
   - Equipo tencialización;
   - Seccionamiento automático de la alimentación;
   - Dispositivos a corriente de fuga;
   - Extra baja tensión;
   - Barreras y envolturas;
   - Bloqueos e impedimentos;
   - Obstáculos y mamparas;
   - Aislamiento de las partes vivas;

- Aislamiento doble o reforzada;
- Colocación fuera de alcance;
- separación eléctrica.

6) Rutinas de trabajo - Procedimientos
   - Instalaciones des-energizadas;
   - Liberación para servicios;
   - Señalización;
   - Inspecciones de áreas, servicios, herramental y equipo;
7) Responsabilidades

Dr. Ramón Ma. Díaz Mañón, Abogado Notario Público, Santo Domingo, R.D.N. Mat. # 2570

2) SEGURIDAD EN EL SISTEMA ELÉCTRICO DE POTENCIA (SEP)

Todos los trabajadores autorizados que ejecutan trabajos en instalaciones eléctricas energizadas con alta tensión (Tensión superior o igual a 1000Vca y 1500Vcc). Para participar de este curso complementario, es prerrequisito haber participado, con aprovechamiento satisfactorio, del curso básico definido anteriormente.

Carga horaria mínima - 30h:

Programación Mínima:

1) Presentación del RAC-11
2) Organización del Sistema Eléctrico de Potencia - SEP.
3) Organización del trabajo:
   - Programación y planificación de los servicios;
   - Trabajo en equipo;
   - Prontuario y registro de las instalaciones;
   - Métodos de trabajo; y
   - Comunicación
4) Aspectos comportamentales.
5) Condiciones impeditivas para servicios.
6) Riesgos típicos en el SEP y su prevención (*):
   - Proximidad y contactos con partes energizadas;
   - Inducción;
   - Descargas atmosféricas;
   - Estática;
   - Campos eléctricos y magnéticos;
   - Comunicación e identificación; y
   - Trabajos en altura, máquinas y equipos especiales
7) Técnicas de análisis de Riesgo en el S E P (*)

8) Procedimientos de trabajo - análisis y discusión. (*)
9) Técnicas de trabajo bajo tensión: (*)
   - En línea viva;
   - Al potencial;
   - En áreas internas;
   - Trabajo a distancia;
   - Trabajos nocturnos; y
   - Ambientes subterráneos.
10) Equipos y herramientas de trabajo (elección, uso, conservación, verificación, ensayos) (*).
11) Sistemas de protección colectiva (*).
12) Equipos de protección individual (*).
13) Posturas y vestuarios de trabajo (*).
14) Seguridad con vehículos y transporte de personas, materiales y equipos (*).
15) Señalización y aislamiento de áreas de trabajo (*).
16) Liberación de instalación para servicio y para operación y uso (*).
17) Capacitación en técnicas de retirada, atención, transporte de accidentados (*).
18) Accidentes típicos (*) - Análisis, discusión, medidas de protección.
19) Responsabilidades (*).

(*) Estos tópicos deben ser desarrollados y dirigidos específicamente para las condiciones de trabajo características de cada ramo, estándar de operación, de nivel de tensión y de otras peculiaridades específicas al tipo o condición especial de actividad, siendo obedecida la jerarquía en el perfeccionamiento técnico del trabajador.

1.0 INTRODUCCION

Este Plan establece los procesos del Sistema de Gestión de la calidad (SGC) y los recursos que serán aplicados en el Proyecto Termoeléctrico Punta Catalina.

El Plan cumple con los requisitos establecidos por el Cliente y lo establecido en la norma NBR ISO 9001: 2008 - Sistemas de Gestión de la Calidad - Requisitos

2.0 OBJETIVO

Definir las directrices del Programa de la Calidad a ser implementado para la ejecución del proyecto Termo Termoeléctrico Punta Catalina en el desarrollo de los servicios de:

Ingeniería, Procura, Construcción, Pre comisionamiento, y Comisionamiento, con el apoyo del CLIENTE antes de la operación de la planta.

El proyecto consiste en la construcción de una Termoeléctrica a Carbón de 720 MW (gross), integrada por 2 unidades de 360 MW, para la generación de energía, un muelle para la recepción del carbón, así como todas las instalaciones de apoyo como son: patios de carbón, instalaciones de descarga, control de emisiones de partículas, sistema de refrigeración y de tratamiento de agua, sistemas de control de emisión de cenizas y subestaciones.

(Ingeniería Incluye; Ingeniería Básica e Ingeniería de Detalle, Construcción incluye Obra Civil, Mecánica, Eléctrica, Instrumentación, Telecomunicaciones y Servicios relacionados)

Para el caso de los subcontratistas, cuyos servicios suministrados no conlleven la necesidad de implementación de un Sistema de Gestión de la Calidad, pero sí de algunos procedimientos específicos, se les proveerán dichos documentos, para que los implementen en el desarrollo de sus actividades.

3.0 ALCANCE

Aplica para la implementación y mantenimiento del Programa de la Calidad en el desarrollo de las actividades del proyecto Termo Azua RD.

El CONSORCIO conformado por la Constructora Norberto Odebrecht, S.A. (CNO), Tecnimont S.p.A. e Ingeniería Estrella están a cargo de la gestión general del proyecto, que incluye: toda la Ingeniería, Procura y actividades de embarque al sitio, Construcción, Pre comisionado, Comisionamiento y asistencia al arranque y pruebas de desempeño, para la planta: Servicios Auxiliares, Almacenamiento / Tratamiento de Aguas, Logística, Administración de Servicios Auxiliares etc.

La compañía Tecnimont (TCM) está a cargo de la Ingeniería.

4.0 REFERENCIAS

Los siguientes documentos establecen los requisitos generales aplicados para desarrollar el presente Plan de la Calidad a implementarse en el desarrollo del Proyecto.

- Contrato
- Plan de la Calidad
- ISO 9001:2008 Sistemas de Gestión de la Calidad-Requisitos
- ISO 9000:2005 Sistemas de Gestión de la Calidad–Fundamentos y vocabulario

5.0 TERMINOS Y DEFINICIONES

1) **Cliente:** Organización o persona que recibe un producto.
2) **Proceso:** Conjunto de actividades mutuamente relacionadas o que interactúan, las cuales transforman elementos de entrada en resultados.
3) **Proceso de Medición:** Conjunto de operaciones que permiten determinar el valor de una magnitud.
4) **Producto:** Resultado de un proceso (cuatro categorías genéricas de productos; servicios, software, hardware, materiales procesados).
5) **Programa de la Calidad:** Sistema de Gestión de la Calidad.
6) **Seguimiento:** Proceso de aseguramiento de características necesarias de un determinado producto y/o servicio.
7) **Contratista/ Consorcio:** es la asociación constituida por:
   - Odebrecht
   - Tecnimont
   - Ingeniería Estrella

6.0 SIGLAS Y DEFINICIONES

Par los efectos de este Plan de Calidad los términos y las definiciones indicadas en la Norma ISO 9000:2005 y el Contrato serán aplicables y tendrán el significado indicado en esta sección. No es intención en esta sección definir palabras comunes, las que se utilizan de acuerdo con su significado establecido en un diccionario. Las siguientes siglas de terminología específica están definidas para el proyecto:

- **SGC** Sistema de Gestión de la calidad
- **EDT** Entrenamientos Diarios de Trabajo

7.0 RESPONSABILIDADES

NA

8.0 PROGRAMA DE LA CALIDAD

8.1 REQUISITOS GENERALES

El CONSORCIO establece el Programa "Sistema de Gestión" de la Calidad (SGC), para demostrar la capacidad de proporcionar coherentemente servicios que satisfagan los requisitos de nuestro CLIENTE.

La calidad comienza a partir de la concepción del proyecto, se planea, se gestiona y está estrechamente ligada a satisfacer las necesidades declaradas o implícitas del CLIENTE.

La dirección de la calidad se basa en la participación de todos los miembros del equipo, que deben dar la misma prioridad a su gestión que a la que se da a la gestión del tiempo o del coste del proyecto y abarca todo el ciclo de vida, desde su definición inicial hasta los procesos del proyecto, la dirección de su equipo, sus entregables y su cierre.

En el desarrollo de este Programa de la Calidad y buscando actuar bajo este concepto, se identifican y establecen los procesos y actividades principales, así como la interacción entre ellos, para la ejecución del proyecto. (ver figura 1)

Fig.1 Macro procesos

Para verificar la capacidad de dichos procesos para alcanzar los resultados planificados, son desarrolladas metodologías adecuadas para su seguimiento, y para la medición de sus principales características. Dichas metodologías están descritas en la planificación del proyecto y en la documentación del Programa de la Calidad.

Para el seguimiento del desempeño del Programa de la Calidad, el cumplimiento de los requisitos contractuales y de la Política de la Calidad del CONTRATISTA establecemos:

- **Objetivos de la Calidad específicos para el Proyecto:** El seguimiento a dichos objetivos se realiza por medio de indicadores de Desempeño definidos para dichos Procesos. La gestión de eventuales proveedores/subcontratistas que influyan en la calidad final de los productos y/o servicios será siempre del responsable del proceso que solicita el producto y/o servicio adquirido.

La interacción de los procesos se efectúa a través del uso de planes y procedimientos documentados según la estructura de la documentación (Ver figura 2).

Se identificó los procesos necesarios para el SGC, que además de la Dirección del Contrato son:

- Gerencia de Producción;
- Gerencia de Equipos;
- Gerencia Administrativa y Financiera;
- Gerencia de Ingeniería;
- Gerencia Comercial;
- Gerencia de Calidad;
- Gerencia de Seguridad, Salud en el Trabajo y Medio Ambiente;

8.2 REQUISITOS DE LA DOCUMENTACIÓN

I. Generalidades

La documentación del Programa de la Calidad, está estructurada de acuerdo a lo siguiente:

Plan de la Calidad, planes referenciados, procedimientos de la calidad, documentación técnica del proyecto, documentación de origen externo (normas técnicas aplicables, especificaciones de materiales, manuales y procedimientos de otras organizaciones). Dicha documentación está reflejada y se controla a través de los siguientes documentos:

- Lista de documentos internos del Programa de la Calidad
- Lista de documentos externos (Manuales de la Calidad, procedimientos documentados de las empresas integrantes, Normas Técnicas, Requisitos Reglamentarios, etc. aplicables al Programa de la Calidad
- Lista de documentos técnicos de Ingeniería (Diseños, especificaciones técnicas, estudios, etc.)

La documentación del proyecto es codificada conforme al procedimiento preestablecido para documentos en la empresa.

9.0 MANUAL DE LA CALIDAD

El alcance del Sistema de Gestión de la Calidad, los procedimientos establecidos y una descripción de la interacción entre los procesos del SGC, están establecidos en este Plan de la Calidad.

10.0 ASEGURAMIENTO DE LA CALIDAD

EL aseguramiento de calidad consiste en la aplicación de actividades planificadas y sistemáticas relativas a la calidad, para asegurar que el proyecto emplee todos los procesos necesarios para cumplir con los requisitos.

El director de proyector tiene la responsabilidad de establecer los procedimientos y procesos administrativos necesarios para asegurar y demostrar que la declaración del alcance cumple con los requerimientos actuales del CLIENTE; es el responsable, junto con su equipo, de determinar qué procesos serán utilizados para asegurar a las partes interesadas que las actividades

relacionadas con la calidad se llevarán a cabo adecuadamente, y que todos los aspectos relacionados con la legislación serán contemplados y convenientemente seguidos.

11.0 CONTROL DE LOS DOCUMENTOS

La jerarquía de la documentación relacionada con el Plan de la Calidad se presenta a continuación:

Fig.2 Estructura de la documentación

Los documentos de ingeniería serán preparados, distribuidos y controlados con los procedimientos de cada organización, así como su control electrónico.

Toda la documentación del proyecto se transmitirá al CLIENTE por el Gerente de Proyecto a través del Control de documentos.

El CONTRATISTA tendrá una base de datos donde contenga la documentación del Proyecto en el sitio de Obra.

Los documentos técnicos y de proyecto, de origen interno y externo, así como los documentos necesarios para establecer, implementar y mantener este Plan son controlados a través del procedimiento "Control de los Documentos" a fin de asegurar que:

- Todos los documentos son aprobados antes de su emisión,
- Los documentos serán revisados y nuevamente aprobados cuando sea necesario,

- Las modificaciones o cambios en cada revisión de los documentos son identificados,
- Las versiones pertinentes de los documentos estén disponibles en los puntos de uso,
- Los documentos permanecen legibles y fácilmente identificables,
- Los documentos de origen externo son identificados y controlada su distribución,
- Los documentos obsoletos son identificados de forma adecuada a fin de evitar su uso no intencionado.

El control de los documentos en el sitio de la obra es realizado por medio de programas de manejo internos del CONSORCIO.

Cada subcontratista utilizará sus procedimientos específicos para esas actividades, en el ámbito de sus servicios; los cuales deben ser previamente aprobados por la Gerencia del CONSORCIO.

11.1 CONTROL DE LOS REGISTROS

Los registros que sean generados en los procesos de Ingeniería y Compras serán controlados con los procedimientos del CONSORCIO.

Para el control de los registros en el sitio de obra, se define e implementa el procedimiento "Control de los Registros". En este procedimiento están los lineamientos aplicables para la identificación, archivo, protección, recuperación, retención y disposición de los registros bajo su control, a fin de garantizar que estén legibles, identificables y que se les pueda recuperar pronta y fácilmente.

El sistema de control de los registros en el proceso de Construcción se definirá de manera que permita la integración periódica del "Plan de la Calidad" del Proyecto, en donde se incluirán las evidencias objetivas de ejecución de las actividades inherentes al mismo.

El procedimiento de Preparación del Dossier de Calidad, definirá la metodología para la integración y conformación del "Data Book" del proyecto con toda la documentación que deberá ser entregada al cliente conforme a lo establecido en el contrato.

12.0 RESPONSABILIDAD DE LA DIRECCIÓN

12.1 COMPROMISO DE LA DIRECCIÓN

El compromiso de la Dirección con la implementación y el desarrollo del Programa de la Calidad y su mejora continua está basado en la definición e implementación de la Política y Objetivos de la Calidad, en la realización de las Revisiones del Programa de la Calidad, en la garantía de la disponibilidad de los recursos necesarios, en la comunicación a todos los involucrados de la importancia de cumplir con los requisitos del Cliente, los requisitos legales y reglamentarios.

El Contratista se regirá por un Comité Ejecutivo, encabezado por un Director Ejecutivo CEO y un Director Adjunto.

El Comité Ejecutivo estará constituido por Director Ejecutivo, Director Adjunto, Director de Finanzas y un Director de Control de Proyecto.

La Dirección es el único interlocutor con el Propietario para todos los asuntos y para la coordinación con Tecnimont, se regirán por el procedimiento de coordinación específico del proyecto. (A confirmar).

El equipo de dirección del proyecto: Director de Contrato (DC) en el proyecto denominado Director de Proyecto y sus respectivos Responsables por Procesos (RP´s) en el proyecto denominadas Gerencias de Área, elaboran e implementan sus Programas de Acción (PA), donde definen su compromiso con el cumplimiento del Programa de la Calidad. (Cada socio y eventuales subcontratistas realizaran estas acciones conforme sus lineamientos de organización).

El PA es un instrumento medible de compromiso y planificación a través de la delegación planeada que define el negocio y su filosofía de conducción, los resultados (incluyendo los objetivos de la calidad/indicadores de desempeño), bien como los plazos y los recursos necesarios para los servicios a ejecutar. Es un instrumento por el cual se hace el seguimiento del proceso.

12.2 ENFOQUE AL CLIENTE

Conforme a las condiciones presentadas en las bases de licitación, se identificaron y listaron cuales eran los requerimientos del CLIENTE para con esto, elaborar una estrategia a fin de identificar y priorizar las actividades, definir los alcances y emplear todos los procesos necesarios para cumplir con los requisitos.

13.0 POLÍTICA DE LA CALIDAD

El CONSORCIO cuenta con un equipo interdisciplinario con la capacidad necesaria acorde con la complejidad y características del proyecto lo que garantiza que los trabajos serán ejecutados conforme a las especificaciones y requerimientos del CLIENTE.

La política de la calidad es comunicada a todo el personal involucrado con el Proyecto por medio de charlas de integración, cursos y seminarios internos, EDT – Entrenamientos Diarios de Trabajo, Entrenamiento en servicio y diversos dispositivos de comunicación como: carteles, cuadros y otros, de manera a asegurar que todos la entienden y la ponen en marcha durante la ejecución de sus actividades. La implementación de esta será evaluada, en las reuniones de Revisión por la Dirección.

La Política de la Calidad para el proyecto es:

Satisfacer al Cliente a través de la provisión de servicios enfocados en los costos y plazos considerando:

- La efectiva atención a los requisitos de los Clientes;
- Los Objetivos de la Calidad y su revisión;
- La revisión de esta Política con el enfoque en su permanente adecuación, y;
- La mejora continua de la eficacia del Programa (Sistema de Gestión) de la Calidad.

A través de la mejora continua se pretende lograr el objetivo de los cinco ceros:

- 0 defectos: plena calidad de producción
- 0 averías: Máximo rendimiento de instalaciones
- 0 stocks: Mínimos capitales inmovilizados
- 0 retrasos:
- 0 papeles: papeles inútiles. Máxima eficiencia administrativa

La Política es analizada en las Revisiones del Programa de la Calidad por la Dirección, cuando se evalúa la eventual necesidad de hacer cambios en la misma, para mantener su adecuación a la realidad del Proyecto.

Cada socio y eventuales subcontratistas realizaran estas acciones conforme a los lineamientos tanto de su organización como las establecidas por el CONSORCIO.

14.0 PLANIFICACIÓN

14.1 OBJETIVOS DE LA CALIDAD

Los objetivos de calidad forman parte integral de las políticas del CONSORCIO. Estos objetivos especifican qué quiere la organización conseguir y el límite temporal en el que deberá alcanzarse. Los objetivos de los mismos, son establecidos en las funciones y niveles pertinentes Para el cumplimiento de estas políticas; se establecen metas para los Procesos y Objetivos específicos.

El seguimiento de los Procesos es a través de Indicadores de Desempeño. Las metas y objetivos de la calidad establecidos están reflejados en el Programa de Acción (PA) de cada Gerencia. Cada socio y eventuales subcontratistas realizaran estas acciones conforme a los lineamientos del CONSORCIO.

14.2 PLANIFICACIÓN DEL PROGRAMA DE LA CALIDAD

La planificación de este Programa de la Calidad involucra la identificación de los Procesos, las actividades que deben controlarse, la secuencia e interacción de los mismos, la definición del cronograma para su implementación y seguimiento, la verificación del cumplimiento de los requisitos aplicables. La planificación está reflejada en el cronograma de implementación del programa de la calidad.

La planificación del programa de la calidad se evidencia por medio de lo establecido en este plan y en la documentación que lo soporta. Los requisitos del programa de la calidad son atendidos e implementados a lo largo del desarrollo del proyecto, conforme al cronograma de implementación.

El seguimiento, medición, revisión y mejora de los Procesos, así como las actividades involucradas en los mismos son realizadas conforme a lo establecido en este plan y en los documentos en el referenciados.

15.0 RESPONSABILIDAD, AUTORIDAD Y COMUNICACIÓN

Las responsabilidades y autoridades están establecidas a lo largo de la documentación desarrollada para el Programa de la Calidad, estas son comunicadas a los responsables nombrados a través de entrenamientos y/o distribución de los documentos, con el propósito que todos estén conscientes de la importancia de su buen desempeño frente a los requisitos aplicables.

14.3 REPRESENTANTE DE LA DIRECCIÓN DEL PROYECTO PARA EL PROGRAMA DE LA CALIDAD

El Representante de la Dirección del CONTRATISTA para la Gestión de la Calidad en el Proyecto es el Gerente de la Calidad. El representante, además de otras responsabilidades que se le asignen, tiene las siguientes atribuciones, responsabilidad y autoridad para:

- Asegurar que el Programa de la Calidad esté establecido, implementado y mantenido, de acuerdo con las directrices de este Plan.
- Informar a la Dirección sobre el desempeño del Programa de la Calidad y cualquier necesidad de mejora.
- Asegurar que se promueve la toma de conciencia de los requisitos aplicables a cada caso en todos los niveles.

14.4 COMUNICACIÓN INTERNA

El CONTRATISTA se apoya de diversas herramientas para realizar la comunicación interna, referente a los temas del Proyecto, entre otras:

- Escrita: Datos de reuniones, correos, consultas técnicas, documentos del Programa de la Calidad, registros, Informes mensuales, etc.
- Verbal: Charla directa entre el líder y sus liderados, entrenamientos de todo tipo, reuniones de coordinación, etc.
- Visual: Carteles y cuadros.
- Electrónica: Correo electrónico, internet, teléfono, etc.

La distribución de los documentos del Programa de la Calidad se realiza a través de la Matriz de Distribución de Documentos.

La comunicación referente a la eficacia del Programa de la Calidad del proyecto se hace a través de los indicadores de desempeño.

16.0 REVISIÓN POR LA DIRECCIÓN

14.5 GENERALIDADES

La Dirección del CONTRATISTA realiza las Revisiones del Programa de la Calidad cada seis meses, con base en los temas discutidos en las reuniones mensuales de coordinación, para asegurarse de su conveniencia, adecuación y eficacia continúa.

Las revisiones del Programa de la Calidad del CONTRATISTA son coordinadas por el Gerente de la Calidad y cuentan con la participación del Director y de los Gerentes.

La Revisión por la Dirección se registra a través del formato Informe de Revisión del Programa de Calidad.

14.6 INFORMACIÓN PARA LA REVISIÓN

La información de entrada para las revisiones por la dirección incluye:

- Resultados de auditorías;
- Retroalimentación del Cliente;
- Desempeño de los Procesos y la conformidad de los productos y/o servicios;
- Estado de las Acciones Correctivas y Preventivas;
- Seguimiento de acciones originadas en revisiones previas del Programa de la Calidad;
- Cambios que puedan afectar al Programa de la Calidad;
- Desempeño de proveedores;
- Recomendaciones para mejora de los Procesos.

14.7 RESULTADOS DE LA REVISIÓN

Los resultados de la revisión incluyen las decisiones y acciones relacionadas con:

- La mejora de la eficacia del Programa de la Calidad y sus Procesos;
- La mejora de los productos y/o servicios frente a los requisitos del Cliente;
- La necesidad de recursos.

Cuando sea aplicable, las acciones resultantes de las revisiones estarán reflejadas en los Programas de Acción de los Gerentes del Contratista, donde se establecen las responsabilidades y plazos para su cumplimiento. Es responsabilidad del Representante de la Dirección del Contratista hacer el seguimiento de la implementación de dichos planes, en lo que se refiere a dichas acciones, así como se encarga de informar los resultados del seguimiento a la Dirección.

17.0 GESTIÓN DE LOS RECURSOS

17.1 PROVISIÓN DE LOS RECURSOS

La Dirección del CONTRATISTA tiene el compromiso de proporcionar los recursos relativos a personal (incluyendo los relacionados con las actividades de: verificación, inspección, auditorías internas, pruebas y vigilancia de las operaciones que afectan a la conformidad de los requisitos de los productos, servicios y procesos), software, hardware, instalaciones, equipo y otras facilidades (transporte, comunicaciones e informática). Para ello los Gerentes identifican los recursos en los documentos de planificación del proyecto y están disponibles en tiempo conforme al Plan de Ejecución del Proyecto e histogramas.

18.0 RECURSOS HUMANOS

18.1 GENERALIDADES

La Dirección del CONTRATISTA establece que el personal que realice trabajos de Diseño y Procura sea competente y evaluado conforme a los lineamientos del CONSORCIO, para los trabajos de Construcción, incluyendo los subcontratistas, en todo lo relacionado a sus actividades, deben ser competentes con base en educación, formación (entrenamiento), habilidades y experiencia apropiadas.

18.2 COMPETENCIA, FORMACIÓN Y TOMA DE CONCIENCIA

Son establecidos requisitos, con base en educación, entrenamiento, habilidades y experiencia profesional, para la selección del personal que ejecuta actividades que tienen influencia en la calidad.

EL CONTRATISTA determina y provee entrenamiento u otras acciones necesarias para satisfacer las necesidades de competencia, verificar la eficacia de los mismos y mantiene los registros apropiados.

El cumplimiento de los requisitos de competencia (educación, formación, habilidades y experiencia) se verifica en el momento de admisión del personal previsto en la matriz de competencia. Las habilidades necesarias, son verificadas en el momento de la admisión de los empleados o en el inicio de las actividades, bajo metodologías específicas establecidas.

A los integrantes de nuevo ingreso del CONTRATISTA se les proporcionaran Charlas de Inducción al trabajo.

Las necesidades de formación/entrenamiento son identificadas, planificadas y llevadas a cabo por los responsables de los diversos Procesos, para cada función.

Para asegurar que el personal conozca sus responsabilidades y de cómo contribuyen al logro de los objetivos de la calidad, se realizan reuniones donde se transmite al personal sus actividades

descritas en los procedimientos de trabajo y se explica su contribución para el logro de las metas y objetivos.

Se hace la verificación de la eficacia del entrenamiento por medio del seguimiento (análisis de tendencias y de los indicadores de desempeño) de las actividades de los empleados que hayan sido entrenados, por los responsables de los diversos Procesos.

Se mantendrán los registros apropiados de educación, experiencia, formación y habilidades.

19.0 INFRAESTRUCTURA

La infraestructura necesaria y adecuada para la ejecución de los servicios es identificada, definida y prevista en la fase de planificación del proyecto, e incluye:

- Los aspectos relacionados con las oficinas, campamentos de obra, espacios de trabajo y servicios asociados,
- Equipamiento para los procesos incluyendo hardware y software,
- Sistemas de apoyo tales como transporte, comunicaciones e informática.

Los requerimientos de infraestructura se especificarán contractualmente a los subcontratistas que trabajen en las instalaciones del proyecto.

El mantenimiento de la infraestructura y equipos propiedad del CONTRATISTA se desarrollará conforme a los programas de preservación, con la finalidad de tenerla disponible para la ejecución de las actividades del proyecto.

Los proveedores/subcontratistas desarrollaran actividades de mantenimiento de sus equipos con base en metodologías específicas, las cuales serán revisadas antes del inicio de los servicios.

Se mantendrán los registros de los mantenimientos realizados.

19.1 AMBIENTE DE TRABAJO

Las condiciones adecuadas para el desarrollo de las actividades de los servicios del Contratista y de sus subcontratistas en las instalaciones del mismo, están aseguradas a través de la utilización de las instalaciones y procedimientos apropiados, tomando en consideración factores como:

- Localización adecuada de las áreas de trabajo;

- Instalaciones adecuadas, además de las condiciones en las cuales el trabajo es ejecutado, considerando: calor, humedad, iluminación, ventilación, higiene, limpieza, ruido, vibración y polución; además de factores físicos;

- Uso de equipamiento de protección personal.

20.0 REALIZACIÓN DEL PRODUCTO

14.8 PLANIFICACIÓN DE LA REALIZACIÓN DEL PRODUCTO

La planificación y desarrollo de los Procesos necesarios para la realización del proyecto son descritos a detalle en el Plan de Ejecución del Proyecto y los planes referenciados en el mismo. Dicha planificación y desarrollo son llevadas a cabo de manera coherente con los demás requisitos del Programa de la Calidad.

Durante la planificación de la realización del proyecto se consideran los siguientes puntos:

- Los objetivos de la calidad, los requisitos específicos para los productos y/o servicios,

- Los procesos, documentos y recursos específicos necesarios,

- Las actividades requeridas para realizar la verificación, validación, seguimiento, medición, inspección y ensayo/prueba específicas para el proyecto, así como los criterios de aceptación del mismo

- Los registros necesarios para proporcionar evidencia de que los procesos de realización y los elementos del proyecto resultantes cumplen con los requisitos, y que son controlados de acuerdo a lo especificado en los procedimientos de coordinación con el CLIENTE o lo especificado en el contrato.

21.0 PROCESOS RELACIONADOS CON EL CLIENTE

21.1 DETERMINACIÓN DE LOS REQUISITOS RELACIONADOS CON EL PRODUCTO

El CONTRATISTA identificó los posibles requisitos del cliente, así como aquellos necesarios para el uso correcto de los productos y servicios, además de los requisitos reglamentarios y legales aplicables. Esto se traduce en los procedimientos, planes e instrucciones que constituyen la documentación del Programa de la Calidad.

La comunicación de dichos requisitos se realiza a través de la distribución, por la Dirección, de copias del contrato o aditivos, y sus anexos a los gerentes y además de esto en la comunicación de los requisitos también ocurre a través de procedimientos, planos, instrucciones de trabajo que constituyen la documentación del Sistema de la Calidad y de diseño donde están reflejados.

Cuando los requisitos fueran alterados, los documentos pertinentes serán revisados y el personal involucrado será comunicado.

El CONTRATISTA se asegura de que los requerimientos solicitados por el cliente son comprendidos internamente, así como los requisitos especificados por el cliente han sido trasladados adecuadamente a los documentos de ingeniería, a los documentos de compras; y que se han comprendido por los fabricantes, proveedores y subcontratistas.

21.2 REVISIÓN DE LOS REQUISITOS RELACIONADOS CON EL PRODUCTO

La revisión de los requisitos relacionados con el proyecto es realizada por el CONTRATISTA antes de la firma del contrato, a fin de que, queden claros cuales son los requerimientos y expectativas del CLIENTE.

En los casos de alteraciones en el contrato, es necesario dejar en claro:

- Definición de los requisitos
- Capacidad de cumplir

Son mantenidos registros del resultado de estas revisiones a través del contrato firmado y cuando aplique, de sus alteraciones.

Los Documentos Contractuales (Contrato, directrices, especificaciones, comunicaciones con el Cliente, etc.) resultantes de la revisión, son mantenidos por la Administración Contractual del CONTRATISTA e incluyen todas las condiciones contractuales escritas. Los acuerdos verbales y adiciones al contrato solo serán válidos cuando se documenten y se autoricen por el CLIENTE.

El Director del CONSORCIO se asegura que los requisitos del contrato son acordados antes de su aceptación y confirmados por escrito antes de su ejecución. Cuando se firma el contrato con el cliente, esto certifica que las revisiones fueron realizadas.

En caso de que se presenten cambios/modificaciones en los requisitos del proyecto, Administración Contractual se asegura de que la documentación pertinente sea modificada y de que el personal involucrado sea consciente de los requisitos modificados.

21.3 COMUNICACIÓN CON EL CLIENTE

Los canales de comunicación con el CLIENTE son aquellos establecidos en el contrato; puede realizarse por medio de cartas y actas de reuniones, informes diarios de obra, conforme a los lineamientos definidos de común acuerdo y establecidos en los procedimientos de coordinación, donde se tratan, de acuerdo a lo requerido en los contratos, los siguientes puntos:

- consultas técnicas y aclaraciones,
- retroalimentación del CLIENTE, incluyendo reclamaciones,
- información sobre proyecto y su desarrollo,
- manejo de cambios o modificaciones al alcance del contrato,
- información de subcontratistas, seguimiento a órdenes de compra y avance de fabricación de equipos.

La gerencia Comercial mantiene una sistemática para dar seguimiento al proceso de comunicación con el CLIENTE que tiene como objetivos:

- Mantener las pendencias tanto solicitudes como reclamos, bajo condiciones controladas hasta la solución definitiva;
- Sistematizar y compilar la masa de datos resultantes de este control que representen desvíos, reclamos del Cliente, Falta de acciones en el entendimiento con el Cliente.
- Ser un instrumento eficaz para ser utilizado en el monitoreo de la percepción del Cliente y de los procesos

Estas comunicaciones pueden ser recibidas del CLIENTE a través de cartas y de actas de reunión.

Todas las semanas la Gerencia Comercial informa el estado de las comunicaciones con el CLIENTE para cada una de las gerencias para el análisis y la toma de acciones.

Según aplique, la Gerencia de la Calidad en conjunto con las Gerencias involucradas pueden decidir por la emisión de un Informe de No Conformidad.

Para la fase del desarrollo, cierre y entrega del proyecto, el canal de comunicación autorizado es el Director del CONSORCIO y/o a quien se designe como sustituto.

22.0 DISEÑO Y DESARROLLO

La gestión del Proceso de Diseño y Desarrollo está a cargo del Gerente de Ingeniería del CONTRATISTA, que se encarga de gestionar el seguimiento y las interfaces entre el Contratista y los proyectistas.

Las actividades de diseño se dividen en disciplinas según su especialidad.

Las disciplinas de ingeniería son:

i. Ingeniería de Proceso.

ii. Ingeniería Civil y Arquitectura.

iii. Ingeniería Mecánica.

iv. Ingeniería Eléctrica.

v. Ingeniería de Tuberías y Flexibilidad.

vi. Ingeniería de Instrumentación y Control.

En el proceso de diseño son consideradas las mejores prácticas de ingeniería enfocadas a la productividad y garantía de la calidad.

División del trabajo entre los centros de ingeniería:

Toda la ingeniería del proyecto está a cargo de la empresa Tecnimont, la cual tiene su sede principal en Milán, Italia, bajo la coordinación del Gerente de proyectos.

Dentro del alcance de sus trabajos incluye:

- Ingeniería básica y de detalle
- Establecimiento de las bases de diseño
- Servir de interfaz entre los Suplidores de los equipos para lograr la correcta integración de cada una de las partes.
- Ejecución de todos los dibujos y modelado 3D que incluye toda la parte civil, partes eléctricas y de instrumentación.
- Proveer a los suplidores todas las informaciones referentes a cálculos, cantidades y especificaciones de los equipos así como los planos de los mismos.

El Programa de la Calidad a ser implementado en el Proceso de diseño y desarrollo debe seguir las metodologías establecidas por el CONSORCIO y sus eventuales subcontratistas, conforme sus respectivos Planes de la Calidad.

Los planes deben contemplar las actividades para:

- Las etapas relacionadas con la planificación del diseño y detalles,
- Los elementos de entrada para el Proceso del Diseño,
- Los resultados pactados de este Proceso,
- Las etapas de revisión, verificación y validación (los momentos de validación del diseño forman parte de los planes de la calidad de las empresas proyectistas) del Proceso del Diseño,
- El control de los cambios que se hacen durante y después del desarrollo de las actividades de este Proceso.

La coordinación del Proceso se hace a través de la realización de:

- Reuniones de coordinación,
- Seguimiento a los planes de ejecución del diseño y desarrollo,
- Indicadores de desempeño acordados con las empresas proyectistas, y
- Seguimiento de las empresas proyectistas (si hubiere) para ello las empresas que realicen diseño pondrán a disposición del CONTRATISTA la evidencia documentada de la aplicación de sus sistemas de gestión de la calidad.

23.0 PRODUCCIÓN Y PRESTACIÓN DEL SERVICIO

23.1 Control de la producción y de la prestación del servicio

El CONTRATISTA es responsable de la ejecución de todas las actividades de construcción y supervisión para el alcance del proyecto.

Los productos y servicios son realizados conforme al Plan de Ejecución de la Construcción y Programa del Proyecto, bajo condiciones controladas, aplicando los lineamientos de la Ingeniería de detalle desarrollada, las especificaciones técnicas, los documentos del Programa de la Calidad y la planificación de actividades establecida.

Los lineamientos establecidos en el Programa de la Calidad para el proceso de Fabricación - Construcción tienen por objeto asegurar que dichas actividades son realizadas con los medios (humanos y materiales) adecuados y de acuerdo con los planos, especificaciones, estándares, códigos, observando los requisitos legales y reglamentarios aplicables para el proyecto y reflejados en los correspondientes subcontratos.

A partir del Plan de Ejecución del Proyecto, Planes de Control de la Calidad, son identificados los procedimientos aplicables que serán emitidos para la ejecución y seguimiento de las actividades, así como para el entrenamiento (en caso necesario) de los profesionales involucrados en la ejecución.

Las condiciones que se identifican para controlar el proceso de fabricación u constructivo incluyen los puntos relevantes correspondientes a:

- La disponibilidad de información que describa las características del producto, tales como: planos, especificaciones, órdenes de compra, manuales de instalación, operación y mantenimiento,
- Procedimientos e instrucciones de trabajo documentadas donde se define la forma de ejecutar cada proceso cuando la ausencia de tales instrucciones pueda afectar la calidad,
- La utilización de maquinaria y equipos constructivos necesarios y adecuados,
- El cumplimiento con los procedimientos, los instructivos, las normas y códigos aplicables a los procesos,
- Las actividades de supervisión y control de los parámetros adecuados del proceso y las características del producto y/o servicio,
- La disponibilidad y uso de equipos de seguimiento y medición,
- Aprobar de forma apropiada los procesos especiales y los equipos para la realización de los mismos,
- La implementación de actividades de seguimiento y la medición para los procesos y productos,
- La implementación de actividades de liberación, entrega y posteriores a la entrega del producto.

La supervisión de la calidad que aplicamos a los trabajos realizados por los subcontratistas se lleva a cabo mediante inspecciones, verificaciones y auditorias a las actividades de obra a efectos de confirmar el cumplimiento de estándares, diseños, especificaciones, planes de control de la calidad.

23.2 VALIDACIÓN DE LOS PROCESOS DE LA PRODUCCIÓN Y DE LA PRESTACIÓN DEL SERVICIO

La validación de los procesos se realiza para las actividades de construcción donde los productos resultantes no puedan verificarse mediante actividades de seguimiento o medición posteriores, y como consecuencia las deficiencias aparecen únicamente después de que el producto esté siendo utilizado o se haya prestado el servicio (procesos especiales). La validación demuestra la capacidad de estos procesos para alcanzar los resultados planificados.

Los procesos especiales a validarse en el proyecto, son;

- Soldadura
- Aplicación de recubrimientos anticorrosivos
- Tratamientos térmicos

La calificación de los técnicos y operadores, la descripción de las actividades de supervisión y control de los parámetros de los procesos para asegurar que cumplan con lo especificado están definidos en los procedimientos aplicables.

El personal de Calidad que requiere calificación es el siguiente:

- Inspectores de Soldadura
- Auditores

El personal ejecutor de procesos que requiere calificación es el siguiente

- Soldadores
- Montadores electromecánicos
- Técnicos de Tratamiento térmicos

23.3 IDENTIFICACIÓN Y TRAZABILIDAD

Para la identificación y trazabilidad de los materiales, equipos e insumos del proyecto desde su recepción hasta su instalación y entrega final de las instalaciones, esta se realizará por medios adecuados, se mantendrá en materiales o equipos individuales, lotes de materiales, así como los elementos resultantes de procesos de fabricación intermedia que seguirán su ruta de transformación hasta la integración de equipos o sistemas mayores los cuales integrarán, la planta completa.

Ésta identificación tiene por objetivo proveer confianza de la correspondencia inequívoca entre los diseños, productos, servicios y registros comprobatorios generados y también proveer la trazabilidad de los mismos, cuando aplica.

El estado del producto con respecto a los requisitos de seguimiento y medición se realizara por medio de marcaciones, uso de etiquetas, registros.

Será garantizada durante las fases de recibimiento, almacenamiento, construcción, montaje y condicionamiento, tanto por el CONSORCIO como por los proveedores, la correlación necesaria entre los servicios y sus respectivos certificados e informes de la calidad (materiales, inspecciones y ensayos).

Se mantendrán los registros de la trazabilidad.

23.4 PROPIEDAD DEL CLIENTE

La propiedad del CLIENTE se identifica, verifica y protege. Para su uso en el proyecto, se controla siguiendo las indicaciones específicas de acuerdo con el tipo de producto que se trate. De igual forma se atenderán disposiciones particulares que se acuerden con el CLIENTE.

Posterior a la inspección de los bienes propiedad del CLIENTE y la generación del respectivo registro, si se llegase a dañar algún bien, se pierda o que por cualquier otro motivo sea inadecuado para el uso, se realizará el correspondiente registro y se procederá a informar al CLIENTE.

Los productos suministrados por el CLIENTE deben mantener su identificación, de no contar con ello estos serán identificados conforme a los procedimientos de coordinación y se almacenarán identificándolos como propiedad del CLIENTE, cuidando las condiciones de preservación estipuladas en el contrato, como temperatura, humedad, estiba, acceso, seguridad e iluminación, para evitar daños, deterioros, pérdidas o usos inadecuados. En caso de que se detecten productos no conformes durante la entrega por el cliente estos serán tratados conforme al procedimiento de Control de Producto No Conforme.

La verificación a la recepción de estos productos no absuelve al CLIENTE de la responsabilidad de suministrar productos que cumplan con los requisitos y especificaciones establecidas.

La información técnica proporcionada por el CLIENTE para la ejecución del proyecto es considerada de su propiedad, por lo cual se reconocerán las obligaciones de confidencialidad para no distribuir o comunicar la misma.

23.5 PRESERVACIÓN DEL PRODUCTO

Los materiales, equipos y componentes de todo lo relacionado con el Proyecto serán preservados a fin de mantener su integridad, desde la recepción el sitio de obra hasta la entrega al cliente. La preservación incluye la identificación, manejo, embalaje, almacenamiento y protección de los productos, los controles que definimos consideran las recomendaciones del fabricante o proveedores.

24.0 CONTROL DE LOS EQUIPOS DE SEGUIMIENTO Y MEDICIÓN

En la planificación del Programa de la Calidad se consideran las actividades que requieren seguimiento y medición, la identificación de los equipos de seguimiento y medición adecuados para las magnitudes previstas; con la finalidad de gestionar eficazmente las mediciones que proporcionan evidencia de la conformidad del producto. Los puntos de seguimiento y medición aplicables a los procesos constructivos están establecidos en los Planes de Control de la Calidad.

Los equipos de seguimiento y medición, incluyendo los de los subcontratistas, deben cumplir los lineamientos establecidos en el procedimiento, deben contar con calibración vigente antes de su utilización.

El área de control de calidad se asegura que:

- Estén determinadas en los planes de control de la calidad, las inspecciones y pruebas, las mediciones que deben realizarse y asegurarse de la exactitud del equipo para realizar la inspección, medición y prueba.

Para asegurar la validez de los resultados el equipo es:

- Calibrado y ajustado en intervalos prescritos, antes de su utilización, comparado con patrones de medición trazables a patrones internacionales o nacionales, por un laboratorio acreditado.
- Ajustado o reajustado según sea necesario,
- Identificado con una marca apropiada, o un registro de identificación aprobado que muestre el estado de calibración, la práctica común es utilizar la identificación única del mismo equipo, se mantiene actualizada una lista del equipo aprobado para utilizarse en la ejecución del proyecto,
- Protegido contra ajustes que pudieran invalidar el resultado de la medición,

- Protegido contra daños y deterioros durante el manejo, el mantenimiento y almacenamiento para mantener su exactitud y aptitud de uso

En caso de presentarse resultados de medición incorrectos deberán ser validados, y deberán tomarse acciones sobre el equipo y sobre cualquier producto afectado.

Los registros de los resultados de la calibración se analizarán para verificar la idoneidad de la utilización de estos equipos, teniendo en cuenta los resultados presentados en la calibración, la tolerancia de las medidas de la incertidumbre, este análisis se llevará a cabo por el Responsable de Calidad o su designado, los registros serán mantenidos en la Gerencia de la Calidad.

25.0 MEDICIÓN, ANÁLISIS Y MEJORA

25.1 GENERALIDADES

Los procesos necesarios de seguimiento, medición, análisis y mejora continua están establecidos en el punto 26.2 de este Plan.

25.2 SEGUIMIENTO Y MEDICIÓN

25.2.1 SATISFACCIÓN DEL CLIENTE

Como forma de medir el desempeño del CONSORCIO, la Gerencia Comercial del Proyecto y demás Procesos involucrados, monitorea las informaciones relativas a la satisfacción del cliente, valiéndose de la colecta, análisis y disposición de las informaciones de las siguientes fuentes:

- Actas de reunión,
- Comunicaciones escritas del cliente: cartas, fax, e-mail, otros,
- Informaciones verbales del cliente recibidas en el día a día.

La información obtenida acerca de la percepción del cliente provee la base para la toma de decisiones orientada a mejorar las habilidades y la respuesta de la organización en el cumplimiento de los requisitos del cliente.

La gerencia Comercial realiza el seguimiento de las informaciones, solicitudes, reclamos y otros que son identificados a través de actas de reunión y cartas.

Estas informaciones son consolidadas y son usadas como datos de entrada de las reuniones de Revisión de la Dirección, reuniones periódicas junto al Cliente y en las reuniones de acompañamiento de PA's.

25.2.2 AUDITORÍA INTERNA

Las auditorias del Programa de la Calidad se realizan de forma planificada, conforme al procedimiento de Auditoría Interna donde están establecidas las responsabilidades, competencias y la sistemática a emplear para informar de los resultados y para mantener los registros.

Las auditorías tienen como fin determinar si el Programa de la Calidad del proyecto es conforme:

- Con los requisitos y condiciones establecidos contractualmente,
- Con los requisitos de la Norma Internacional ISO 9001:2008 con la política y objetivos del Programa de la Calidad del proyecto,

Los criterios de auditoría y el alcance de la misma se documentan en la notificación y plan de auditoría. Las auditorías se programan de acuerdo a:

- Al estado e importancia del proceso o área a ser auditada
- Los resultados de las auditorías previas.

El programa de Auditorías tiene los siguientes enfoques:

- Auditoria al Programa de la calidad del proyecto para asegurar su correcta implementación.
- Auditoria a subcontratistas con base al impacto que puedan tener a la calidad de los servicios.
- Auditorías a los procesos de Diseño, Procura y Construcción, cuya periodicidad está determinada por el porcentaje de avance e impacto.

Los lineamientos para la Programación de Auditorias por el Contratista son:

- Implementación del Programa de la Calidad
- 1ª Auditoría al Programa de la Calidad para asegurar su correcta implementación

Proceso de Diseño

- 1ª Auditoria 20% avance y siguientes cada 7 meses en las empresas proyectistas.

Proceso de Procura

- 1ª Auditoria 10% avance y siguientes cada 7 meses en las empresas que ejecuten el proceso.

  Nota: La auditoría al proceso de Procura considera el alcance de trabajo las empresas integrantes del CONTRATISTA. Las auditorías a fabricantes o proveedores de equipos solo se realizarán cuando sean requeridos.

Proceso de Construcción

- 1ª Auditoria 20% avance y siguientes cada 7 meses en el sitio de obra. Las auditorias deben incluir a las empresas subcontratadas que estén ejecutando trabajos en el sitio de obra.

El Gerente de Calidad del Contratista integra, según se requiera, el equipo de auditores internos en coordinación con los demás socios. La selección de los auditores se lleva a cabo de tal forma que se asegure que este personal es independiente y no tiene responsabilidad directa sobre el área o función a ser auditada.

Los resultados de las auditorías internas, se integran a los datos de entrada para las actividades de la Revisión de la Dirección para el Programa de la Calidad.

25.2.3 SEGUIMIENTO Y MEDICIÓN DE LOS PROCESOS

El seguimiento y medición de los procesos del Programa de la Calidad son realizados por medio de los indicadores de desempeño establecidos en los Programas de Acción respectivos para demostrar el grado de cumplimiento de los objetivos y metas de cada proceso.

El control y seguimiento de los indicadores es realizado por los Gerentes, quienes deben informar los resultados. Dichos indicadores son revisados por la Dirección de Proyecto en las reuniones de Revisión por la Dirección al Programa de la Calidad y en las evaluaciones de cumplimiento de los Programas de Acción establecidos.

En el caso que los resultados obtenidos no cumplan los requisitos de desempeño establecidos, deben tomarse las acciones necesarias para garantizar la conformidad de los productos, servicios y procesos, incluyendo las acciones correctivas pertinentes.

25.2.4 SEGUIMIENTO Y MEDICIÓN DEL PRODUCTO

El seguimiento y medición del producto o servicio está definido en los Planes de Control de la Calidad y procedimientos. La liberación del producto o servicio se realiza hasta que sean completados los puntos de revisión, inspección o prueba y los resultados indiquen conformidad.

La medición y seguimiento obedecen a los siguientes lineamientos:

- Especial atención en los aspectos de prevención de defectos durante la ejecución de procesos,
- Utilización de personal competente de acuerdo con los requisitos específicos,
- La ejecución de acuerdo como esta especificado en los requerimientos de diseño,
- Asegurar la realización de todas las inspecciones y reportes necesarios, conforme planes de control de la calidad
- Utilización de equipos de medición y seguimiento calibrados,
- Comunicación oportuna de los resultados a quienes están involucrados,
- Identificación y segregación de productos no conformes,
- Identificación, clara, precisa y a tiempo de los estados de inspección, así como sus respectivos resultados,
- Certificar el avance de las obras con respecto a los puntos de control de la calidad definidos.

Los registros de las actividades de control de la calidad se asientan en el formato aplicable de cada Plan de Control de la Calidad específico, en los que se indica claramente si este ha sido aceptado o rechazado, así como la autoridad de inspección responsable de liberar el producto.

Todo equipo fabricado en sitio, elemento de fabricación intermedia o elemento prefabricado final y/o planta industrial productiva, solo se libera en tanto hayan sido concluidas satisfactoriamente las inspecciones y pruebas requeridas, o bien, se hayan recibido y verificado los informes necesarios, excepto cuando el producto sea liberado con procedimientos de recuperación claramente establecidos.

25.3 CONTROL DEL PRODUCTO NO CONFORME

En el procedimiento de Control de producto no conforme están definidos los mecanismos para tratar los productos no conformes, la sistemática para identificarlos y asegurar que se prevenga el uso o instalación de dichos productos.

El personal que labore en el proyecto es responsable de reportar a su líder inmediato o al Gerente de la Calidad el hallazgo de cualquier situación de No Conformidad que se presente tanto en los

1920

procesos constructivos como en los productos. Las no-conformidades pueden ser detectadas por todos los involucrados, inclusive por el cliente.

Le corresponde a Calidad la emisión de los informes de no-conformidad y la notificación a los involucrados, mismos que definirán las acciones de corrección y disposiciones. Tales acciones y disposiciones pueden considerar:

- Re-trabajar o reparar,
- Liberar por concesión, o
- Reclasificación para otro uso,
- Rechazo

Corresponde al Gerente de la Calidad realizar la revisión de las disposiciones y correcciones propuestas y realizar el seguimiento de la ejecución de las acciones.

Cuando se corrige un producto no conforme, este debe ser sometido a una verificación de acuerdo con lo establecido en el Plan de Control de la Calidad, los procedimientos documentados y los requerimientos contractuales a fin de demostrar la conformidad con los requisitos.

Los registros de los productos no conformes son conservados en la Gerencia de la Calidad

25.4 ANÁLISIS DE DATOS

El análisis de los datos se basa en el análisis de los Indicadores de desempeño de cada Proceso, así como de los Indicadores Generales del Programa de la Calidad.

El resultado de los análisis permite demostrar la idoneidad y la eficacia del Programa de la Calidad, identificar los procesos donde se pueden implementar mejoras incluyendo los relacionados con el Programa de la Calidad. Los datos analizados proveen informaciones acerca de:

- La satisfacción del cliente,
- La conformidad con los requisitos del proyecto,
- Las características y tendencias en el seguimiento y medición de los procesos,
- El grado de desempeño de los proveedores a través de las evaluaciones,

- Características y tendencias de los procesos; a través del análisis de la planificación, indicadores de desempeño,

Los datos anteriores son utilizados como información de entrada de las reuniones de Revisión por la Dirección, así como son las bases para la definición de acciones encaminadas a la mejora de los procesos y del propio Programa de la Calidad.

25.5 MEJORA

25.5.1 MEJORA CONTINUA

El compromiso asumido por la dirección para la mejora continua de la eficacia del Programa de la Calidad se hace efectivo por medio del uso de:

- La política de la calidad
- Los objetivos de la calidad e indicadores, incluyendo los programas y metas definidos
- Los resultados de las auditorías internas
- El análisis de datos, las acciones correctivas y preventivas
- La Revisión por la Dirección

Los Programas de Acción son herramientas a través de las cuales se planifican y se establecen objetivos y metas para la mejora continua.

25.5.2 ACCIÓN CORRECTIVA

En el procedimiento Acción Correctiva están definidas las acciones para identificar la causa raíz de las no conformidades, determinar la acción correctiva a tomar enfocada en evitar su repetición.

Las necesidades de Acciones Correctivas para el proyecto surgen de:

- Resultados de Inspección de productos y procesos
- Análisis de los reportes de no conformidades
- Realización de auditorías internas de calidad
- Realización de auditorías externas

- Reportes u observaciones del cliente
- Las mediciones de los indicadores de gestión.

Dicho procedimiento define los requisitos para:

- Revisar las no conformidades (incluyendo las quejas de los clientes);
- Determinar las causas de las no conformidades;
- Evaluar la necesidad de adoptar acciones para asegurarse de que las no conformidades no vuelvan a ocurrir;
- Determinar e implementar las acciones necesarias;
- Registrar los resultados de las acciones tomadas;
- Revisar la eficacia de las acciones correctivas tomadas; y
- Comunicar los resultados de las acciones.

Las acciones correctivas deben ser apropiadas a los efectos y magnitud de los problemas. En forma general, aquellas no conformidades de carácter repetitivo y las que conlleven un alto costo, son objeto de acciones correctivas.

25.5.3 ACCIÓN PREVENTIVA

El procedimiento de Acción Preventiva está creado con el propósito de identificar la causa raíz de las no conformidades potenciales, determinar la acción preventiva enfocada en evitar su ocurrencia. La Acción Preventiva debe ser apropiada a los efectos y magnitud de los problemas potenciales.

El análisis de reclamaciones, los resultados de auditorías, la retroalimentación de ingeniería y construcción, la revisión de los Indicadores de Desempeño, proveen información para identificar situaciones de riesgo potenciales.

Dicho procedimiento define los requisitos para:

- Determinar las no conformidades potenciales y sus causas;
- Evaluar la necesidad de actuar para prevenir la ocurrencia de no conformidades;
- Determinar e implementar las acciones necesarias;

- Registrar los resultados de las acciones tomadas;
- Revisar la eficacia de las acciones preventivas tomadas; y
- Comunicar los resultados de las acciones.

OFERTA TÉCNICA

DOCUMENTOS DE SUBSANACIÓN DE LA OFERTA TÉCNICA

De conformidad con el Ordinales Resolutivos Primero y Segundo de la Vigésima Octava Resolución del Comité de Licitación, emitida en fecha 30 de octubre de 2013, y para fines de declarar al Participante No. 1303 como Participante Oferente Semifinalista, se adjunta los siguientes documentos para subsanar la Oferta Técnica.

RESOLUCIÓN RELATIVA AL PROCESO DE APERTURA Y EVALUACIÓN DE OFERTAS NO ECONÓMICAS

Conforme el Ordinal Primero Sección II, Punto 1:

"II. En cuanto a la Oferta Técnica:

1. Nuevos ejemplares de los formularios de Oferta Técnica indicados en el Considerando Tercero de la presente resolución, que resuelvan los Defectos Subsanables identificados en los literales a), b), c), d), e), f), g), h), i), j), k), l) y m) del referido numeral 1, según corresponda."

EQUIPO DE FLUIDIZACIÓN DE AIRE DE AQCS (POR CALDERA)		
Número de sopladores de aire de fluidización de baja presión.	Ea.	14 (7 + 7 stand by)
Capacidad de cada soplador de aire de fluidización de baja presión.	lb./hr	Silo de cal quemada 2 x 6.000 Silo hidratado y descarga cal 2 x 10.000 Buffer hydrated lime silo 2 x 2.000 Descarga Filtro de Mangas 4 x 7.000 Sistema de recirculación 2 x 5.000 Silo del producto final 2 x 7.000
Número de Calentadores de Aire de Fluidización de Baja Presión.	Ea.	3
Capacidad de los Calentadores de Aire de Fluidización de Baja Presión.	kW	50
Número de sopladores de Aire de Fluidización de Media Presión.	Ea.	Incluido en ventiladores anteriores

Proyecto Punta Catalina	LICITACIÓN PÚBLICA INTERNACIONAL NO. CDEEE-LPI-01-2013 PROYECTO PUNTA CATALINA		*Noviembre 2013*
			Código Documento: *Formulario TS-06*
	OFERTA TÉCNICA	Página 3 de 3	*Tabla 06-Datos de los Equipos de Control de Calidad del Aire*

Capacidad de los sopladores de Aire de Fluidización de Media Presión.	lb./hr	Incluido en ventiladores anteriores
Número de Calentadores de aire de fluidización de media presión	Ea.	Incluido en ventiladores anteriores
Capacidad de Calentadores de aire de fluidización de media presión	kW	Incluido en ventiladores anteriores
EQUIPO DE RECIRCULACION DE CENIZAS AQCS (POR UNIDAD)		
Número de Contenedores Agitados de Cenizas	Ea.	2 Byproduct Disposal Bins per PJFF, 2 Distribution Bins per CDS, 1 Discharge Container per CDS
Capacidad de Contenedores de Cenizas (Combustible de Rendimiento en MCR, 2 hr) cada uno.	lb.	47,344
Capacidad de Contenedores de Cenizas (Combustible de Rendimiento en MCR, 2 hr) cada uno.	cu. ft	526
ELEVADOR (POR UNIDAD)		
Número de Elevadores	Ea.	1
Fabricante		Ver ANEXO 01 Descripción Oferta Técnica – Lista de Suplidores
Capacidad Neta	lb.	1100
Velocidad	fpm	115
Tamaño de la Plataforma (L x W)	ft	4 x 3.2
Altura de la Cabina	Ft	7.87
Número de paradas	qty	3

Notas:

(1) Los valores indicados son las temperaturas que las mangas pueden soportar. Debido al hecho que la temperatura del gas de escape en la entrada del filtro de mangas está controlado por inyección de agua, incluso en el caso de no operación del calentador de aire, la temperatura del filtro de mangas estará por debajo del máximo.

(2) Las cenizas y los productos de la reacción química entre la cal y el SO_x (producto final) están continuamente recicladas a la entrada del absorbedor, por lo tanto, no se necesita una tolva de almacenamiento es necesaria: los volúmenes de las tolvas serán de acuerdo a las dimensiones geométricas del compartimiento pero no para capacidad de almacenamiento.

TABLA 14 - GENERADOR SINCRONIZADO ROTOR-CILÍNDRICO (POR UNIDAD)

Descripción	Unidades/ Opciones	Datos Espec	Datos de Fabricante
DATOS GENERALES			
Fabricante			GENERAL ELECTRIC
Catalogo/ No. Serial		Por Fabricante	390H 8038405
Localidad de fabricación		Por Fabricante	USA
Localidad del Centro de Servicio OEM más cercano		Por Fabricante	Houston,Texas
CONDICIONES DE OPERACIÓN			
Salida de la Turbina–Capacidad Nominal máxima	MW	Por Fabricante	387.000
Condiciones de Capacidad Nominal Máxima		Por Fabricante	As per heat Balance
Salida Nominal de la turbina–Condiciones de diseño	MW	Por Fabricante	387.000
Condiciones de diseño en la Salida Nominal		Por Fabricante	As per heat Balance
Temperatura ambiente máxima del sitio	°F	Section 01 30 00	93.2
Temperatura ambiente mínima del sitio	°F	Section 01 30 00	87.1
Elevación del Generador	ft	Por Contratista	49
Temperatura ambiente máxima del medio ambiente operando.	°F	Section 01 30 00	93.2
Temperatura ambiente mínima del medio ambiente operando.	°F	Section 01 30 00	87.1
Agua de enfriamiento:			
Temperatura ambiente máxima	°F	Por Contratista	95
Temperatura ambiente mínima	°F	Por Contratista	84.2
Presión máxima	psig	Por Contratista	72.5
Presión mínima	psig	Por Contratista	65.3
Voltaje DC de la planta	VDC	125	125
Sistema de enfriamiento.		Enfriamiento por Hidrógeno Refrigerado	Enfriamiento por Hidrógeno Refrigerado
Sistema de los terminales conductores del Generador		Barra de Ducto Aislada	Barra de Ducto Aislada
CLASIFICACIONES Y DATOS FISICOS			
Clasificación MVA en la placa del equipo	MVA	Por Fabricante para coincidir con la garantía nominal de la turbina al mínimo	430
Temperatura de la zona Fría del (Cooling Medium) ambiente refrigerado.	°F	Por Fabricante	113

Proyecto Punta Catalina	LICITACIÓN PÚBLICA INTERNACIONAL NO. CDEEE-LPI-01-2013 PROYECTO PUNTA CATALINA		*Octubre 2013*
			Código Documento: *Formulario TS-14*
	OFERTA TÉCNICA	Página 2 de 11	*Tabla 14 – Generador Sincronizado Rotor-Cilíndrico*

Capacidad Nominal Minima Continua	MVA	Por Fabricante	118 MVA (@35% TMCR)
Temperatura de la zona Fría del (Cooling Medium) ambiente refrigerado.	°F	Por Fabricante	86
Capacidad Nominal Maxima Continua	MVA	Por Fabricante	430
Temperatura de la zona Fría del (Cooling Medium) ambiente refrigerado.	°F	Por Fabricante	113
Voltage Nominal en los Terminales	kV	Por Fabricante	22
Rango de voltaje de operación contínua (% del Voltaje nominal de los terminales).	%	95%-105%	±5%
Frecuencia nominal	Hz	60	60
Capacidad de variación de frecuencia y voltaje en relación de la frecuencia nominal.	+ % / - %	De acuerdo con los estándares de la Ley Eléctrica de República Dominicana	De acuerdo con los estándares de la Ley Eléctrica de República Dominicana
Velocidad nominal de sincronismo del Generador. GGeneradortasada del generador sincronizado	rpm	Por Fabricante	3600
Conexión de Generador a Fuerza Motriz	Directo o Caja de Engranaje	Directo	Directo
Capacidad máxima de sobrevelocidad sobre la nominal, sin daño	%	Por estándares	120%
Factor de Potencia Nominal:			
Inductiva	pu	0.85	0.85
Capacitiva	pu	0.95	0.95
Clase de aislamiento mínimo del estator	Class	F	F
Clase de aislamiento mínimo del rotor	Class	F	F
Elevación máxima de la temperatura en Carga Nominal	Class	Por Fabricante	39.9°C (stator RTD)
Máxima temperatura de punto caliente en Carga Nominal y temperatura de enfriamiento máximo medio	^{o}C	Por Fabricante	130
Temperatura Máxima en la carga clasificada y temperature media de máximo enfriamiento			
Estator	°F	Por Fabricante	125.7°C
Rotor	°F	Por Fabricante	130.8°C
Ubicación de los terminales del generador	Tope/ Fondo/ lado	Fondo	Fondo
Máximo nivel de ruido a distancia permisible	dBA	85	85
Máximo nivel de ruido cercano permisible	dbA	90	90
Peso total	lbs	Por Fabricante	809,000
Peso total transportado	lbs	Por Fabricante	576,000
Espacio requerido en el frente del generador para extracción del rotor	ft	Por Fabricante	41
Orden de Fase de Rotación en el cual las fases alcanzan el Máximo Positivo.		A determinar por el contratista de EPC durante toda la velocidad sin carga y ajustado previo a la sincronización.	Antihorario

C047

Tipo de Modelo IEEE del PSS		A determiner por el contratista de EPC basado en el sistema de estudios de estabilización	IEEE PSS2B
Provee Cálculos, Ajustes Iniciales para PSS	Y/N	Y	Y
Proporciona ajustes/regulagem y Comisionamiento de PSS	Y/N	Y	Y
Control de VAr/Factor de Potencia	Y/N	Y	Y
Control de Rede (Tie-Line) MW /VAr	Y/N	Y	N
Fabricante Del Regulador de Voltaje.		Por Fabricante	General Electric
Tipo de Regulador de Voltaje		Por Fabricante	EX2100
Transformador Potencial de Potencia (PPT):			
Tipo de Ubicacion.	Interior o exterior	Interior	Interior
Ubicacion de la alimentacion de Alto Voltaje		Por Fabricante	1SWGR-1C 6.9kV Quadro de MT
Potencia Nominal.	kVA	Por Fabricante	2500
Fases	1 o 3	3	3
Voltajes Nominales.			
Alto Voltaje	kV	Por Fabricante	6.9kV
Bajo Voltaje	V	Por Fabricante	970
Configuración de fases:			
Alto Volatje	Delta/Wye	Por Fabricante	Estrella
Bajo Voltaje	Delta/Wye	Por Fabricante	Delta
Ubicación de Entrada de Cable (Arriba, Abajo, Lado)		Por Fabricante	Abajo
Peso Total	lb	Por Fabricante	13,600
ATERRIZAJE DEL NEUTRO			
Método		Alta Impedancia	Alta Impedancia
Impedancia.	ohm	Por Fabricante	0.7
Voltaje Nominal.	VAC	Por Fabricante	240
Corriente Nominal.	A	Por Fabricante	300
Tiempo Nominal	sec	60	60
Tranformador de puesta a tierra (Para Sistema de Alta Inpedancia):			
Fabricante		Por Fabricante	GE Supply
Tipo	Azeite/Seco	Seco	Seco
Tipo de protecion mecanica	NEMA	1	1
KVA Nominal.	kVA	Por Fabricante	25
BIL Nominal.	kV	Por Fabricante	60
Terminales de Alto Voltaje	kV	Por Fabricante	12
Terminales de Bajo Voltaje	VAC	240	240
Interruptor de Aislamiento del Neutro.	Y/N	N	N
Ubicación de la Entrada de Cable (Arriba, Abajo, o Lado)		Por Fabricante	Abajo
Transformadores de corriente del terminal lado línea.			
Clase de Precision y Carga	ANSI C57.13	0.3B1.8 and C800	0.3B1.8 and C800
Cantidad en cada fase	qty	5	4

Relacion de transformacion CT	pri / sec	12000/5	15000/5
Configuración	Delta / Estrella	Estrella – Aterrizado	Estrella – Aterrizado
Cantidad por fase que Requieran Certificados de Calibración de Laboratorios .	qty	dos	2
Tranformadores de corriente del terminal lado neutro.			
Clase de Precision y Carga	ANSI C57.13	0.3B1.8 and C800	0.3B1.8 and C800
Cantidad en cada fase	qty	4	4
Relacion de transformacion CT	pri / sec	12000/5	15000/5
Configuración	Delta / Wye	Estrella – Aterrizado	Estrella – Aterrizado
Cantidad por fase que Requieran Certificados de Calibración de Laboratorios .	qty	None	0
TRANSFORMADORES DE VOLTAJE			
Transformador de Voltaje Conjunto #1:			
Presición y exigência de carga	ANSI C57.13	0.3 W, X, M, Y, Z, and ZZ	0.3 W, X, M, Y, Z, and ZZ
Voltaje Nominal.			
Alto Voltaje (Línea - Línea)	kV	Por Fabricante	22
Bajo Voltaje (Línea - Línea)	V	120	120
Relacion del Transformador de Voltage (VTR)	HV:LV	Por Fabricante	22000/120V
Cantidad	qty	3	3
Configuración	Delta Abierto / Estrella Aterrizado	Estrella – Aterrizado	Estrella – Aterrizado
Construcción tipo extraible .	Y/N	N	N
Fusibles principales	Y/N	Y	Y
Proporcionar certificado de calibración de laboratorio	Y/N	Y	Y
Transformador de Voltaje Conjunto #2			
Presición y exigência de carga	ANSI C57.13	0.3W, X, M, Y, Z, and ZZ	0.3 W, X, M, Y, Z, and ZZ
Voltaje Nominal.			
Alto Voltaje (Línea - Línea)	kV	Por Fabricante	22
Bajo Voltaje (Línea - Línea)	V	120	120
Relacion de Voltaje del Transformador (VTR)	HV:LV	Por Fabricante	22000/120V
Cantidad	qty	3	3
Configuración	Delta Abierto / Estrella Aterrizado	Estrella – Aterrizado	Estrella – Aterrizado
Construcción tipo extraible .	Y/N	N	N
Fusiles Principales	Y/N	Y	Y
Proporcionar certificado de calibración de laboratorio	Y/N	Y	Y
PARARRAYOS			
Proveer Pararayos	Y/N	Y	Y
Voltaje Nominal.	kV	Por Fabricante	22
MCOV Nominal	kV	Por Fabricante	14
CAPACITORES PARA SOBRETENSION.			
Proveer capacitores para sobretenciones.	Y/N	Y	Y

Capacitancia	µF	Por Fabricante	~ 0.3
Voltaje Nominal	kV	Por Fabricante	22
AGUA DE REFRIGERACIÓN Y ENFRIADORES DEL GENERADOR			
Enfriamiento del circuito de Abastecimiento de Agua	Open/Closed	Cerrado	Cerrado
Temperatura, Día Caliente (Bulbo Seco ≥ 80°F)	°F	Por Contratista	93.2
Temperatura, Día Normal (80°F < Bulbo seco < 60°F)	°F	Por Contratista	77
Temperatura, Día Frío (Bulbo seco ≤ 60°F)	°F	Por Contratista	59
Porcentaje de propilenglycol	%	Por Contratista	0%
Factor de Ensuciamiento		Por Contratista	0.001
Presión de diseño para lado de agua.	psi	Por Contratista	125
Pérdida Máxima permisible por fricción en el lado agua	psi	Por Contratista	~ 11
Tipo de intercambiador de calor Del Generador.		Carcasa y Tubo	Aleta de placa
Material de la chapa de los tubos de los enfriadores del Generador.		Muntz Metal or Naval Brass	Carbon Steel
Material de los tubos de los enfriadores del Generador		90/10 Cu-Ni	90/10 Cu-Ni
Velocidad de agua en los tubos	ft/sec	Por Fabricante	GE Proprietary
Caudal de agua de enfriamiento	GPM (m^3/hr)	Por Fabricante	2300 GPM
Caida de presión al caudal nominal.	psi	Por Fabricante	10.3
Incremento de la temperatura del agua	°F	Por Fabricante	5.2°C
Número de enfriadores		Por Fabricante	4 post mounted
Capacidad de carga del generador con un enfriador fuera de servicio.	% de Nominal	100%	100%
GAS HIDROGENO			
Flujo de aceite para los sellos del eje @ Temperatura del aceite de entrada.	gpm	Por Fabricante	11.4
Total a presión de hidrógeno de 1/2 psi	gpm	Por Fabricante	55
Total a presión de hidrógeno de 45 psi	gpm	Por Fabricante	11.4
Flujo de aceite lado Gas a ½ psi	gpm	Por Fabricante	2.3
Qantidad por diferencia de 1" en el nivel de aceite de la mirilla inferior de tanque de vacío de aceite de sello	gal	Por Fabricante	No Aplicable
Differencial de presión de aceite de sello y de hidrógeno	psi	Por Fabricante	5
Cantidad de espacio para gas en la carcasa del generador.	cu ft	Por Fabricante	3000

Cantidad de dioxide de carbon requerido para removier el aire de la carcasa (Generador parado)	cu ft	Por Fabricante	3000
Cantidad de dioxide de carbon requerido para remover el hidrógeno de la carcasa (Generador parado)	cu ft	Por Fabricante	6000
Cantidad de hidrógeno requerido para llenar la cubierta a un 90% de pureza a ½ psi (Generador parado)	cu ft	Por Fabricante	6000
Presión Nominal de Hidrógeno	psi	Por Fabricante	60
Cantidad de Hidrógeno requerido para aumentar la presión en la cubierta.			
0.5 a 15 psi	cu ft	Por Fabricante	3000
0.5 a 30 psi	cu ft	Por Fabricante	3000
0.5 a 45 psi	cu ft	Por Fabricante	3000
Pureza mínima del hidrógeno en el cilindro.	%	Por Fabricante	Greater than 99
Pureza del Hidrógeno en la carcasa del generador a operación normal.	%	Por Fabricante	95-98
Requerimiento de cantidad máximo de hidrógeno del generador en operación normal a:			
0.5 psi	cu ft/dia	Por Fabricante	400
15 psi	cu ft/dia	Por Fabricante	500
30 psi	cu ft/dia	Por Fabricante	600
45 psi	cu ft/dia	Por Fabricante	700
Bomba principal de aceite de sello: Provee dos (2) bombas de AC			No Aplicable
120Capacidad	gpm	Por Fabricante	No Aplicable
Capacidad nominal del motor de la bomba	hp	Por Fabricante	No Aplicable
Voltaje nominal y fases del motor de la bomba	VAC / Ph	Por Fabricante	No Aplicable
Duración de operación sin daño en condición de sacada de servicio	min.	Por Fabricante	No Aplicable
Arrancador VAC sumistrado	Y/N	Y	No Aplicable
Bomba de emergencia de aceite de sello:			
Capacidad	gpm	Por Fabricante	182
Capacidad nominal del motor de la bomba	hp	Por Fabricante	20
Voltaje nominal del motor de la bomba	VDC	125	125
Duración de operación sin daño en condición de sacada de servicio	min.	Por Fabricante	120
Arrancador VDC suministrado	Y/N	Y	Y
Bomba de Vacío:			No Aplicable

Capacidad	cfm	Por Fabricante	No Aplicable
Capacidad nominal del motor de la bomba	hp	Por Fabricante	No Aplicable
Voltaje de terminal del motor de la bomba	VAC	Por Fabricante	No Aplicable
Duración de operación sin daño en condición de sacada de servicio	min.	Por Fabricante	No Aplicable
Arrancador VAC suministrado	Y/N	N	No Aplicable
CALENTADORES DE ESPACIO:			
Cantidad	qty	Por Fabricante	2
Ubicacion	---	Por Fabricante	Casing
Potencia Nominal	kW	Por Fabricante	0.750
Voltaje Nominal y Fases	VAC / ph	Por Fabricante	480
MONITOREO DE VIBRACION			
Sensores de Vibración (X & Y)	Y/N	Y	Y
Vibración máxima	mils	Por Fabricante	Según la norma ISO 7919-2
OTROS EQUIPOS			
Valor de aislamiento de los cojinetes de generador	MΩ	10 M ohm	10 M ohm
Suministrado acopladores para descargas parciales.	Y/N	Y	Y – Capacitor
Proveer monitoreo del generador	Y/N	N	N
Proveer Caja de Terminales y Trenzado Flexible para la conexión á lo IPB (ducto de fases aisladas)	Y/N	Y	Y
Proveer Caja de Terminal de Neutro y sus conecciones	Y/N	Y	Y
Proveer Caja de equipo para Sobretensiones/VT	Y/N	Y	Y
Proveer condiciones de aterrizaje del conjunto de escobillass y sus accessorios del campo de acoplamiento (Fiel Grounded/Brush Lift-Off Field Ground Coupler)	Y/N	N	N
Panel de Control del Generador	Y/N	Y	Y
Principales Componentes del Panel de Control:			
Sincroscopio		Por Fabricante	GE Supply
Luces indicadoras		Por Fabricante	Ge Supply
Interruptor de Control "aumentar/disminuir"		Por Fabricante	GE Supply
Medidor de energía para faturacion	MAXSYS/ Siemens 2510-DNP-	1	MAXSYS/ Siemens OR equivalent - 1

	L2 (Level 2)		
Interruptores de control para Disparo del Interruptor ,	qty	2	2
Relevador de Protección del Generador	qty	2	2
Interruptores de aislamiento para coincidir el esquema de control con el de protección.	qty	Por Fabricante	4
Relevador de proteccion para Energización Accidental	qty	1	1
Relevador de protección de Transformador	qty	1	1
Interruptores de prueba para todos CT, VT, y circuitos de disparo.	qty	Por Fabricante	1 cada aparato
Control Voltaje	VDC	125	125
CARACTERISTICAS ELECTRICAS			
Impedancia:			
MVA base para impedancias	MVA	Por Fabricante	430
Relacion mínima de corto circuito	SCR	Por Fabricante	0.5

RESOLUCIÓN RELATIVA AL PROCESO DE APERTURA Y EVALUACIÓN DE OFERTAS NO ECONÓMICAS

Conforme el Ordinal Segundo

SOLICITUDES DE ACLARACIONES TÉCNICAS

ANEXO A

ÍNDICE

a) Aclarar en el Item 37, Formulario ME-2 el Sistema de aire y gases con doble línea;

b) Proveer los planos que se indican a continuación, con mejor resolución:

- 3645-NN-DN-501-001 Rev. 2 - 3645-NN-DN-501-002 Rev. 3 - 3645-NN-DN-502-002 Rev. 3
- 3645-NN-DN-502-001 Rev. 3 - 3645-NN-DN-502-003 Rev. 3 - 3645-NN-DN-502-004 Rev. 3
- 3645-NN-DN-502-005 Rev. 3

c) Aclarar de la página 895, el arreglo presentado del pulidor de agua de condensado;

d) Proporcionar el análisis último del carbón que fue asumido para el diseño preliminar al preparar su propuesta.

e) Nuevos ejemplares de las tablas con los cambios solicitados en el Ordinal Primero Sección II, Punto 1.

f) En su hoja de datos de proceso en la Página No. 1025, aclarar si la diferencia es justificada o error. Justificar.

g) Proporcionar la reubicación de la entrada de agua de mar y la descarga hacia el Este del muelle donde se muestra en los dibujos suministrados dentro del corredor establecido para este propósito.

h) Aclarar cómo se cumplirá el límite de temperatura de descarga del condensador.

i) Aclarar ubicación del campamento.

j) Aclarar si la subestación 345kV utilizará barras tubulares rígidas y estructuras tubulares cónicas.

k) Aclarar si "6.9 kV" es el valor correcto o "6.6 kV".

l) Aclarar si en los requerimientos para la contención del aceite del Artículo 1.05 Sección 01 36 26 de las Especificaciones Técnicas, cuando debería ser en base al Artículo 1.08 de dichas Especificaciones.

m) Aclarar si el sistema de 277/480V será aterrizado a alta impedancia (3 cables) y si el sistema de 120/208V será un sistema de cableado a tierra sólida.

n) Aclarar si por qué existe un margen tan amplio entre la Capacidad Neta y la Capacidad Neta Garantizada.

ACLARACIÓN:

a) Se ha propuesto un sistema de aire y gases con doble línea. Sólo un calentador de aire simple está incluido en las Especificaciones Técnicas (ítem 37, Formulario ME 2).

RESPUESTA:

Según lo requerido en las Especificaciones Técnicas, se ajustará el sistema de aire y gases a una sola línea.

En efecto, favor considerar a partir de esta aclaración técnica que el sistema de aire y gases será de una sola línea en la referencia Descripción de la Planta y Criterios de Diseño, ítem 4.2.1.

Sin embargo, el uso de dos líneas provee una mayor disponibilidad de la planta, así como mayores facilidades de operación y mantenimiento de esos equipos.

ACLARACIÓN:

c) En la página 895 de su Oferta, el arreglo presentado del pulidor de agua de condensado no es del todo entendible. El Participante No. 1303 debe aclarar si cada Unidad tendrá tres bloques de 50% de capacidad y dos bloques con capacidad de servicio en todo momento para tratar el flujo total de agua de condensado.

RESPUESTA:

Correcto. Cada unidad cuenta con un tren de 3 x 50% de pulidores de agua, dedicado, estando dos (02) en servicio en todo momento para tratar el flujo total de agua de condensado y uno (01) en "stand-by".

En este sentido, el pulidor de agua para la Unidad 1 se encuentra referido en el plano **PFD 3645-WZ-DP-106 1-2 WATER/STEAM CYCLE (sistema** 10LCP10AK001) página 895, y por separado, el pulidor de agua para la Unidad 2 se encuentra referido en el plano **PFD 3645-WZ-DP-106 2-2 WATER/STEAM CYCLE** (sistema 20LCP10AK001), página 896. Copia de ambos planos entregados se encuentran anexos a esta respuesta.

ACLARACIÓN:

d) Los comentarios sobre el análisis del carbón en las Especificaciones Técnicas han sido observados. El Participante No. 1303 debe proporcionar el análisis último del carbón que fue asumido para el diseño preliminar al preparar su propuesta, incluyendo la humedad, el poder calorífico en Btu/lb y todos los demás componentes. Según se desprende de su Oferta, el Participante No. 1303 ha asumido un poder calorífico de 10,325 Btu/lb, lo cual podría ser aceptable. El rendimiento de su Unidad permanecería igual. La especificación del carbón establecida en las Especificaciones Técnicas no es un análisis último de un carbón real. El carbón a utilizar en la prueba de rendimiento podrá ser acordado (puede ser una mezcla de carbón) con uno que se asemeje a la mezcla de carbón que se ha especificado.

RESPUESTA:

El análisis de carbón considerado para el diseño de la Oferta, es exactamente el que se muestra en la Sección 2 del documento *Descripción de la Planta y Criterios de Diseño*, página 8 de 16 (Páginas 37 a la 39 de la Oferta Técnica), el cual muestra la humedad, el poder calorífico y todos los demás componentes solicitados (ver anexo). Para fines de elaboración de ese documento, se utilizó el carbón de referencia mencionado en la **ADENDA N. 01, ESPECIFICACIONES TÉCNICAS (versión en inglés) 4 de septiembre de 2013**, con un poder calorífico de 10,500 BTU/lb.

Igualmente y a dichos fines, se tomó en consideración la **Aclaratoria No. 14.1 - 04 de Octubre de 2013**, donde la CDEEE ratifica que *"La información del carbón de diseño contenida en las Especificaciones Técnicas es correcta, la cual proviene de mediciones directas de poder calorífico a través de calorímetro"*.

2.1.5.3 DATA SOBRE EL CARBÓN

De acuerdo a las informaciones de la ADENDA N.01, Septiembre 04, 2013:

Tabla. Análisis Final

	Unidad	Carbón de Desempeño	Diseño	
Humedad	p%	14.5	8.30	15.50
Ceniza	p%	15.40	5.50	16.00
Azufre	p%	2.20	0.40	3.70
Carbono	p%	54.9	54.20	70.80
Hidrógeno	p%	3.71	3.50	5.30
Nitrógeno	p%	1.20	0.90	1.50
Oxígeno	p%	8.05	7.90	9.40
Cloro	p%	0.04	0.01	0.05
Total	p%	100.00	-	-
Mayor potencia calorífica	Btu/lb	10,500	10,400	12,500.00
Menor potencia calorífica	Btu/lb	10,137	9,720	11,600.00
Hardgrove Indice	HGI	45.00	42.00	57.00

Tabla. Análisis Aproximado

	Desempeño	Mínimo	Máximo
Material Volátil	25 (2)	25.00	37.50
Carbón Fijo	45.1 (3)	-	-
Humedad Total	14.5	-	-
Ceniza	15.4	-	-
Total	100.00	-	-
Temperatura inicial deformación (°F)	>1890	-	-
Temperatura Suavizamiento (°F)	>2095	-	-
Temperatura Hemisférica (°F)	>2170	-	-
Temperatura de Fluido (°F)	>2280	-	-
Factor Ensuciamiento	>0.84	-	-
Factor Slagging	>0.92	-	-

0076

Notas:

(2) Valor revisado de 24.84% como está definido en la "**ADENDA N. 01, ESPECIFICACIONES TÉCNICAS (versión en inglés) 4 de septiembre de 2013**", Pagina 3 de 9, debido a que el % reportado es menor que le mínimo.

(3) Valor revisado de 45% como está definido en la "**ADENDA N. 01, ESPECIFICACIONES TÉCNICAS (versión en inglés) 4 de septiembre de 2013**", Pagina 3 de 9, con el fin de que esté de acuerdo con el contenido de volatilidad, humedad y ceniza.

Otros componentes como Hg, F y As no han sido considerados, ya que no han sido provistos en la composición del carbón.

El carbón debe respetar los siguientes requisitos adicionales que no han sido definidos por la composición mostrada por el Cliente en la documentación técnica del proceso licitatorio:

1. **Ácido alcalinos solubles** - Los combustibles quemados en la caldera deben tener un combinado de sodio soluble en ácido acético (Na) y potasio (K) a menos de 0,05% (500 ppm) en una base de combustible seco para mitigar el potencial para la de aglomeración.
2. **Cloro** - El nivel de cloro en el combustible quemado debe ser menor que 0,1% en una "base tal como se recibió" para mitigar el potencial de corrosión y problemas de aglomeración.
3. **Humedad de la superficie** - La humedad superficial del combustible crudo debe estar por debajo de 10%.
4. **Vanadio y níquel** - El vanadio total y el contenido de níquel en el combustible sobre una "base según lo recibido" no deben exceder los 2,500 ppm. Operación en niveles superiores a 2,500 ppm aumentará el potencial para la aglomeración que puede resultar en paradas adicionales de la unidad para operaciones de limpieza y reparaciones.

NOTA IMPORTANTE

Cualquier cambio en la composición del carbón con el fin de alcanzar el HHV de 10,500 BTU/lb afectará la comparación de los cálculos de la eficiencia de la caldera de los distintos oferentes.

El Consorcio ha adoptado el criterio mencionado arriba con el fin de asegurar una compración objetiva de los oferentes.

Tabla. Análisis típico de la ceniza

DESCRIPCIÓN		TÍPICO
Phosphorous Pentoxide (%)	P2O5	0.27
Silicon dioxide (%)	SiO2	50.92
Ferric Oxide (%)	Fe2O3	16.67
Aluminum oxide (%)	Al2O3	19.66
Titanium Dioxide (%)	TiO2	1.02

0077

Calcium Oxide (%)	CaO	3.16
Magnesium oxide (%)	MgO	1.88
Potassium Oxide (%)	K2O	2.13
Sodium Oxide (%)	NaO2	2.04
Sulfur trioxide (%)	SO3	2.25
Total (%)		100.00

1. El Carbón a manipular y los equipos de molienda se diseñan para manejar carbón de 2 pulgadas (50 mm) de tamaño, como máximo.
2. Típica distribución del tamaño de carbón:

Tabla. Granulometría del Carbón

DESCRIPCIÓN	TIPICO
Retained 2 inches (50 mm) round	0%
Retained 1 inch (25 mm) round	20%
Retained ½ inch (12.5 mm) round	40%
Retained ¼ inch (6.3 mm) round	30%
Passing ¼ inch (6.3 mm) round	10%

2.1.5.4 DATOS SOBRE EL DIESEL

Análisis típico del fuel oil n.02 de acuerdo a la **ADENDA N. 01, Septiembre 04, 2013**:

1. Azufre: 0.05 – 1.0%.
2. Hidrogeno: 11.8 – 13.9%.
3. Carbono: 86.1 – 88.2%.
4. Nitrógeno: 0 – 0.1%.
5. Oxígeno: --.
6. Ceniza: 0 – 0.1%.
7. API: 28 – 41.
8. Gravedad Específica: 0.825 – 0.887.
9. Poder Calorífico: 19,000 – 19,750 BTU/lb.
10. Viscosidad (centistokes): 0.5 – 5.8.
11. Punto de Fluidez: 32.
12. Agua y sedimentos: 0 – 0.1%.

2.1.6 REQUISITOS DE DESEMPEÑO DE LAS PLANTAS

0078

ACLARACIÓN:

e) Las tablas de diseño fueron completadas con las criterios mínimos y presentadas con la nota añadida a la parte inferior de cada página que indica "TODOS LOS DATOS INCLUIDOS EN LA TABLA PRESENTE NO SON VINCULANTES". Al efecto, el Comité De Licitación está en el deber de señalar que dicha información no puede ser modificada con posterioridad a la apertura de la Oferta Técnica del Participante No. 1303. Este comentario debe ser retirado de cada una de las Tablas citadas.

RESPUESTA:

Retirados todos los comentarios, conforme se evidencia en las nuevas tablas suministradas a dichos fines.

ACLARACIÓN:

f) En su hoja de datos de proceso en la Página No. 1025, la temperatura del vapor principal se muestra como 568 °C y la temperatura de recalentado caliente es de 567.5 °C. En la Tabla 1, en el equilibrio de calor, la temperatura del vapor principal se muestra como 541 °C y la temperatura de recalentado caliente como 538 °C. En principio estas cifras inferiores son correctas. No obstante, es preciso que el Participante No. 1303 aclare si ¿La temperatura más alta es un margen de diseño o un error? Asimismo, debe confirmar la razón de la diferencia.

RESPUESTA:

Las temperaturas registradas en la página 1025 fueron un error de digitación. Las temperaturas válidas son las presentadas en el HEAT BALANCE, TE-02 (Página 541 en adelante de la Oferta Técnica). En ese sentido reiteramos que tanto para el vapor de alta presión como para el vapor recalentado, la temperatura del vapor a la salida de la caldera es 541°C mientras a la entrada de la turbina es 538°C.

ACLARACIÓN:

g) El consumo de agua de mar y la descarga se presenta como situado al Oeste del muelle. Esto no concuerda con los planos de referencia suministrados para el presente proceso. CDEEE no es la propietaria del terreno donde se encuentran la entrada de agua de mar y la descarga. El Participante No. 1303 debe proporcionar la reubicación de la entrada de agua de mar y la descarga hacia el Este del muelle donde se muestra en los dibujos suministrados dentro del corredor establecido para este propósito.

RESPUESTA:

El consumo de agua de mar y la descarga fueron reubicados como requerido en los documentos actualizados 3645-XX-DG-501-001 Rev.07 (General Layout); 3645-XX-DG-502-001-001 Rev.4 (Site Plan Intake & Outfall); 3645-XX-DG-501-002-02 Rev.4 (Power Plant Unit) y 3645-XQ-DK-001-001 Rev.05 (Drainage Phylosophy).

Es oportuno puntualizar que, la ubicación y configuración finales habrán de reflejar el resultado de los estudios complementarios de tierra y mar a ser realizados, así como los requerimientos del Estudio de Impacto Ambiental (EIA).

Anexo los planos enumerados con las modificaciones solicitadas.

ACLARACIÓN:

h) El Participante No. 1303 debe aclarar cómo se cumplirá el límite de temperatura de descarga del condensador. Las Especificaciones Técnicas requieren que la descarga de agua sea diseñada para que el aumento de temperatura del agua de mar medida a 100 metros de la salida no supere los 3 °C. El Participante No. 1303 debe aclarar también cómo el diseño de la descarga acomodará las futuras Unidades de 300MW.

RESPUESTA:

El límite de temperatura requerido se cumplirá por medio de dispositivos disipadores de energía (y temperatura) adecuados: vertedores y escaleras colocados a lo largo del canal de descarga. Cuando los datos del mar sean obtenidos, será posible realizar los modelos de dispersión térmica, previstos en la fase del contracto EPC, a fin de definir la cantidad, dimensiones, y ubicación más efectiva de dichos dispositivos.

El diseño de la descarga que acomodará las futuras unidades, se indica en el documento actualizado 3645-XX-DG-501-001- Rev. 07 - General Layout adjunto, (ver plano anexo).

Proyecto Puerto Catania

ACLARACIÓN:

i) El plano No. PTEC-CA-DA-002 muestra un área de trabajo (vivienda). Esto debe colocarse lejos de la propiedad de la CDEEE. Existe la posibilidad que una entidad privada esté construyendo una planta en un lugar adyacente al terreno donde será instalada la planta. El Participante No. 1303 debe aclarar si el campamento estará ubicado lejos del área de construcción.

RESPUESTA:

Conforme a lo indicado en la respuesta a la Aclaración sobre esta pregunta, enviada por el Comité de Licitación por email el viernes 8 de noviembre de 2013, tenemos a bien enviar la nueva reestructuración de asiento del Campamento en las áreas ubicadas al Norte y Este del Terreno, al tiempo que consideramos esta Aclaración como una enmienda a las Especificaciones Técnicas.

En esta reestructuración fueron tomados en cuenta todas los requerimientos de la Sección 01 50 00 de las Especificaciones Técnicas, garantizando siempre que sean cumplidas las reglas de seguridad y vigilancia que se aplican al Proyecto.

Como este nuevo espacio posee dimensiones menores a la necesidad de nuestra estrategia de gerenciamiento, procederemos a reubicar las áreas: [G) Canchas Deportivas, H) Alojamiento Tipo C, I) Alojamiento Tipo B, J) Lavandería] del plano No. PTPC-CA-DA-002 en otro lugar acordado con el Propietario, bajo la premisa de los términos de la Aclaratoria Técnica 12.16.

ACLARACIÓN:

j) El Participante No. 1303 ha confirmado su compromiso con el cumplimiento de los requerimientos de la subestación 345kV (Especificación Técnica Sección 33 72 26, página 10). Sin embargo, la propuesta de plano 3645-NN-DN-501-002, muestra una sección tipo torre de celosía y barras entrelazadas mientras las Especificaciones Técnicas prohíben torres de celosía tipo reticulado y requieren barras rígidas. En tal sentido, para fines de evaluación el Participante No. 1303 debe aclarar si la subestación 345kV utilizará barras tubulares rígidas y estructuras tubulares cónicas.

RESPUESTA:

Confirmamos que las estructuras y barras de la subestación de 345kV serán provistas y diseñadas utilizando barras tubulares rígidas y estructuras autoportantes tubulares cónicas con placa base soldada, pernos de anclaje, agarraderas de soporte en la base, cable de amortiguación interna o equivalente, según lo requerido en la sección 33 72 26 Página 4, Párrafo 2.03 literal A y Página 3, párrafo 2.02 literal B de las especificaciones técnicas.

La representación gráfica de dichas estructuras metálicas de la Subestación 345 kV fueron modificadas en los documentos 3645-XX-DG-501-002 Rev.05 (Plant General Arrangement and Sections A-A, B-B, C-C y D-D); 3645-NN-DG-001 Rev.05 (Site Electrical Distribution Drawing) y 3645-NN-DG-002 Rev.04 (Site Facilities Electrical Equipment General Arrangement), adjuntos a estas respuestas.

ACLARACIÓN:

k) En la Propuesta Técnica del Participante No. 1303, se utiliza en varios acápites la mención "6.9kV', así como también "6.6kV'. Estas menciones han sido asumidas como una desviación menor, así como que la intención del Participante No. 1303 ha sido "6.9 kV'. Por favor aclare si "6.9 kV" es el valor correcto.

RESPUESTA:

Confirmamos que efectivamente el valor correcto de voltaje de diseño del sistema será de "6.9 kV" en concordancia con la Sección 01 36 26, página 2 párrafo 1.05 literal A y B de las especificaciones técnicas. Así que cualquier referencia errática a "6.6kV" debe ser considerada o leída como "6.9kV".

ACLARACIÓN:

l) El Participante No. 1303 ha indicado que cumpliría los requerimientos para la contención del aceite en virtud del Artículo 1.05 Sección 01 36 26 de las Especificaciones Técnicas, cuando debería ser en base al Artículo 1.08 de dichas Especificaciones. El Participante No. 1303 debe aclarar si esto constituye un error.

RESPUESTA:

Confirmamos que esto constituye un error, siendo que la referencia del requerimiento del sistema de contención del aceite debe seguir lo requerido en el Artículo 1.07 de la Sección 01 36 26 de las Especificaciones Técnicas:

"1.07 OIL CONTAINMENT

A. Fire protection for outdoor transformer: Providing minimum separation distances from adjacent structures and from each other by firewalls, spatial separation, or other approved means for the purpose of imiting the damage and potential spread of fire from a transformer failure in accordance with NFPA 850 Recommended Practice for Fire Protection for Electric Generating Plants and High Voltage Direct Current Converter Stations.

B. Transformer containment:

1. *Provide outdoor liquid-filled transformers with spill containment to prevent accidental release of the transformer fluid to the ground or in to unprotected building and/or equipment.*
2. *Design the spill containment system in accordance with the IEEE STD 980 (Guide for Containment and Control of Oil Spills in Substations) or equivalent standard.*
3. *Extend the containment perimeter at least 5 ft (1.5 m) beyond fluid-containing components, including any external coolers, for transformers with up to 1,000 gal (3.8 m3); and 8 ft (2.4 m) for transformers with more than 1,000 gal (3.8 m3).*
4. *Provide a system for removal of rainwater from the containment area."*

Observamos que la referencia incluida en la letra l) del Anexo A de la Resolución de Subsanación, debería de leerse "1.07" en vez de "1.08".

Proyecto Punta Catalina	LICITACIÓN PÚBLICA INTERNACIONAL NO. CDEEE-LPI-01-2013 PROYECTO PUNTA CATALINA	*Noviembre 2013*
ODEBRECHT ESTRELLA	OFERTA TÉCNICA	*Documentos de Subsanación*

ACLARACIÓN:

m) La narrativa de la propuesta del diseño eléctrico del Participante No. 1303, describe un sistema de distribución a tierra sólida de 480V; y afirma cumplir la sección de especificaciones de requisito de diseño eléctrico general. Las Especificaciones Técnicas, establecen como un requisito la alta impedancia. El Participante No. 1303 presenta una discrepancia menor indicando el sistema de 480/208V (Pagina 13 de 18 Sección 6), lo cual es imposible. En ese tenor, el Participante No. 1303 debe aclarar si el sistema de 277/480V será aterrizado a alta impedancia (3 cables) y si el sistema de 120/208V será un sistema de cableado a tierra sólida.

RESPUESTA:

La discrepancia presentada en la descripción del sistema eléctrico (Página 13 de 18 Sección 6), ha sido un error. En este sentido, confirmamos que efectivamente el sistema de distribución de baja tensión de la planta a 277/480V será aterrizado a alta impedancia (3 cables), trifásico, a tres alambres, y el sistema de distribución de baja tensión de 120/208V será un sistema de cableado a tierra sólida, trifásico, 4 alambres, de acuerdo con la Sección 01 36 26, página 2 párrafo 1.05 literal B de las especificaciones técnicas.

Dr. Ramón Ma. Urbáez Mañecho
Notario Público
Santo Domingo, R. D. N.

ACLARACIÓN:

n) En la Tabla 2, los valores mostrados para el MCR presentan una Capacidad Bruta de 384,944 kW, una Capacidad Neta de 347,576 kW y una Carga Auxiliar de 37,368 kW. La Tabla 1 muestra una Capacidad Neta Garantizada de 337,390 kW. El comité de Licitación requiere aclarar si esto es correcto o si por el contrario es un error de escritura. En caso de que sea correcto el Participante No. 1303 debe aclarar por qué existe un margen tan amplio entra la Capacidad Neta y la Capacidad Neta Garantizada.

RESPUESTA:

Las cifras que se muestran en la tabla 1 se refieren a la condición de Tasa Continua Máxima de la turbina (TMCR), mientras que las que se muestran en la Tabla 2 se hace referencia a la Tasa Continua Máxima de la Caldera (BMCR).

Con el fin de poder comparar el rendimiento de la planta bajo las mismas condiciones, podemos mencionar que la salida de potencia neta esperada en TMCR es 340,260 kW que es 0,8 % mayor que el valor garantizado que es 337,390 kW.

Las tablas 1 y 2 se han completado teniendo en cuenta las siguientes definiciones:

Planta @MCR se refiere a la potencia máxima generada por la planta con la caldera operando a su tasa máxima continua (BMCR) y la turbina de vapor operando a VWO.

MCR Garantizado se refiere a la potencia generada por la turbina operando a su tasa máxima continua (TMCR) con las válvulas mariposas principales de la turbina de vapor en control (alrededor de 2,5 % a partir de la condición VWO de la válvula).

Es una práctica común diseñar la turbina con un margen (del 2 al 5 %) entre la TMCR y la VWO (BMCR) para compensar el envejecimiento de la turbina de vapor. Con el tiempo el rendimiento y la salida de la turbina de vapor están obligados a caer ligeramente, principalmente debido a la mayor separación entre pares y la ampliación de los álabes. La turbina de vapor exigiría un mayor flujo de vapor para mantener la salida. Condiciones VWO abordará este problema adecuadamente.

Garantía No. LG/001/13
Cantidad: USD 22,000,000.00
Fecha de Vencimiento: 17 de Marzo de 2014

Por medio de la presente dejamos constancia que nosotros, **The Bank of Nova Scotia**, con dirección en la Av. 27 de Febrero esquina Winston Churchill, Santo Domingo, R.D. (en lo adelante denominado "El Garante") emitimos la presente Carta de Garantía Irrevocable, la cual incondicionalmente garantiza a favor de **Corporación Dominicana De Empresas Eléctricas Estatales (CDEEE),** (en lo adelante "La Corporación") hasta la suma total de **USD 22,000,000.00 (Veintidós Millones con 00/100 dólares estadounidenses),** pagadera al recibo en nuestras oficinas de su primera solicitud por escrito y acompañada de una comunicación escrita y firmada que declare que el Participante Oferente está incurriendo en violación de sus obligaciones contraídas bajo las siguientes condiciones:

a) Si el Participante Oferente retira su Oferta antes de finalizada la vigencia de esta Garantía de Seriedad y Mantenimiento de Oferta.

b) Si el Oferente Adjudicatario no suscribiere el acta de aceptación declaratoria de Oferente Adjudicatario a que hace referencia la Sección 17.3 de las Bases de la Oferta, en la forma y dentro del plazo establecido en esta Sección 17.3 de las Bases de la Oferta; y/o

c) Si el Oferente Adjudicatario no realizare, por causas imputables a dicho Oferente Adjudicatario, cualquier acto que sea necesario de su parte para efectos de formalizar los acuerdos resultantes de su Oferta durante la Fase de Cierre, incluyendo, sin limitación, la suscripción del Contrato de EPC.

Esta Garantía tendrá vigencia hasta e incluyendo el 17 de Marzo de 2014, y será renovada, mediante enmienda a requerimiento del Participante Oferente, atendiendo a las extensiones de plazo de validez de la Oferta que oficialmente solicite la Corporación para la Licitación que nos ocupa.

Santo Domingo, D.N.
República Dominicana.

Referencia: Aceptación de Adjudicación y Confirmación de Obligaciones Asumidas en Virtud de la Oferta y Declaratoria de Oferente Adjudicatario.

Estimado Comité De Licitación:

El Consorcio constituido por las Personas Jurídicas Constructora Norberto Odebrecht, S.A., Tecnimont S.p.A. e Ingeniería Estrella S.R.L. (en adelante, de manera conjunta, "**Participante No. 1303**"), debidamente representado por el suscrito, en calidad de Representante Autorizado del Participante No. 1303, por medio de la presente acusa recibo de la Resolución Declaratoria de Oferta Ganadora y Por Ende Oferente Adjudicatario al Participante Oferente Semifinalista No. 1303 (Trigésima Resolución) de fecha 18 de noviembre de 2013 del Comité De Licitación, enviada por correo electrónico al suscrito con fecha 22 de noviembre de 2013 (en adelante, "**Resolución De Adjudicación**"), mediante la cual, entre otras cosas, se declara al Participante No. 1303 como Oferente Adjudicatario de la Licitación Pública Internacional No. CDEEE-LPI-01-2013 para la Selección del Contratista que Ejecutará los Trabajos de Ingeniería, Procura y Construcción (EPC) de Dos (2) Unidades Termoeléctricas en Base a Carbón Mineral con una Capacidad de 300 MW (±20%) Cada Una (en adelante, "**Licitación**"). Para efectos de este instrumento, hacemos referencia a los siguientes documentos: (a) "Bases De Licitación – Antecedentes Y Normas Aplicables A Toda La Licitación", emitido por el Comité De Licitación con fecha 13 de mayo de 2013 (en adelante, incluyendo cualquier modificación que se le haya hecho al mismo durante la Licitación, "**Antecedentes Y Normas Generales De La Licitación**"); (b) "Bases De Licitación – Bases Fase De Precalificación", emitido por el Comité De Licitación con fecha 13 de mayo de 2013 (en adelante, incluyendo cualquier modificación que se le haya hecho al mismo durante la Licitación, "**Bases Fase De Precalificación**"); (c) "Bases De Licitación – Bases Fase De Ofertas Y Cierre", emitido por el Comité De Licitación con fecha 23 de agosto de 2013 (en adelante, incluyendo cualquier modificación que se le haya hecho al mismo durante la Licitación, "**Bases Fases De Ofertas Y Cierre**", y de manera conjunta con los Antecedentes Y Normas Generales De La Licitación y las Bases Fase De Precalificación, en adelante, "**Bases De Licitación**"); y (d) Oferta presentada por el Participante No. 1303 en el Acto De Ofertas celebrado en fecha 15 de octubre de 2013 (incluyendo

todos y cada uno de los Documentos De Subsanación presentados por el Participante No. 1303 en virtud de la Resolución De Evaluación De Ofertas No Económicas (según dicho término se define en el párrafo siguiente, literal (e)(ii), del presente instrumento), en adelante, "**Oferta Adjudicada**"). Para efectos del presente instrumento, los términos utilizados con letra mayúscula, y no definidos en este instrumento, tendrán el significado que se les atribuye en las Bases De Licitación.

En su calidad de Oferente Adjudicatario y en cumplimiento de lo establecido en las Bases De Licitación (particularmente en la Sección 17.3 de las Bases Fases De Ofertas Y Cierre) y en la Resolución De Adjudicación (particularmente en su Ordinal Resolutivo Tercero), dentro del plazo y con las formalidades que para estos efectos se establecen en las Bases De Licitación y en la referida Resolución De Adjudicación, el Participante No. 1303, debidamente representado por el suscrito en calidad de Representante Autorizado de todas y cada una de las Personas Jurídicas que integran dicho Participante, por medio de la presente:

a) Acepta, de manera expresa, la declaratoria de Oferente Adjudicatario que consta en la Resolución De Adjudicación.

b) Confirma y reitera, de manera expresa, el compromiso asumido en virtud y/o como resultado de su participación en la Licitación, de la presentación de la Oferta Adjudicada y de la declaratoria de Oferente Adjudicatario, de cumplir con todas y cada una de las obligaciones derivadas y/o resultantes de dicha participación, oferta y declaratoria, incluyendo, sin limitación, su obligación de (i) suscribir el Contrato De EPC y documentos relacionados para efectos de ejecutar las Obras, y (ii) realizar cualquier acto que sea necesario de su parte para efectos de formalizar los acuerdos resultantes de la Oferta Adjudicada durante la Fase De Cierre; lo anterior, con sujeción a y de conformidad con dicho contrato, demás Documentos De Licitación y Oferta Adjudicada (tales obligaciones, de manera conjunta, "**Obligaciones Asumidas**").

c) Se obliga a cumplir con todas y cada una de las Obligaciones Asumidas dentro de los plazos y bajo las condiciones establecidas en los Documentos De Licitación (incluyendo, sin limitación, el Contrato De EPC y las Especificaciones Técnicas) y la Oferta Adjudicada, con las modificaciones, si así fuere el caso, que el Participante No. 1303 y la Corporación, en su calidad de líder y coordinadora de la Licitación y en representación de las Empresas Distribuidoras, acordaren, de manera expresa, durante la Fase De Cierre.

d) Confirma y reitera toda información y declaración contenida en sus Credenciales, incluyendo, sin limitación, aquella información/documentación adicional presentada con fecha 16 de julio de 2013 para efectos de subsanar los errores o defectos no sustanciales de que adolecían tales Credenciales descritos en la Resolución Relativa al Resultado de la Evaluación de Credenciales (Quinta Resolución) que emitiera el Comité De Licitación al Participante No. 1303 con fecha 29 de junio de 2013, incluyendo, sin limitación, todas y cada una de las declaraciones, reconocimientos y aceptaciones contenidas en la Declaración Jurada a que hace referencia la Sección 8.1 de las Bases Fase De Precalificación adjunta al Sobre De Credenciales del Participante No. 1303 (Anexo 6 de las Bases Fase De Precalificación).

e) Confirma y reitera toda información, declaración, reconocimiento y/o aceptación contenida(o) en cualquier documento adjunto a la Oferta Adjudicada, incluyendo, sin limitación:

(i) La Declaración Jurada de Confirmación de Aceptación de Bases De Licitación y Validez de Oferta a que hace referencia la Sección 12.1(a) de las Bases Fases De Ofertas Y Cierre, adjunta a su Oferta Administrativa (Anexo 01 de las Bases Fases De Ofertas Y Cierre);

(ii) Los Certificados De Existencia Y Representación Fase De Ofertas emitidos por cada una de las Personas Jurídicas integrantes del Participante No. 1303, adjuntos a su Oferta Administrativa (Anexo 02 de las Bases Fases De Ofertas Y Cierre), incluyendo el nuevo Certificado de Existencia Y Representación Fase De Ofertas que hiciera llegar respecto de la Persona Jurídica Technimont S.p.A. para efectos de cumplir con lo requerido por la Resolución Relativa al Proceso de Apertura y Evaluación de Ofertas No Económicas (Vigésimo Octava Resolución) que emitiera el Comité de Licitación al Participante No. 1303 con fecha 30 de octubre de 2013 ("**Resolución De Evaluación De Ofertas No Económicas**"). Para efectos del presente instrumento, los Certificados De Existencia Y Representación Fase De Ofertas antes indicados serán referidos, de manera conjunta, como "**Certificados De Existencia Y Representación Del Participante No. 1303**";

(iii) Los Formularios De Oferta Técnica y demás información/documentos adjuntos a su Oferta Técnica, incluyendo las sustituciones, aclaraciones y/o modificaciones efectuadas a alguno de tales formularios y/o documentos/información en virtud de la Resolución De Evaluación De Ofertas No Económicas;

(iv) Los Formularios De Oferta De Financiamiento y demás información/documentos adjuntos a su Oferta De Financiamiento, incluyendo las sustituciones, aclaraciones y/o modificaciones efectuadas a alguno de tales formularios y/o documentos/información en virtud de la Resolución De Evaluación De Ofertas No Económicas; y

(v) Los Formularios De Oferta Económica y demás información/documentos adjuntos a su Oferta Económica.

f) Declara y certifica que el Acuerdo Consorcial adjunto a su Oferta Administrativa no ha sido objeto de enmienda o modificación alguna y se encuentra plenamente vigente a la fecha del presente instrumento ("**Acuerdo Consorcial Del Participante No. 1303**").

g) Confirma y ratifica todos y cada uno de los actos y/o presentaciones efectuadas a la fecha del presente instrumento por su Representante Autorizado, o cualquier otra persona que haya actuado en nombre y representación del Participante No. 1303 o de cualquiera de las Personas Jurídicas que lo integran, con motivo de o en relación con la Licitación, cualquiera fuere la naturaleza del acto o presentación de que se trate.

Finalmente, el suscrito declara, reconoce y acepta expresamente, bajo la fe de juramento, que (i) se encuentra investido de todos los poderes necesarios para suscribir el presente instrumento en nombre y representación de todas y cada una de las Personas Jurídicas que integran el Participante No. 1303, (ii) los poderes otorgados al suscrito que constan en los Certificados De Existencia Y Representación Del Participante No. 1303 no han sido revocados y se encuentran plenamente vigentes a la fecha del presente instrumento, (iii) la designación de Representante Autorizado de todas y cada una de las Personas Jurídicas que integran al Participante No. 1303 que consta en el Acuerdo Consorcial Del Participante No. 1303 no ha sido revocada y se encuentra plenamente vigente a la fecha del presente

instrumento, (iv) que el presente documento constituye, desde el momento mismo de su ejecución por el suscrito, en calidad de Representante Autorizado de cada una de las Personas Jurídicas que integran el Participante No. 1303, una obligación válida y vinculante para y respecto de todas y cada una de tales Personas jurídicas, y (v) para efectos de lo dispuesto en el numeral (iv) anterior, no se requiere de ningún acto, gestión o autorización adicional por parte de ningún órgano y/o autoridad de ninguna de las Personas Jurídicas que integran el Participante No. 1303.

En la ciudad de Santo Domingo de Guzmán, Distrito Nacional, capital de la República Dominicana, a los veintisiete (27) días del mes de noviembre de dos mil trece (2013).

ACLARACIONES

----------[Final de Página]----------

"Año del Bicentenario del Natalicio de Juan Pablo Duarte"

CORPORACIÓN DOMINICANA DE EMPRESAS ELÉCTRICAS ESTATALES (CDEEE)

LICITACIÓN PÚBLICA INTERNACIONAL No. CDEEE-LPI-01-2013

PARA LA SELECCIÓN DEL CONTRATISTA QUE EJECUTARÁ LOS TRABAJOS DE INGENIERÍA, PROCURA Y CONSTRUCCIÓN (EPC) DE DOS (2) UNIDADES TERMOELÉCTRICAS EN BASE A CARBÓN MINERAL CON UNA CAPACIDAD DE 300 MW (±20%) CADA UNA

Aclaración No. 1

03 de junio de 2013

1.1. Para efectos de esta Aclaración, los términos utilizados con letra mayúscula, y no definidos en esta Aclaración, tendrán el significado respectivo que se les atribuye en los Antecedentes Y Normas Generales De La Licitación y en las Bases Fase De Precalificación, según sea el caso.

1.2. En atención a algunas Consultas/Aclaraciones recibidas con respecto de algunos temas relacionados con la presentación de Credenciales y conformación de Consorcios, es preciso aclarar lo siguiente:

(i) Los Participantes Registrados pueden presentar Credenciales individualmente o como parte de un Consorcio;

(ii) En caso de que un Participante Registrado decidiera presentar Credenciales bajo la modalidad de Consorcio, no es necesario que los demás integrantes del Consorcio respectivo se hayan registrado como Participantes Registrados de manera previa. Es decir, para presentar Credenciales bajo la modalidad de Consorcio, basta que uno de los integrantes del Consorcio respectivo sea Participante Registrado;

(iii) Conforme se establece en el Artículo 11 de las Bases Fase De Precalificación, los Consorcios que fueren declarados como Participantes Precalificados podrán reconstituirse después de su declaratoria de Precalificación para efectos de presentar una Oferta sujeto, siempre y en todo caso, a los parámetros y restricciones establecidas para tal efecto en la Sección 2.9 de las Bases Fase De Precalificación; y

(iv) Si un Participante Registrado presenta Credenciales de manera individual y es declarado Participante Precalificado, podrá constituir un Consorcio después de su declaratoria de Precalificación (ya sea con Afiliadas o no Afiliadas) para efectos de presentar una Oferta en la medida que dicho Participante Precalificado de manera individual tenga al menos un cincuenta y uno por ciento (51%) del control (en los términos que se establecen en la definición de Afiliada contenida en la Sección 3.1 de los Antecedentes Y Normas Generales De La Licitación) de dicho Consorcio.

"Año del Bicentenario del Natalicio de Juan Pablo Duarte"

CORPORACIÓN DOMINICANA DE EMPRESAS ELÉCTRICAS ESTATALES (CDEEE)

LICITACIÓN PÚBLICA INTERNACIONAL No. CDEEE-LPI-01-2013

PARA LA SELECCIÓN DEL CONTRATISTA QUE EJECUTARÁ LOS TRABAJOS DE INGENIERÍA, PROCURA Y CONSTRUCCIÓN (EPC) DE DOS (2) UNIDADES TERMOELÉCTRICAS EN BASE A CARBÓN MINERAL CON UNA CAPACIDAD DE 300 MW (±20%) CADA UNA

Aclaración No. 2

15 de junio de 2013

1.1. Para efectos de esta Aclaración, los términos utilizados con letra mayúscula, y no definidos en esta Aclaración, tendrán el significado respectivo que se les atribuye en los Antecedentes Y Normas Generales De La Licitación y en las Bases Fase De Precalificación, según sea el caso.

1.2. En atención a algunas Consultas/Aclaraciones recibidas con respecto a la aplicabilidad de la Ley No. 322 de fecha 2 de junio del año 1981 ("**Ley No. 322**"), que entre otras cosas, en su Artículo 1 establece que "*A partir de la entrada en vigencia de la presente Ley, para que una empresa o persona física extranjera pueda participar en concursos, sorteos, o mediante cualquiera otra modalidad de adjudicación, o pueda ser contratada por el Estado Dominicano, sus instituciones autónomas, los ayuntamientos o empresas en las que el Estado Dominicano figure como accionista, para la ejecución de cualquier obra o trabajo, dicha empresa o persona física extranjera deberá estar asociada con una empresa nacional o de capital mixto*", por la presente se confirma a todos los Participantes Registrados la aplicabilidad de dicha Ley al proceso de Licitación, lo anterior, entre otras, de conformidad con lo dispuesto en las Secciones 2.1, 4.6 y 5.11.1 de los Antecedentes Y Normas Generales De La Licitación y del Artículo 79 de la Ley No. 340-06. Por consiguiente, toda Persona Jurídica Extranjera que se encuentre participando en la Licitación, ya sea individualmente o como parte de un Consorcio, deberá observar y cumplir, en todos sus aspectos, las disposiciones de la Ley No. 322 y demás Legislación Dominicana aplicable al momento de presentar su Oferta, incluyendo, sin limitación, las disposiciones contenidas en los Artículos 1 y 3 de la Ley No. 322. Lo anterior se entiende sujeto de las excepciones a ciertos requerimientos de la Ley No. 322 en beneficio de Personas Jurídicas Extranjeras de nacionalidad estadounidense contenidas en el Anexo 9.1.2(b)(i), Sección J, Numeral 3, del Tratado de Libre Comercio entre la República Dominicana, Centroamérica y Estados Unidos de América (DR-CAFTA).

"Año del Bicentenario del Natalicio de Juan Pablo Duarte"

1.3. Asimismo, se ha decidido lo siguiente respecto de la participación consorcial mínima requerida en la Sección 2.9 de las Bases Fase De Precalificación para la Empresa Solvente Aceptable y Empresa Técnica Aceptable:

a) Reducir de un cuarenta por ciento (40%) al treinta y cinco por ciento (35%) la participación consorcial mínima requerida para la Empresa Solvente Aceptable y la Empresa Técnica Aceptable cuando las Personas Jurídicas integrantes del Consorcio respectivo que acreditan el Requisito Financiero (Empresa Solvente Aceptable) y Requisito De Experiencia Técnica (Empresa Técnica Aceptable) fueren distintas; y

b) Reducir de un cincuenta y un por ciento (51%) del control (en los términos que se establecen en la definición de Afiliada contendida en la Sección 3.1 de los Antecedentes Y Normas Generales De La Licitación) del Consorcio respectivo al cincuenta por ciento (50%) de dicho control a la Persona Jurídica integrante del Consorcio respectivo que acredita el cumplimiento del Requisito Financiero (Empresa Solvente Aceptable) y el Requisito De Experiencia Técnica (Empresa Técnica Aceptable) fuere la misma.

De conformidad con lo anterior, todas las referencias a dichos porcentajes mínimos contenidas en las Bases Fase De Precalificación se entenderán modificadas en el sentido establecido en este Párrafo.

Aclaración No. 3

04 de julio de 2013

1.1. Para efectos de esta Aclaración, los términos utilizados con letra mayúscula, y no definidos en esta Aclaración, tendrán el significado respectivo que se les atribuye en los Antecedentes Y Normas Generales De La Licitación y en las Bases Fase De Precalificación, según sea el caso.

1.2. Con el objeto de facilitar el procedimiento establecido en la Sección 10.8.8 de las Bases Fase De Precalificación para materializar la presentación de la documentación requerida por el Comité De Licitación para efectos subsanar las Credenciales de aquellos Participantes Registrados que adolezcan de errores o defectos no sustanciales, según dicha documentación se describe en la correspondiente "Resolución Relativa al Resultado de la Evaluación de Credenciales" emitida por el Comité De Licitación con fecha 29 de junio de 2013 y notificada a tales Participantes Registrados con fecha 1 de julio de 2013 (dicha documentación, "Documentos De Subsanación"), se ha decidido Permitir, en caso de ser necesario, la Presentación de Documentos De Subsanación por una persona distinta del Representante Autorizado del Participante Registrado correspondiente (dicha persona, "Apoderado Especial").

1.3. Con el objeto de habilitar al Apoderado Especial para los efectos establecidos en el Párrafo 1.2 anterior, se deberá seguir el siguiente procedimiento:

a) En la comunicación a que se refiere la Sección 10.8.8 que el Participante Registrado respectivo, a través de su Representante Autorizado, debe enviar al Comité De Licitación para efectos de coordinar el día y hora en que la presentación de los Documentos De Subsanación ha de materializarse, se deberá incluir la siguiente información adicional:

i) La razón por la cual el Representante Autorizado respectivo no podrá presentar, de manera personal, los Documentos De Subsanación;

ii) Designación expresa del Apoderado Especial para los efectos establecidos el Párrafo 1.2 del presente Comunicado, indicando (A) el nombre completo del Apoderado Especial, (B) el número de pasaporte o cédula de identidad y electoral del Apoderado Especial y (c) la relación que dicho Apoderado Especial tiene con el Participante Registrado respectivo; y

iii) Declaración expresa del Representante Autorizado de que cuenta con poder suficiente para efectos de designar al Apoderado Especial para los fines establecidos en el Párrafo 1.2 del presente Comunicado.

1.4. La presentación física de los Documentos De Subsanación deberá efectuarse de manera personal, ya sea por el Representante Autorizado o su Apoderado Especial debidamente habilitado para ello, según sea el caso, siguiendo, en todo lo demás, las disposiciones de la Sección 10.8.8 de las Bases Fase De Precalificación. No se aceptarán Documentos De Subsanación que se presenten por vía postal, correo electrónico o cualquier otro medio de comunicación.

1.5. Deberá presentarse (i) un original de cada uno de los Documentos De Subsanación debidamente marcado como "ORIGINAL" en la primera página del ejemplar correspondiente; y (ii) tres (3) copias simples de dicho ejemplar, debidamente marcadas, en su primera página, como "COPIA 1", "COPIA 2" y "COPIA 3", respectivamente. Asimismo, los Documentos De Subsanación deberán cumplir con todas las formalidades del caso exigidas por las Bases Fase De Precalificación y Antecedentes Y Normas Generales De La Licitación.

1.6. Para efectos de acreditar la identidad del Representante Autorizado o Apoderado Especial, según sea el caso, se exigirá lo siguiente:

b) Respecto del Representante Autorizado, se exigirá el pasaporte, en original, que identifique a dicho Representante Autorizado según información que consta en el Registro De Participantes; y

c) Respecto del Apoderado Especial, se exigirá, según sea el caso, el pasaporte o la cédula de identidad y electoral, en original, que identifique a dicho Apoderado Especial según información que se hubiere proporcionado de conformidad con el procedimiento establecido en el Párrafo 1.3 del presente Comunicado.

LICITACIÓN PÚBLICA INTERNACIONAL No. CDEEE-LPI-01-2013

PARA LA SELECCIÓN DEL CONTRATISTA QUE EJECUTARÁ LOS TRABAJOS DE INGENIERÍA, PROCURA Y CONSTRUCCIÓN (EPC) DE DOS (2) UNIDADES TERMOELÉCTRICAS EN BASE A CARBÓN MINERAL CON UNA CAPACIDAD DE 300 MW (±20%) CADA UNA

Aclaración No. 4

26 de julio de 2013

1.1. Para efectos de esta Aclaración, los términos utilizados con letra mayúscula, y no definidos en esta Aclaración, tendrán el significado respectivo que se les atribuye en los Antecedentes Y Normas Generales De La Licitación y en las Bases Fase De Precalificación, según sea el caso.

1.2. Para efectos de materializar cualquier visita al terreno en que se desarrollará el Proyecto ("**Terreno**"), los Participantes Precalificados deberán seguir el siguiente procedimiento:

a) El Representante Autorizado del Participante Precalificado respectivo deberá enviar al Comité De Licitación una comunicación, a través del Correo De La Licitación (esto es, licitacioninternacional@cdeee.gob.do), solicitando la visita respectiva ("**Visita**") e indicando (i) las actividades a realizar, (ii) las personas que asistirán a la Visita e individualización de tales personas, incluyendo, nombre completo, nacionalidad, domicilio, número de pasaporte, país y fecha de emisión o Cédula de Identidad y Electoral, profesión y cargo o relación con el Participante Precalificado respectivo (dichas personas, "**Visitantes Autorizados**"), y (iii) fecha y duración esperada de la Visita (dicha comunicación, "**Solicitud De Visita**");

b) El Comité De Licitación responderá a la Solicitud De Visita mediante el envío de un acuerdo de autorización ("**Acuerdo**"), el cual, como condición previa para materializar la Visita respectiva, deberá ser (i) suscrito por el Representante Autorizado del Participante Precalificado respectivo y por cada uno de los Visitantes Autorizados y (ii) devuelto al Comité De Licitación en la forma que se establece en dicho Acuerdo; y

c) Una vez que el Comité De Licitación reciba, a través del Correo De La Licitación, una copia en formato pdf del Acuerdo, debidamente suscrito por el Representante Autorizado del Participante Precalificado respectivo y por cada uno de los Visitantes Autorizados, comunicará (i) dicha circunstancia al Representante Autorizado del Participante Precalificado respectivo, (ii) el o los representantes del Comité De Licitación que éste ha designado para que acompañe(n) a los Visitantes Autorizados, y (iii) el representante del Comité De Licitación con quien deberá coordinarse cualquier otro detalle necesario para efectos de materializar la Visita respectiva. Lo anterior será comunicado al referido Representante Autorizado a través del envío de una comunicación al efecto al correo electrónico de dicho Representante que consta en el Registro De Participantes.

1.3. Los Participantes Precalificados serán los únicos autorizados para solicitar visitas al Terreno.

1.4. Una vez que se haya solicitado y autorizado la Visita correspondiente de conformidad con el procedimiento establecido en el Párrafo 1.2 de esta Aclaración, los únicos representantes del Participante Precalificado respectivo que podrán participar en dicha Visita serán los Visitantes Autorizados. Esto es, y para efectos de claridad, no se permitirá la participación en la Visita respectiva de ningún representante del Participante Precalificado respectivo (i) que no esté incluido en el listado de Visitantes Autorizados o (ii) que con posterioridad a la emisión de la comunicación a que se refiere el Subpárrafo 1.2(c) de esta Aclaración, haya sido autorizado a participar en la Visita respectiva, de manera previa y por escrito, por parte del Comité De Licitación.

Aclaración No. 5

28 de agosto de 2013

1.1. Para efectos de esta Aclaración, los términos utilizados con letra mayúscula, y no definidos en esta Aclaración, tendrán el significado respectivo que se les atribuye en las Bases De Licitación.

1.2. En relación con el terreno en el que el Oferente Adjudicatario deberá desarrollar e implementar el Proyecto, el Comité De Licitación aclara lo siguiente:

a) De conformidad con las Secciones 2.29 y 2.126 de las Bases Fase De Ofertas Y Cierre, el Oferente Adjudicatario deberá desarrollar e implementar el Proyecto en el terreno que se describe en el Dossier Inmobiliario ("**Terreno**"), documento que el Comité De Licitación ha puesto a disposición de todos los Participantes Precalificados, con esta misma fecha, en el Portal De La Licitación; y

b) Por consiguiente, toda referencia que se haga o haya hecho en cualquier Documento De Licitación (incluyendo, sin limitación, la Sección 3.52 de los Antecedentes Y Normas Generales De La Licitación, Anexo A de los Antecedentes Y Normas Generales De La Licitación y Especificaciones Técnicas) al terreno ubicado en la localidad de Hatillo, Provincia de Azua, República Dominicana, antes informado, deberá entenderse hecha, a partir de esta fecha y para todos los efectos de la Licitación, al Terreno.

1.3. Según lo establecido en la Sección 5 de las Bases Fase De Ofertas Y Cierre, para fines de materializar la visita y conocimiento del Terreno, favor referirse a la Aclaración No. 4 de fecha 26 de julio de 2013, copia de la cual se encuentra a disposición de todos los Participante Precalificados en el Portal De La Licitación.

Aclaración No. 6

4 de septiembre de 2013

1.1. Para efectos de esta Aclaración, los términos utilizados con letra mayúscula, y no definidos en esta Aclaración, tendrán el significado respectivo que se les atribuye en las Bases De Licitación.

1.2. En relación con el Dossier Inmobiliario que el Comité De Licitación puso a disposición de todos los Participantes Precalificados, a través del Portal De La Licitación, con fecha 28 de agosto de 2013, el Comité De Licitación informa lo siguiente:

a) Que a partir de esta fecha se modifican y reemplazan los Anexos 1 y 2 del Dossier Inmobiliario ("**Anexos Originales**") con los nuevos Anexos 1 y 2 adjuntos a esta Aclaración ("**Anexos De Reemplazo**");

b) Por consiguiente, toda referencia que se haga o haya hecho en el Dossier Inmobiliario o cualquier otro Documento De Licitación a los Anexos Originales o a cualquiera de los Anexos Originales, según sea el caso, deberá entenderse hecha, a partir de esta fecha y para todos los efectos de la Licitación, a los Anexos De Reemplazo o al correspondiente Anexo De Reemplazo, según sea el caso; y

c) Asimismo, y como consecuencia de lo anterior, los Participantes Precalificados (i) deberán abstenerse de utilizar los Anexos Originales en formatos AutoCAD (.dwg) que se pusieron a disposición de los Participantes Precalificados, a través del Portal De La Licitación, con fechas 28 de agosto de 2013 y 02 de septiembre de 2013, los cuales han sido removidos de dicho portal y (ii) podrán descargar copia de los Anexos De Reemplazo, en formato AutoCAD (.dwg), a partir de esta fecha.

Aclaración No. 7

10 de septiembre de 2013

1.1. Para efectos de esta Aclaración, los términos utilizados con letra mayúscula, y no definidos en esta Aclaración, tendrán el significado respectivo que se les atribuye en las Bases De Licitación.

1.2. Según consta del Párrafo 13 de la Adenda No. 1 – Especificaciones Técnicas (versión inglés) de fecha 4 de septiembre de 2013, copia de la cual se encuentra a disposición de todos los Participantes Precalificados en el Portal De La Licitación, la Sección 01 92 00-13 – Facility Operation and Maintenance de las Especificaciones Técnicas ha sido eliminada, en su totalidad, de dicho documento.

1.3. Por consiguiente, se aclara a todos los Participantes Precalificados que (i) con motivo de lo anterior y (ii) en concordancia con los términos y condiciones de las Bases Fase De Ofertas Y Cierre que fueron puestas a disposición de todos los Participantes Precalificados con fecha 23 de agosto de 2013, debe entenderse, para todos los efectos de la Licitación, que:

a) El Objeto De La Licitación no incluye ni incluirá la operación y mantenimiento del Proyecto; y

b) Toda referencia que se haga o haya hecho a dicha operación y mantenimiento en las Especificaciones Técnicas, incluyendo, sin limitación, la referida Sección 01 92 00-13 – Facility Operation and Maintenance, o en cualquier otro Documento De La Licitación ha quedado sin efecto.

Señores
Comité De Licitación
Licitación Pública Internacional No. CDEEE-LPI-01-2013
Ave. Independencia Esq. Calle Fray Cipriano de Utrera
Centro de los Héroes de Constanza Maimón y Estero Hondo
Santo Domingo, D.N.
República Dominicana

De mi consideración:

Conforme a lo requerido en la Sección 12 de las Bases Fase De Ofertas Y Cierre (según dicho término se define el numeral Primero del presente documento) emitidas en relación con la Licitación Pública Internacional No. CDEEE-LPI-01-2013 (en adelante, "**Licitación**") que ha sido convocada por las Empresas Distribuidoras, lideradas y coordinadas por la Corporación Dominicana de Empresa Eléctricas Estatales (CDEEE), quien suscribe, _____, de nacionalidad _____, mayor de edad, de profesión _____, titular del [documento de identidad] _____, domiciliado en _____, actuando, de conformidad con el poder especial de representación de fecha _____, en calidad de Representante Autorizado de _____, sociedad comercial, organizada y regida de conformidad con las leyes de _____, con su domicilio y asiento social en _____, e inscrita en el Registro Nacional de Contribuyentes (RNC) con el No. _____ [o equivalente en la jurisdicción respectiva], [listar acá las generales antes descritas de cada una de las Personas Jurídicas representadas por el Representante Autorizado y descripción de los poderes otorgados por dichas Personas Jurídicas al Representante Autorizado], en nombre y representación de la(s) Persona(a) Jurídica(s) arriba listada(s) (en adelante, "**Representada(s)**"), **DECLARA, RECONOCE Y ACEPTA EXPRESAMENTE BAJO LA FE DE JURAMENTO** lo siguiente:

PRIMERO: Para efectos de este documento, los términos utilizados con letra mayúscula, y no definidos en este documento, tendrán el significado que se les atribuye en los siguientes documentos (colectivamente, "**Bases De Licitación**"): (a) "Bases De Licitación – Antecedentes Y Normas Aplicables A Toda La Licitación", emitido por el Comité De Licitación con fecha 13 de mayo de 2013, (b) "Bases

De Licitación – Bases Fase De Precalificación", emitido por el Comité De Licitación con fecha 13 de mayo de 2013, y (c) "Bases De Licitación – Bases Fase De Ofertas Y Cierre", emitido por el Comité De Licitación con fecha 22 de agosto de 2013 (en adelante, "**Bases Fase De Ofertas Y Cierre**").

SEGUNDO: Que su(s) Representada(s) acepta(n) todos y cada uno de los términos, condiciones y estipulaciones establecidas en las Bases De Licitación, incluyendo, sin limitación, la advertencia, desistimientos y limitaciones de responsabilidad establecidas en la Sección 4 de los Antecedentes Y Normas Aplicables A Toda La Licitación, así como todos y cada uno(a) de sus Anexos, comunicados, adendas, aclaraciones, respuestas a Consultas/Aclaraciones y todo otro documento o información entregada o puesta a disposición de los Participantes, incluyendo su(s) Representada(s), por el Comité De Licitación durante o en relación con la Licitación y que no tiene(n) nada que alegar u objetar al respecto.

TERCERO: Que su(s) Representada(s) se compromete(n) a cumplir con (i) las normas contenidas en la Ley General sobre Medio Ambiente y Recursos Naturales (Ley No. 64-00) de la Republica Dominicana; (ii) todas las disposiciones establecidas por el Ministerio de Medio Ambiente y Recursos Naturales, y (iii) las normas, criterios y reglamentos internacionales relativos a la protección del medioambiente que se indican en las Especificaciones Técnicas, en conjunto ("**Garantía Protección al Medio Ambiente**").

CUARTO: Que su(s) Representada(s) se compromete(n) a que, en caso de ser declarada(s) Oferente Adjudicatario, dará(n) las garantías requeridas de todas las partes y equipos, de acuerdo a las Especificaciones Técnicas ("**Garantía de Todas las Partes y Equipos**"), y en el caso de que para algunos equipos o materiales los mismos no hayan sido indicados en las Especificaciones Técnicas, el periodo de tiempo a cubrir no será menor a un (1) año, contado a partir de la Fecha de Aceptación Provisional.

QUINTO: Que su(s) Representada(s) se compromete(n) a que, en caso de ser declarada(s) Oferente Adjudicatario, cumplirá(n) con las normas y códigos aplicables indicadas en las Especificaciones Técnicas de la Licitación ("**Compromiso Cumplimiento con Normas y Códigos Aplicables**"), o en su defecto, cumplir con normas y códigos que sean iguales, equivalentes o superiores a los indicados en las Especificaciones Técnicas. En este último caso, las normas y códigos distintos a los establecidos en las Especificaciones Técnicas serán incluidos en la Oferta Técnica, con la documentación que demuestre que

CORPORACIÓN DOMINICANA DE EMPRESAS ELÉCTRICAS ESTATALES (CDEEE)

LICITACIÓN PÚBLICA INTERNACIONAL No. CDEEE-LPI-01-2013

PARA LA SELECCIÓN DEL CONTRATISTA QUE EJECUTARÁ LOS TRABAJOS DE INGENIERÍA, PROCURA Y CONSTRUCCIÓN (EPC) DE DOS (2) UNIDADES TERMOELÉCTRICAS EN BASE A CARBÓN MINERAL CON UNA CAPACIDAD DE 300 MW (±20%) CADA UNA

Aclaración No. 9

7 de octubre de 2013

1.1. Para efectos de esta Aclaración, los términos utilizados con letra mayúscula, y no definidos en esta Aclaración, tendrán el significado respectivo que se les atribuye en las Bases De Licitación.

1.2. En relación con el Anexo H de las Condiciones Generales Del Contrato De EPC (Monto de las Penalidades), el Comité De Licitación aclara lo siguiente:

a) El monto máximo de la penalidad por Día de atraso respecto del plazo total que se establece en el referido Anexo H es del 10% (diez por ciento) del Precio Del Contrato por cada una de las Unidades del Proyecto; y

b) El monto máximo del conjunto de indemnizaciones por falla en el cumplimiento de las Pruebas De Aceptación que se establecen en el referido Anexo H es del 10% (diez por ciento) del Precio Del Contrato por cada una de las Unidades del Proyecto.

1.3. En relación con el párrafo final de la Sección 7.1 de las Condiciones Generales Del Contrato De EPC, el Comité De Licitación aclara lo siguiente:

a) El Precio del Contrato excluirá el pago de todo tipo de impuesto, tributo, tasa, contribución, licencia, arancel, derecho, así como de cualquier otro gravamen, cualquiera fuera su naturaleza, que grave o pudiese gravar las maquinarias, equipos, materiales e insumos que se utilicen directamente en la ejecución de las Obras, ya sea que tales maquinarias, equipos, materiales e insumos sean provistos por el Contratista (según dicho término se define en las Condiciones Generales Del Contrato De EPC) o sus Subcontratistas (según dicho término se define en las Condiciones Generales

Del Contrato De EPC) y/o proveedores. Para efectos de claridad, el Precio del Contrato no excluirá el pago de impuestos, tributos, tasas, contribuciones, licencias, aranceles, derechos, así como de cualquier otro gravamen, cualquiera fuera su naturaleza, que grave o pudiese gravar las maquinarias, equipos, materiales e insumos que se utilicen de manera indirecta en la ejecución de las Obras, ya sea que tales maquinarias, equipos, materiales e insumos sean provistos por el Contratista o sus Subcontratistas y/o proveedores.

b) El Contratista y sus Subcontratistas y proveedores serán responsables del Impuesto Sobre la Renta y de los costos relativos a la Seguridad Social aplicable al personal a utilizar en la ejecución de las Obras.

COMUNICADO No. 1

03 junio de 2013

INFORMACIÓN RELEVANTE RELATIVA AL ACTO DE PRECALIFICACIÓN

Se comunica a todos los Participantes Registrados información relevante relativa al Acto De Precalificación a ser celebrado en la fecha que se indica en el Cronograma. Para efectos de este Comunicado, los términos utilizados con letra mayúscula, y no definidos en este Comunicado, tendrán el significado respectivo que se les atribuye en los Antecedentes Y Normas Generales De La Licitación y en las Bases Fase De Precalificación, según sea el caso.

1. **Persona Autorizada para Presentar Credenciales.**

   Conforme se establece en la Sección 10.3 de las Bases Fase De Precalificación, las Credenciales de un Participante Registrado deberán ser presentadas, de manera personal, por su Representante Autorizado. No se aceptarán Credenciales que se presenten por vía postal, correo electrónico o cualquier otro medio de comunicación.

2. **Personas Autorizadas para Acompañar al Representante Autorizado al Acto De Precalificación.**

   Conforme se establece en la Sección 10.8.1 de las Bases Fase De Precalificación, además del Representante Autorizado del Participante Registrado respectivo que vaya a presentar Credenciales, podrán asistir al Acto De Precalificación los funcionarios y asesores de dicho Participante Registrado que éste hubiere designado para tales fines. Para efectos de lo anterior, los Participantes Registrados, a través de su Representante Autorizado, deberán remitir a más tardar el día jueves 06 de junio de 2013, vía correo electrónico al Correo De La Licitación (licitacioninternacional@cdeee.gob.do), un listado de tales funcionarios y asesores, los cuales no podrán exceder de tres (3) personas distintas al Representante Autorizado. Dicho listado deberá contener la siguiente información respecto de cada uno de tales funcionarios y asesores: (a) nombre completo; (b) número de pasaporte o cédula de identidad

y electoral; y (c) relación con el Participante Registrado respectivo. Para efectos de este Comunicado, el Representante Autorizado del Participante Registrado respectivo que vaya a presentar Credenciales junto a los funcionarios y asesores que éste haya designado de conformidad con el procedimiento anterior para efectos de participar en el Acto De Precalificación, serán referidos como "**Representantes**".

3. Fecha, Hora y Lugar en que se Llevará a Cabo el Acto De Precalificación.

Fecha: 10 de Junio de 2013

Hora: 10:00 am

Lugar: **FAVOR TENER PRESENTE QUE LA PRESENTACIÓN DE CREDENCIALES NO SE EFECTUARÁ EN EL DOMICILIO DE LA CORPORACIÓN, COMO SE ESTABLECE EN LA SECCIÓN 10.2 DE LAS BASES FASE DE PRECALIFICACIÓN. EN REEMPLAZO DE DICHO DOMICILIO, EL ACTO DE PRECALIFICACIÓN SE LLEVARÁ A EFECTO EN EL SIGUIENTE LUGAR**:

Hotel Hilton Santo Domingo
Gran Salón ABC
Avenida George Washington No. 500
Santo Domingo 10104
República Dominicana
Teléfono: (809) 685-0000

4. Preinscripción de Participantes Registrados que Vayan a Presentar Credenciales y Verificación de Representantes.

Para efectos de acceder al recinto en el cual se llevará a cabo el Acto De Precalificación (en adelante, "**Salón Del Acto De Precalificación**"), se observará el siguiente procedimiento:

a) Sólo se permitirá el acceso al Salón Del Acto De Precalificación a los Representantes del Participante Registrado que vaya a presentar Credenciales; para mayor claridad, no se permitirá el acceso al Salón Del Acto De Precalificación a los Representantes de un Participante Registrado que no vaya a presentar Credenciales;

b) Todo Participante Registrado que vaya a presentar Credenciales deberá preinscribirse, previo al acceso de sus Representantes al Salón Del Acto De Precalificación, en un registro que se abrirá para tales efectos (en adelante, "**Preinscripción**");

c) La Preinscripción se llevará a cabo desde las 8:00 am hasta las 10:00 am del día en que se celebrará el Acto De Precalificación;

d) La Preinscripción de todo Participante Registrado que vaya a presentar Credenciales deberá efectuarse de manera personal por su Representante Autorizado respectivo, dentro del horario antes referido;

e) Para efectos de acreditar la identidad de los Representantes del Participante Registrado que vaya a presentar Credenciales, se exigirá la presentación de la siguiente documentación:

(i) Respecto del Representante Autorizado, se exigirá el pasaporte, en original, que identifique a dicho Representante Autorizado según información que consta en el Registro De Participantes; y

(ii) Respecto de los otros Representantes, se exigirá, según sea el caso, el pasaporte o la cédula de identidad y electoral, en original, que identifique a dicho Representante según información que se hubiere proporcionado de conformidad con el procedimiento establecido en el Párrafo 2 de este Comunicado.

f) Sólo podrán acceder al Salón Del Acto De Precalificación los Representantes del Participante Registrado respectivo que hubieren acreditado debidamente sus identidades, de conformidad con lo establecido en el literal (e) anterior. Para mayor claridad, no se permitirá la realización de ningún cambio o sustitución en la identidad de los Representantes de un Participante Registrado que vaya a presentar Credenciales, al momento en que se lleve a cabo la Preinscripción; y

g) Todos los Representantes de un Participante Registrado que vaya a presentar Credenciales deberán acreditar su identidad al mismo tiempo. Esto es, no se permitirá la acreditación de identidad y acceso al Salón Del Acto De Precalificación de los Representantes de dicho Participante Registrado de manera separada. Para efectos de mayor claridad, todos los Representantes de un Participante Registrado que vaya a presentar Credenciales, deberán preinscribirse e ingresar de manera conjunta al Salón Del Acto De Precalificación. Una vez que el proceso de Preinscripción y acreditación de identidad de los Representantes de un Participante Registrado hubiere concluido, no se permitirá la acreditación de identidad y acceso al Salón Del Acto De Precalificación de ningún otro Representante de dicho Participante Registrado.

5. Comienzo del Acto De Precalificación.

El Acto De Precalificación comenzará a las 10:00 a.m. A dicha hora, se cerrarán las puertas del Salón Del Acto De Precalificación, y a partir de ese momento, no se permitirá el acceso de ninguna otra persona a dicho acto, salvo que el Comité De Licitación, por razones extraordinarias y justificadas, a ser evaluadas exclusivamente por el Comité De Licitación, permita la entrada a otras personas después de dicho cierre, lo anterior, conforme se establece en la Sección 10.8.2 de las Bases Fase De Precalificación.

6. Determinación de Horas.

Conforme se establece en la Sección 5.10.1 de los Antecedentes Y Normas Generales De La Licitación, para efectos de determinar las horas que se establecen en este Comunicado se utilizará de manera exclusiva, el reloj publicado en el Portal De La Licitación. A tales fines, los Representantes de los Participantes Registrados que vayan a presentar Credenciales, deberán consultar y conocer la hora colocada en el Portal De La Licitación.

7. **Presentación del Sobre De Credenciales**.

El Sobre de Credenciales a ser presentado por el Representante Autorizado del Participante Registrado respectivo, deberá estar debidamente cerrado y sellado y deberá cumplir con todos los requisitos fijados en las Bases Fase De Precalificación, muy especialmente en sus Secciones 2.27, 10.4 y 10.5.

8. **Información Adicional respecto de la Presentación de Credenciales y Acto De Precalificación.**

Para mayor información respecto de los requisitos y formalidades previstos para la presentación de Credenciales y la celebración del Acto De Precalificación, favor referirse al Artículo 10 de las Bases Fase De Precalificación.

COMUNICADO No. 3

10 junio de 2013

INFORMACIÓN RELEVANTE RELATIVA AL ACTO DE PRECALIFICACIÓN

Se comunica a todos los Participantes Registrados información relevante relativa al Acto De Precalificación a ser celebrado en la fecha que se indica en el Cronograma, según el mismo ha sido modificado por el Comunicado No. 2 de fecha 05 de junio 2013. Para efectos de este Comunicado, los términos utilizados con letra mayúscula, y no definidos en este Comunicado, tendrán el significado respectivo que se les atribuye en los Antecedentes Y Normas Generales De La Licitación y en las Bases Fase De Precalificación, según sea el caso.

1. **Persona Autorizada para Presentar Credenciales.**

   Conforme se establece en la Sección 10.3 de las Bases Fase De Precalificación, las Credenciales de un Participante Registrado deberán ser presentadas, de manera personal, por su Representante Autorizado. No se aceptarán Credenciales que se presenten por vía postal, correo electrónico o cualquier otro medio de comunicación.

2. **Personas Autorizadas para Acompañar al Representante Autorizado al Acto De Precalificación.**

   Conforme se establece en la Sección 10.8.1 de las Bases Fase De Precalificación, además del Representante Autorizado del Participante Registrado respectivo que vaya a presentar Credenciales, podrán asistir al Acto De Precalificación los funcionarios y asesores de dicho Participante Registrado que éste hubiere designado para tales fines. Para efectos de lo anterior, los Participantes Registrados, a través de su Representante Autorizado, deberán remitir a más tardar el día jueves 20 de junio de 2013, vía correo electrónico al Correo De La Licitación (licitacioninternacional@cdeee.gob.do), un listado de tales funcionarios y asesores, los cuales no podrán exceder de tres (3) personas distintas al Representante Autorizado.

Dicho listado deberá contener la siguiente información respecto de cada uno de tales funcionarios y asesores: (a) nombre completo; (b) número de pasaporte o cédula de identidad y electoral; y (c) relación con el Participante Registrado respectivo. Para efectos de este Comunicado, el Representante Autorizado del Participante Registrado respectivo que vaya a presentar Credenciales junto a los funcionarios y asesores que éste haya designado de conformidad con el procedimiento anterior para efectos de participar en el Acto De Precalificación, serán referidos como "**Representantes**".

3. **Fecha, Hora y Lugar en que se Llevará a Cabo el Acto De Precalificación.**

Fecha: 24 de Junio de 2013

Hora: 10:00 am

Lugar: **FAVOR TENER PRESENTE QUE LA PRESENTACIÓN DE CREDENCIALES NO SE EFECTUARÁ EN EL DOMICILIO DE LA CORPORACIÓN, COMO SE ESTABLECE EN LA SECCIÓN 10.2 DE LAS BASES FASE DE PRECALIFICACIÓN. EN REEMPLAZO DE DICHO DOMICILIO, EL ACTO DE PRECALIFICACIÓN SE LLEVARÁ A EFECTO EN EL SIGUIENTE LUGAR**:

Hotel Hilton Santo Domingo
Gran Salón ABC
Avenida George Washington No. 500
Santo Domingo 10104

Teléfono: (809) 685-0000

4. **Preinscripción de Participantes Registrados que Vayan a Presentar Credenciales y Verificación de Representantes.**

Para efectos de acceder al recinto en el cual se llevará a cabo el Acto De Precalificación (en adelante, "**Salón Del Acto De Precalificación**"), se observará el siguiente procedimiento:

a) Sólo se permitirá el acceso al Salón Del Acto De Precalificación a los Representantes del Participante Registrado que vaya a presentar Credenciales; para mayor claridad, no se permitirá el acceso al Salón Del Acto De Precalificación a los Representantes de un Participante Registrado que no vaya a presentar Credenciales;

b) Todo Participante Registrado que vaya a presentar Credenciales deberá preinscribirse, previo al acceso de sus Representantes al Salón Del Acto De Precalificación, en un registro que se abrirá para tales efectos (en adelante, "**Preinscripción**");

c) La Preinscripción se llevará a cabo desde las 8:00 am hasta las 10:00 am del día en que se celebrará el Acto De Precalificación;

d) La Preinscripción de todo Participante Registrado que vaya a presentar Credenciales deberá efectuarse de manera personal por su Representante Autorizado respectivo, dentro del horario antes referido;

e) Para efectos de acreditar la identidad de los Representantes del Participante Registrado que vaya a presentar Credenciales, se exigirá la presentación de la siguiente documentación:

   (i) Respecto del Representante Autorizado, se exigirá el pasaporte, en original, que identifique a dicho Representante Autorizado según información que consta en el Registro De Participantes; y

   (ii) Respecto de los otros Representantes, se exigirá, según sea el caso, el pasaporte o la cédula de identidad y electoral, en original, que identifique a dicho Representante según información que se hubiere proporcionado de conformidad con el procedimiento establecido en el Párrafo 2 de este Comunicado.

f) Sólo podrán acceder al Salón Del Acto De Precalificación los Representantes del Participante Registrado respectivo que hubieren acreditado debidamente sus identidades, de conformidad con lo establecido en el literal (e) anterior. Para mayor claridad, no se permitirá la realización de ningún cambio o sustitución en la identidad de los Representantes de un Participante Registrado que vaya a presentar Credenciales, al momento en que se lleve a cabo la Preinscripción; y

g) Todos los Representantes de un Participante Registrado que vaya a presentar Credenciales deberán acreditar su identidad al mismo tiempo. Esto es, no se permitirá la acreditación de identidad y acceso al Salón Del Acto De Precalificación de los Representantes de dicho Participante Registrado de manera separada. Para efectos de mayor claridad, todos los Representantes de un Participante Registrado que vaya a presentar Credenciales, deberán preinscribirse e ingresar de manera conjunta al Salón Del Acto De Precalificación. Una vez que el proceso de Preinscripción y acreditación de identidad de los Representantes de un Participante Registrado hubiere concluido, no se permitirá la acreditación de identidad y acceso al Salón Del Acto De Precalificación de ningún otro Representante de dicho Participante Registrado.

5. Comienzo del Acto De Precalificación.

El Acto De Precalificación comenzará a las 10:00 a.m. A dicha hora, se cerrarán las puertas del Salón Del Acto De Precalificación, y a partir de ese momento, no se permitirá el acceso de ninguna otra persona a dicho acto, salvo que el Comité De Licitación, por razones extraordinarias y justificadas, a ser evaluadas exclusivamente por el Comité De Licitación,

permita la entrada a otras personas después de dicho cierre, lo anterior, conforme se establece en la Sección 10.8.2 de las Bases Fase De Precalificación.

6. **Determinación de Horas.**

Conforme se establece en la Sección 5.10.1 de los Antecedentes Y Normas Generales De La Licitación, para efectos de determinar las horas que se establecen en este Comunicado se utilizará de manera exclusiva, el reloj publicado en el Portal De La Licitación. A tales fines, los Representantes de los Participantes Registrados que vayan a presentar Credenciales, deberán consultar y conocer la hora colocada en el Portal De La Licitación.

7. **Presentación del Sobre De Credenciales.**

El Sobre de Credenciales a ser presentado por el Representante Autorizado del Participante Registrado respectivo, deberá estar debidamente cerrado y sellado y deberá cumplir con todos los requisitos fijados en las Bases Fase De Precalificación, muy especialmente en sus Secciones 2.27, 10.4 y 10.5.

8. **Información Adicional respecto de la Presentación de Credenciales y Acto De Precalificación.**

Para mayor información respecto de los requisitos y formalidades previstos para la presentación de Credenciales y la celebración del Acto De Precalificación, favor referirse al Artículo 10 de las Bases Fase De Precalificación.

COMUNICADO No. 8

07 octubre de 2013

INFORMACIÓN RELEVANTE RELATIVA AL ACTO DE OFERTAS

Se comunica a todos los Participantes Precalificados información relevante relativa al Acto De Ofertas a ser celebrado en la fecha que se indica en el Cronograma. Para efectos de este Comunicado, los términos utilizados con letra mayúscula, y no definidos en este Comunicado, tendrán el significado respectivo que se les atribuye en las Bases De Licitación.

1. **Derecho a Presentar Ofertas.**

   Conforme se establece en la Sección 6.2 de las Bases Fase De Ofertas Y Cierre, sólo podrán presentar Ofertas los Participantes Precalificados que tenga el carácter de Participantes Precalificados Habilitados.

2. **Persona Autorizada para Presentar la Oferta Respectiva.**

   Conforme se establece en la Sección 6.6 de las Bases Fase De Ofertas Y Cierre, la Oferta deberá ser presentada, de manera personal, por el Representante Autorizado del Participante Precalificado respectivo. No se aceptarán, bajo ningún criterio, hecho o circunstancia, Ofertas que se presenten por vía postal, correo electrónico o cualquier otro medio de comunicación.

3. **Personas Autorizadas para Acompañar al Representante Autorizado al Acto De Ofertas.**

   Para efectos de determinar las personas que podrán acompañar al respectivo Representante Autorizado al Acto De Ofertas, dicho Representante Autorizado deberá remitir a más tardar el día jueves 10 de octubre de 2013, vía correo electrónico al Correo De La Licitación (licitacioninternacional@cdeee.gob.do), un listado de los funcionarios y asesores a que se

refiere la Sección 8.1(v) de las Bases Fase De Ofertas Y Cierre, los cuales no podrán exceder de tres (3) personas distintas al Representante Autorizado correspondiente. Dicho listado deberá contener la siguiente información respecto de cada uno de tales funcionarios y asesores: (a) nombre completo; (b) número de pasaporte o cédula de identidad y electoral; y (c) relación con el Participante Precalificado respectivo. Para efectos de este Comunicado, el Representante Autorizado del Participante Precalificado respectivo y los funcionarios y asesores de dicho Participante que se hayan designado de conformidad con el procedimiento anterior serán referidos, de manera conjunta, como "**Representantes**".

4. **Fecha, Hora y Lugar en que se Llevará a Cabo el Acto De Ofertas.**

Fecha: 15 de octubre de 2013

Hora: 4:00 pm

Lugar: **Hotel Crowne Plaza Santo Domingo**
Salón Las Américas B
Avenida George Washington No. 218
Santo Domingo 2890
República Dominicana
Teléfono: (809) 221-0000

5. **Preinscripción de Participantes Precalificados que Vayan a Presentar Ofertas y Verificación de Representantes.**

Para efectos de acceder al recinto en el cual se llevará a cabo el Acto De Ofertas (en adelante, "**Salón Del Acto De Ofertas**"), se observará el siguiente procedimiento:

a) Sólo se permitirá el acceso al Salón Del Acto De Ofertas a los Representantes del Participante Precalificado respectivo que vaya a presentar una Oferta ("Participante Precalificado Oferente"); para mayor claridad, no se permitirá el acceso al Salón Del Acto De Ofertas a los Representantes de un Participante Precalificado que no tenga el carácter de Participante Precalificado Oferente;

b) Todo Participante Precalificado Oferente deberá preinscribirse, previo al acceso de sus Representantes al Salón Del Acto De Ofertas, en un registro que se abrirá para tales efectos (en adelante, "**Preinscripción**");

c) La Preinscripción se llevará a cabo desde las 3:00 pm hasta las 4:00 pm del Día en que se celebrará el Acto De Ofertas;

d) La Preinscripción de todo Participante Precalificado Oferente deberá efectuarse de manera personal por su Representante Autorizado, dentro del horario antes referido;

e) Para efectos de acreditar la identidad de los Representantes del Participante Precalificado Oferente respectivo, se exigirá la presentación de la siguiente documentación:

(i) Respecto del Representante Autorizado, se exigirá el pasaporte, en original, que identifique a dicho Representante Autorizado según información que consta en el Registro De Participantes; y

(ii) Respecto de los otros Representantes, se exigirá, según sea el caso, el pasaporte o la cédula de identidad y electoral, en original, que identifique a dicho Representante según información que se hubiere proporcionado de conformidad con el procedimiento establecido en el Párrafo 3 de este Comunicado.

f) Sólo podrán acceder al Salón Del Acto De Ofertas los Representantes del respectivo Participante Precalificado Oferente que hubieren acreditado debidamente sus identidades de conformidad con lo establecido en el literal (e) anterior. Para mayor claridad, no se permitirá la realización de ningún cambio o sustitución en la identidad de los Representantes de un Participante Precalificado Oferente al momento en que se lleve a cabo la Preinscripción; y

g) Todos los Representantes de un Participante Precalificado Oferente deberán acreditar su identidad al mismo tiempo. Esto es, no se permitirá la acreditación de identidad y acceso al Salón Del Acto De Ofertas de los Representantes de dicho Participante Precalificado Oferente de manera separada. Para efectos de mayor claridad, todos los Representantes de un Participante Precalificado Oferente deberán preinscribirse e ingresar de manera conjunta al Salón Del Acto De Ofertas. Una vez que el proceso de Preinscripción y acreditación de identidad de los Representantes de un Participante Precalificado Oferente hubiere concluido, no se permitirá la acreditación de identidad y acceso al Salón Del Acto De Ofertas de ningún otro Representante de dicho Participante Precalificado Oferente.

6. Comienzo del Acto De Ofertas.

El Acto De Ofertas comenzará a las 4:00 pm. A dicha hora, se cerrarán las puertas del Salón Del Acto De Ofertas, y a partir de ese momento, no se permitirá el acceso de ninguna otra persona a dicho acto, salvo que el Comité De Licitación, por razones extraordinarias y justificadas, a ser evaluadas exclusivamente por el Comité De Licitación, permita la entrada a otras personas después de dicho cierre, lo anterior, conforme se establece en la Sección 8.2 de las Bases Fase De Ofertas Y Cierre.

7. Determinación de Horas.

Conforme se establece en la Sección 5.10.1 de los Antecedentes Y Normas Generales De La Licitación, para efectos de determinar las horas que se establecen en este Comunicado se

utilizará, de manera exclusiva, el reloj publicado en el Portal De La Licitación. A tales fines, los Representantes de los Participantes Precalificados Oferentes deberán consultar y conocer la hora colocada en el Portal De La Licitación.

8. Información Adicional respecto de la Presentación de Ofertas y Acto De Ofertas.

Para mayor información respecto de los requisitos y formalidades previstos para la presentación de Ofertas y la celebración del Acto De Ofertas, favor referirse a los Artículos 6 y 8 de las Bases Fase De Ofertas Y Cierre.

CONDICIONES GENERALES DEL CONTRATO DE EPC

1. PROPÓSITO Y DEFINICIONES

1.1 PROPÓSITO

El presente documento contiene los términos y condiciones generales del Contrato de Ingeniería, Procura y Construcción a que hace referencia la Sección 1.2.11(i), más abajo (el presente documento, incluyendo cualquier modificación que se le haga, y sus anexos, en adelante, "**Condiciones Generales**").

1.2 DEFINICIONES

Para efectos de estas Condiciones Generales, a las palabras y términos que a continuación se relacionan con letra inicial mayúscula se les atribuirá el significado que seguidamente para ellos(as) se indica. Los conceptos que denoten singular también incluyen el plural y viceversa, siempre y cuando el contexto así lo requiera. Aquellos términos que no estuvieren expresamente definidos en estas Condiciones Generales (a) tendrán el significado que se les asigna en las Bases De Licitación o (b) en su defecto, se entenderán (i) en el sentido que les atribuya el lenguaje técnico y jurídico correspondiente o (ii) en su defecto, en su sentido natural y obvio según el uso general de los mismos.

1.2.1 "**Anticipo Del Precio Del Contrato**": Tiene el significado que se le asigna a dicho término en la Sección 7.4 de estas Condiciones Generales.

1.2.2 "**Balance De Planta**": Es el conjunto de los equipos que conforman la Planta, con excepción de la caldera, el turbo-generador y el sistema de control de calidad del aire (AQCS de sus siglas en ingles), según lo establecido en las Especificaciones Técnicas en la sección 01 30 00, numeral 1.03F.

1.2.3 "**Certificado De Inspección**": Tiene el significado que se le asigna a dicho término en la Sección 21.1 de estas Condiciones Generales.

1.2.4 "**Certificado De Recepción Final**": Tiene el significado que se le asigna a dicho término en la Sección 32 de estas Condiciones Generales.

1.2.5 "**Certificado De Recepción Provisional Parcial**": Tiene el significado que se le asigna a dicho término en la Sección 30.2 de estas Condiciones Generales.

1.2.6 "**Certificado De Recepción Provisional Total**": Tiene el significado que se le asigna a dicho término en la Sección 30.1 de estas Condiciones Generales.

1.2.7 "**Certificados De Recepción Provisional**": Significa, de manera colectiva, el(los) Certificado(s) De Recepción Provisional Parcial que se emita(n) y el(los) Certificado(s) De Recepción Provisional Total que se emita(n).

1.2.8 "**CMSC**": Tiene el significado que se le asigna a dicho término en la Sección 34.1 de estas Condiciones Generales.

1.2.9 "**Condiciones Generales**": Tiene el significado que se le asigna a dicho término en la Sección 1.1 del presente documento.

1.2.10 "**Contratista**": Tiene el significado que se le asigna a dicho término en la Sección 2.13 de las Bases Fase De Ofertas Y Cierre.

1.2.11 "**Contrato De EPC**": Significa, de manera colectiva, (i) el Contrato de Ingeniería, Procura y Construcción del Proyecto a ser suscrito por el Contratista, por una parte, y la Empresa, por la otra parte y (ii) todos y cada uno de los anexos a dicho documento, incluyendo, sin limitación, estas Condiciones Generales, las Especificaciones Técnicas, demás Documentos De Licitación y la Oferta Del Contratista, en virtud de los cuales, entre otras cosas, el Contratista asume la obligación de desarrollar e implementar el Proyecto bajo las condiciones adjudicadas y acordadas.

1.2.12 "**Contrato De Financiamiento**": Tiene el significado que se le asigna a dicho término en la Sección 2.15 de las Bases Fase De Ofertas Y Cierre.

1.2.13 "**Cuadro De Precios**": Significa el detalle/desglose de los precios indicados por el Contratista en el Formulario EE-01 A (Composición Monto Propuesta) adjunto a su Oferta Económica.

1.2.14 "**Documentos De Licitación**": Tiene el significado que se le asigna a dicho término en la Sección 2.27 de las Bases Fase De Ofertas Y Cierre.

1.2.15 "**Empresa**": Tiene el significado que se le asigna a dicho término en la Sección 2.33 de las Bases Fase De Ofertas Y Cierre.

1.2.16 "**Fábrica**" o "**Taller**": Significa los lugares destinados a la fabricación, elaboración, reparación, premontaje u otra actividad relacionada con el suministro de equipos y materiales necesarios para

el Proyecto, o con la adecuación o adaptación de equipos y materiales adquiridos para el Proyecto.

1.2.17 "**Fecha De Operación Comercial**": Tiene el significado que se le asigna a dicho término en la Sección 30.6 de estas Condiciones Generales.

1.2.18 "**Fecha De Término**": Tiene el significado que se le asigna a dicho término en la Sección 26.3(a) de estas Condiciones Generales.

1.2.19 "**Fuerza Mayor**": Tiene el significado que se le asigna a dicho término en la Sección 35 de estas Condiciones Generales.

1.2.20 "**Garantía De Buen Uso Del Anticipo**": Tiene el significado que se le asigna a dicho término en la Sección 33.1(b) de estas Condiciones Generales.

1.2.21 "**Garantía De Fiel Cumplimiento**": Tiene el significado que se le asigna a dicho término en la Sección 33.1(a) de estas Condiciones Generales.

1.2.22 "**Garantía De Vicios Ocultos**": Tiene el significado que se le asigna a dicho término en la Sección 33.2 de estas Condiciones Generales.

1.2.23 "**Garantías De Cumplimiento**": Tiene el significado que se le asigna a dicho término en la Sección 33.1(b) de estas Condiciones Generales.

1.2.24 "**Hitos Del Proyecto**": Tiene el significado que se le asigna a dicho término en la Sección 14.1 de estas Condiciones Generales.

1.2.25 "**Informe De Variación**": Tiene el significado que se le asigna a dicho término en la Sección 22.2 de estas Condiciones Generales.

1.2.26 "**Informe Mensual De Avance**": Tiene el significado que se le asigna a dicho término en la Sección 15.5 de estas Condiciones Generales.

1.2.27 "**Ingeniero De La Empresa**": Tiene el significado que se le asigna a dicho término en la Sección 20.2 de estas Condiciones Generales.

1.2.28 "**Instalaciones Comunes Relacionadas**": Significa todas y cada una de las Instalaciones Comunes necesarias para la Puesta En Servicio de la Unidad respectiva.

1.2.29 "**Instalaciones Comunes**": Tiene el significado que se le asigna a dicho término en la Sección 1.2.51 de estas Condiciones Generales.

1.2.30 "**Libro De Obras**": Tiene el significado que se le asigna a dicho término en la Sección 6.5.3 de estas Condiciones Generales.

1.2.31 "**Listado Y Programa De Entrega De Planos**": Tiene el significado que se le asigna a dicho término en la Sección 8.4.2 de estas Condiciones Generales.

1.2.32 "**Manual De Procedimientos**": Tiene el significado que se le asigna a dicho término en la Sección 8.4.8(b) de estas Condiciones Generales.

1.2.33 "**Montaje E Instalación**": Significa todo el trabajo que debe ejecutar el Contratista y todos los gastos involucrados (incluyendo, sin limitación, mano de obra, materiales, equipos, transporte, pruebas), incluidos los gastos generales en que incurra el Contratista, para recibir, proteger, conservar, almacenar, resguardar y luego montar o instalar en el lugar estipulado en, o de acuerdo con, el Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas, un artículo, pieza, equipo, aparato o dispositivo del Proyecto.

1.2.34 "**Normas Del CCCCI**": Tiene el significado que se le asigna a dicho término en la Sección 34.1 de estas Condiciones Generales.

1.2.35 "**Notificación Inicial De Fuerza Mayor**": Tiene el significado que se le asigna a dicho término en la Sección 35 de estas Condiciones Generales.

1.2.36 "**Notificación-Detalle De Fuerza Mayor**": Tiene el significado que se le asigna a dicho término en la Sección 35 de estas Condiciones Generales.

1.2.37 "**Obras Provisionales**": Significa toda obra o construcción de carácter temporal, de cualquier naturaleza, que se requiera o que deba inferirse como necesaria para la ejecución de las Obras, aun cuando no esté necesariamente definida en el Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas, pero cuya ejecución y precio se consideran incluidos en el Precio Del Contrato.

1.2.38 "**Obras**": Significa las obras físicas incluidas en el Proyecto, así como el total de los trabajos, suministros y servicios a ejecutar, proveer y prestar por el Contratista, ya sean temporales o

permanentes, propios o incidentales que fueren necesarios para el cabal y oportuno desarrollo e implementación del Proyecto.

1.2.39 "**Oferta Del Contratista**": Significa la Oferta presentada por el Contratista en la Fase De Ofertas Y Cierre, incluyendo cualquier subsanación a la misma efectuada de conformidad con la Sección 9.2 de las Bases Fase De Ofertas Y Cierre.

1.2.40 "**Orden De Proceder**": Tiene el significado que se le asigna a dicho término en el Anexo D de estas Condiciones Generales.

1.2.41 "**Pago Final**": Tiene el significado que se le asigna a dicho término en el Anexo E de estas Condiciones Generales.

1.2.42 "**Período De Garantía-Unidad E Instalaciones Comunes Relacionadas**": Tiene el significado que se le asigna a dicho término en la Sección 31 de estas Condiciones Generales.

1.2.43 "**Planta De Construcción**": Significa todos aquellos elementos de uso temporal, maquinarias, equipos, instalaciones, materiales, herramientas y otros de cualquier naturaleza, necesarios para la ejecución de las Obras en terreno y que no quedarán formando parte del Proyecto.

1.2.44 "**Precio Del Contrato**": Tiene el significado que se le asigna a dicho término en la Sección 7.1 de estas Condiciones Generales.

1.2.45 "**Prestamista**": Significa el(los) prestamista(s) con el(los) cual(es) el Ministerio De Hacienda firme un Contrato De Financiamiento.

1.2.46 "**Programa Contractual Preliminar**": Tiene el significado que se le asigna a dicho término en la Sección 15.1 de estas Condiciones Generales.

1.2.47 "**Programa Contractual**": Tiene el significado que se le asigna a dicho término en la Sección 15.1 de estas Condiciones Generales.

1.2.48 "**Programa De Control De Obras**": Tiene el significado que se le asigna a dicho término en la Sección 15.1.1 de estas Condiciones Generales.

1.2.49 "**Programa**": Significa el cronograma de actividades, debidamente definidas en su alcance, duración y fechas de inicio y término, relacionadas entre sí mediante conexiones lógicas de secuencia, por medio del cual el Contratista muestra y compromete un modelo optimizado de

ejecución de las Obras que cumple con los plazos y demás obligaciones estipuladas en el Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas. El Programa será aquel que el Contratista presentó en su Oferta, modificado en función de los cambios que la Empresa hubiere solicitado durante la negociación del Contrato De EPC.

1.2.50 "**Programas De Trabajo**": Tiene el significado que se le asigna a dicho término en la Sección 15.1 de estas Condiciones Generales.

1.2.51 "**Proyecto**": Significa (a) dos (2) unidades termoeléctricas en base a carbón mineral con una capacidad de 300 MW (±20%) cada una, ambas con su correspondiente *"Balance of Plant"* y (b) todas las instalaciones comunes o *"common facilities"* ("**Instalaciones Comunes**"), incluyendo, sin limitación, (i) un puerto de descarga y un sistema de manejo y acopio de carbón, (ii) un sistema de captación y descarga de agua de mar, (iii) la habilitación de un depósito de cenizas de carbón mineral, (iv) una subestación eléctrica de salida en 345 kV, (v) una subestación eléctrica de entrada de 138 kV, línea de transmisión a 138 kV y conexión a la línea de 138 kV existente, y (vi) demás infraestructura, instalaciones y bienes relacionados, incluyendo, sin limitación, la totalidad de los equipos, maquinarias, aparatos, materiales, dispositivos, repuestos, oficinas, administración, almacenes, talleres, caminos, urbanización, cierros definitivos, instalaciones de control de accesos y salidas, sistemas de seguridad y vigilancia exterior, instalaciones auxiliares de apoyo e iluminación exterior que debe proveer, montar, instalar, probar, poner en servicio y entregar el Contratista de acuerdo con lo previsto en el Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales, las Especificaciones Técnicas y la Oferta Del Contratista.

1.2.52 "**Pruebas Al Término**": Tiene el significado que se le asigna a dicho término en la Sección 28 de estas Condiciones Generales.

1.2.53 "**Pruebas De Aceptación**": Tiene el significado que se le asigna a dicho término en la Sección 29.1 de estas Condiciones Generales.

1.2.54 "**Pruebas De Confiabilidad**": Tiene el significado que se le asigna a dicho término en la Sección 29.2 de estas Condiciones Generales.

1.2.55 "**Puesta En Servicio**": Significa el conjunto de pruebas y ensayos de funcionamiento de los equipos que componen cada Unidad y sus Instalaciones Comunes Relacionadas, que se efectúan durante un cierto período de tiempo, una vez terminada su construcción y Montaje E Instalación,

todo de conformidad con los términos y condiciones del Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas.

1.2.56 "**Recepción Final**": Tiene el significado que se le asigna a dicho término en la Sección 32 de estas Condiciones Generales.

1.2.57 "**Reclamación**": Tiene el significado que se le asigna a dicho término en la Sección 34.1 de estas Condiciones Generales.

1.2.58 "**Reunión De Partida**": Tiene el significado que se le asigna a dicho término en la Sección 8.4.2 de estas Condiciones Generales.

1.2.59 "**Revisor Sísmico**": Tiene el significado que se le asigna a dicho término en la Sección 8.4.5 de estas Condiciones Generales.

1.2.60 "**Sistema De Clasificación De Documentos**": Tiene el significado que se le asigna a dicho término en la Sección 8.4.8(b) de estas Condiciones Generales.

1.2.61 "**Sitio**": Significa el Terreno que se ponga a disposición del Contratista por o en representación de la Empresa y sobre, debajo, en o a través del cual deberán construirse las Obras. Para efectos de claridad, el Sitio no incluye lugares respecto de los cuales el Contratista ha tomado posesión o tiene acceso temporal para efectos de las Obras pero que no han sido puestos a disposición del Contratista por o en representación de la Empresa.

1.2.62 "**Solicitud De Pago**": Significa el conjunto de documentos mediante el cual el Contratista formula cobranzas a la Empresa por trabajos ejecutados o por servicios prestados en un cierto período, en las oportunidades, formas y condiciones establecidas en el Contrato De EPC.

1.2.63 "**Subcontratista**": Significa la persona natural o Persona Jurídica, incluyendo a sus sucesores y cesionarios, aceptados por el Contratista y aprobados previamente por la Empresa, que, en virtud de un Subcontrato, contrae con el Contratista la obligación de efectuar parte de las Obras.

1.2.64 "**Subcontrato**": Significa el documento suscrito por el Contratista y un Subcontratista en el cual se estipulan las responsabilidades, derechos y obligaciones de cada una de las partes que lo suscriben, en relación con la ejecución de la parte de las Obras que la Empresa apruebe que sea ejecutada por el Subcontratista respectivo.

1.2.65 "**Terreno**": Tiene el significado que se le asigna a dicho término en la Sección 2.126 de las Bases Fase De Ofertas Y Cierre.

1.2.66 "**Unidad Ejecutora Del Proyecto**": Tiene el significado que se le asigna a dicho término en la Sección 20.2 de estas Condiciones Generales.

1.2.67 "**Unidad**": Significa cada una de las dos (2) unidades termoeléctricas en base a carbón mineral con una capacidad de 300 MW (±20%) cada una, ambas con su correspondiente *"Balance of Plant"*, que integran el Proyecto.

1.2.68 "**Variación**": Significa cualquier cambio a las condiciones del Contrato De EPC, incluyendo, sin limitación, cambios relacionados con las Obras, plazos y Precio Del Contrato.

2. EXTENSIÓN DEL CONTRATO DE EPC.

2.1 OBLIGACIÓN DE DESARROLLAR EL PROYECTO POR LA SOLA FIRMA DEL CONTRATO DE EPC; RESPONSABILIDAD SOLIDARIA DE LOS INTEGRANTES DEL CONTRATISTA; GARANTÍA.

Por el solo hecho de firmar el Contrato De EPC, se entenderá que el Contratista acepta su obligación de desarrollar e implementar el Proyecto bajo la modalidad "llave en mano", entendiéndose por ésta, la obligación de la realización integral del Proyecto conforme a los términos y condiciones adjudicados y acordados.

Las Personas Jurídicas integrantes del Contratista serán solidariamente responsables de todas y cada una de las obligaciones del Contratista bajo el Contrato De EPC. Ninguna de tales Personas Jurídicas podrá modificar su estado legal, ceder o liberarse de la responsabilidad legal de las obligaciones que el Contrato De EPC le confiere, sin la autorización previa y por escrito de la Empresa.

Asimismo, si el cumplimiento de alguno(s) de los Requisitos De Precalificación fue(ron) acreditado(s) por la Casa Matriz o una o más Afiliadas de una o más de las Personas Jurídicas integrantes del Contratista, dicha Casa Matriz o Afiliada(s) deberá(n) garantizar todas y cada una de las obligaciones de dicha Persona Jurídica bajo el Contrato De EPC; y a tales fines suscribirán los contratos, documentos e instrumentos adicionales requeridos para constituir, perfeccionar y/o ejecutar las garantías de que se trate.

2.2 ALCANCE DE LAS OBRAS

Por tratarse de un contrato "llave en mano", será de responsabilidad y cargo del Contratista proveer un Proyecto que funcione eficientemente como un todo integrado. Lo anterior se entiende sin perjuicio de que el Proyecto deberá cumplir con todos y cada uno de los requisitos y especificaciones establecidas al efecto en el Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas.

Será parte del alcance de las Obras, la provisión de la totalidad de las obras civiles, marítimas, estructurales, infraestructura y del equipamiento mecánico, eléctrico y de instrumentación y control, la construcción de las obras civiles, el Montaje E Instalación, las pruebas y la Puesta En Servicio de todos y cada uno de los componentes del Proyecto. Asimismo, se incluye en el alcance las Obras, la prestación por parte del Contratista de los servicios de asistencia técnica, de adiestramiento y capacitación del personal de la Empresa y otros servicios especificados en los Documentos De Licitación (particularmente las Especificaciones Técnicas) o que sean implícitamente requeridos para la conclusión del Proyecto.

De igual forma, se incluye dentro del alcance de las Obras, todas las Obras Provisionales o auxiliares necesarias para la construcción, equipos o sistemas especiales requeridos para la construcción y el Montaje E Instalación del Proyecto.

Además de todo el equipo principal y secundario antes señalado, conjuntamente con sus instalaciones auxiliares, dentro del alcance de las Obras se incluye (i) la provisión de los repuestos y herramientas indicadas en las Especificaciones Técnicas, (ii) la prestación de los servicios de ingeniería correspondientes a los estudios definitivos del Terreno, al diseño, planificación, control, supervisión y coordinación que sean requeridos para la construcción, Montaje E Instalación, pruebas y Puesta En Servicio de las Unidades e Instalaciones Comunes del Proyecto, (iii) recepción de todas las instalaciones contratadas, (iv) los servicios de garantía de las Unidades y de sus respectivas Instalaciones Comunes Relacionadas durante el correspondiente Período De Garantía-Unidad E Instalaciones Comunes Relacionadas, (v) el flete de los equipos con sus materiales y accesorios, importados y de origen nacional, fuera y dentro de la República Dominicana, (vi) los gastos portuarios, (vii) todos los seguros exigidos en estas Condiciones Generales y (viii) cualquier otro trabajo o suministro que sea necesario para que el Contratista pueda entregar la totalidad del Proyecto funcionando en la forma contratada.

Por tratarse de un proyecto "llave en mano", el Proyecto deberá incluir todos los componentes, trabajos, equipos auxiliares, accesorios y documentos necesarios para una operación, control, protección y mantenimiento del mismo y sus instalaciones auxiliares en forma correcta y segura, aún en el caso que no

se encuentren expresamente indicados en el Contrato De EPC y Documentos De Licitación, particularmente, las Especificaciones Técnicas y estas Condiciones Generales.

El diseño y fabricación del equipo y materiales a suministrar deberá cumplir con (i) las condiciones especificadas en el Contrato De EPC y Documentos De Licitación, particularmente, estas Condiciones Generales y las Especificaciones Técnicas, (ii) lo dispuesto en la Legislación Dominicana aplicable según lo establecido en el numeral 3.1 y (iii) las mejores prácticas de ingeniería y construcción existentes a la fecha.

Todo el suministro entregado por el Contratista deberá ser nuevo, sin uso y fabricado con la precisión y tolerancias requeridas, de manera de asegurar tanto una operación óptima como su reemplazo y fácil mantenimiento.

2.3 BUENA FE Y NEGOCIOS JUSTOS

En todos los asuntos que afecten al Contrato De EPC, su interpretación, implementación y/o ejecución de las Obras, las partes negociarán en forma justa entre sí y actuarán de buena fe en todo momento. En este contexto, la buena fe incluirá, sin limitar su obligación, la cooperación que no induzca intencionalmente a error en la ejecución de los términos y condiciones del Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas, en beneficio mutuo de las partes, aceptando que cada una tendrá derecho de alcanzar sus objetivos razonables en el marco del Contrato De EPC.

Las partes estarán abiertas a compartir la información relacionada con las Obras que sea de importancia para la otra parte, incluyendo información de costos, sujeto sólo a las obligaciones de confidencialidad correspondientes.

El cumplimiento de las obligaciones derivadas del Contrato De EPC (incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas) a tiempo y dentro del presupuesto requerirá la cooperación de ambas partes. Para tal efecto, las partes se reunirán en todo momento y en toda forma que sea deseable para lograr dicho objetivo. La obligación de cooperar incluirá obligaciones de ambas partes para advertir sobre consecuencias potenciales, incluyendo costos de las acciones propuestas, y evitar interferencias innecesarias en la actividad de la otra parte, entre otras consideraciones necesarias a fines de que, si fuese posible, no se impida el avance en el desarrollo de las Obras.

Cada parte se obliga a advertir a la otra sobre los asuntos que pudiesen afectar las Obras en cuanto tenga conocimiento de los mismos. En tal sentido, Las Partes definirán y establecerán un mecanismo de

coordinación y comunicación, en el cual podrán participar los asesores y personas invitadas por cada una, tendente a la resolución de cualquier situación que afecte las Obras o la ejecución del Contrato EPC. .

2.4 RESPONSABILIDAD POR LA ENTREGA DE POSESIÓN DEL SITIO AL CONTRATISTA

Sujeto a las disposiciones de las Secciones 4.1 y 4.2 de estas Condiciones Generales, la Empresa será responsable de proporcionar y garantizar la posesión legal y física del Sitio al Contratista a más tardar en la fecha o fechas estipuladas en el Contrato De EPC y/o Programa correspondiente o, si no existieren tales fechas, en las fechas razonables en las que el Contratista notifique a la Empresa para tal efecto.

2.5 FÓSILES, DEPÓSITOS MINERALES DE INTERÉS ECONÓMICO Y ARTÍCULOS DE INTERÉS ARQUEOLÓGICO EN EL SITIO

Todos los fósiles, depósitos minerales de interés económico, artículos de valor o antigüedad considerable y estructuras y otros restos o artículos de interés geológico o arqueológico que se encuentren en el Sitio quedarán bajo el cuidado y autoridad de la Empresa, la que se encargará de ellos de acuerdo con la Legislación Dominicana aplicable. El Contratista tomará las precauciones pertinentes para evitar que su personal, el personal de sus Subcontratistas y/o proveedores u otras personas retiren o dañen cualquiera de estos hallazgos. Al momento de descubrir el hallazgo correspondiente, el Contratista deberá dar aviso inmediato por escrito a la Empresa, la que emitirá, por esa misma vía, las instrucciones del caso.

3. LEGISLACIÓN APLICABLE; CÓDIGOS Y NORMAS; REGLAMENTOS TÉCNICOS LOCALES; LICENCIAS; PERMISOS; PATENTES Y DERECHOS DE AUTOR; PROPIEDAD DE LOS TRABAJOS Y PLANOS.

3.1 LEGISLACIÓN APLICABLE.

El Contrato De EPC será considerado para todos los efectos legales como celebrado en la República Dominicana y en ese tenor, deberá interpretarse de acuerdo con la Legislación Dominicana.

Para todos los efectos del Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas, se considerará que el Contratista tiene conocimiento de toda la Legislación Dominicana aplicable, sin excepción alguna, y que tomó en consideración en su Oferta el modo en que ésta puede afectar, regir, limitar o aplicarse al desarrollo e implementación del Proyecto.

El Contratista deberá cumplir con toda la Legislación Dominicana aplicable que (i) se encuentre vigente a la fecha de la firma del Contrato De EPC, (ii) se relacionen con el Proyecto y el Contrato De EPC y todos, los acuerdos, contratos, convenios que surjan con ocasión del referido Proyecto y Contrato De EPC y/o (iii) se dicte durante su vigencia.

3.2 CÓDIGOS Y NORMAS DESCRITOS EN LAS ESPECIFICACIONES TÉCNICAS.

Los diseños, cálculos, materiales, procedimientos de trabajo (incluyendo, sin limitación, soldadura y pintura) deberán corresponder a los establecidos en las últimas ediciones de las normas y códigos aplicables que se describen en las Especificaciones Técnicas. A requerimiento de la Empresa, será obligación del Contratista proveerle oportunamente, sin cargo para aquélla, copias en español e inglés de los referidos códigos y normas. Conjuntos similares se mantendrán en los Talleres y en las oficinas del Contratista en el Sitio.

Las referencias a códigos y normas tienen como fin aportar una medida de buena práctica de ingeniería, métodos de cálculo, pruebas en Taller y de terreno, medidas de seguridad, de construcción y de Montaje E Instalación que deberán igualarse o superarse para que se les considere aceptables para ser usados de acuerdo con el Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas.

Si un determinado código o norma, o si otra norma aplicable, admite o establece más de un grado de calidad, el Contratista deberá dar cumplimiento a la disposición, código o norma más exigente, según determine la Empresa.

3.3 REGLAMENTOS TÉCNICOS LOCALES.

Aparte de las normas y códigos aplicables que se describen en las Especificaciones Técnicas, el Contratista deberá cumplir con la Legislación Dominicana aplicable en relación con el diseño, desarrollo e implementación del Proyecto. En caso de discrepancia entre la Legislación Dominicana aplicable y las normas y códigos aplicables que se describen en las Especificaciones Técnicas, prevalecerá aquélla disposición más exigente que favorezca la plena y cabal terminación de las Obras en condiciones óptimas, según determine la Empresa.

3.4 PERMISOS, LICENCIAS Y APROBACIONES DE AUTORIDADES LOCALES PARA LA EJECUCIÓN DE LAS OBRAS.

Salvo aquellos permisos que se establecen en el Anexo A de estas Condiciones Generales, los cuales serán de responsabilidad del Contratista, la Empresa obtendrá a su propio costo todos los permisos, licencias o aprobaciones de todas las Autoridades dominicanas pertinentes que se requieran obtener y que sean necesarias para la ejecución de las Obras, incluyendo aquellas que se listan en el Anexo B de estas Condiciones Generales. El fiel cumplimiento de las obligaciones contractuales por parte del Contratista quedará sujeto a la condición de que éste no se vea impedido de cumplir con tales obligaciones debido a restricciones o limitaciones basadas en la falta de obtención, de manera oportuna, de los permisos, licencias o aprobaciones que sean responsabilidad de la Empresa.

3.5 PROPIEDAD INDUSTRIAL Y DERECHOS DE AUTOR

El Contratista será enteramente responsable de las consecuencias que pueda acarrear el uso de patentes u otro tipo de propiedad industrial o intelectual en el Proyecto o parte de él, incluyendo, sin limitación, cualquier sistema de software. En consecuencia, el Contratista mantendrá indemne, liberará de todo daño y, a su propio costo defenderá a la Empresa de cualquier juicio, y toda clase de reclamaciones, acciones, procedimientos legales, judiciales o administrativos, demandas, daños, costos y honorarios de abogados, relacionados con cualquier violación de propiedad industrial o derecho de autor originada por la inclusión en el Proyecto de cualquier elemento patentado o registrado como propiedad industrial o intelectual en los materiales de diseño.

En caso que se decrete judicialmente en el país de origen o en la República Dominicana la retención del total o parte de cualquier suministro o la prohibición de su uso por causa de infracción a la legislación de propiedad industrial o derechos de autor, el Contratista, a su costo, procurará obtener la eliminación de la retención o la prohibición de uso o aplicará una de las siguientes modalidades:

a) Retiro del suministro respectivo y su reemplazo por otro equivalente que haya aprobado previamente la Empresa; o

b) Modificación del suministro respectivo en forma que no constituya infracción y se mantengan las condiciones técnicas convenidas.

El Contratista asumirá todos los gastos que se generen a causa de cualquier nuevo trabajo, obra, estudio, diseño, programación, fabricación, inspección, asesoría, transporte, seguro, garantía, Montaje E

Instalación, pruebas y Puesta En Servicio relacionado(s) con el referido suministro, lo que, en ningún caso le dará derecho a ampliaciones en los plazos contractuales o aumentos en el Precio Del Contrato.

3.6 PROPIEDAD DE LOS TRABAJOS Y PLANOS

Sin perjuicio de lo dispuesto en la Sección 30.5 de estas Condiciones Generales, los trabajos y planos que se realicen a causa o como consecuencia del Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas, serán de propiedad exclusiva de la Empresa y serán entregados por el Contratista a requerimiento de la Empresa, sin que el dicho Contratista o sus empleados, Subcontratistas, proveedores y en general cualquiera otra persona que participe en dichos trabajos o planos pueda invocar otro derecho que no sea el pago del Precio Del Contrato de conformidad con los términos y condiciones del Contrato De EPC.

4. VIGENCIA Y VALIDEZ DEL CONTRATO DE EPC; CONDICIONES PARA EL INICIO DE LAS OBRAS

4.1 VIGENCIA Y VALIDEZ DEL CONTRATO DE EPC

El Contrato De EPC entrará en vigencia una vez que se cumplan las condiciones que se listan en el Anexo C de estas Condiciones Generales.

Una vez que el Contrato De EPC entre en vigencia de conformidad con el párrafo anterior, éste será obligatorio y efectivo y permanecerá plenamente vigente hasta que (i) el Contratista haya cumplido con la totalidad de sus obligaciones pactadas en el Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas, (ii) se haya producido la Recepción Final de la última Unidad y de sus Instalaciones Comunes Relacionadas por parte de la Empresa, (iii) el Precio Del Contrato haya sido pagado en su totalidad, de conformidad con los términos y condiciones del Contrato De EPC, y (iv) se cumpla cualquier otra condición prevista en el Contrato De EPC.

El Contrato De EPC podrá ser terminado (i) por cualquiera de las partes si no se cumplen las condiciones para el inicio de las Obras a que se refiere la Sección 4.2 de estas Condiciones Generales dentro del plazo de doscientos setenta (270) Días contados a partir de su firma, o (ii) de conformidad con la Sección 26 de estas Condiciones Generales, o (iii) de conformidad con cualquier otra disposición contenida en el Contrato De EPC.

4.2 CONDICIONES PARA EL INICIO DE LAS OBRAS.

A menos que las partes acuerdan expresamente lo contrario, la ocurrencia de todos y cada uno de los eventos que se describen en el Anexo D de estas Condiciones Generales será necesaria para efectos de dar inicio a las Obras.

5. IDIOMA Y ORDEN DE PRELACIÓN DE DOCUMENTOS.

5.1 IDIOMA.

El idioma del Contrato De EPC, incluyendo, sin limitación, sus anexos, correspondencia, minutas de reuniones, manuales de instrucción, instrucciones en los paneles de control, identificaciones y advertencias, será el español. Lo anterior, se entiende sin perjuicio (i) de que la Empresa acepte, de manera anticipada y expresa, el idioma inglés para ciertos documentos relacionados con el Contrato De EPC, (ii) de los Documentos De Licitación que se encontraren en idioma inglés, tales como las Especificaciones Técnicas, o (iii) de aquellos documentos o placas que las Especificaciones Técnicas establecen, de manera expresa, que han de otorgarse o hacerse en idioma inglés.

Los documentos que, conforme a lo anterior, estén exclusivamente en idioma inglés se interpretarán en dicho idioma. Los documentos que, conforme a lo anterior, estén en idioma español e inglés se interpretarán en idioma español.

Por lo anterior, será obligación del Contratista destinar personal que domine el idioma español para actuar como interlocutor con el personal o asesores de la Empresa durante toda la vigencia del Contrato De EPC y para todas las etapas o aspectos del mismo.

5.2 ORDEN DE PRELACIÓN DE DOCUMENTOS.

Los diferentes documentos que formarán parte del Contrato De EPC deberán considerarse como complementarios entre sí. En caso de contradicción o discrepancia entre cualquiera de los términos contenidos en tales documentos, para su correcta interpretación y entendimiento, se atenderá a aquélla que más favorezca la plena y cabal ejecución y terminación de las Obras y se aplicará el siguiente orden de prelación:

a) Los Documentos De Licitación a que hace referencia la Sección 1.2.14 de estas Condiciones Generales;

b) Texto del Contrato de Ingeniería, Procura y Construcción del Proyecto a que hace referencia la Sección 1.2.11(i) de estas Condiciones Generales;

c) Demás anexos del Contrato De EPC no listados con anterioridad, excluyendo la Oferta Del Contratista;

d) Especificaciones Técnicas;

e) Condiciones Generales;

f) Cualquier orden de proceder limitada que se emita, de conformidad con el Contrato De EPC, con anterioridad a la Orden De Proceder;

g) Orden De Proceder;

h) Comunicados emitidos por el Comité De Licitación durante todo el proceso de Licitación;

i) Aclaraciones emitidas por el Comité De Licitación durante todo el proceso de Licitación;

j) Respuestas emitidas por el Comité De Licitación a Consultas/Aclaraciones formuladas por el Contratista, o cualquiera de sus integrantes, a lo largo de la Licitación;

k) Respuestas emitidas por el Comité De Licitación a Consultas/Aclaraciones formuladas por cualquier Participante Precalificado, incluyendo, el Contratista, o cualquiera de sus integrantes, y que el Comité De Licitación haya puesto a disposición de todos los Participantes Precalificados a través del Portal De La Licitación;

l) Formularios adjuntos a la Oferta Del Contratista;

m) Demás componentes de la Oferta Del Contratista;

n) Planos proporcionados por el Comité De Licitación y documentos de referencia; y

o) Cualquier otro Documento De Licitación no incluido en alguno de los subpárrafos anteriores.

6. DESIGNACIÓN DE APODERADO; NOTIFICACIONES AL CONTRATISTA; NOTIFICACIONES A LA EMPRESA; CAMBIO DE DOMICILIO; COMUNICACIONES RELACIONADAS CON EL DESARROLLO DEL CONTRATO DE EPC; PUBLICIDAD.

6.1 DESIGNACIÓN DE APODERADO.

Como condición previa a la celebración del Contrato De EPC, las Personas Jurídicas que integren al Contratista deberán designar una persona natural apoderada común con domicilio en la República Dominicana, quien, a su vez, deberá ser apoderada de cada una de dichas Personas Jurídicas y sus respectivas Casas Matrices y/o Afiliadas, según fuere el caso, con facultades suficientes para ser notificado judicial o extrajudicialmente de cualquier acción que la Empresa interponga en contra de todos o cualquiera de tales Personas Jurídicas, Casas Matrices y/o Afiliadas, y para contestar demandas, de modo tal que la notificación que se practique a dicho apoderado emplazará válidamente al representado o mandante de que se trata.

Asimismo, el mandato a que se refiere el párrafo anterior deberá facultar al apoderado que se designe para, entre otras cosas, (i) Suscribir cualquier acto, documento, instrumento, asumir compromisos y obligaciones en nombre y representación de la persona del Contratista, las Personas Jurídicas que integren al Contratista y sus respectivas Casas Matrices y/o Afiliadas, según fuere el caso (ii) tomar las medidas requeridas para hacer cumplir las obligaciones del Contratista bajo el Contrato De EPC y las regulaciones y normas previstas en la Legislación Dominicana que le sean aplicables;.,(iii) fijar domicilio en la República Dominicana y (iv) someter todas las controversias que se susciten entre las partes con ocasión del Contrato De EPC al procedimiento establecido en la Sección 34 de estas Condiciones Generales. En ningún caso tales gestiones podrán ser iniciadas por los representantes legales individuales de las Personas Jurídicas integrantes del Contratista, por lo que, de así ocurrir, tales gestiones carecerán de toda validez.

El mandato que se otorgue deberá ser aceptado expresamente por el apoderado que se designe y se entenderá vigente mientras el Contratista no haya notificado a la Empresa, de conformidad con el Contrato De EPC, su revocación y nueva designación de mandatario con las mismas facultades antes señaladas.

6.2 NOTIFICACIONES AL CONTRATISTA.

Salvo las excepciones expresamente establecidas en el Contrato De EPC, cualquier notificación que deba ser cursada al Contratista bajo los términos del Contrato De EPC se le hará llegar enviando la misma por correo certificado al domicilio del Contratista que conste en el Contrato De EPC.

6.3 NOTIFICACIONES A LA EMPRESA.

Salvo las excepciones expresamente establecidas en el Contrato De EPC, cualquier notificación que deba ser cursada a la Empresa bajo los términos del Contrato De EPC y sus anexos se le hará llegar enviando la misma por correo certificado al domicilio de la Empresa que conste en el Contrato De EPC.

6.4 CAMBIO DE DOMICILIO

Cualquiera de las partes podrá cambiar su domicilio designado para efectos del Contrato De EPC, previo aviso por escrito a la otra parte, designando el nuevo domicilio en la forma que se establezca para tal efecto en el Contrato De EPC.

6.5 COMUNICACIONES RELACIONADAS CON EL DESARROLLO DEL CONTRATO DE EPC.

6.5.1 General

El Manual De Procedimientos establecerá la forma más expedita de efectuar las comunicaciones relacionadas con el desarrollo e implementación del Contrato De EPC, incluyendo:

a) Cartas;

b) Libro De Obras; y

c) Correo Electrónico.

Tal como se indica en la Sección 5.1 de estas Condiciones Generales, toda comunicación entre las partes deberá hacerse en idioma español.

6.5.2 Correspondencia por Carta

Será la vía obligada para el tratamiento de los temas oficiales y contractuales entre las partes. En particular, el Contratista deberá utilizar sólo este medio para plantear o responder sobre Variaciones.

6.5.3 Libro De Obras

Será la vía de tratamiento repetitivo y rutinario de las comunicaciones entre la Unidad Ejecutora Del Proyecto o sus delegados (incluyendo al Ingeniero De La Empresa) y el Contratista. Para tales efectos, será obligación del Contratista llevar un libro de Obras foliado y en triplicado ("**Libro De Obras**").

Todas las observaciones en el Libro De Obras deberán indicar la fecha de su realización y ser firmadas en conjunto por el personal designado por la Empresa y el Contratista.

El Libro De Obras no podrá ser utilizado por el Contratista para el tratamiento de Variaciones.

6.5.4 Correo Electrónico

El correo electrónico podrá ser utilizado entre las partes para anticipar el contenido de una carta o para reemplazar o precisar información telefónica. La información transmitida por éste medio no tendrá carácter contractual a menos que la carta o información que reproduce haya sido formalmente enviada por el remitente vía carta y recibida efectivamente por el destinatario.

6.6 PUBLICIDAD

Cualquier publicación o publicidad que concierna al Proyecto o al Contrato De EPC, que desee hacer el Contratista, requerirá aprobación previa y por escrito de la Empresa.

7. PRECIO DEL CONTRATO; CONDICIONES Y FORMA DE PAGO DEL PRECIO DEL CONTRATO; IMPUESTOS Y EXENCIONES; AVANCE DEL PRECIO DEL CONTRATO

7.1 PRECIO DEL CONTRATO

El precio del Contrato De EPC, por el total de las Obras, será un monto igual al monto de la Oferta Económica-Desarrollo Del Proyecto que el Contratista haya indicado en su Oferta Económica, con sujeción a las adiciones o deducciones a dicho monto que puedan ser negociadas por las partes ("**Precio Del Contrato**"). En el Precio Del Contrato se considerará incluido, sin que esta enumeración sea exhaustiva (además de los servicios de ingeniería, el suministro del equipamiento, la construcción de las obras civiles, el Montaje E Instalación, las pruebas, la Puesta En Servicio y los servicios de garantía de todos los componentes del Proyecto) los siguientes costos:

a) Costos (directos o indirectos) de inspecciones y pruebas, los ensamblajes correspondientes, la emisión de informes y protocolos, certificaciones de calidad y demás costos relacionados;

b) Costos de embalajes, cargas, descargas, almacenajes, transportes, transbordos, gastos portuarios, gastos de recepción y entrega y todo otro tipo de manipulación específica, incluyendo el transporte desde el almacenaje temporal en terreno al sitio de montaje, cuando corresponda;

c) Los costos de almacenaje de equipos, instrumentos y herramientas de construcción o de ensayo;

d) Todos los impuestos, tasas, derechos y gravámenes de cualquier naturaleza y denominación que graven el Contrato De EPC en el(los) país(es) de cualquiera de las Personas Jurídicas integrantes del Contratista u otro país, distinto de la República Dominicana, que deban ser pagados por éste a causa o con ocasión del Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas;

e) Costo de todas las certificaciones, visado y legalizaciones de documentos que fuere pertinente/necesario efectuar con motivo del Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas;

f) Todos los costos/gastos relacionados con/necesarios para la obtención de los permisos de responsabilidad del Contratista que se listan en el Anexo A de estas Condiciones Generales;

g) Todos los costos/gastos en que incurra el Contratista con motivo de/en relación con su apoyo a la Empresa para la obtención por parte de ésta de cualquiera de los permisos del Proyecto que sean de cargo de la Empresa, incluyendo aquellos que se listan en el Anexo B de estas Condiciones Generales;

h) Costo de todos los planos, manuales, documentos técnicos, normas y otros que debe proporcionar el Contratista de conformidad con el Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas;

i) Gastos de traslado, alojamiento y alimentación para todo el personal del Contratista que viaje a la República Dominicana para aclaraciones, coordinación, asesoría,

abastecimientos y servicios de todo tipo requeridos por el Contrato De EPC (incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas) durante toda su vigencia;

j) Costo de las garantías y seguros requeridos por el Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas;

k) Herramientas y equipos especiales de montaje;

l) Materiales de consumo requeridos hasta la emisión del correspondiente Certificado De Recepción Provisional; y

m) Los derechos que corresponda pagar por licencias que afecten a cualquiera de las partes, piezas y elementos que configuren el Proyecto.

Sujeto a las disposiciones establecidas en estas Condiciones Generales, el Precio Del Contrato excluye el pago de todo tipo de impuesto, tributo, tasa, contribución, licencia, arancel, derecho, así como de cualquier otro gravamen, cualquiera fuere su naturaleza, que grave o pudiese gravar las maquinarias, equipos, materiales e insumos que se utilicen directamente en la ejecución de las Obras. El Contratista y sus Subcontratistas y proveedores no estarán exentos del Impuesto Sobre la Renta, ni de los costos relativos a la Seguridad Social aplicable al personal a utilizar en la ejecución de las Obras.

7.2 CONDICIONES Y FORMA DE PAGO DEL PRECIO DEL CONTRATO

Las condiciones y forma de pago del Precio Del Contrato se establecen en el Anexo E de estas Condiciones Generales.

7.3 IMPUESTOS Y EXENCIONES

Los aspectos impositivos y sobre exenciones tributarias se establecen en el Anexo F de estas Condiciones Generales.

7.4 AVANCE DEL PRECIO DEL CONTRATO

La Empresa pagará, a cuenta del Precio Del Contrato y a título de anticipo, el monto de ciento cincuenta millones de Dólares (US$150,000,000.00), "**Anticipo Del Precio Del Contrato**". El Anexo E de estas Condiciones Generales describe en más detalle los términos, incluyendo el monto y fecha de desembolso, del Anticipo Del Precio Del Contrato.

8. SERVICIOS DE INGENIERÍA.

8.1 ALCANCE GENERAL.

Estará incluido en el alcance de los servicios de ingeniería, y será responsabilidad del Contratista, el desarrollo de toda la ingeniería básica y de detalle necesaria para el diseño, suministro, construcción, Montaje E Instalación, mediciones, ensayos, pruebas y Puesta En Servicio de todos los equipos e instalaciones que comprenden el Proyecto, así como cualquier otra actividad de ingeniería que resulte necesaria para el desarrollo e implementación del Proyecto.

El Contratista deberá, por lo tanto, realizar toda la ingeniería que le permita tanto adquirir los equipos, materiales y elementos, como ejecutar las Obras, hasta dejar la totalidad del Proyecto en operación a satisfacción de la Empresa, de acuerdo con el Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas.

Los servicios de ingeniería que prestará el Contratista incluirán, entre otros, la elaboración de memorias de cálculo, planos y documentos de ingeniería, además de otros servicios de ingeniería requeridos durante la construcción de las Obras.

Dentro del alcance de la ingeniería se incluye la preparación del manual de operación y de mantenimiento de los equipos e instalaciones del Proyecto y el entrenamiento del personal de la Empresa que ésta destine para efectos de la operación y mantenimiento del Proyecto.

De igual manera, debe considerarse dentro de los servicios de ingeniería, las labores de investigación y de coordinación necesarias para integrar de manera efectiva el funcionamiento del Proyecto con aquellas instalaciones y sistemas a los cuales el Proyecto se encuentre vinculado.

Está incluido dentro del alcance de los servicios de ingeniería a prestar por el Contratista la preparación y entrega a la Empresa de las memorias de cálculo civiles, estructurales, mecánicas y de electricidad necesarias para el desarrollo de los diseños y para respaldar, demostrar y garantizar que los equipos e instalaciones cumplen con los requerimientos técnicos, criterios de diseño, parámetros garantizados y otras características establecidas en el Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas.

8.2 COORDINACIÓN.

El Contratista será responsable de la adecuada coordinación de todos los trabajos y servicios que debe prestar con motivo del Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas, ya sean efectuados directamente o mediante Subcontratistas.

El Contratista proveerá a la Empresa todos los servicios necesarios para administrar, supervisar y coordinar el diseño de detalle, fabricación, adquisición, suministro, transporte, internación, construcción, Montaje E Instalación, pruebas y Puesta En Servicio de las Unidades y de sus Instalaciones Comunes Relacionadas.

Deberá suministrar a la Empresa, sin costo adicional para ésta, servicios de especialistas calificados del Contratista o de fabricantes, los que deberán visitar en forma periódica las Obras, participar en reuniones periódicas con personal de la Unidad Ejecutora Del Proyecto y del Ingeniero De La Empresa, tanto en terreno como en las oficinas de la Empresa establecidas en el Contrato De EPC, para así asegurar que los servicios de ingeniería, suministro y construcción estén bien coordinados y ejecutados por el Contratista de acuerdo con los programas, plazos y especificaciones del Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas.

Los representantes del Contratista deberán estar bien familiarizados con las materias en que participarán.

8.3 INGENIERÍA GENERAL Y DE ESPECIALIDADES.

Considerando que el Contratista suministrará todo el equipamiento y ejecutará todas las Obras como un "contrato llave en mano", deberá disponer y poner al servicio de las Obras una organización y personal adecuados para ejecutar todo trabajo requerido de ingeniería y coordinación de especialidades, los que incluirán, entre otros, los siguientes deberes:

a) Ingeniería, diseño, cálculo y especificaciones para todas las especialidades, incluidos los equipos auxiliares, los equipos complementarios y los accesorios requeridos, de modo tal que las instalaciones se desempeñen y funcionen como un todo armónico y en las condiciones especificadas en el Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas. Con este fin, el Contratista deberá proporcionar los planos y toda la información complementaria a los de disposición general que debe entregar a la Empresa;

b) Coordinación de los suministros, incluyendo programación individual y control de entrega oportuna de la información necesaria a proveedores asociados; y

c) Someter a la consideración y para evaluación de la Empresa alternativas de diseño, de equipos y soluciones constructivas.

8.4 DISEÑOS E INGENIERÍA; PLANOS Y DOCUMENTOS.

8.4.1 Planos Proporcionados por el Comité De Licitación.

Los planos entregados por el Comité De Licitación como parte de los Documentos De Licitación muestran las dimensiones y características relevantes del Proyecto. Los referidos planos podrán usarse como referencia para el diseño y planificación del Proyecto, pero no para los fines de ejecución de las Obras. Será de responsabilidad y cargo del Contratista verificar la concordancia de tales antecedentes con la realidad para los fines de la ingeniería y diseño definitivos del Proyecto y ejecución de las Obras.

8.4.2 Programa de Diseño e Ingeniería.

El Contratista preparará y someterá a la aprobación de la Empresa, a más tardar treinta (30) Días después de la emisión de la Orden De Proceder (o con anterioridad a dicha fecha si las partes así lo acordaren por escrito), un programa inmediato de actividades de ingeniería que incluirá una reunión de partida del Proyecto ("**Reunión De Partida**") entre el Contratista y los representantes que la Empresa designe para tales efectos, incluyendo representantes de la Unidad Ejecutora Del Proyecto y del Ingeniero De La Empresa, en donde se tomarán las decisiones básicas de diseño y construcción del Proyecto. Después de dicha reunión, el Contratista entregará un listado y Programa, completo y específico, para la entrega de los planos necesarios para el diseño, desarrollo e implementación del Proyecto, en el cual indicará las fechas comprometidas por él para la entrega de cada uno de tales planos a la Empresa ("**Listado Y Programa De Entrega De Planos**"). El Listado Y Programa De Entrega De Planos hará indicación inicial del primer conjunto de planos y documentos de ingeniería conceptual y básica que darán comienzo a la ingeniería de detalle después de su aprobación por parte de la Unidad Ejecutora Del Proyecto y del Ingeniero De La Empresa. Posteriormente, el Listado Y Programa De Entrega De Planos se irá complementando y actualizando periódicamente de acuerdo con el avance de las actividades de ingeniería del Proyecto. El Listado Y Programa De Entrega De Planos deberá ser congruente con lo establecido en las Especificaciones Técnicas en la sección 01 83 10.

Las fechas o plazos de entrega deberán ser coherentes con los Programas de fabricación, construcción y Montaje E Instalación.

Antes de presentar los planos para su revisión, el Contratista deberá contar con la aprobación (previa y por escrito) de la Empresa, del Listado Y Programa De Entrega De Planos.

Los títulos de los planos indicados en Listado Y Programa De Entrega De Planos deberán ser suficientemente claros como para tener una adecuada información sobre el alcance y contenido de cada uno de ellos. En caso contrario, el Contratista deberá acompañar una lista explicativa al respecto.

Los planos, especificaciones y otros documentos técnicos del Contratista serán presentados a la Empresa para fines de emitir sus observaciones y comentarios, en la secuencia de entrega indicada en el Listado Y Programa De Entrega De Planos.

Al preparar el Listado Y Programa De Entrega De Planos el Contratista deberá considerar:

a) Quince (15) Días para la revisión, observaciones y comentarios de la Empresa;

b) Tiempo para las revisiones o cambios que deberá realizar debido a las observaciones y comentarios de la Empresa, el que no podrá exceder de Quince (15) Días;

c) Siete (7) Días para las observaciones o comentarios finales de la Empresa, después que el Contratista ha vuelto a entregar los planos revisados; y

d) El tiempo requerido para los respectivos envíos por correo.

La Empresa considerará como efectivamente entregados sólo aquellos planos que contengan la información comprometida en el Listado Y Programa De Entrega De Planos o requerida en el Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas, y con el grado de detalle que, a su exclusivo juicio, sea el adecuado a los fines pertinentes.

La determinación de qué planos deberán ser entregados para revisión y aprobación de la Empresa y cuáles sólo para su información será definida por la Empresa, sobre la base del Listado Y Programa De Entrega De Planos o el Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas.

8.4.3 Forma de Entrega de los Planos del Contratista

Los planos y documentos técnicos que debe entregar el Contratista deberán cumplir con las normas especificadas por la Empresa en el Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas. Las normas o símbolos especiales relativos a superficies,

soldaduras u otras indicaciones que difieran de las de aceptación general, deberán describirse especialmente. Las dimensiones se expresarán en unidades del sistema métrico decimal de medida.

Todas las dimensiones indicadas con cifras en los planos, prevalecerán sobre las dimensiones según escala.

El costo de confección de los planos, el de sus copias, su envío y otros gastos relacionados se considerarán incluidos en el Precio Del Contrato. Por tal motivo, el Contratista no podrá pretender el pago de sumas adicionales por dicho concepto.

El envío de los planos a la Empresa deberá hacerse por mano o por correo certificado y con un embalaje que impida su deterioro.

Los planos originales (reproducibles) y sus copias deberán ser ejecutados en material de primera calidad y claramente legibles.

El Contratista estará obligado a presentar a la Empresa los planos en el tamaño y formato que oportunamente ésta le señale.

Se deberá usar el sistema internacional de medidas. El idioma en los planos deberá ser español e inglés, o según se establezca en el Manual De Procedimientos. Las leyendas en los planos de montaje definitivos deberán ser hechas en español.

8.4.4 Observaciones o Comentarios a los Planos

Durante la etapa de revisión, los planos deberán ser enviados vía correo electrónico, en el formato CAD que determine la Empresa. Los comentarios de ésta se efectuarán por la misma vía.

Será por cuenta y riesgo del Contratista cualquier compra de materiales, fabricación, construcción, Montaje E Instalación de obras efectuadas previamente a las observaciones o comentarios de la Empresa a los planos de que se trate, incluido el costo de las eventuales demoliciones y reconstrucciones que fueren necesarias.

El Contratista no podrá pretender mayores plazos o costos amparado en eventuales demoras de la Empresa en emitir sus observaciones o comentarios o revisión de los planos y documentos relacionados.

Será de responsabilidad del Contratista cualquier revisión de los planos que presente. Asimismo, cualquier trabajo extraordinario que se requiera para conformar los planos revisados y aprobados será de cuenta y cargo del Contratista.

No obstante las observaciones o comentarios que la Empresa pudiere haber efectuado, o no efectuado, a los planos y demás documentos presentados por el Contratista, éste último será el único y pleno responsable del diseño del Proyecto, de su adecuada construcción y Montaje E Instalación, de su correcto funcionamiento y del cabal cumplimiento de todo lo exigido en el Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas.

Si se detectasen errores en los planos del Contratista durante la fabricación, construcción o Montaje E Instalación, la corrección correspondiente será anotada en el plano respectivo, debiendo el Contratista presentarlo de nuevo para su correspondiente revisión y registrarlo en la forma indicada anteriormente.

Todos los costos en que deba incurrir el Contratista en relación con las correcciones de los planos entregados a la Empresa, sus revisiones y copias estarán a cargo del Contratista.

El Contratista deberá tener disponible en todo momento, tanto en Taller como en el Sitio, dos (2) copias de los planos que tienen relación con las Obras respectivas. Estos planos estarán a disposición para consulta de la Empresa o de cualquier persona que tenga autorización escrita para ello por parte de la Empresa.

Sin perjuicio de los plazos de revisión señalados en la Sección 8.4.2 anterior, la Empresa estará facultada para rechazar en cualquier momento dentro del período de vigencia del Contrato De EPC, y el Contratista deberá corregir, cualesquier diseño o trabajo que no esté conforme con el Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas, o con la Legislación Dominicana aplicable. El Contratista no podrá pretender indemnización alguna o modificaciones a los plazos y Precio Del Contrato por esta circunstancia.

8.4.5 Revisor Sísmico.

El Contratista deberá incluir, a su costo, la participación en el diseño del Proyecto de un profesional u oficina especializada en el diseño sísmico de instalaciones similares al Proyecto, de preferencia con experiencia en estudios y diseños sísmicos en la República Dominicana ("**Revisor Sísmico**"). El Revisor Sísmico actuará, siempre y en todo caso, como especialista independiente. Todos los planos estructurales, civiles y del equipamiento principal del Contratista deberán ser revisados y presentarse una vez autorizados por el Revisor Sísmico.

El costo que pudiere representar al Contratista cumplir con las recomendaciones y/o exigencias del Revisor Sísmico se considerará incluido en el Precio Del Contrato.

La designación del Revisor Sísmico deberá ser sometida a la aprobación previa y por escrito de la Empresa, para lo cual, oportunamente, el Contratista deberá entregar a la Empresa los antecedentes relevantes que acrediten la experiencia e idoneidad de dicho revisor.

8.4.6 Otros Especialistas.

El Contratista deberá contar con la participación de un profesional u oficina especializada en geotecnia y mecánica de suelos que elabore en detalle las especificaciones necesarias para el diseño del Proyecto.

Además, y debido a la frecuente ocurrencia en la República Dominicana de huracanes, el Contratista deberá contar con la participación en su equipo de ingeniería de un profesional u oficina especializada en diseño de estructuras resistente al paso de huracanes.

Para efectos de asegurar la calidad del diseño del Proyecto, todos los especialistas que el Contratista incluya en su equipo de ingeniería del Proyecto deberán tener experiencia en proyectos similares al Proyecto. Su designación deberá ser sometida a la aprobación previa y por escrito de la Empresa, para lo cual, oportunamente, el Contratista deberá entregar a la Empresa los antecedentes relevantes que acrediten la experiencia e idoneidad del profesional de que se trata. El costo de la contratación de estos especialistas deberá ser incluido en el Precio Del Contrato.

8.4.7 Estudios y Memorias de Cálculo.

El Contratista deberá presentar estudios y cálculos que demuestren el cumplimiento con las normas y buenas prácticas aceptadas de ingeniería y, en general, que los equipos son adecuados para los servicios a prestar. Deberá, además, presentar los cálculos y análisis de aquellos temas específicos que indique el Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas. Estos estudios deberán ser indicados en el Listado Y Programa De Entrega De Planos.

Los cálculos o verificaciones basados en programas de computador deberán acompañarse de suficientes datos explicativos para permitir a la Empresa hacer un seguimiento y control del proceso y resultado del cálculo respectivo. Si en opinión de la Empresa la aclaración entregada del proceso computacional no fuese adecuada, previo aviso escrito de aquélla al Contratista, el cálculo correspondiente se considerará como no entregado.

La entrega de las memorias de cálculo se hará en forma coordinada con la de los planos respectivos. Aquellos planos para los cuales la Empresa estime necesario disponer de cálculos para su revisión deberán acompañarse de dichos cálculos. En caso contrario, su aprobación o comentario podría retenerse hasta su recibo.

8.4.8 Manuales de Equipos y de Procedimientos

El Contratista deberá preparar y presentar a la Empresa, para su aprobación y respecto de todos los componentes del Proyecto, los manuales de equipos, montaje, operación, mantenimiento y Puesta En Servicio y de procedimientos definidos a continuación, los que deberán ser entregados en forma impresa, además del archivo magnético de respaldo correspondiente:

a) Manuales de Equipos: Sin perjuicio de los demás antecedentes que se detallan en las Especificaciones Técnicas, los manuales de equipos deberán incluir la descripción clara, sencilla e inequívoca de toda la información que se necesita para montar, operar y mantener el equipo respectivo e incluirán, al menos, la siguiente información:

i) Una descripción detallada del equipo, incluyendo sus partes, componentes y accesorios. También se incluirá un listado pertinente de planos;

ii) Principios operacionales. Se incluirán las bases técnicas que permitan visualizar la operación del equipo o del sistema de equipos incluyendo diagramas de flujo, diagramas lineales, diagramas de cables, diagramas de tuberías y otros;

iii) Instrucciones de montaje (Manual de Montaje), incluyendo planos, esquemas, secuencias, tolerancias, equipos especiales y toda otra información necesaria para verificar un correcto Montaje E Instalación del equipamiento;

iv) Instrucciones de operación (Manual de Operación). Éstas, editadas en forma de manual, deberán ser claras, concisas y ordenadas de acuerdo con las secuencias operacionales respectivas e incluirán tanto los equipos individuales como los sistemas de los que éstos formen parte;

v) Instrucciones de mantenimiento, reparación y detección de problemas o

dificultades;

vi) Manuales de Inspección, garantía de calidad y otros, que incluyen los procedimientos internos, criterios y normas que digan relación con estos temas; y

vii) Manual de Puesta En Servicio.

Los manuales en forma de borrador deberán ser presentados por el Contratista en tres (3) copias, a lo menos tres (3) meses antes de su uso potencial.

Una vez terminada exitosamente la Puesta En Servicio de cada una de las Unidades y de sus Instalaciones Comunes Relacionadas, el Contratista deberá incorporar en los respectivos manuales todos los cambios y precisiones de acuerdo con la experiencia derivada de las pruebas y funcionamiento de la respectiva Unidad y de sus Instalaciones Comunes Relacionadas y entregar su versión definitiva a la Empresa. Lo anterior será una condición para la emisión del Certificado De Recepción Provisional Total de dicha Unidad e Instalaciones Comunes Relacionadas.

b) Manual de Procedimientos: Dentro del plazo de treinta (30) Días contados a partir de la fecha en que se celebre la Reunión De Partida, el Contratista deberá entregar a la Empresa una propuesta de manual de procedimientos, cuyo objeto es normalizar el tratamiento de los documentos y el manejo de la correspondencia entre las partes ("**Manual De Procedimientos**"). Entre otras cosas, el Manual De Procedimientos deberá contener:

i) Ejecución de Planos: Numeración, colocación de títulos, presentación general, reglamentación y uniformidad técnica;

ii) Cartas y otras Comunicaciones: Sistema de numeración e identificación, recorrido y firmas;

iii) Cálculos y otros Cómputos Parecidos: Formato, presentación general y otras reglamentaciones requeridas para su presentación; y

iv) Sistema De Clasificación De Documentos e índice tentativo de materias de los siguientes manuales:

- Manual de montaje.
- Manual de inspección y certificación de calidad.
- Manual de Puesta En Servicio.
- Manual de mantención.
- Manual de operación.
- Programa de entrega de todos los manuales en su primera versión.

Todos los documentos técnicos, incluyendo planos, memorias de cálculo, manuales, catálogos y similares, que tengan relación con el Proyecto, deberán ser clasificados de acuerdo con un sistema de clasificación de documentos que deberá ser propuesto por el Contratista y aprobado por la Empresa ("**Sistema De Clasificación De Documentos**").

El objetivo del Sistema De Clasificación De Documentos es dar a cada uno de los documentos relacionados con las Obras su propia identificación. Los documentos que el Contratista envíe sin este número de clasificación se entenderán como no enviados.

Todos los manuales deberán ser redactados y entregados en idioma español. Versiones en inglés serán aceptadas sólo con la aprobación previa y por escrito de la Empresa.

8.5 REGISTRO DE EJECUCIÓN DE LAS OBRAS.

8.5.1 Registro Fotográfico

El Contratista deberá mantener un registro fotográfico de la ejecución de las Obras, en la forma y con la periodicidad que indique la Empresa. Pruebas de tales fotografías, o los archivos magnéticos correspondientes en su caso, deberán ser entregadas para la aprobación previa de la Empresa, a quien el Contratista deberá suministrar finalmente tres (3) copias tamaño postal, junto con los negativos o archivo magnético de cada fotografía aprobada.

Cada una de las fotos deberá registrar su fecha y descripción del trabajo, equipo o actividad que representa y entregarse debidamente ordenadas en un álbum. Una copia de cada fotografía aprobada deberá estar firmada por la Empresa y será devuelta al Contratista para su custodia.

8.5.2 Registros Videográficos.

El Contratista deberá hacer un registro videográfico de la ejecución de las Obras con la oportunidad y la frecuencia que le indique la Empresa. El Contratista someterá a la revisión y aprobación de la Empresa el contenido de las grabaciones acumuladas secuencialmente, las que, una vez concluidas las Obras, permitirán obtener una idea razonable y aproximada del desarrollo histórico de éstas.

Al término de las Obras, el Contratista entregará el original y dos copias perfectamente claras del registro videográfico. Todas las copias deberán estar rotuladas tanto en el video como en la caja que lo proteja.

8.5.3 Actualización de Planos y Registros de la Construcción

El Contratista deberá proveer y mantener actualizados los planos, registros, instrucciones y manuales de todos los equipos fabricados y montados o instalados.

Estos planos y documentos deberán mostrar las diferencias existentes con los planos y documentos originales, incluyendo las ubicaciones exactas, tamaños y tipo de trabajos ejecutados.

Se entregarán copias de estos documentos a la Empresa, pero se mantendrán temporalmente en el Taller u oficina del Contratista en el Sitio como registro de archivo.

Al fin de cada mes, todas las entradas de información, cambios o revisiones que se hagan en los planos serán sometidos por el Contratista a consideración de la Empresa.

8.5.4 Planos "As - Built" y Documentos Finales

Como condición previa para la emisión del Certificado De Recepción Provisional Total de la última Unidad y de sus Instalaciones Comunes Relacionadas por parte de la Empresa, el Contratista deberá suministrar a ésta los planos y documentos completos, actualizados, debidamente revisados y aprobados, de acuerdo con el siguiente esquema:

a) Una (1) copia reproducible y un archivo electrónico en formato CAD, en la versión que determine la Empresa, de la revisión final de todos los planos del Proyecto. En ésta versión deben estar incorporadas todas las modificaciones que hubieren experimentado las Obras durante su desarrollo y reflejar fielmente el modo final en que ellas han sido construidas y montadas (Planos "As - Built"). En tanto tales planos contengan diferencias con relación a la realidad, no podrán considerarse como "As-Built";

b) Tres (3) copias encuadernadas de los manuales de montaje, operación, mantenimiento, reparación, detección de problemas y fallas y demás manuales;

c) Tres (3) copias encuadernadas de catálogos ordenados y marcados de todos los componentes estándar del equipo, en los cuales se pueda encontrar el tipo exacto, características y fabricación de los repuestos y reemplazos necesarios;

d) Tres (3) copias ordenadas y encuadernadas de todos los cálculos y datos usados en el diseño del equipo;

e) Tres (3) copias de listas detalladas de las herramientas y repuestos definitivos; y

f) Registros videográficos y fotográficos.

El costo de todo lo anterior se considerará incluido en el Precio Del Contrato.

9. CAPACITACIÓN DEL PERSONAL.

Será responsabilidad del Contratista entrenar y capacitar de forma completa y adecuada al personal que designe la Empresa para llevar a cabo la operación y mantenimiento del Proyecto (ya sean empleados/funcionarios de la Empresa o de un tercero contratado por la Empresa para llevar a cabo la operación y mantenimiento del Proyecto) de acuerdo con lo indicado en el Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas, para lo cual el Contratista deberá asignar el personal técnico especializado.

Esta capacitación deberá ser organizada por el Contratista con supervisión de la Empresa (o del tercero contratado por la Empresa para llevar a cabo la operación y mantenimiento del Proyecto) y deberá ser realizada por personal calificado de habla española, el que estará a disposición de la Empresa antes y durante el período de la Puesta En Servicio de la respectiva Unidad y de sus Instalaciones Comunes Relacionadas y hasta la fecha de emisión del Certificado De Recepción Provisional Total de dicha Unidad e Instalaciones Comunes Relacionadas.

El Contratista deberá entregar, conforme, en el momento y forma que le sea solicitado por la Unidad Ejecutora Del Proyecto, un detalle del nivel de preparación mínima que debe tener el personal a ser capacitado en terreno y de los conocimientos específicos que debe poseer para permitirle recibir la capacitación de que se trate.

Tal personal, una vez seleccionado por la Empresa, participará en cursos específicos que deberán ser impartidos en idioma español por instructores calificados del Contratista, en los campos propios de la operación, control y mantenimiento del Proyecto.

Los cursos deberán tener la profundidad y duración necesaria y suficiente como para asegurar la idoneidad de los alumnos para desempeñar los cargos y funciones correspondientes a tales campos, hecho que debe ser debidamente certificado por el Contratista al final de dichos cursos.

Asimismo, el Contratista deberá, durante el Período De Garantía-Unidad E Instalaciones Comunes Relacionadas respectivo y al sólo requerimiento de la Empresa, enviar el personal especializado necesario para atender y resolver los problemas y fallas que presente la respectiva Unidad y sus Instalaciones Comunes Relacionadas.

Todos los costos que represente esta capacitación y asistencia técnica a ser impartida por el Contratista, incluyendo, sin limitación, el traslado, alojamiento y alimentación, de los instructores, y todo otro costo involucrado, se considerará incluido en el Precio Del Contrato.

Además, el Contratista deberá, durante el Período De Garantía-Unidad E Instalaciones Comunes Relacionadas respectivo y al sólo requerimiento de la Empresa, disponer de uno o varios supervisores de operaciones que continuarán con la capacitación del personal a cargo de la operación de la Unidad respectiva, en servicio y conectada al sistema eléctrico.

10. EQUIPOS, INSTRUMENTOS, HERRAMIENTAS, MATERIALES Y REPUESTOS.

10.1 CALIDAD Y ORIGEN.

Todos los materiales y productos que sean usados en la fabricación e instalación de los equipos a suministrar por el Contratista deberán ser nuevos, sin defectos o imperfecciones y de la clase más apropiada para el servicio previsto. La selección y uso de ellos será tal que, en condiciones de trabajo, en ninguna parte del equipo se produzca corrosión, distorsión, deterioro, inconvenientes o tensiones de deformación mayores que las admisibles según las normas aplicables o los requisitos funcionales.

El Contratista deberá proporcionar el nombre de los fabricantes de los productos de manufactura o estándar, identificando las normas bajo las cuales se fabricaron y todo tipo de información adicional útil para el conocimiento y aprobación de la Empresa. Si el Contratista no cumpliere con esta estipulación, la Empresa podrá rechazar dichos suministros, sin que ello pueda ser aducido por el Contratista como causal de incremento del Precio Del Contrato o para el otorgamiento de plazo adicional alguno.

Cuando la Empresa especifique productos o marcas de fabricantes, estas referencias se hacen sólo por motivos ilustrativos en cuanto a tipo, diseño, característica y calidad del artículo deseado y no estará limitado a los productos del fabricante o de la marca específica.

El Contratista deberá contar con aprobación previa y por escrito de la Empresa en todos los casos en que requiera hacer uso de materiales o productos equivalentes a los establecidos en el Contrato De EPC, incluyendo, sin limitación, las Especificaciones Técnicas, o a los ya aprobados con anterioridad.

10.2 INTERNACIÓN.

Los términos y condiciones generales que regirán la internación de los equipos, repuestos, instrumentos y herramientas de origen extranjero que formarán parte del Proyecto se encuentran establecidos en el Anexo F de estas Condiciones Generales.

10.3 MATERIAL DE CONSUMO.

El Contratista deberá suministrar a la Empresa todos los materiales de consumo necesarios tanto para terminar el Montaje E Instalación como para efectuar el mantenimiento y operación del equipo durante todo el período de Puesta En Servicio de la respectiva Unidad y de sus Instalaciones Comunes Relacionadas. Tales materiales deberán incluir, entre otros, aceites, grasas, pinturas, electrodos, solventes, filtros, reactivos y empaquetaduras. Un listado específico de los mismos deberá ser sometido a la Empresa para su aprobación con la suficiente anticipación al inicio de la Puesta En Servicio de la respectiva Unidad y de sus Instalaciones Comunes Relacionadas o la emisión del Certificado De Recepción Provisional de dicha Unidad e Instalaciones Comunes Relacionadas en el caso previsto en la Sección 30.4 de estas Condiciones Generales. El costo de estos materiales se considerará incluido en el Precio Del Contrato.

10.4 REPUESTOS

El Contratista deberá proveer el juego de repuestos mínimos necesarios para manejar las contingencias que puedan presentarse durante el arranque y comisionamiento de cada una de las Unidades y de sus Instalaciones Comunes Relacionadas.

10.5 EMBALAJE

El embalaje deberá cumplir con las exigencias establecidas al respecto en el Contrato De EPC, incluyendo, sin limitación, estas Condiciones generales y las Especificaciones Técnicas, y considerar

tanto los requerimientos propios del transporte como la seguridad contra mermas o robos durante éste y el almacenamiento. En caso que el transporte deba efectuarse sobre cubierta, deberán tomarse todas las precauciones especiales necesarias para evitar cualquier daño al equipo o materiales.

Todos los bultos deberán disponer de marcas claras e indelebles de identificación las que se colocarán en placas metálicas firmemente adheridas a ellos. También deberán tener marcas para facilitar su manejo seguro durante el embarque y el transporte por tierra, tales como indicaciones para colocar estrobos y ganchos, centro de gravedad, advertencias, pesos y otras que puedan ser necesarias. Todos los bultos se premunirán de una lista de empaque con las partes que contienen.

En los embalajes en cajones cerrados se incluirán materiales higroscópicos en suficiente cantidad para asegurar la absorción de toda la humedad que pueda acumularse durante el transporte.

La superficies maquinadas o pulidas de los equipos, materiales y demás elementos que no deban ser pintadas se cubrirán para el transporte con grasa, plástico, tela u otro medio adecuado de protección, el cual pueda ser removido por solventes comerciales posteriormente.

Los cajones de embalaje deben ser fuertes y suficientemente rígidos y consistentes para resistir sin mayores daños un amarre incorrecto o cargas sobre ellos en los almacenes de las naves y puertos.

Aquellas piezas pesadas y robustas que puedan ser despachadas sin embalaje, deberán contar con los refuerzos y protecciones necesarios para evitar cualquier daño.

Todo material de relleno será de un tipo que no absorba humedad.

Los repuestos se deberán proteger y embalar de manera que resistan sin deterioros un almacenamiento adicional de varios años bajo condiciones normales y se dispondrán en cajas separadas con marcas especiales que los identifiquen como tales y deberán incluir una lista de empaque detallada que identifique claramente cada uno de los repuestos y el equipo principal al que están destinados.

Los repuestos delicados se protegerán por medio de capas protectoras aplicadas por inmersión o embalándose en envolturas o recipientes sellados.

10.6 PROPIEDAD DE LOS ARTÍCULOS, MATERIALES, EQUIPAMIENTO Y DEMÁS COMPONENTES DEL PROYECTO

A menos que las partes acuerden expresamente lo contrario en el Contrato De EPC, todos los bienes, materiales, instalaciones, equipamiento y demás componentes del Proyecto, suministrados por el

Contratista o en su nombre, pertenecerán al Contratista hasta que sean incorporados a las Obras, o sean pagados, lo que ocurra primero. Al momento de la incorporación o el pago, la propiedad de los referidos bienes, materiales, instalaciones, equipamiento y demás componentes del Proyecto se transferirá a la Empresa, de manera que la Empresa será su dueña a partir de ese momento. Para efectos de claridad, las disposiciones de la presente Sección no implican la transferencia de riesgos, todos los cuales correrán a cargo del Contratista hasta la fecha del correspondiente Certificado De Recepción Total.

El Contratista garantizará la integridad de los referidos bienes, materiales, instalaciones, equipamiento y demás componentes del Proyecto, y garantizará que tales bienes serán transferidos a la Empresa, tal como se describe en el párrafo anterior, libre de cualquier derecho de retención, reclamación, cargo, interés, gravamen y derechos de sus Subcontratistas y/o proveedores y de cualquier otra persona.

El Contratista no impondrá gravámenes ni alegará derechos de retención o de fideicomiso, ni gravará los referidos bienes, materiales, instalaciones, equipamiento y demás componentes del Proyecto de ninguna otra manera, ni permitirá que sus agentes o terceros impongan gravámenes, aleguen derechos de retención o de fideicomiso, ni graven los referidos bienes, materiales, instalaciones, equipamiento y demás componentes del Proyecto de ninguna otra manera, donde quiera que éstos se encuentren. En caso de que cualquier suplidor, agente, empleado o tercero acreedor del Contratista, de alguna forma grave, retenga o de cualquier otra manera afecte los referidos bienes, materiales, instalaciones, equipamiento y/o demás componentes del Proyecto; el Contratista deberá realizar, a su costo y de forma inmediata, todas y cada una de las gestiones que sean necesarias para liberar dichos bienes, materiales, instalaciones, equipamiento y/o demás componentes del Proyecto de forma inmediata, incluyendo pero no limitado al pago de los créditos que han provocado su afectación, entrega de otros bienes del Contratista no relacionados con el Proyecto o la Empresa en sustitución de aquellos afectados, constitución de garantías de pago o cumplimiento en favor del acreedor actuante, a los fines de liberaciones de los gravámenes o cargas sobre los bienes, materiales, instalaciones, equipamiento y/o demás componentes del Proyecto, entre otros; todo sin perjuicio de los derechos de la Empresa frente al Contratista o el tercero actuante de reclamar resarcimiento y/o ejercer las acciones que el Contrato De EPC y/o la Legislacion Dominicana le acuerde con respecto a la situación descrita.

11. TRÁNSITO Y ACCESOS

11.1 INTERFERENCIAS CON EL TRÁNSITO Y CON DERECHOS DE TERCEROS

Todas las actividades necesarias para la ejecución de las Obras deberán efectuarse de modo de no interferir ni afectar los servicios públicos, el derecho de uso y ocupación de caminos públicos, privados,

senderos o propiedades, sean éstas de la Empresa o de cualquier otra persona natural o Persona Jurídica. El Contratista debe mantener libre e indemne e indemnizar a la Empresa en relación a todo reclamo, demanda, acciones legales, daños, costos, cargos y cualquier gasto que resultase como consecuencia de las infracciones cometidas por el Contratista al respecto.

11.2 TRÁNSITO EXTRAORDINARIO

El Contratista usará todos los medios razonables para evitar daños o perjuicios que pueda ocasionar cualquier tránsito suyo o el de cualquiera de sus Subcontratistas o proveedores, en cualquiera de las vías, puentes y estructuras públicas que comunican con o se encuentren en las vías hacia el Sitio y, en particular, seleccionará las vías, escogerá y usará vehículos y limitará o distribuirá las cargas de modo que cualquiera de estos tránsitos extraordinarios que inevitablemente se produzca al transportar el suministro y material desde y hasta el Sitio, se limite razonablemente en la mayor medida posible, de manera tal que las carreteras y puentes a utilizar no experimenten daños o deterioros, liberando de toda responsabilidad, sin limitación alguna, a la Empresa.

En caso que las cargas por eje de los equipos de transporte excedan los valores autorizados, el Contratista deberá obtener, a su costo, los permisos especiales que se requieran de las Autoridades locales pertinentes.

11.3 VÍAS DE ACCESO

El Contratista será el único responsable de la evaluación de las condiciones de los caminos y vías de acceso al Sitio y de su incidencia en el Precio Del Contrato.

Será de responsabilidad y cargo del Contratista tanto el reunir toda la información técnica sobre el estado y capacidad de carga de las vías que utilice como la ejecución de los refuerzos y obras temporales que necesiten las vías y puentes para permitir el transporte de los equipos del Proyecto.

El Contratista no podrá pretender pago ni plazo adicional alguno por las dificultades, interferencia, daños y otras circunstancias que pudieren afectar a tales vías y puentes durante el desarrollo de las Obras.

12. EJECUCIÓN DE LAS OBRAS

12.1 COMIENZO DE LAS OBRAS

El Contratista deberá dar inicio a las Obras una vez que se cumplan todas y cada una de las condiciones establecidas en la Sección 4.2 de estas Condiciones Generales. Sin perjuicio de lo anterior, las partes

podrán acordar el inicio de ciertas Obras antes de que se cumplan las condiciones establecidas en la referida Sección 4.2 en la medida que dicho acuerdo conste por escrito y la Empresa emita la orden de proceder limitada correspondiente.

12.2 ENTREGA DEL SITIO

Previo a la emisión de la Orden De Proceder, y en base a la emisión de una orden de proceder limitada, la Empresa entregará al Contratista la posesión del Sitio para que el Contratista pueda comenzar con las Obras de acuerdo con el Programa Contractual vigente.

12.3 ACOMODACIÓN DEL PERSONAL DEL CONTRATISTA Y SERVICIOS DE AGUA, ELECTRICIDAD, BASURA Y OTROS

El Contratista deberá, a su propio riesgo y costo, acomodar al personal propio y de sus Subcontratistas y proveedores en el Sitio.

Todas las instalaciones temporales de trabajo, incluyendo, sin limitación, Talleres, almacenes, comedores y oficinas, que requiera el Contratista serán diseñadas, construidas, operadas, mantenidas, desarmadas y retiradas del Sitio por el propio Contratista, bajo su responsabilidad y a su propio costo.

La Empresa no tendrá responsabilidad alguna sobre la administración de las instalaciones temporales de trabajo, ni sobre su conservación, mantenimiento o cuidado.

Los servicios de agua para la construcción, agua potable, adquisición y distribución de energía eléctrica, alcantarillado, extracción de basura, aseo, vigilancia, prevención y extinción de incendios, entre otros, serán proporcionados por el Contratista a su solo riesgo, cargo y costo.

La Unidad Ejecutora Del Proyecto inspeccionará que todas estas instalaciones y servicios estén de acuerdo con la Legislación Dominicana aplicable, incluyendo sin limitación, las normas de higiene, salubridad y medio ambiente. Para tales efectos, el Contratista deberá hacer entrega a la Unidad Ejecutora Del Proyecto de los planos básicos y especificaciones de las instalaciones provisorias y servicios, para su conocimiento y aprobación.

El Contratista debe mantener libre e indemne e indemnizar a la Empresa en relación, directa o indirecta, a todo reclamo, demanda, acciones legales, daños, costos, cargos y cualquier gasto vinculado con lo antes expuesto.

12.4 TRANSPORTE PARA EL PERSONAL DEL SITIO DE OBRAS

El Contratista será responsable por la adecuada provisión del transporte, a su costo, desde y hacia el Sitio, para su propio personal y el de sus Subcontratistas y proveedores, los cuales podrán ser movilizados diariamente desde sus lugares de residencia.

La referida movilización deberá contar, en todo caso, con un seguro de "accidentes de tránsito", de acuerdo con la Legislación Dominicana aplicable.

El Contratista debe mantener libre e indemne e indemnizar a la Empresa en relación, directa o indirecta, a todo reclamo, demanda, acciones legales, daños, costos, cargos y cualquier gasto vinculado con lo antes expuesto.

12.5 PROTECCIÓN DE LOS INTERESES DE LA EMPRESA

El Contratista estará obligado a proteger y velar por los intereses de la Empresa en todas sus actuaciones que tengan relación con el desarrollo e implementación del Proyecto.

12.6 CONDICIONES GENERALES DE EJECUCIÓN

El Contratista será total y únicamente responsable por la ejecución de toda Obra realizada por su propio personal, el de sus Subcontratistas y proveedores o por personal calificado o no calificado contratado localmente por el Contratista.

12.7 CONDICIONES DESFAVORABLES

Durante períodos de clima desfavorable, huracanes, tormentas, suelo mojado u otras condiciones poco convenientes para determinadas operaciones, el Contratista ejecutará los trabajos de tal forma que éstos no sean afectados adversamente por estas condiciones. Ningún componente del Proyecto será montado en condiciones que pudiesen afectar en forma adversa la calidad o eficiencia del mismo, salvo que el Contratista tome precauciones especiales para realizar las Obras respectivas en forma correcta y satisfactoria. Estas condiciones desfavorables deberán ser previstas por el Contratista en el Programa De Trabajos respectivo y su ocurrencia no dará motivo a ninguna extensión de plazo o aumento en el Precio Del Contrato, salvo que se trate de un evento constitutivo de Fuerza Mayor.

13. OBRAS PROVISIONALES, PLANTA DE CONSTRUCCIÓN, EQUIPOS DE MONTAJE Y/O MATERIALES; LIMPIEZA Y DESPEJE DEL SITIO; PROTECCIÓN DEL MEDIO AMBIENTE; OFICINAS EN EL SITIO; INSTALACIONES PARA EL INGENIERO DE LA EMPRESA; EQUIPOS DE CONSTRUCCIÓN; REMOCIÓN DE MATERIALES; EVIDENCIA DEL DERECHO DEL CONTRATISTA SOBRE LAS INSTALACIONES, OBRAS O MATERIALES; CLÁUSULA DE CESIÓN A FAVOR DE LA EMPRESA

13.1 OBRAS PROVISIONALES, PLANTA DE CONSTRUCCIÓN, EQUIPOS DE MONTAJE Y/O MATERIALES

El Contratista suministrará a su costo y será responsable por todas las Obras Provisionales, Planta De Construcción, equipos de montaje y/o materiales que se requieran para el desarrollo e implementación del Proyecto. Una vez en el Sitio, dichos elementos serán usados exclusivamente para el desarrollo e implementación del Proyecto y el Contratista no podrá removerlos, o cualquiera de su partes (salvo para su traslado dentro del Sitio), sin la aprobación previa y por escrito de la Empresa.

La Empresa no será responsable, en ningún momento y por causa alguna, por la pérdida o deterioro de cualquier parte de las referidas Obras Provisionales, Planta De Construcción, equipos de montaje y/o materiales. El Contratista debe mantener libre e indemne e indemnizar a la Empresa en relación a todo reclamo, demanda, acciones legales, daños, costos, cargos y cualquier gasto vinculado con lo antes expuesto.

13.2 LIMPIEZA Y DESPEJE DEL SITIO

El Contratista deberá efectuar una limpieza diaria de la basura y del material de desecho de las áreas de trabajo y de sus instalaciones, manteniendo el Sitio ordenado y aseado durante toda la vigencia del Contrato De EPC. Asimismo, al término o antes de finalizar los trabajos, el Contratista deberá limpiar exhaustivamente toda el área del Sitio, desmantelar y remover toda estructura provisional construida por él, remover toda la basura y escombros y dejar el Sitio en adecuadas condiciones de orden y presentación. Será de responsabilidad y cargo del Contratista el traslado y disposición de tales elementos de acuerdo con la Legislación Dominicana aplicable.

13.3 PROTECCIÓN DEL MEDIO AMBIENTE

Tanto el Contratista como su personal y Subcontratistas y proveedores deberán proteger la flora y fauna local, evitar su destrucción innecesaria, contribuir a mantener las condiciones ecológicas de la zona y ceñirse a la Legislación Dominicana aplicable, a las instrucciones que se indiquen en el Contrato De EPC

incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas, o que al respecto entregue la Empresa. En particular, el Contratista deberá ejecutar todas las obras, trabajos y gestiones necesarias para atender cabalmente los requerimientos de las Autoridades locales emitidos o que se emitan durante la vigencia del Contrato de EPC con ocasión del desarrollo e implementación del Proyecto.

13.4 OFICINAS DEL CONTRATISTA EN EL SITIO

Durante toda la vigencia del Contrato de EPC, el Contratista deberá mantener una oficina apropiada en el Sitio, la cual será el centro de operaciones de su representante autorizado en terreno. Los comunicados entregados a dicho representante, o enviados a la oficina del Contratista en terreno si él no estuviese, se supondrán como presentados al Contratista, lo que será regulado en el Manual De Procedimientos.

13.5 INSTALACIONES PARA LA UNIDAD EJECUTORA DEL PROYECTO

El Contratista deberá proporcionar –a su costo– en el Sitio las instalaciones para el uso de la Unidad Ejecutora Del Proyecto y del Ingeniero De La Empresa, con sus respectivas líneas de servicios, tales como redes de alimentación de agua potable, instalaciones de alcantarillado, instalación de gas, instalaciones eléctricas y de comunicaciones, además de cualquier otra necesaria para la correcta y completa inspección de las Obras. El detalle de las instalaciones será entregado a la Empresa conjuntamente con los planos básicos y especificaciones de las instalaciones provisorias indicados en la Sección 12.3 de estas Condiciones Generales.

13.6 EQUIPOS DE CONSTRUCCIÓN

El Contratista deberá suministrar todos los equipos, herramientas, elementos de consumo e instrumentos necesarios para que la ejecución de las Obras se lleve a cabo de acuerdo con los términos y condiciones establecidas en el Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas.

13.7 REMOCIÓN DE LA PLANTA DE CONSTRUCCIÓN Y MATERIALES

Una vez terminadas todas las Obras, los materiales, herramientas, equipos y Planta De Construcción de propiedad del Contratista, serán retirados por éste del Sitio.

13.8 EVIDENCIA DEL DERECHO DEL CONTRATISTA SOBRE LAS INSTALACIONES, OBRAS O MATERIALES

El Contratista deberá, a pedido de la Empresa, proveerle evidencia satisfactoria sobre la propiedad de cualquier instalación, obra provisional o material o, alternativamente, del contrato respectivo mediante el cual los mismos han sido alquilados, cedidos u obtenidos.

13.9 CLÁUSULA DE CESIÓN A FAVOR DE LA EMPRESA EN ACUERDOS DE ARRENDAMIENTO O ARRENDAMIENTO CON OPCIÓN DE COMPRA DEL CONTRATISTA

Con el objeto de asegurar que, en el caso eventual que el Contratista incurra en causal de incumplimiento, abandono, quiebra, u otra circunstancia que no permita que continúe ejecutando las Obras, la Empresa pueda disponer de la Planta De Construcción, Obras Provisionales o materiales tomados en arrendamiento, o en arrendamiento con opción de compra (leasing), por el Contratista, éste deberá asegurar mediante una cláusula especial, que le permita en cada contrato de alquiler o arrendamiento con opción de compra (leasing) cederlos a la Empresa y, a ésta, asumir todos los derechos y obligaciones (menos las obligaciones asumidas anteriormente por el Contratista en relación a dicho acuerdo). Ello deberá permitir a la Empresa, dentro de un plazo de catorce (14) Días y después de haber cancelado todo alquiler o pago pendiente, continuar usando dichos equipos e instalaciones en los mismos términos contractuales que aquéllos bajo los cuales se le arrendó o entregó al Contratista. La Empresa tendrá derecho a permitir su uso a cualquier otro contratista empleado con el objeto de terminar las Obras según los términos del Contrato De EPC.

En caso que la Empresa asuma los pagos en cualquier acuerdo de arrendamiento o arrendamiento con opción de compra, en concordancia con lo anterior, por Planta De Construcción, Obras Provisionales o materiales conforme a las estipulaciones de esta Sección, toda suma pagada por la Empresa bajo las estipulaciones de cualquiera de estos acuerdos y todos los gastos cubiertos por la Empresa al comprometerse con tales acuerdos, se supondrán parte de los costos para terminar las Obras y se imputarán al Precio Del Contrato.

14. PLAZOS Y MODIFICACIONES A LOS MISMOS POR FUERZA MAYOR

14.1 PLAZO TOTAL Y PLAZOS PARCIALES (HITOS DEL PROYECTO)

El Contratista deberá dar término a las Obras correspondientes a cada Unidad e Instalaciones Comunes Relacionadas en las condiciones estipuladas en el Contrato De EPC, incluyendo, sin limitación, estas

Condiciones Generales y las Especificaciones Técnicas, en el plazo o en la fecha que se establezca en el Programa, fecha a partir de la cual quedará en mora de cumplimiento sin necesidad de requerimiento adicional.

Asimismo, el Contratista estará obligado a dar inicio, o término según corresponda, a las actividades que se expliciten en el Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas, en los plazos o fechas que en tales documentos se establezca.

Dentro de los plazos total y parciales antes aludidos se entenderá incluido el tiempo requerido por la Empresa para desarrollar sus actividades de inspección durante las etapas de fabricación, construcción, Montaje E Instalación, pruebas y Puesta En Servicio de cada una de las Unidades e Instalaciones Comunes Relacionadas y para la revisión y comentario de los planos y demás antecedentes que debe proporcionarle el Contratista.

El Contratista deberá comprometer en el Programa Contractual, para cada Unidad e Instalaciones Comunes Relacionadas, el plazo de término de al menos los hitos descritos en el Formulario TE-04 adjunto a su Oferta Técnica ("**Hitos Del Proyecto**").

14.2 MODIFICACIÓN DE PLAZOS POR FUERZA MAYOR

Tanto la Empresa como el Contratista no serán responsables de los retrasos que tengan su origen en un hecho constitutivo de Fuerza Mayor.

El Contratista sólo podrá solicitar modificación en los plazos contractuales si se atrasare en el término del total de las Obras, o en una actividad sometida a plazo parcial para ser completada, por un evento constitutivo de Fuerza Mayor. A tales fines, el Contratista deberá incluir en la Notificación-Detalle De Fuerza Mayor, además de la información a que se refiere la Sección 35 de estas Condiciones Generales, todos los antecedentes necesarios que demuestren que el evento de Fuerza Mayor alegado (i) ha incidido en el mencionado atraso como el número de Días de incidencia o (ii) incidirá en los plazos contractuales y el número de Días de incidencia. Si el Contratista no proveyere dicha información o cualquiera de las informaciones requeridas en la Sección 35 de estas Condiciones Generales en la Notificación-Detalle De Fuerza Mayor o si no hiciere la Notificación Inicial de Fuerza Mayor y/o la Notificación-Detalle De Fuerza Mayor dentro del plazo indicado en la Sección 35 de estas Condiciones Generales, se considerará que el Contratista ha renunciado a solicitar cualquier aumento en los plazos contractuales con motivo de o en relación con el evento de Fuerza Mayor alegado.

La Empresa, sobre la base (i) de los antecedentes aportados por el Contratista en la Notificación-Detalle De Fuerza Mayor, (ii) cualquier otra información adicional aportada por el Contratista con posterioridad a dicha notificación, ya sea a iniciativa propia o a requerimiento de la Empresa, y (ii) del Programa De Trabajo respectivo, determinará el eventual aumento del o los plazos contractuales respectivos.

Sin perjuicio de lo establecido en la Sección 35 de estas Condiciones Generales, y sólo para efectos de claridad, no se otorgará aumento de plazo alguno al Contratista por (i) atrasos causados por mano de obra inadecuada, (ii) no disponibilidad de mano de obra, (iii) razones climatológicas, (iv) problemas derivados de fletes marítimos o terrestres, (v) una omisión del Contratista en colocar las órdenes de los equipos y materiales con la suficiente anticipación para asegurar la oportuna entrega de ellos, o (vi) atrasos de responsabilidad de sus Subcontratistas o proveedores, si los referidos eventos no constituyen o resulten de un evento de Fuerza Mayor.

15. PROGRAMACIÓN DE LAS OBRAS Y CONTROL DE AVANCE Y RESULTADOS

15.1 PROGRAMA CONTRACTUAL PRELIMINAR, PROGRAMA CONTRACTUAL Y PROGRAMAS DE TRABAJO

Previo a la firma del Contrato De EPC, el Contratista deberá preparar y presentar a la Empresa una propuesta de Programa contractual en forma de malla de actividades con paso crítico CPM y de gráfico de barras, Carta Gantt o cronogramas, o según sea el requerimiento de la Empresa ("**Programa Contractual Preliminar**"). El Programa Contractual Preliminar (i) deberá tener como base el Cronograma De Ejecución Del Proyecto adjunto a la Oferta Técnica del Contratista (incluyendo cualquier modificación al mismo que se le haya hecho de conformidad con la Sección 9.2 de las Bases Fase De Ofertas Y Cierre) y (ii) será aprobado por la Empresa una vez verificada su coherencia, que contiene la información requerida por los Documentos De Licitación y que cumple los plazos totales y parciales estipulados en los mismos. Una vez aceptado expresamente por la Empresa, el Programa Preliminar Contractual devendrá en el Programa de actividades a desarrollarse durante la vigencia del Contrato y constituirá la base para toda su programación ("**Programa Contractual**").

Posteriormente, para el seguimiento y control de las Obras, el Contratista deberá presentar Programas de trabajo, los cuales detallarán la forma en que desarrollará sus actividades para cumplir los requerimientos del Programa Contractual ("**Programas De Trabajo**").

Los procedimientos incluirán un control de fechas, cantidades o costos, cualesquiera que la Empresa considere necesarios para llevar un control eficiente.

A continuación se describen las condiciones y requerimientos mínimos de los Programas antes indicados.

15.1.1 Contenido del Programa Contractual

El Programa Contractual deberá contener separadamente las actividades respectivas para cada Unidad y sus Instalaciones Comunes Relacionadas.

El Programa Contractual deberá incluir toda aquella información requerida por la Empresa para controlar el avance de las Obras, tales como:

a) Fechas claves de actividades críticas, de control y de las afectas a plazos parciales;

b) Relaciones de dependencia entre las distintas actividades;

c) Inicio y término más temprano/tardío de cada actividad;

d) Método y planificación general de la ejecución;

e) Cantidad de trabajo, equipo y personal previsto para estos fines;

f) Programas de ingeniería de detalle y de planificación general del trabajo;

g) Programas de fabricación;

h) Programas de pruebas en Taller;

i) Preparación del Sitio;

j) Construcción;

k) Transporte al Sitio;

l) Inspección de recepción y preparación para Montaje E Instalación;

m) Montaje E Instalación;

n) Puesta En Servicio;

o) Pruebas individuales, funcionales y preliminares de todos los componentes;

p) Recepción provisional parcial de las Obras;

q) Recepción provisional total de las Obras;

r) Remoción del equipo de construcción y Montaje E Instalación, despeje del Sitio;

s) Período De Garantía-Unidad E Instalaciones Comunes Relacionadas; y

t) Recepción Final.

El Programa Contractual deberá ser elaborado y controlado computacionalmente usando para ello un software de reconocida eficacia y adecuado para el control de programaciones de esta magnitud, tipo "Primavera" ("**Programa De Control De Obras**"). El Programa De Control De Obras deberá ser informado a la Empresa para su aprobación previa y por escrito.

El Programa Contractual deberá presentarse como malla de secuencia de actividades y contener, al menos, los siguientes antecedentes de cada actividad:

u) Código WBS *(Work Breakdown Structure)*;

v) Descripción o título resumido;

w) Descripción detallada o alcance;

x) Duración estimada en Días corridos;

y) Ponderador asociado; y

z) Relaciones de precedencia.

Las actividades deberán presentarse agrupadas o desagregadas de acuerdo con el desglose que requiera la Empresa, utilizando los codificadores adecuados.

Las curvas de avance físico acumulado deberán obtenerse directamente de las actividades y ponderadores de la malla de secuencia.

15.1.2 Programas De Trabajo

El Contratista deberá presentar los siguientes Programas De Trabajo, los cuales deberán ser totalmente compatibles y coordinados entre sí y con el Programa Contractual, describiendo con mayor detalle las actividades a realizar:

a) Programa de Fabricación, Pruebas en Fábrica y Suministro;

b) Programa de Construcción y Montaje; y

c) Programa de Pruebas y Puesta En Servicio.

El "Programa de Fabricación, Pruebas en Fábrica y Suministro" abarcará desde el inicio de las actividades de aprovisionamiento de materiales para la fabricación hasta la entrega en obra del último componente del Proyecto, incluidos los repuestos. Deberá considerar las actividades de ingeniería, acopio de materiales, fabricación, pruebas en Taller, preparación para despacho, transporte, internación y entrega en el Sitio. Las fechas de entrega en el Sitio deberán ser acordes con los compromisos establecidos en el Programa Contractual.

El "Programa de Construcción y Montaje", en su parte obras civiles, abarcará desde el inicio de las actividades de preparación del Sitio para movimiento de tierras e instalación temporales de trabajo y, en su parte montaje, desde la preparación del Sitio para el montaje de las primeras piezas del Proyecto hasta el último Día de la actividad de Montaje E Instalación del último componente del Proyecto. Este Programa deberá considerar todas las instalaciones temporales de trabajo así como las actividades de preparación, traslado de equipos al lugar de instalación, posicionamiento, nivelación, armado o ensamble, inyecciones de cemento, hormigones secundarios y chequeos dimensionales, y la entrega para pruebas funcionales individuales y preliminares. Las fechas de inicio y término deberán ser coherentes con los compromisos establecidos en el Programa Contractual.

El "Programa de Pruebas y Puesta En Servicio" abarcará desde la liberación de los equipos para pruebas hasta la emisión de Certificado De Recepción Provisional Total de la última Unidad y de sus Instalaciones Comunes Relacionadas. Este Programa considerará todas las pruebas y certificaciones individuales de los equipos y las de sistemas completos, sin carga y con ella, definiendo claramente las condiciones para los eventos significativos y el inicio y término de las Pruebas De Aceptación y Pruebas De Confiabilidad establecidas en el Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas, y las instancias de determinación de los parámetros o valores garantizados de eficiencia, de capacidad u otros.

15.2 CALENDARIO DE TRABAJO

Al comenzar los trabajos, el Contratista someterá a la aprobación de la Empresa los diferentes horarios y calendarios de trabajo que propone implantar en las Obras, con el fin que sean coordinados con otros trabajos, según se prevé en Sección 16.2 de estas Condiciones Generales. Cualquier modificación que

desee hacer al calendario y horarios autorizados, deberá ser sometida a aprobación de la Empresa con cinco (5) Días de anticipación, salvo casos de emergencia en que este plazo puede ser menor.

La Empresa podrá requerir al Contratista la adopción de un calendario general que involucre todos o una parte de los trabajos, para coordinar varios contratistas o modificar los calendarios y horarios de trabajo establecidos, cada vez que sea necesario, para cumplir con los plazos y Programas que se han convenido en el Contrato De EPC o de conformidad con el mismo. El Contratista no podrá pretender pago ni compensación alguna por dicho hecho.

15.3 CONTROL DEL AVANCE Y DE RESULTADOS

La Empresa evaluará el avance de las Obras (incluyendo, sin limitación, ingeniería, fabricación, construcción, Montaje E Instalación, pruebas y Puesta En Servicio) cada siete (7) y cada treinta (30) Días, o cuando lo estime conveniente. Podrá igualmente realizar controles adicionales de avance a intervalos menores, si fuese necesario por cualquier motivo.

El Contratista está obligado a proporcionar, sin demora, los datos e información requeridos para llevar a cabo dichos controles de avance. En particular, el Contratista entregará como parte del Informe Mensual De Avance, una actualización del Programa respectivo mediante el informe de avance detallado de actividades y el listado de actividades críticas que entrega el Programa De Control De Obras, incluyendo las fechas de inicio y de término de las actividades y el avance de cada una de ellas a la fecha de control de los trabajos respectivos.

La Empresa informará al Contratista sobre los resultados de la evaluación del control de avance, en relación con la desviación observada entre las fechas programadas y las reales.

Si las proyecciones muestran que las fechas y plazos contractuales o cualquier otro tipo de condiciones de avance no se han cumplido por motivos imputables al Contratista, éste deberá, sin demora y a más tardar a siete (7) Días de ser notificado, presentar para aprobación por parte de la Empresa, el Programa De Trabajo respectivo revisado y detallado con los cambios de procedimiento propuestos mediante los cuales las fechas previstas se mantendrían.

Dicho Programa De Trabajo revisado será la base para la ejecución futura de los trabajos respectivos.

15.4 MEDIDAS DE AJUSTE

Si cualquier fecha o plazo de término es excedido o cualquiera otra condición de avance no se cumple y, como consecuencia, pueden anticiparse atrasos futuros, el Contratista deberá, a su propio costo, tomar todas las medidas necesarias, incluyendo el uso de mano de obra y equipo adicional, para cumplir con las fechas y plazos de término contractuales, así como con las demás condiciones de avance.

El Contratista estará obligado a iniciar las acciones encaminadas a recuperar los atrasos, para cumplir con el Programa Contractual, al más breve plazo y en todo caso dentro del plazo establecido en el respectivo Programa De Trabajo revisado y aprobado por la Empresa.

15.5 INFORME MENSUAL DE AVANCE

Una vez aprobados los Programas respectivos por parte de la Empresa, el Contratista deberá cumplir con lo que en ellos se establezca.

El Contratista deberá preparar y someter mensualmente a aprobación por parte de la Empresa, en la oportunidad que fije la Empresa dentro de los primeros diez (10) Días de cada mes, un informe mensual de avance, indicando las fechas reales de inicio o de término de las actividades, las cantidades de trabajo establecidas en el Programa De Trabajo respectivo y las cantidades acumuladas de trabajo realmente ejecutado, ambos expresados en porcentaje de trabajo total ("**Informe Mensual De Avance**"). El Informe Mensual De Avance indicará asimismo, la cantidad y clasificación de su personal, el tipo y cantidad de materiales suministrados, planta y equipos del Contratista usados. El informe también indicará todos aquellos hechos o eventos que pudiesen resultar relevantes en la evaluación del avance de los trabajos y señalará las razones y causas del atraso respectivo, si ese fuere el caso, independientemente de los términos contractuales al respecto.

El Contratista notificará de inmediato a la Empresa la ocurrencia de cualquier dificultad que pudiese interferir con el avance de las Obras o poner en peligro su ejecución.

15.6 PLANIFICACIÓN ADELANTADA

El Contratista deberá informar en forma adelantada a la Empresa, y con la periodicidad que ésta establezca, sobre sus planes para ejecutar cualquier parte de las Obras.

Para cumplir con lo anterior, deberá emitir los informes que ésta demande y asistir a reuniones programadas con la Empresa. Si la Empresa estimase inadecuados los equipamientos o los métodos

usados por el Contratista para asegurar la requerida seguridad, calidad y avance de las Obras, podrá dar aviso al Contratista para que tome las medidas necesarias para corregir tal situación, lo que el Contratista deberá hacer a la brevedad posible, a su propio costo.

El cumplimiento de tales indicaciones o la omisión de la Empresa de emitirlas no relevarán al Contratista de sus obligaciones con relación a la seguridad, la calidad de las Obras y el avance requerido por el Contrato De EPC.

15.7 REUNIONES PERIÓDICAS DE CONTROL DE AVANCE

Se realizarán reuniones semanales y mensuales para analizar el grado de avance de las Obras durante su ejecución en terreno, según ordene la Empresa en el terreno mismo. Estas reuniones tendrán por objeto discutir y revisar detalladamente el avance actualizado de fabricación, construcción y Montaje E Instalación con relación al Programa Contractual y recibir del Contratista su planificación adelantada.

Con el objeto de permitir a la Empresa su adecuada revisión durante las reuniones de avance de las Obras, el Contratista proporcionará, con una anticipación mínima de dos (2) Días antes de cada reunión, un detalle de los ítems de trabajo específicos que se han realizado durante el período anterior, junto con una comparación con lo programado.

Si cualquier obra o trabajo o parte de ellos se encontrase atrasado respecto al Programa previsto, el Contratista deberá explicar claramente las causas de ello, como también plantear propuestas para recuperar el atraso.

Para tales reuniones de avance, el Contratista deberá designar al menos una persona de su organización que, conociendo los Programas acordados y vigentes de conformidad con el Contrato De EPC y su estado de cumplimiento, esté autorizada para comprometer al Contratista respecto de los acuerdos logrados durante las reuniones.

Las reuniones podrán tener lugar en las oficinas de la Empresa designadas en el Contrato De EPC, cuando ésta lo considere necesario.

16. SUBCONTRATOS

16.1 SUBCONTRATACIÓN

El Contratista podrá ejecutar parte de las Obras a través de Subcontratistas, para lo cual requerirá la autorización previa y por escrito de la Empresa. Con dicho objeto, el Contratista deberá presentar por

escrito a la Empresa, con al menos treinta (30) Días de antelación a la fecha de requerir la subcontratación respectiva, el nombre, calificación, organización y experiencia del Subcontratista, junto con el alcance y características del Subcontrato, reservándose la Empresa la facultad de aceptarlo o de rechazarlo a su discreción. Este trámite no será necesario en el caso de aquellos Subcontratistas que hayan sido informados en la Oferta Del Contratista.

El Contratista no podrá aducir ni solicitar mayores plazos o pagos por las consecuencias de un eventual rechazo de un Subcontratista por parte de la Empresa.

No habrá relación jurídica alguna entre el Subcontratista y la Empresa.

El Contratista será el responsable único y total de las Obras y la autorización de un Subcontratista por parte de la Empresa en ningún caso liberará al Contratista de sus obligaciones y responsabilidades para con la Empresa bajo o de conformidad con el Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas. Consecuentemente, todo trabajo, obra, diligencia, acción u omisión de un Subcontratista con respecto al Proyecto, a los fines del Contrato De EPC se reputarán como realizada o incurrida por el Contratista en lo que respecta a las obligaciones de este último frente a la Empresa bajo el Contrato De EPC.

Los equipos o partes no fabricadas en los Talleres del Contratista y que forman parte del Proyecto (i) deberán provenir de firmas de primer orden y experiencia reconocida en la materia, (ii) deberán cumplir con las mismas exigencias que el equipo fabricado por el Contratista y (iii) para todos los efectos del Contrato De EPC se considerarán como fabricados y suministrados por él.

Si un Subcontratista ejecutase su trabajo en forma tal que, en opinión fundada de la Empresa, no fuese concordante con los términos y condiciones del Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas, ésta tendrá derecho a rechazar el trabajo del Subcontratista mediante notificación al Contratista; sin perjuicio del derecho de la Empresa de tomar cualquier medida o ejercer cualquier derecho que le acuerde el Contrato De EPC, incluyendo estas Condiciones Generales y las Especificaciones Técnicas con ocasión de esta situación. El Contratista deberá acatar tal notificación en forma inmediata, a su propio costo, una vez recibida dicha notificación de conformidad con el Contrato De EPC. Ninguna medida tomada por la Empresa de acuerdo con esta Sección liberará al Contratista de sus obligaciones, ni lo facultará para reclamar daño alguno ni aumento de plazos o del Precio Del Contrato.

16.2 COOPERACIÓN Y COORDINACIÓN CON OTROS TRABAJADORES Y CONTRATISTAS

La Empresa se reserva el derecho de otorgar otros contratos en el Sitio.

El Contratista deberá dar a tales otros contratistas oportunidad razonable para el ingreso y acopio de sus materiales y para que puedan ejecutar simultáneamente sus trabajos con los propios.

El Contratista deberá cooperar y será responsable de establecer una coordinación efectiva con todos los demás contratistas que estén ejecutando trabajos para la Empresa en el Sitio, en forma tal que su trabajo interfiera lo mínimo posible con las labores de dichos contratistas o trabajadores. Con este objetivo establecerá dicha coordinación e informará a la Empresa de los acuerdos de trabajo alcanzados.

El Contratista no podrá reclamar modificaciones de plazo o incrementos en el Precio Del Contrato por efecto de tal coordinación y adaptación de sus Programas De Trabajo.

El Contratista deberá reparar a la brevedad y a su propio costo, cualquier perjuicio o daño causado por su culpa o negligencia que afecte a otros contratistas o a personal de la Empresa.

17. SEGUROS

17.1 CONDICIONES GENERALES

El Contratista deberá contratar los seguros que se indican en estas Condiciones Generales, en las condiciones y por los plazos de vigencia establecidos en esta Sección 17.

Todas las pólizas contratadas por el Contratista o Subcontratistas no podrán ser cancelables excepto por terminación del Contrato De EPC, y contendrán una cláusula que señale:

> ***"El asegurador no podrá cancelar y/o modificar las condiciones de póliza sin previo aviso a [nombre de la Empresa]. El aviso de cualquier solicitud de cancelación y/o modificación de las condiciones de póliza, deberá ser notificado fehacientemente a [nombre de la Empresa] con sesenta (60) días de anticipación al momento en que pretenda hacerla efectiva".***

Si el Contratista dejase de contratar o de mantener en vigencia los seguros de su responsabilidad, la Empresa, sin perjuicio de cualquier otro derecho o recurso que pudiere ejercer, tendrá la facultad de contratar, mantener en vigencia o recontratar dichos seguros según corresponda, pagando las primas

necesarias. En tal caso, la Empresa podrá deducir en cualquier momento las sumas desembolsadas por estos conceptos de cualquier pago que deba hacer al Contratista o imputarlo a las garantías del Contrato De EPC.

Los seguros requeridos en estas Condiciones Generales que sean contratados por el Contratista y sus Subcontratistas deberán contar con la aprobación previa y por escrito de la Empresa, antes del inicio de las Obras.

Será responsabilidad del Contratista, durante toda la vigencia del Contrato De EPC, todo accidente que cause daños materiales o lesiones corporales o muerte, ya sea a sus trabajadores o a terceros, y que sea consecuencia de la ejecución del Contrato De EPC, por acciones u omisiones de su personal o de sus Subcontratistas o proveedores.

Sin perjuicio de la póliza de todo riesgo de construcción y montaje y de responsabilidad civil por daños a terceros, que se detalla más adelante, en caso de cualquier reclamo de terceros contra la Empresa, por asuntos de responsabilidad del Contratista, en conformidad con los términos del Contrato De EPC, ésta notificará de tal hecho al Contratista y éste deberá, a su propio costo, efectuar las gestiones ante el asegurador u otros para resolver sobre tales y respecto a cualquier otro litigio que surja de ellos, liberando a la Empresa de toda responsabilidad a este respecto. El Contratista mantendrá libre e indemne e indemnizará a la Empresa en relación a todo reclamo, demanda, acciones legales, daños, costos, cargos y cualquier gasto vinculadorelacionado, directa o indirectamente, con lo antes expuesto.

A requerimiento de la Empresa, el Contratista estará obligado a acreditar la contratación y pago de las primas de todos los seguros requeridos por estas Condiciones Generales.

El Contratista podrá requerir la contratación de los seguros que se detallan en estas Condiciones Generales a cada Subcontratista que contrate o bien los incluirá en sus pólizas como asegurados adicionales.

Todos y cada uno de los seguros mencionados más adelante deberán contener una cláusula que los sujeten a la jurisdicción de los tribunales competentes de la República Dominicana. Esta sección 17, relativa a seguros, será revisada con un asegurador local aceptable por las Partes.

17.2 SEGUROS A CONTRATAR POR EL CONTRATISTA

Sin perjuicio de los demás seguros que el Contratista estime pertinente para cautelar sus intereses, con treinta (30) Días de anticipación al inicio de las Obras, y como una condición para el inicio de las mismas,

tal como se indica en la Sección 4.2 y Anexo D de estas Condiciones Generales, el Contratista deberá contratar en forma exclusiva a su propio costo y de acuerdo con los requisitos de los documentos del contrato, y mantener vigente durante toda la duración de las Obras, como mínimo, los seguros que se señalan a continuación, y su costo se considerará incluido en el Precio Del Contrato.

17.2.1 Seguro de Accidentes del Trabajo: Este seguro ha de cubrir la totalidad de los empleados del Contratista y Subcontratistas, conforme a la Legislación Dominicana aplicable.

17.2.2 Seguro de Responsabilidad Civil de Vehículos: Este seguro será, por el límite mínimo que se establece en el Anexo G de estas Condiciones Generales, por automóvil o para todos aquellos vehículos livianos propios, arrendados, en arriendo con promesa de venta ("leasing") y con matrícula para transitar en caminos públicos, que tengan directa relación con la ejecución de las Obras. Deberán figurar los Subcontratistas y la Empresa como asegurados adicionales.

17.2.3 Seguro de Equipo Móvil del Contratista: Este seguro cubrirá todos aquellos equipos móviles o semi-móviles o pesados propios, arrendados o en "leasing", que el Contratista utilice con motivo de las Obras, amparando los daños físicos ocurridos a dichos equipos y con el límite que se establece en el Anexo G de estas Condiciones Generales por daños a terceros, incluyendo pero no limitando como tales, los bienes de la Empresa y de otros. Deberán figurar sus Subcontratistas y la Empresa como asegurados adicionales.

17.2.4 Seguro de Todo Riesgo de Construcción y Montaje y de Responsabilidad Civil: Este seguro cubrirá las pérdidas o daños causados por o a consecuencia de incendio, explosión, fenómenos de la naturaleza, huelga, actos terroristas, sabotaje, pruebas en frío y en caliente, Puesta En Servicio de cada una de las Unidades e Instalaciones Comunes Relacionadas correspondientes y hasta el inicio de la marcha comercial de cada Unidad e Instalaciones Comunes Relacionadas correspondientes, errores de diseño, material y mano de obra defectuosa y demás riesgos propios de un seguro de todo riesgo de construcción y montaje. El límite de la póliza de seguro será el monto total del Contrato De EPC y cubrirá todos los bienes del Contrato De EPC, es decir, obras civiles, materiales, equipos, maquinarias, gastos de administración, imprevistos y otros que formen parte de las Obras, así como campamentos e instalaciones provisionales del Contratista y de la Empresa.

El seguro cubrirá el transporte terrestre del suministro nacional y almacenaje fuera del Sitio.

El seguro cubrirá las extensiones, tendrá límites que se establecen en el Anexo G de estas

Condiciones Generales y será a primer riesgo.

La cobertura entrará en vigencia a más tardar con la instalación temporales de trabajo u obras preliminares y expirará cuando sea emitido el Certificado De Recepción Provisional Total de la última Unidad y de sus Instalaciones Comunes Relacionadas. Se incluirá, además, cobertura de tiempo mínimo de amplio mantenimiento *(extended maintenance)* a contar de la fecha de emisión del referido Certificado De Recepción Provisional Total, según se establece en el Anexo G de estas Condiciones Generales.

El seguro incluirá cobertura de Responsabilidad Civil por daños a terceras personas y/o su propiedad, como consecuencia de accidentes que ocurran durante la ejecución de las Obras y deberá tener el límite por ocurrencia que se establece en el Anexo G de estas Condiciones Generales.

El seguro incluirá la cláusula de responsabilidad civil cruzada para la Empresa, para el Contratista y para los Subcontratistas y amparará los daños a bienes y/o lesiones corporales causados por ellos en el Sitio y amparará, además, las responsabilidades civiles causadas por equipo móvil dentro del Sitio.

El seguro de Todo Riesgo de Construcción y Montaje considerará como asegurado principal al Contratista y, en forma adicional, a la Empresa y Subcontratistas, a proveedores, ingenieros, técnicos y demás profesionales, como asimismo a bancos, instituciones financieras y todas aquellas partes involucradas en la realización o financiación de las Obras, por sus respectivos derechos e intereses, incluyendo asimismo una cláusula de renuncia de los derechos de subrogación contra los mismos.

Las exclusiones del seguro serán las estándares en las pólizas de construcción y montaje.

El seguro incluirá una cobertura por pérdidas de beneficio de la Empresa *("Advance Loss Of Profit" (ALOP))* motivadas por un atraso en la Puesta En Servicio del Proyecto debido a un siniestro ocurrido en el Proyecto durante su construcción, Montaje E Instalación o pruebas, y sus deducibles no serán mayores de treinta (30) Días. Estos deducibles serán de cargo del Contratista. La cobertura de este seguro será por el monto que se establece en el Anexo G de estas Condiciones Generales.

17.2.5 Seguro de Transporte Marítimo/Aéreo/Terrestre de Importación: El Contratista contratará un seguro en modalidad Todo Riesgo Cláusula A que ampare los riesgos de transporte marítimo y/o

aéreo y/o terrestre y/o fluvial / carga / descarga / transbordos / almacenamiento, guerra y huelga sobre suministros, maquinaria, piezas, partes, equipos, repuestos y otros elementos importados.

El seguro considerará como asegurado principal al Contratista y como asegurados adicionales a la Empresa y Subcontratistas.

Los deducibles de esta póliza serán de cargo y costo del Contratista y no serán superiores al monto que se establece en el Anexo G de estas Condiciones Generales.

El monto asegurado por cada embarque será equivalente a su valor CIF.

La cobertura, que incluirá una cláusula 50/50 con aseguradores del riesgo de construcción y montaje, será de almacén a almacén y comenzará ex-fábrica en el país de origen y concluirá cuando los bienes sean depositados en el Sitio, amparándose transporte terrestre, transbordos y estadía en almacén de aduana, u otras, y sesenta (60) Días de desembalaje diferido.

El límite de indemnización de la póliza deberá corresponder al monto máximo esperado en un sólo embarque/ubicación.

El Contratista deberá permitir y coordinar las inspecciones de los representantes de los aseguradores, de las partidas críticas del Proyecto, a su carga y descarga en los puntos de origen y destino respectivamente, y cumplir estrictamente con las recomendaciones de seguridad impartidas por éstos.

El seguro incluirá una cobertura por pérdidas de beneficio de la Empresa *("Advance Loss Of Profit" (ALOP))* motivadas por un atraso en la Puesta En Servicio de cada Unidad e Instalaciones Comunes Relacionadas correspondientes debido a un siniestro ocurrido durante el transporte. El deducible de esta cobertura no será superior a treinta (30) Días y será de cargo del Contratista. La cobertura por ALOP de este seguro será por el monto que se establece en el Anexo G de estas Condiciones Generales.

18. PERSONAL DEL CONTRATISTA

18.1 OBLIGACIONES Y RESPONSABILIDADES GENERALES DEL CONTRATISTA

Será de exclusiva incumbencia, gasto y costo del Contratista toda responsabilidad laboral, previsional, civil o penal y de seguridad social, respecto de su personal y el de sus Subcontratistas y proveedores, por todo y cualquier accidente de trabajo y todo riesgo o daño que pudiere producirse con motivo u ocasión

del Contrato De EPC, materia respecto de la cual el Contratista deberá tomar y mantener todas las medidas de seguridad y resguardo que la naturaleza y circunstancia que las Obras requieren. Del mismo modo, el Contratista será único y absoluto responsable ante la Empresa por toda obligación de orden legal, contractual o extracontractual que se relacione con los aspectos antes indicados.

Para todos los efectos legales y contractuales, el Contratista será exclusivo empleador del personal que destine directa o indirectamente al cumplimiento de las obligaciones que le impondrá el Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas.

La Empresa no tendrá vínculo laboral ni jurídico alguno con el personal del Contratista o sus Subcontratistas y/o proveedores, razón por la cual no le corresponderá injerencia en esta materia. El Contratista exonera y libera expresa y totalmente a la Empresa respecto a terceros, de toda reclamación y responsabilidad penal, civil, laboral, de seguridad social, patronal, fiscal o de cualquier naturaleza que pudiese surgir con motivo de la ejecución del Contrato De EPC.directa o indirecta que pudiese surgir con motivo de la ejecución del Contrato De EPC; debiendo mantener a la Empresa, libre e indemne frente a cualquier reclamo, demanda, acción, investigación, condenación u otros cargos de cualquier naturaleza por ese concepto; y resarcir a la Empresa, al primer requerimiento, todos los gastos y montos, por penalidades, condenaciones, multas, etc., que le hayan sido impuestas a la Empresa con ocasión de cualesquiera reclamaciones o procesos, directa o indirectamente relacionados con el mismo; sin perjuicio del derecho de la Empresa de resarcirse los daños y perjuicios que dicha situación le causare y/o ejercer cualesquiera acciones o derechos que le acuerde el Contrato De EPC o la Legislación Dominicana en estos casos.

El Contratista será totalmente responsable de dar las facilidades para alimentación del personal propio y de sus Subcontratistas y proveedores.

18.2 RELACIONES DE TRABAJO

El Contratista será directamente responsable de todo conflicto que se produzca entre él y los trabajadores, obreros y/o empleados a su cargo, como asimismo de los conflictos que se presenten con los trabajadores, obreros y/o empleados de sus Subcontratistas y proveedores. La Empresa no será responsable, de manera alguna, ni intervendrá en ningún conflicto de esta naturaleza, en atención a que la Empresa no tendrá vínculo laboral ni jurídico alguno con aquellos trabajadores, obreros y/o empleados, tal como se indicara anteriormente.

18.3 NORMAS DE USO LOCAL

a) Restricciones de Circulación: El Contratista y su personal tendrá libre circulación por sus obras y campamentos y los lugares de acceso a ellos. El Contratista y su personal tendrán acceso condicionado y sólo por razones de trabajo, al área de:

i) Oficinas de la Empresa en el Sitio; y

ii) Obras ejecutadas por otros contratistas.

Habrá total prohibición de circulación en otras áreas no contempladas en el párrafo anterior o que no hayan sido expresamente autorizadas por la Empresa de conformidad con el Contrato De EPC.

b) Identificación: El Contratista deberá establecer un sistema de identificación sobre la base de tarjeta individual y cédula de identidad y electoral o pasaporte. Esta identificación será imprescindible para ingresar al Sitio y su presentación podrá ser exigida dentro del mismo en cualquier oportunidad. Adicionalmente, el Contratista propondrá un distintivo visible para uso de su personal, el que deberá ser autorizado por la Empresa.

c) Visitas a las Obras: Toda visita al Sitio de personas que no formen parte del personal permanente de las Obras, deberá contar con la previa autorización del Contratista y/o de la Unidad Ejecutora Del Proyecto.

d) Tránsito: La circulación de vehículos del Contratista, expresamente autorizados para utilizar los caminos interiores, deberá ceñirse a las disposiciones de la Legislación Dominicana aplicable, además, a las limitaciones adicionales que expresamente establezca la Empresa.

e) Puertas de Control: El acceso de vehículos o personal al Sitio estará reglamentado y el personal del Contratista y de sus Subcontratistas y proveedores deberá ceñirse a las instrucciones expresas sobre esta materia.

f) Comportamiento Interno: El Contratista y su personal y el personal de los Subcontratistas y proveedores del Contratista deberán respetar, dentro del Sitio, las disposiciones generales de orden dispuestas para todo el país. El personal del Contratista y de los Subcontratistas y proveedores del Contratista deberán observar buena conducta y

abstenerse de cualquier acción reñida con la moral y las buenas costumbres dentro del Sitio. El Contratista será responsable ante la Empresa, y ante terceros, del comportamiento de dicho personal, tanto en las faenas como en el Sitio, velando por la correcta conducta y comportamiento del mismo durante toda la vigencia del Contrato De EPC. Por lo anterior, el Contratista adquirirá solidariamente las responsabilidades correspondientes, liberando a la Empresa de toda clase de demandas, pagos e indemnizaciones, cualquiera sea su naturaleza y monto. El Contratista y los Subcontratistas y proveedores del Contratista deberán dar estricto cumplimiento a las disposiciones especiales de orden interno, tales como áreas de restricción, condiciones de ingreso al Sitio, normas de seguridad y otras que establezca la Empresa.

g) Sanciones por Incumplimiento de Normas de Uso Local: El Contratista, a requerimiento de la Empresa, deberá poner término a la participación en las Obras, independientemente de la acción de la justicia ordinaria que correspondiere y sin perjuicio de las penalidades e indemnizaciones a las que se pudiere hacer acreedor de conformidad con el Contrato De EPC, de cualquier trabajador del Contratista o de los Subcontratistas y/o proveedores del Contratista que incumpliere cualquiera de las disposiciones de la presente Sección. Cualquier daño que se produzca a las Obras o las instalaciones existentes por el no cumplimiento de lo estipulado en esta Sección será de la exclusiva responsabilidad del Contratista. El Contratista deberá reparar e indemnizar dichos daños, a su cargo y costa, dentro del plazo que establezca la Empresa.

18.4 DIRECCIÓN Y SUPERVISIÓN DE LAS OBRAS

18.4.1 Representante del Contratista en Terreno

El Contratista deberá asignar en el Sitio un representante autorizado que deberá poseer un conocimiento adecuado del idioma español, con el objeto de ser capaz de entregar y recibir instrucciones sin dificultad y comunicarse adecuada y fluidamente con los representantes de la Empresa.

Dicho representante deberá permanecer en el Sitio desde el inicio de las Obras hasta el término de las mismas de conformidad con el Contrato De EPC.

La calificación profesional y experiencia mínima que deberá tener dicho representante se precisará en el Contrato De EPC.

18.4.2 Personal de Supervisión de los Fabricantes

La supervisión técnica de los trabajos de instalación de los equipos principales deberá estar bajo la dirección inmediata de personal delegado de los fabricantes respectivos. La principal función de este personal será la completa y responsable supervisión técnica en concordancia con las especificaciones y normas técnicas de los fabricantes del equipamiento respectivo.

Sin perjuicio de lo anterior, el Contratista deberá proporcionar y mantener en el Sitio su propio personal de supervisión e inspección que deberá coordinarse oportunamente con el personal del fabricante respectivo en sus labores.

Antes de enviar cualquier persona delegada al Sitio, el Contratista deberá someter para la aprobación de la Empresa, con treinta (30) Días de anticipación a la partida programada, la siguiente información relacionada con dicho personal:

a) Curriculum vitae;

b) Listado de montajes o puestas en servicio en las cuales haya participado y las responsabilidades y deberes que le fueron asignadas; y

c) Indicación de los equipos que quedarán bajo su responsabilidad.

Si la Empresa no aprueba un candidato, entonces el Contratista deberá presentar un candidato alternativo en el plazo más breve posible. El Contratista no podrá pretender modificaciones de plazo o aumentos en el Precio Del Contrato por los retrasos que tal circunstancia le pudiere representar.

18.4.3 Personal del Contratista en Terreno

El Contratista proveerá y empleará en el Sitio:

a) Personal competente, diestro y experimentado en sus respectivas especialidades y capataces y jefes de cuadrilla que puedan ayudar efectivamente al progreso de las Obras; y

b) Mano de obra especializada y semi-especializada necesaria para la ejecución correcta y oportuna de las Obras, incluyendo los necesarios ayudantes no especificados.

El Contrato De EPC podrá establecer la calificación y cantidad de personal de supervisión mínima que deberá mantener el Contratista en el Sitio.

La Empresa podrá calificar a su juicio la idoneidad del referido personal del Contratista.

18.4.4 Información Sobre Recursos Humanos

A requerimiento de la Empresa, el Contratista deberá proporcionarle, en cualquier momento e instancia del Contrato De EPC, toda información pertinente a la identificación, calificación, cargo ocupado y demás antecedentes que aquélla le solicite referente del personal dependiente del Contratista, Subcontratistas y proveedores empleados en la ejecución de las Obras, para lo cual éste deberá mantener actualizadas las nóminas y fichas correspondientes.

18.4.5 Cambios del Personal del Contratista

Si durante el desarrollo de los trabajos se presentaran circunstancias imprevistas que obliguen al cambio del personal contratado, el Contratista estará obligado a efectuar los reemplazos pertinentes, con personal de igual o mejor categoría técnico-profesional que aquel que es objeto de reemplazo.

A requerimiento de la Empresa, el Contratista deberá proceder al retiro inmediato de las Obras de cualquier persona empleada por él, por sus Subcontratistas o proveedores y que trabaje en su ejecución, incluyendo, sin limitación, el representante en terreno del Contratista y el personal de supervisión del fabricante, cuando en opinión debidamente motivada de la Empresa dicha persona se conduzca en forma inconveniente o demuestre incompetencia o negligencia en el correcto desempeño de sus obligaciones. Las personas así removidas deberán reemplazarse a la brevedad por un substituto competente.

El Contratista proporcionará un reemplazante adecuado, a su propio costo, y no tendrá derecho a mayores plazos o aumentos en el Precio Del Contrato debido a tales cambios de personal.

Las personas retiradas de las Obras a requerimiento de la Empresa no podrán emplearse nuevamente en ninguna ocupación relacionada con las Obras, salvo autorización previa y por escrito de la Empresa.

18.4.6 Personal Empleado por la Empresa

El Contratista no podrá emplear u ocupar personal contratado previamente por la Empresa ni tampoco tratará de reclutar a dicho personal. En caso de hacerlo, la Empresa se reserva el derecho de rechazar el ingreso al Sitio de dicho personal.

18.4.7 Obligaciones Laborales y Previsionales

Será de cargo del Contratista el pago y el estricto cumplimiento de las leyes laborales y sociales aplicables conforme la Legislación Dominicana, que se relacionen con el desempeño de sus trabajadores en la ejecución de las Obras.

Será obligación del Contratista pagar íntegra y oportunamente, en la forma convenida, las remuneraciones pactadas con sus trabajadores.

La Empresa no contraerá obligación alguna por concepto de remuneraciones o cotizaciones previsionales u otras obligaciones laborales o previsionales, cualquiera fuere su naturaleza, respecto del personal que presta servicios para el Contratista, las que serán de responsabilidad exclusiva de este último.

Tal como se indicara con anterioridad, para todos los efectos legales y contractuales, no existirá vinculación jurídica alguna entre la Empresa y el personal del Contratista y de los Subcontratistas y proveedores del Contratista.

El Contratista, en relación con el personal técnico extranjero que pudiere destinar a la ejecución de las Obras, deberá dar cumplimiento con las obligaciones laborales y previsionales de general aplicación para los trabajadores dominicanos de conformidad con la Legislación Dominicana aplicable.

El Contratista será el único responsable de todas y cada una de las obligaciones que le corresponden como único patrón de los empleados que pudiere utilizar en la ejecución del Contrato De EPC, incluyendo leyes de trabajo, seguro social, indemnizaciones por accidentes de trabajo y cualquier otra similar; en general, frente a cualquier otra ley, decreto, norma o resolución de esta naturaleza. El Contratista exonera y libera expresa y totalmente a la Empresa, de toda reclamación, acción, demanda, investigación, compensación, penalidad o multa, surgida o que se derive, directa o indirectamente, de la relación laboral del Contratista con su personal y el cumplimiento por parte del Contratista de las regulaciones que le fueran aplicables a dicha relación; debiendo mantener a la Empresa, libre e indemne frente a cualquier reclamo, demanda, acción, investigación, condenación u otros cargos de cualquier naturaleza por ese concepto; y resarcir a la Empresa, al primer requerimiento, todos los gastos y montos, por penalidades, condenaciones, multas, etc., que le hayan sido impuestas a la Empresa con ocasión de cualesquiera reclamaciones o procesos, directa o indirectamente relacionados con el mismo; sin perjuicio del derecho de la Empresa de resarcirse los daños y perjuicios que dicha situación le causare y/o ejercer cualesquiera acciones o derechos que le acuerde el Contrato De EPC o la Legislación Dominicana en estos casos.

18.4.8 Responsabilidad Subsidiaria

Sin perjuicio de lo establecido en el acápite anterior, y con el objeto de precaver la eventual responsabilidad subsidiaria de la Empresa, ésta tendrá las siguientes facultades:

a) Verificar mensualmente el cumplimiento de las obligaciones laborales y previsionales que afecten al Contratista respecto de sus dependientes. Para estos efectos, la Empresa tendrá derecho a revisar y el Contratista obligación de exhibir, entre otros, los contratos de trabajo, documentos que acrediten el pago de remuneraciones, planillas de declaración y pago de imposiciones previsionales y registro de asistencia y control de jornada de trabajo;

b) Retener, total o parcialmente, todo pago o anticipo que deba efectuar la Empresa según el Contrato De EPC, cuando el Contratista no hubiese dado cumplimiento a sus obligaciones laborales o previsionales o aquélla señalada en la letra precedente. La retención operará sólo mientras el Contratista se mantenga en estado de incumplimiento, sin perjuicio de la facultad contenida en la letra siguiente, y las sumas retenidas no devengarán reajustes ni intereses. Con todo, será obligación de la Empresa denunciar este estado de incumplimiento a las Autoridades competentes, dando cuenta de las retenciones efectuadas para los efectos pertinentes; y

c) Pagar directamente y en representación del Contratista aquéllos tributos y obligaciones laborales adeudados a las instituciones o reparticiones públicas y privadas que correspondan, si el incumplimiento del Contratista no hubiere sido superado por éste dentro del plazo de treinta (30) Días contados desde la fecha de la respectiva retención.

19. SEGURIDAD Y PREVENCIÓN DE RIESGOS

19.1 NORMAS DE SEGURIDAD

El Contratista deberá cumplir con toda la Legislación Dominicana aplicable sobre seguridad industrial e higiene, proporcionando protectores auditivos, cascos, zapatos, cinturones, guantes y demás elementos de seguridad, según corresponda a la naturaleza de la tarea respectiva. Deberá, además, dar cumplimiento a la Legislación Dominicana aplicable relativa a normas sobre accidentes de trabajo, enfermedades profesionales y en lo referente a prevención de riesgos.

Todo el personal del Contratista, de sus Subcontratistas y proveedores que visite o permanezca en recintos de propiedad de la Empresa deberá cumplir con las normas y/o reglamentos que la Empresa tenga establecidos. El Contratista será responsable por el cumplimiento de lo antedicho.

Si así lo ordenare la Empresa, el Contratista estará obligado a detener o suspender las Obras, o parte de ellas, por causas justificadas que tengan relación con la seguridad del personal, sin que ello le dé derecho al Contratista para pretender aumentos de plazos o en el Precio Del Contrato.

Los vehículos, equipos e instalaciones del Contratista en el Sitio deben cumplir, siempre y en todo caso, con la Legislación Dominicana aplicable en materia de seguridad, higiene y tránsito.

El Contratista tendrá la obligación de mantener en el Sitio la presencia de un profesional experto en prevención de riesgos y accidentes de trabajo.

El Contratista deberá llevar registros relativos a la salud, seguridad y accidentes y dichos registros deberán estar a disposición de la Empresa conforme ésta lo solicite. Deberán enviarse datos detallados sobre cualquier accidente a la Empresa lo más pronto posible como sea razonable luego de ocurrido el accidente.

Como parte de su obligación de acatar todas las normas y disposiciones de seguridad vigentes en el Sitio (incluyendo las normas y disposiciones de seguridad emitidas por la Empresa), el Contratista deberá poner a disposición de su personal y del personal de sus Subcontratistas y proveedores todas esas normas y disposiciones y darles instrucciones expresas y claras de que las acaten.

Al momento de preparar todos los Subcontratos y órdenes de adquisición, el Contratista deberá adjuntar un aviso de que todas las normas y requerimientos de seguridad aplicables para el Sitio y las Obras deberán ser cumplidas, y deberá dar aviso de que los términos de todas las normas y requerimientos de seguridad están disponibles previa solicitud, y deberá dar aviso a la Empresa de cualquier violación (en caso de estar al tanto de ella) de tales normas y disposiciones y recomendar acciones correctivas al respecto.

19.2 INSTALACIONES PARA PRIMEROS AUXILIOS

La Empresa no proporcionará atención médica al personal del Contratista o de sus Subcontratistas y proveedores.

El Contratista deberá instalar y mantener a su propio costo, una o más postas de auxilio enteramente equipadas y contratará personal paramédico competente para que atienda a los enfermos o accidentados en el Sitio. En casos de mayor gravedad proveerá transporte de estos pacientes desde el Sitio a un hospital.

19.3 EQUIPO CONTRA INCENDIO

El Contratista deberá proveer y mantener en el Sitio y hasta la emisión del Certificado De Recepción Provisional Total de la última Unidad y de sus Instalaciones Comunes Relacionadas, sin cargo, con aprobación de la Empresa y la autoridad respectiva del Cuerpo de Bomberos, equipos portátiles adecuados contra incendio en la cantidad y calidad que éstos requieran.

19.4 SEGURIDAD DE LAS OBRAS

El Contratista será absolutamente responsable por la seguridad de las Obras, de su personal y de otras personas, incluyendo Subcontratistas y proveedores, y bienes en relación con la ejecución de las Obras. Por lo tanto, deberá prevenir los riesgos y actuar en consecuencia. Para este efecto deberá, entre otros, proveer y mantener a su propio costo, cercos, barandas, alumbrado, letreros de señalización y prevención, señaleros, vigilantes, rondines y porteros donde sea necesario, donde lo requiera la Legislación Dominicana aplicable, las Autoridades competentes o la Empresa.

20. SUPERVISIÓN GENERAL DEL CONTRATO

20.1 GENERALIDADES

Las instrucciones al Contratista serán impartidas por la Empresa según las vías de comunicación establecidas en la Sección 6 de estas Condiciones Generales.

El Contratista tiene la obligación de responder inmediatamente, o dentro del plazo estipulado, a todas las instrucciones y órdenes de la Empresa, con el fin de evitar cualquier atraso en las Obras.

Las instrucciones dadas por la Empresa no relevarán de ningún modo al Contratista de su responsabilidad referente a la calidad y adecuada ejecución de las Obras.

20.2 COORDINACIÓN, SUPERVISIÓN Y FISCALIZACIÓN DEL CONTRATO DE EPC

Para efectos de realizar la coordinación, supervisión y fiscalización del Contrato De EPC, la Empresa (i) creará una estructura orgánica especializada ("**Unidad Ejecutora Del Proyecto**"), como una dependencia

directa de la Vicepresidencia Ejecutiva de la Corporación. y (ii) contratará al Ingeniero De La Empresa, quien dependerá de la Unidad Ejecutora Del Proyecto.

Corresponderá a la Unidad Ejecutora Del Proyecto, directamente o a través del Ingeniero De La Empresa, las siguientes funciones y atribuciones, entre otras:

a) La interpretación del Contrato De EPC en todos sus aspectos;

b) La revisión y aprobación de la ingeniería y el diseño del Contratista;

c) Comprobar que los suministros hechos por el Contratista correspondan a aquéllos indicados en el Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales, las Especificaciones Técnicas y la Oferta Del Contratista, y que su calidad responda a los niveles convenidos en dichos documentos;

d) Requerir del Contratista los antecedentes que den testimonio acerca del cumplimiento de las obligaciones laborales, previsionales, fiscales, tributarias y administrativas en relación con la ejecución de las Obras;

e) Supervisar y fiscalizar técnicamente, y en todos sus aspectos, el avance y la calidad del suministro y de las Obras en general, haciendo cumplir fielmente las especificaciones del Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas;

f) Revisar los estados de avance de las Obras las Solicitudes De Pago y la documentación anexa, verificando las cubicaciones y que se dé cumplimiento a lo estipulado en el Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas;

g) Requerir del Contratista, en cualquier momento, la información que estime necesaria a fin de mantener informada a la Empresa del avance de las Obras y del cumplimiento de sus obligaciones;

h) Efectuar la inspección de la fabricación y de las pruebas de los equipos principales (caldera y turbo-generador) que componen el Proyecto;

i) Efectuar el control, inspección y supervisión de los trabajos de construcción, Montaje E Implementación de todos los componentes del Proyecto, e impartir las instrucciones del caso que resulten de su inspección;

j) Controlar el cumplimiento de Programas, disposiciones administrativas y reglamentos de seguridad;

k) Efectuar el control, inspección y supervisión de la Puesta En Servicio de cada una de las Unidades y de sus Instalaciones Comunes Relacionadas;

l) Efectuar la Recepción Final de cada una de las Unidades y de sus Instalaciones Comunes Relacionadas; y

m) Efectuar el control, inspección y supervisión de las actividades de reparaciones y operación durante cada uno de los Períodos De Garantía-Unidad E Instalaciones Comunes Relacionadas.

La Empresa designará una firma de ingeniería de nivel internacional para efectuar la revisión de la ingeniería y diseño del Proyecto, y para asesorar a la Unidad Ejecutora Del Proyecto en todos los asuntos de carácter técnico relacionados con el mismo ("**Ingeniero De La Empresa**"). La Unidad Ejecutora Del Proyecto informará oportunamente por escrito al Contratista la identidad del Ingeniero De La Empresa.

La Unidad Ejecutora Del Proyecto, con la asistencia del Ingeniero De La Empresa, supervisará la ejecución del Contrato De EPC, tanto en (i) las oficinas del Contratista para la revisión y discusión de la ingeniería y el diseño del Proyecto, (ii) los Talleres del fabricante y (iii) en el sitio de la construcción y Montaje E Instalación.

El Contratista deberá darle a los integrantes de la Unidad Ejecutora Del Proyecto y del Ingeniero De La Empresa, todas las facilidades razonables que sean necesarias para el desempeño de sus funciones.

21. INSPECCIONES Y PRUEBAS

21.1 GENERAL

Las presentes Condiciones Generales relativas a las inspecciones y pruebas de las Obras son complementadas por aquéllas indicadas en las Especificaciones Técnicas.

La responsabilidad del control de calidad del diseño, ingeniería, fabricación, suministro, construcción, Montaje E Instalación, pruebas, Puesta En Servicio y demás servicios materia del Contrato De EPC incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas, recae íntegramente en el Contratista, quien deberá efectuar todos los controles, ensayos y pruebas establecidos o que se infieran como necesarios en el Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas.

A menos que haya otra indicación al respecto, todas las inspecciones, exámenes y ensayos se basarán, como regla general, en las órdenes de diseño propias del Contratista, en sus instrucciones a laboratorios, en las órdenes de Taller y en otros documentos que especifican ensayos o inspecciones.

Sin perjuicio de lo anterior, la Empresa tendrá derecho, en toda oportunidad, antes y durante las etapas de diseño, construcción, manufactura, embarque, Montaje E Instalación, Puesta En Servicio y cada Período De Garantía-Unidad E Instalaciones Comunes Relacionadas, a inspeccionar, examinar y probar, según corresponda, el diseño, materiales, mano de obra, el funcionamiento y rendimiento de todas las Obras y equipos que deberán ser suministrados de acuerdo con el Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales, las Especificaciones Técnicas y la Oferta Del Contratista.

Para tal objeto, la Empresa, a través de la Unidad Ejecutora Del Proyecto, estará facultada para designar o contratar los inspectores que considere adecuados para inspeccionar los materiales y equipos suministrados y trabajos efectuados en ocasión del Contrato De EPC, para lo cual el Contratista deberá suministrarle oportunamente todos los diseños, documentos e información técnica pertinente.

El Contratista deberá suministrar, además, toda la ayuda y asistencia que sea razonablemente requerida por la Empresa o sus inspectores para una correcta inspección y examen de la ingeniería, los equipos y las Obras y de todas las partes integrantes de los mismos. Para las pruebas a efectuar en las instalaciones del Contratista o de cualquier sub-proveedor o en terreno, el Contratista proveerá, a su propio costo, la necesaria asistencia, maquinaria, mano de obra, materiales, electricidad, combustible, almacenes, aparatos, instrumentos, memorias de cálculo, planos generales y planos de fabricación, que se pudiesen necesitar y razonablemente exigir, para realizar o supervisar estas pruebas en forma correcta y eficiente.

En cualquier momento durante el período de fabricación, el personal designado por la Unidad Ejecutora Del Proyecto para inspeccionar dicha fabricación, tendrá derecho a entrar en los edificios, almacenes de materiales, Talleres y otros lugares en que se realiza el diseño y la fabricación del equipo comprendido en el Proyecto, incluyendo los recintos de los Subcontratistas. En este último caso, el Contratista deberá

coordinar y obtener la autorización necesaria para que la Empresa presencie, examine y verifique las pruebas en la misma forma como si dicho equipo se fabricase en la Fábrica del Contratista.

El personal de la Unidad Ejecutora Del Proyecto estará facultado para pedir, y el Contratista obligado a entregar, toda la información relativa a las pruebas y ensayos para (i) asistir a las pruebas y experiencias necesarias para comprobar el cumplimiento de las disposiciones del Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas, (ii) controlar el embalaje y despacho del equipo y (iii) rechazar aquellas partes que no cumplan con lo especificado.

Estas inspecciones, a los procesos de exámenes o prueba de equipos y Obras, por parte de la Empresa no relevarán al Contratista de cualquier responsabilidad y obligación que tenga bajo o de conformidad con el Contrato De EPC y, especialmente, de inspeccionar, examinar o probar por sí mismo los equipos y Obras.

Los ensayos y pruebas necesarias en terreno durante la etapa de construcción y Montaje E Instalación respectiva, serán efectuados por el Contratista de acuerdo con la Legislación Dominicana aplicable y las disposiciones del Contrato De EPC, particularmente, estas Condiciones Generales y las Especificaciones Técnicas, debiendo el Contratista acreditar adecuadamente el cumplimiento de dicha legislación y disposiciones.

Después de la realización satisfactoria del ensayo o prueba correspondiente, en presencia del(de los) representante(s) de la Unidad Ejecutora Del Proyecto, ésta emitirá un certificado de inspección ("**Certificado De Inspección**"). El Certificado De Inspección contendrá básicamente lo siguiente:

a) Descripción o identificación del equipo o parte del equipo en cuestión;

b) Identificación del lugar en que se efectuó la inspección y fecha; y

c) Una formulación normalizada en que se establezca el cumplimiento con los requisitos de inspección del Contrato De EPC, particularmente, estas Condiciones Generales y las Especificaciones Técnicas.

El Contratista deberá analizar y probar todos los materiales y equipos que la Empresa, la Legislación Dominicana aplicable o las disposiciones del Contrato De EPC, particularmente, estas Condiciones Generales y las Especificaciones Técnicas, estipulen o recomienden que se analicen o prueben. La Empresa tendrá derecho a seleccionar las muestras de materiales a ser probados. El Contratista analizará y probará estos materiales y equipos en la forma, momento y lugar establecidos en forma explícita en el

Contrato De EPC, particularmente, estas Condiciones Generales y las Especificaciones Técnicas, o según lo dispuesto por la Empresa de acuerdo con las provisiones generales del Contrato De EPC.

Salvo que la Empresa se desista por escrito o esté planteado de manera diferente en el Contrato De EPC, toda inspección y prueba se deberá hacer en presencia de la Empresa o del inspector debidamente acreditado por ésta.

Sólo se podrán usar, embarcar y montar materiales, equipos y partes del Proyecto previamente aprobados y por los cuales se haya emitido el respectivo Certificado De Inspección.

El representante de la Unidad Ejecutora Del Proyecto, en general, sólo autorizará aquellos despachos de equipo que constituyan embarques parciales acordados o lotes técnicamente aprovechables. Tales lotes comprenderán aquellas partes del equipo cuyo conjunto puede ser instalado o montado, según la programación de las Obras. Esta es una observación general y será aplicable a todos los trabajos y a todo equipo a ser suministrado según el Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas.

El Contratista deberá entregar una proposición completa, por escrito, de cómo se procederá en el caso de aquellas inspecciones o pruebas para las cuales la Legislación Dominicana aplicable o el Contrato De EPC, particularmente, estas Condiciones Generales y las Especificaciones Técnicas, no describan procedimientos, o no indiquen, entre otros, los valores, límites y tolerancias que deben lograrse. Tal proposición deberá abarcar, entre otros aspectos, los siguientes:

a) Alcance de la inspección o prueba, indicando en forma explícita los valores, parámetros, condiciones y estado que se deba registrar, medir y observar;

b) Normas aplicables o relacionadas;

c) Instrumentos y aparatos a usar, junto con el tipo, grado de precisión y marca, cuando son esenciales para los resultados;

d) Disposición de inspecciones o pruebas;

e) Formularios para el registro de los resultados (tablas, gráficos, impresos y similares); y

f) Conjunto completo de valores admisibles, rangos y límites a ser obtenidos en las pruebas.

Estas proposiciones de pruebas deberán ser entregadas a la Empresa, para sus comentarios, a lo menos veinte (20) Días antes de darse la notificación de las inspecciones o pruebas. En principio, la Empresa no asistirá a inspecciones o pruebas, ni aceptará informes al respecto sin que se haya cumplido la condición indicada. Las demoras y costos que ello le represente serán de la exclusiva responsabilidad del Contratista.

La aceptación por parte de la Empresa de cualquier material o producto no liberará al Contratista de su responsabilidad sobre la calidad de éste, así como de las pruebas y ensayos que el Contratista deba realizar a su costo.

21.2 COSTOS DE PRUEBAS ASUMIDOS POR EL CONTRATISTA

Los costos por pruebas, aunque no se encontraren expresamente mencionadas, que sean habituales para el tipo de trabajo involucrado o cuya necesidad puede considerarse comprendida dentro del contexto de las Obras, serán por cuenta y cargo del Contratista y se considerarán incluidos en el Precio Del Contrato, como así también (i) la provisión o uso, tanto en terreno como en Taller, de todas las muestras, maquinarias, instrumentos y accesorios necesarios, (ii) todos los informes y certificados pertinentes a las pruebas y (iii) el correspondiente personal competente para su ejecución.

A menos que se especifique de otra manera en el Contrato De EPC, el pago y gastos en que incurra la Empresa con motivo de su asistencia a las pruebas no serán cubiertos por el Contratista, salvo que todas o algunas de las partes notificadas como listas para prueba o inspección no puedan probarse o inspeccionarse por causas imputables al Contratista, en cuyo caso los gastos diarios y gastos directos de viaje de la Empresa o del inspector, deberán ser reembolsados por el Contratista.

Lo anterior, sin perjuicio del derecho de la Empresa de imponer penalidades al Contratista por atraso en la terminación, de acuerdo con lo previsto en el Contrato De EPC.

21.3 COSTOS DE PRUEBAS NO CONTEMPLADAS

Si la Empresa ordenase repetir alguna prueba o inspección ya efectuada, o realizar pruebas adicionales de una naturaleza especial, no requerida según el Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas, o la Legislación Dominicana aplicable, y que no pudiera asimilarse a las señaladas en la Sección 21.2 anterior, sean éstas realizadas en terreno o en el lugar de fabricación o en un laboratorio independiente, entonces tales costos serán cubiertos por:

a) La Empresa, si el resultado de tales pruebas demuestra que la calidad de los materiales y la ejecución de las Obras correspondientes concuerdan con lo establecido en el Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas, o con las instrucciones de la Empresa; y

b) El Contratista, si los resultados obtenidos muestran que la calidad de los materiales y la ejecución de las Obras correspondientes no concuerdan con lo establecido en el Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas, o con las instrucciones de la Empresa.

El Contratista deberá ejecutar las pruebas e inspecciones adicionales o repetitivas a la sola orden de proceder de la Empresa.

21.4 PROGRAMA DE INSPECCIÓN Y PRUEBAS

21.4.1 Pruebas en Fábrica

El Contratista suministrará, de manera coherente con el Programa Contractual, el cronograma de fechas finales de fabricación, de ensamble en Taller, de montaje y pruebas correspondientes, con al menos sesenta (60) Días de anticipación al inicio de tales actividades en Fábrica. Dentro del plazo de treinta (30) Días a contar de la fecha de recepción por parte de la Empresa del citado cronograma de fechas finales, ésta devolverá al Contratista dicho cronograma autorizando el Programa de inspecciones según se indique en el mismo o solicitando modificaciones, pruebas adicionales, indicando observaciones o comentarios y señalando las pruebas a las que en principio asistirá. Durante el proceso de fabricación, la Empresa se reserva el derecho de informar al Contratista de otras pruebas programadas a las que desee asistir.

Ante el rechazo por parte de la Empresa de un componente probado, el Contratista estará obligado a efectuar las correcciones necesarias y a repetir las pruebas respectivas. Si lo anterior significare eventualmente una reprogramación de los embarques, ello será de la exclusiva responsabilidad del Contratista, sin que éste pueda alegar modificación alguna al Precio Del Contrato o a los plazos contractuales por tal efecto.

21.4.2 Pruebas en Terreno

A más tardar sesenta (60) Días antes de su uso potencial y previo al inicio de las Pruebas Al Término, Pruebas De Aceptación y Pruebas De Confiabilidad respectivas, el Contratista someterá a la Empresa un informe de dichas pruebas, cuyo detalle se acordará con esta última.

Tal información deberá incluir al menos, lo siguiente:

a) Lista de todo el equipo a ser probado y de las pruebas a realizar;

b) Programa de pruebas;

c) Procedimiento de pruebas, junto con un listado de características a medir y/o registrar;

d) Listado de equipos de pruebas o instrumentos necesarios;

e) Listado de personal necesario; y

f) Valores, características y condiciones que deberán lograrse durante las pruebas.

21.5 NOTIFICACIÓN ANTES DE INSPECCIONAR O PROBAR

El Contratista deberá notificar a la Empresa, al menos con cuarenta y cinco (45) Días de anticipación, en el caso de las pruebas o inspecciones en Fábrica y con veinte (20) Días de anticipación, en el caso de pruebas o inspecciones en terreno, la fecha y lugar en los cuales el equipo u obra se encontrarán listos y disponibles para su prueba o inspección.

De no efectuarse tal notificación oportuna a la Empresa, el Contratista, a requerimiento de ésta, estará obligado a repetir a su costo las pruebas y ensayos que hubiere efectuado sin la presencia del inspector de la Empresa.

El Contratista deberá incluir, cuando sea aplicable, junto con su notificación, una descripción de procedimientos y métodos actualizados para el control y pruebas.

La Empresa dará al Contratista, en un plazo prudencial (pero a más tardar tres (3) Días antes de la fecha anunciada de disponibilidad del equipo u obra para sus pruebas) una notificación por escrito en que indique su intención de asistir a las pruebas. El Contratista será responsable por la preparación y disposición del sitio de pruebas, junto con todo el equipo necesario y todas las partes por someter a prueba.

Será obligación de ambas partes tomar las medidas necesarias para que la inspección, cualquiera sea su naturaleza, pueda hacerse en la fecha acordada, con el fin de no ocasionar perjuicios a la otra parte.

21.6 INSPECCIONES O PRUEBAS EN AUSENCIA DE LA EMPRESA O SUS INSPECTORES

Si la Empresa o sus inspectores autorizados desisten o no confirman la notificación anterior hasta tres (3) Días antes de la fecha anunciada de disponibilidad para pruebas, el Contratista podrá proceder en ausencia del inspector de la Empresa. Dicha prueba se realizará en o después de la fecha anunciada de disponibilidad y se supondrá realizada como en presencia del inspector de la Empresa. El Contratista deberá hacer entrega a la Empresa, en un plazo no mayor de diez (10) Días, el resultado de dichas pruebas.

21.7 INFORMES DE INSPECCIÓN Y PRUEBAS

Una vez que cualquier parte de las Obras o equipos del Proyecto ha pasado las pruebas o inspecciones, el Contratista entregará a la Empresa los registros, protocolos y copias de los informes de pruebas o inspección debidamente certificados.

Tales resultados deberán presentarse en forma tal que permitan verificar el cumplimiento con las especificaciones aplicables para materiales, Obras y equipos probados o inspeccionados. El informe deberá incluir ilustraciones y/o fotos necesarias o útiles que la Empresa requiera o solicite. Por lo tanto el formato quedará sujeto a la aprobación de la Empresa. Informes estándar del fabricante podrán aceptarse siempre que concuerden con estas estipulaciones y que estén escritos en idioma español o inglés, sujeto, en este último caso, a la aprobación previa y por escrito de la Empresa de recibir el informe correspondiente en idioma inglés.

Los informes de pruebas indicarán en forma explícita los resultados de las pruebas aceptables, límites a lograr, normas a usar e información similar que permita una interpretación correcta de los resultados.

Los informes de inspección y pruebas, los de aceptación de materiales y equipos subcontratados como, asimismo, los registros, informes y certificados internos que tengan relación con las Obras y equipo, formarán parte de los servicios de ingeniería que deberá suministrar el Contratista.

21.8 FALLA PARCIAL

Si cualquier parte de los materiales, de los equipos fabricados, de la construcción o del Montaje E Instalación no pasare las pruebas y si así lo solicitare la Empresa o lo disponga el Contrato De EPC, el Contratista deberá repetir a su cargo y costo las pruebas de tales partes dentro de un plazo razonable, en

los mismos términos y condiciones previstos originalmente, una vez eliminados o subsanados los inconvenientes.

21.9 ATRASOS EN LAS PRUEBAS E INSPECCIONES CAUSADOS POR EL CONTRATISTA

Si, en opinión motivada de la Empresa, las pruebas o inspecciones se atrasaren indebidamente, ésta podrá requerir al Contratista, por escrito, que realice estas pruebas o inspecciones en el plazo perentorio de diez (10) Días de emitida dicha notificación. El Contratista estará obligado a realizar las pruebas e inspecciones en cualquier Día que éste fije dentro del referido plazo y comunicará dicho Día a la Empresa con tres (3) Días de anticipación.

Si el Contratista no realizare las pruebas o inspecciones en el plazo especificado, la Empresa podrá proceder a realizar tales pruebas e inspecciones en forma directa o a través de terceros por cuenta, riesgo y costo del Contratista.

21.10 EXAMEN DE LAS OBRAS ANTES DE TAPARLAS

El Contratista no podrá tapar, ni ejecutar segundo concreto, ni colocar mortero de nivelación y, en general, no podrá cubrir ninguna Obra sin la aprobación previa y por escrito de la Empresa. El Contratista deberá dar todas las facilidades necesarias para que la Empresa examine cualquier Obra antes que se tape o cubra. El Contratista deberá notificar debidamente, y con no menos de veinticuatro (24) horas de anticipación, la oportunidad en que tal Obra se encontrará lista para su examen y la Empresa deberá, sin excesiva demora, salvo que no lo considere necesario y así se lo haga saber al Contratista, estar disponible para examinar dicha Obra.

21.11 DESTAPE

A requerimiento de la Empresa, el Contratista deberá destapar o desarmar parte de las Obras o equipos o efectuar aberturas en, o a través de los mismos, y deberá instalarlos nuevamente y reparar tales partes a la entera satisfacción de la Empresa. Si cualquiera de tal o tales partes cubiertas o tapadas, de acuerdo con las verificaciones de la Empresa, se encontrase conforme con lo previsto en el Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas, los gastos del destape o desmantelamiento o los de realizar aberturas en o a través de la Obra correspondiente y subsiguiente restablecimiento y respectiva reparación, serán de cargo de la Empresa, en cuyo caso se acordará entre las partes las modificaciones en los plazos contractuales que fuesen pertinentes. En

cualquier otro caso, todos los gastos serán de cargo del Contratista, sin derecho a eventuales aumentos de plazo o del Precio Del Contrato.

21.12 REMOCIÓN DE EQUIPOS Y MATERIALES NO APTOS

La Empresa tendrá la facultad para ordenar por escrito, y el Contratista estará obligado a acatar, durante la fabricación y Montaje E Instalación:

a) El retiro del Sitio, en el plazo que la Empresa especifique, de cualquier material o equipo que, en su opinión motivada, no esté de acuerdo con los términos del Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas;

b) La sustitución de los materiales o equipos impropios o inadecuados reemplazándolos por equipo o materiales adecuados y convenientes;

c) La remoción y correcta re-ejecución (sin tomar en cuenta pruebas anteriores o pagos intermedios) de cualquier Obra que, en opinión motivada de la Empresa, no esté de acuerdo con los términos del Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas; y

d) La remoción del equipo móvil o transportable de montaje que obstaculice o perturbe el trabajo de otros contratistas y que no se esté ocupando temporalmente.

21.13 DEFECTOS Y CORRECCIONES

Los defectos que sean detectados durante o después de las pruebas en las Obras o equipos, deberán ser corregidos por el Contratista a la brevedad y a satisfacción de la Empresa y repetirse, a costo del Contratista, las pruebas que fueren pertinentes.

Si la Empresa detectase daños o deficiencias de los equipos o de las Obras, y por tal motivo fuera necesaria su reposición, ello se hará sin costo para la Empresa y, por tanto, todos los costos que ello signifique, cualquiera fuere su naturaleza, serán de cargo del Contratista.

En caso de que, como resultado de las inspecciones, fueran rechazados equipos o materiales, tanto en Fábrica como en terreno, y esto implicara repetir las pruebas y un atraso en la entrega del Proyecto o en su Montaje E Instalación, este retardo será de exclusiva responsabilidad y cargo del Contratista y, por tanto, éste no tendrá derecho a ningún aumento en los plazos contractuales o en el Precio Del Contrato por tal motivo.

Los equipos, materiales y Obras ejecutadas que no estén de acuerdo con el Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas, la Legislación Dominicana aplicable o las buenas prácticas técnicas, serán rechazados. El rechazo podrá tener lugar en cualquier momento y hasta que expire el Período De Garantía-Unidad E Instalaciones Comunes Relacionadas respectivo.

Los elementos rechazados por el representante de la Empresa en los Talleres respectivos deberán quedar claramente identificados y el Contratista se hará responsable de que no exista posibilidad que puedan ser despachados como parte del Proyecto.

La inspección y aprobación por parte de la Empresa de cualquier material o equipo no libera al Contratista de ninguna de sus responsabilidades contractuales referentes a defectos u otras fallas que se detecten antes de la Recepción Final de la respectiva Unidad y de sus Instalaciones Comunes Relacionadas.

22. VARIACIÓN DE LAS OBLIGACIONES CONTRACTUALES

22.1 ÓRDENES DE VARIACIÓN

En cualquier momento, durante el desarrollo de las Obras, la Unidad Ejecutora Del Proyecto podrá solicitar por escrito al Contratista la ejecución de trabajos o la prestación de servicios adicionales a los establecidos en el Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas, siempre que dichos trabajos o servicios adicionales no impliquen el aumento del Precio Del Contrato, ni la extensión del plazo de ejecución del Contrato. Asimismo, la Unidad Ejecutora Del Proyecto podrá solicitar por escrito al Contratista, la reformulación o modificación de cualquier trabajo individual, contemplado en el diseño de la Obra, siempre y cuando dicha Variación no implique el aumento del Precio Del Contrato, ni la extensión del plazo de ejecución del Contrato.

Cualquier Variación que implique el aumento del Precio Del Contrato o la extensión del plazo de ejecución del Contrato, tendrá que ser sometida para su aprobación ante la Vicepresidencia Ejecutiva de la Corporación.

El Contratista deberá ejecutar tales Variaciones ciñéndose a las instrucciones específicas de la Unidad Ejecutora Del Proyecto y ateniéndose a las normas, procedimientos y demás condiciones estipuladas en el Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas, para trabajos similares.

No se considerarán como Variaciones aquellos trabajos y servicios que resulte necesario ejecutar o prestar como resultado de la ingeniería de detalle que debe realizar el Contratista.

Tampoco se considerarán como Variaciones aquellos trabajos y servicios requeridos para dar cabal cumplimiento a lo establecido en el Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas.

El Contratista no podrá realizar ninguna Variación de sus obligaciones contractuales sin una orden o aceptación previa y por escrito de la Empresa.

Asimismo, se considerará como Variación la eliminación ordenada por la Empresa de ciertos trabajos o servicios incluidos en el Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas.

22.2 EVALUACIÓN DE LAS VARIACIONES

El Contratista deberá presentar, dentro de un plazo no superior a diez (10) Días Hábiles desde el recibo de la orden correspondiente de la Empresa, un informe de Variación que incluirá la descripción y alcance de la Variación respectiva, efectos del cambio en los costos, así como los efectos de dicha Variación sobre los plazos del Contrato De EPC ("**Informe De Variación**").

Durante el período de análisis del Informe De Variación presentado por el Contratista, la Empresa podrá ordenar a éste suspender los trabajos que fuesen afectados por la Variación respectiva hasta la recepción por escrito de la decisión de la Empresa.

Toda Variación será valorizada a los precios y tarifas establecidas en el Contrato De EPC, si éstos son aplicables. Si el Contrato De EPC no incluye valores aplicables a los trabajos o servicios adicionales, ellos se acordarán entre la Empresa y el Contratista. En caso de desacuerdo, la Unidad Ejecutora Del Proyecto quedará facultada para (i) valorizar y pagar la Variación respectiva a través del sistema de reembolso de gastos directos que se acuerde en el Contrato De EPC, (ii) contratar su ejecución por terceros, o (iii) determinar el precio a su exclusivo juicio. En este último caso, el Contratista podrá presentar un reclamo de conformidad con el Contrato De EPC, si estima que la determinación de la Unidad Ejecutora Del Proyecto lo perjudica.

En caso de ejecución de Variaciones por el sistema de reembolso de gastos directos que se acuerde en el Contrato De EPC, la Empresa pagará al Contratista, previa comprobación y aprobación de éstos por la Unidad Ejecutora Del Proyecto, los gastos directos en que haya incurrido el Contratista con motivo de

ellas, más un recargo del diez por ciento (10 %) por concepto de gastos generales y utilidad. El Contratista deberá llevar una contabilidad exacta y detallada de todos y cada uno de los gastos directos relacionados con Variaciones y mantener su registro hasta un (1) año después de la emisión del Certificado De Recepción Provisional Final de la última Unidad y de sus Instalaciones Comunes Relacionadas.

Además, el Contratista deberá permitir el acceso a la Unidad Ejecutora Del Proyecto, y a sus representantes autorizados, en cualquier momento, a los registros, libros y documentos relacionados con la ejecución de Variaciones.

En cualquier caso, el Contratista deberá entregar a la Unidad Ejecutora Del Proyecto diariamente o con la periodicidad que éste determine, un informe sobre cada una de las Variaciones en ejecución que estén siendo valoradas por el sistema de reembolso de gastos directos que se acuerde en el Contrato De EPC. El informe deberá hacerse en el formato, cantidad de copias y con la información que especifique la Unidad Ejecutora Del Proyecto. Esta información deberá entregarse a partir del primer Día Hábil siguiente al de inicio de la ejecución de cualquier obra extraordinaria, ya sea ejecutada ésta por el propio Contratista o por uno de sus Subcontratistas.

23. RECLAMOS DEL CONTRATISTA

Si el Contratista estimare que alguna circunstancia le da derecho al cobro de gastos adicionales, al pago de alguna indemnización, incremento en el Precio Del Contrato o a una ampliación de plazos, lo solicitará a la Empresa dentro de los diez (10) Días siguientes a la ocurrencia de dicha circunstancia. En esa misma oportunidad deberá (i) entregar toda la información necesaria para que la Unidad Ejecutora Del Proyecto conozca de manera completa y definitiva los fundamentos y alcances de su solicitud, (ii) señalar las disposiciones contractuales en que se apoya, (iii) indicar las circunstancias precisas que la originan y (iv) acompañar la documentación que acredite la veracidad y magnitud de lo pedido.

De no plantear su solicitud, o no aportar la totalidad de los antecedentes que la respaldan en el plazo indicado en el párrafo anterior, se considerará que no ha sido afectado por dicha causa y que renuncia a solicitar todo requerimiento de cobro de gastos adicionales, pago de indemnización, incremento en el Precio Del Contrato o ampliación de plazos por tal efecto.

Si la decisión de la Unidad Ejecutora Del Proyecto sobre su solicitud no le satisface, podrá presentar el reclamo respectivo en el plazo de diez (10) Días contados desde la fecha de la notificación de aquella

decisión. En caso contrario, se considerará que ha renunciado a reclamar y que ha aceptado la decisión de la Unidad Ejecutora Del Proyecto.

El Contratista no podrá negar la entrega de los antecedentes adicionales que la Unidad Ejecutora Del Proyecto requiera para su análisis, estudio y resolución.

Mientras no se haya resuelto el reclamo respectivo, el Contratista enviará a la Unidad Ejecutora Del Proyecto un informe diario de los recursos usados en las Obras por las que está reclamando, salvo que, por las características del reclamo, la Unidad Ejecutora Del Proyecto lo libere, de manera previa y por escrito, de esa obligación. Asimismo, el Contratista informará mensualmente a la Unidad Ejecutora Del Proyecto de los reclamos presentados que estén pendientes de resolución.

La falta del informe diario de recursos, cuando proceda, o la omisión de un reclamo pendiente en el informe mensual, significará que el Contratista ha desistido de los correspondientes reclamos.

24. SUSPENSIÓN O PARALIZACIÓN DE LAS OBRAS

La Empresa podrá, sin expresión de causa, dar orden de paralizar o suspender la totalidad o parte de Obras, previo aviso escrito dado al Contratista, con una anticipación mínima de diez (10) Días.

En la orden escrita de suspender, la Empresa deberá indicar el plazo o plazos parciales que considere necesarios para practicar tal suspensión.

En caso que se ordene la suspensión de las Obras por un plazo superior a treinta (30) Días, las partes procederán a dejar constancia en actas del estado de las Obras paralizadas.

Recibida la instrucción de paralizar las Obras o parte de ellas, el Contratista deberá suspender el avance de los trabajos correspondientes, tomar las medidas necesarias para reducir a un mínimo los gastos producidos por la paralización y acatar con prontitud las instrucciones que al respecto le imparta la Unidad Ejecutora Del Proyecto.

Durante el período de paralización de las Obras, o parte de ellas, el Contratista deberá proteger y conservar las Obras respectivas de una manera satisfactoria, a juicio de la Unidad Ejecutora Del Proyecto.

24.1 POR CAUSAS IMPUTABLES A LA EMPRESA

Cuando la paralización ordenada por la Empresa sea motivada por una causa que no sea la falta de cumplimiento de las obligaciones contraídas por el Contratista o la mala ejecución de las Obras, la

Unidad Ejecutora Del Proyecto concederá una prórroga en los plazos de terminación sólo de las Obras efectivamente afectadas por tal paralización.

En el caso que la paralización ordenada por la Empresa ocasione al Contratista gastos y perjuicios reales, debidamente comprobados y demostrados, éste tendrá derecho a reclamar indemnización con relación a dichos gastos y perjuicios pero sin incluir utilidad alguna.

El Contratista podrá reclamar la indemnización y solicitar la prórroga de plazo antes referidas, solamente dentro de los diez (10) Días siguientes a la fecha de la orden de reiniciar las Obras y deberá entregar en la misma oportunidad toda la información necesaria para que la Unidad Ejecutora Del Proyecto conozca de manera completa y definitiva los fundamentos y alcance de su solicitud, y acompañando la documentación que acredite la veracidad y magnitud de lo pedido. Si así no lo hiciera, se considerará que el Contratista no ha sido afectado por la paralización de las Obras y que, por tanto, no tiene derecho a ninguna indemnización ni a ningún aumento de plazos o del Precio Del Contrato.

Si la ejecución de las Obras fuese suspendida indefinidamente por causas imputables a la Empresa, se pagará al Contratista el valor total de las Obras correcta y efectivamente construidas hasta la fecha de suspensión, deducidas las penalidades y otros descuentos a que hubiere lugar de acuerdo con los términos del Contrato De EPC.

Si por causas imputables a la Empresa las Obras se suspendieran por un plazo acumulado superior a ciento ochenta (180) Días, el Contratista tendrá derecho a dar por terminado el Contrato De EPC.

En caso de tal paralización prolongada las partes podrán optar por un acuerdo que permita mantener el Contrato De EPC vigente, ya sea mediante el pago de una suma mensual por concepto de gastos generales, o mediante el pago del levantamiento de las faenas y su posterior reinstalación.

Para efectos de lo anterior, no se considerará como paralización las demoras en el inicio de la Puesta En Servicio de una Unidad e Instalaciones Comunes Relacionadas correspondientes por no disponibilidad de las condiciones requeridas para la operación normal de dicha Unidad e Instalaciones Comunes Relacionadas.

24.2 POR CAUSAS IMPUTABLES AL CONTRATISTA

La Empresa podrá paralizar en forma inmediata la ejecución de todas o parte de las Obras, con confirmación escrita a más tardar cuatro (4) horas después de dar la instrucción verbal al ejecutivo de mayor jerarquía del Contratista en el Sitio, cuando así lo estime necesario por:

a) No haber entregado el Contratista a la Empresa los planos correspondientes o por carecer éstos de la aprobación del Revisor Sísmico;

b) No contar con las pólizas de seguro (requeridas por estas Condiciones Generales) vigentes;

c) Detectarse problemas de mala ejecución de las Obras;

d) No encontrarse presente en la ejecución de las Obras el personal de supervisión o de inspección idóneo del Contratista; o

e) No estar dando cabal cumplimiento a las condiciones de seguridad e integridad de las Obras, de las instalaciones de la Empresa o de terceros y/o del personal que labora en ellas.

Esta paralización, ya sea total o parcial, podrá extenderse hasta que la causa que la originó haya desaparecido o haya sido subsanada, sin que ello le dé derecho alguno al Contratista a ninguna compensación económica ni a ningún cambio en el Precio Del Contrato o en los plazos contractuales.

25. INCUMPLIMIENTO DEL CONTRATISTA

25.1 INCUMPLIMIENTO GRAVE

Para todos los efectos del Contrato De EPC se considerará que el Contratista ha incurrido en incumplimiento grave del mismo si:

a) Cualquiera de las Personas Jurídicas que lo integran (o sus respectivas Casas Matrices y/o Afiliadas con las que hubieren acreditado alguno de los requisitos de precalificación, según fuere el caso) es declarada en quiebra o solicita su quiebra;

b) Existe orden de ejecución y/o embargo (o acción similar) de todo o parte de los bienes de cualquiera de las Personas Jurídicas que lo integran (o sus respectivas Casas Matrices y/o Afiliadas con las que hubieren acreditado alguno de los requisitos de precalificación, según fuere el caso);

c) Cualquiera de las Personas Jurídicas que lo integran (o sus respectivas Casas Matrices y/o Afiliadas con las que hubieren acreditado alguno de los requisitos de precalificación,

según fuere el caso) iniciare o llegue a arreglo de traspaso de todo o parte de sus bienes en favor de sus acreedores;

d) Fueren protestados documentos comerciales que cualquiera de las Personas Jurídicas que lo integran (o sus respectivas Casas Matrices y/o Afiliadas con las que hubieren acreditado alguno de los requisitos de precalificación, según fuere el caso) mantuviere impagos durante más de sesenta (60) días o no fueren debidamente aclarados dentro de dicho plazo;

e) Ha hecho abandono de las Obras o ha disminuido el ritmo o rendimiento de las mismas, o las Obras presentaren un atraso en un grado tal que, a juicio exclusivo de la Unidad Ejecutora Del Proyecto, pusiere en riesgo la entrega de las Obras dentro de los plazos convenidos en el Contrato De EPC;

f) No ha comenzado las Obras dentro del plazo fijado en el Contrato De EPC o las ha suspendido unilateralmente, ya sea de manera parcial o total, (i) por diez (10) Días o más, (ii) habiendo requerimiento por escrito de la Unidad Ejecutora Del Proyecto de iniciarlas o continuarlas, y (iii) el Contratista no ha justificado, a satisfacción de la Unidad Ejecutora Del Proyecto, tal dilación o suspensión;

g) No ha efectuado dentro del plazo de diez (10) Días, después de haber sido notificado por escrito por la Unidad Ejecutora Del Proyecto, la remoción y reemplazo de materiales, equipos o personal, que hayan sido rechazados por éste;

h) No está ejecutando las Obras, a juicio de la Unidad Ejecutora Del Proyecto, de acuerdo con los términos del Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas, o en forma reiterada o flagrante no cumple con las obligaciones allí estipuladas.

i) Las Obras, a juicio de la Unidad Ejecutora Del Proyecto y por errores del Contratista, quedaren con defectos graves que no pudieran ser reparados y dichos defectos comprometieran, a juicio de la Unidad Ejecutora Del Proyecto, su seguridad, funcionamiento, rendimiento, cumplimiento de parámetros o valores garantizados u obligasen a modificaciones substanciales al Proyecto;

j) Cualquiera de las Personas Jurídicas que lo integran (o sus respectivas Casas Matrices y/o Afiliadas con las que hubieren acreditado alguno de los requisitos de precalificación, según fuere el caso) traspasare parte o la totalidad del Contrato De EPC;

k) Acordare un Subcontrato sin la aprobación de la Unidad Ejecutora Del Proyecto de conformidad con el Contrato De EPC;

l) No efectuare las Obras con la debida diligencia, en opinión de la Unidad Ejecutora Del Proyecto, o dejare de cumplir con las obligaciones asumidas en el Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas;

m) No entregare oportunamente a la Empresa los antecedentes y documentos a que estuviere obligado de acuerdo con el Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas;

n) Falla en alcanzar los valores de garantía de cualquiera de las Unidades, después de realizadas las Pruebas De Aceptación respectivas y realizar gestiones de mejoras de diseño y reemplazos de equipos, sin éxito, de acuerdo con la Sección 29.4 de estas Condiciones Generales; o

o) Atraso mayor a ciento veinte (120) Días en el término del total de las Obras.

25.2 RECURSOS Y FACULTADES DE LA EMPRESA

Si el Contratista:

a) Fuera negligente en ejecutar las Obras;

b) Rehusara o fuera negligente en el cumplimiento de órdenes entregadas a él por escrito por parte de la Empresa, en relación con las Obras;

c) Contraviniera las estipulaciones del Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas; o

d) Incurriera en cualesquiera de las causales previstas en la Sección 25.1 anterior,

la Empresa podrá notificar por escrito al Contratista para que remedie la falla, negligencia o contravención aludidas dentro de un plazo determinado. Si el Contratista no cumpliese con lo exigido en

la notificación respectiva, dentro del plazo designado en la misma, sin perjuicio de lo previsto en el Artículo 31 de la Ley No. 340-06, la Empresa tendrá el derecho a tomar cualquiera de las siguientes medidas:

e) Aplicar las penalidades que establece el Contrato De EPC;

f) Perseguir indemnización de daños y perjuicios;

g) Retirar las Obras, en todo o en parte, de las manos del Contratista, rebajar el valor correspondiente a las mismas del Precio Del Contrato y ejecutar dichas Obras con personal propio o recontratarlos con terceros, sin perjuicio de otros derechos que tenga la Empresa bajo el Contrato De EPC; y/o

h) Dar por terminado anticipadamente el Contrato De EPC.

25.3 USO DE LA PLANTA DE CONSTRUCCIÓN

En el caso previsto en la Sección 25.2(c) anterior, la Empresa tendrá derecho a hacer uso de las facultades establecidas en la Sección 13.9 de estas Condiciones Generales y al libre uso de todo el equipo del Contratista que pueda estar en el Sitio. En dicho caso, la Empresa pagará al Contratista un valor de arriendo que será acordado entre las partes, tomando como antecedente los precios unitarios detallados en el Cuadro De Precios.

De no producirse tal acuerdo, la Unidad Ejecutora Del Proyecto lo fijará unilateralmente, sin perjuicio del derecho de reclamación que le asiste al Contratista según se estipula en la Sección 23 de estas Condiciones Generales.

La Empresa no será responsable ante el Contratista por el desgaste normal de la Planta De Construcción.

La Empresa tendrá derecho a retener, además, cualquier saldo del Precio Del Contrato (o la parte de él que sea necesaria) adeudado al Contratista para imputarlo al pago de los trabajos antes indicados, o para completar las Obras, según sea el caso.

Si el costo de terminar las Obras, o ejecutar parte de ellas, excediera el saldo adeudado al Contratista, éste deberá pagar tal exceso, sin perjuicio de la facultad de la Empresa de hacer efectiva cualquiera de las garantías del Contrato De EPC para cubrir tal diferencia.

25.4 TASACIÓN A LA FECHA DEL DECOMISO Y PAGO POSTERIOR

En el caso previsto en la Sección 25.2(c) anterior, la Empresa, tan pronto como sea practicable, valorizará, sobre la base de los precios unitarios contenidos en el Cuadro De Precios, el equipo nuevo fabricado o suministrado y no usado, los materiales parcialmente usados y los demás costos razonables incurridos por el Contratista hasta la fecha de retiro de las Obras de sus manos.

Si el Contratista no objetare esta decisión en el plazo de cinco (5) Días, se entenderá que tal valorización es aceptada por él y que no presentará reclamo futuro alguno por ella.

En el caso que un retiro del total de las Obras de manos del Contratista haya sido por incumplimiento grave de éste, de acuerdo con la Sección 25.1 de estas Condiciones Generales, la Empresa no estará obligada a pagar al Contratista suma alguna a cuenta del Contrato De EPC hasta el término del Período De Garantía-Unidad E Instalaciones Comunes Relacionadas relativo a la última Unidad y sus Instalaciones Comunes Relacionadas y sólo una vez que los costos de terminación y mantenimiento, perjuicios por atraso en la terminación, si los hubiere, y todos los otros gastos incurridos por la Empresa, hayan sido determinados por ésta.

El Contratista tendrá entonces sólo el derecho a recibir una suma igual (si la hubiere) a la que le habría correspondido recibir de acuerdo con el Precio Del Contrato, al término de las Obras, después de haber deducido los costos y los gastos incurridos por la Empresa mencionados anteriormente. Si estos gastos excedieren la cantidad que le hubiere correspondido al Contratista por el término debido, éste pagará a la Empresa, al ser exigido, el monto de dicho exceso. Si así no lo hiciere, la Empresa podrá imputarlo a cualquiera de los fondos que se adeuden o que pudieran llegar a adeudarse al Contratista o hacer efectiva cualquiera de las garantías del Contrato De EPC.

25.5 REPARACIONES URGENTES

Si por razón de accidente o falla u otro acontecimiento que sucediera a, en o en conexión con, las Obras o cualquier parte de éstas durante su ejecución, o durante el respectivo Período De Garantía-Unidad E Instalaciones Comunes Relacionadas, fuera necesario efectuar cualquier trabajo de reparación u otro trabajo a la respectiva Unidad o a cualquiera de sus Instalaciones Comunes Relacionadas, y si después de la comunicación por escrito y dentro de un plazo razonable convenido entre la Empresa y el Contratista éste estuviere incapacitado o no ejecutare o no estuviere dispuesto a efectuar de inmediato tales trabajos o reparaciones, la Empresa podrá, en este caso, ejecutar los citados trabajos o reparaciones con sus propios trabajadores o con terceros. Si tal trabajo o reparación fuese de responsabilidad y cargo del Contratista,

entonces todos los costos y cargos cubiertos por la Empresa serán pagados por el Contratista al primer requerimiento de aquélla, o podrán ser deducidos por la Empresa de cualesquiera dineros adeudados o que pudieran ser adeudados al Contratista o imputados a cualesquiera de las garantías del Contrato De EPC.

26. TERMINACIÓN ANTICIPADA DEL CONTRATO DE EPC POR PARTE DE LA EMPRESA

La Empresa podrá dar término anticipado al Contrato De EPC en los siguientes casos:

a) Por decisión unilateral de la Empresa; o

b) Por incumplimiento grave del Contratista;

26.2 POR DECISIÓN UNILATERAL DE LA EMPRESA

La Empresa estará facultada, en cualquier momento, para dar por terminado unilateralmente el Contrato De EPC, mediante comunicación escrita al Contratista con a lo menos treinta (30) Días de antelación a la fecha efectiva de la terminación del Contrato De EPC.

Recibida tal comunicación, y salvo que la Empresa le instruya algo distinto al respecto, el Contratista deberá paralizar inmediatamente la ejecución de las Obras, ya sea que las esté ejecutando directamente y/o a través de sus Subcontratistas.

El Contratista estará obligado a entregar a la Empresa, en la forma, plazo y condiciones que ésta determine, todas las Obras ejecutadas previo a la fecha efectiva de tal terminación.

Ocurrido lo anterior, el Contratista tendrá derecho a que la Empresa le pague el precio de todas las Obras ejecutadas previo a la fecha efectiva de tal terminación, para lo cual servirán de base los precios unitarios correspondientes establecidos en el Cuadro De Precios.

Además, el Contratista tendrá derecho a que se le reembolsen los gastos incurridos por él, previamente a la notificación de terminación en (i) la adquisición de materiales aún no ocupados en la fabricación, construcción o Montaje E Instalación de cualquier componente del Proyecto, (ii) la fabricación incompleta de partes del Proyecto y/o (iii) la adquisición y almacenaje de equipos y partes del Proyecto que no se hubieren despachado aún al Sitio a la fecha efectiva de terminación del Contrato De EPC.

El Contratista, para tener derecho al pago de los reembolsos antes referidos, deberá presentar a la Empresa, junto con la Solicitud De Pago correspondiente, todas las facturas y demás documentos que fueren necesarios para acreditar la procedencia y monto de tales reembolsos.

En ningún caso el monto total a pagar por concepto de las Obras ejecutadas, más los reembolsos antes señalados, podrá exceder el precio del ítem respectivo establecido en el Cuadro De Precios.

Adicionalmente, la Empresa le pagará al Contratista, a título de única compensación o indemnización por cualesquiera y todos los daños y perjuicios de cualquiera naturaleza que la terminación anticipada del Contrato pudiese ocasionarle, una suma igual al cinco (5%) por ciento del saldo del Precio Del Contrato, que no se hubiere cancelado en razón de su terminación anticipada. Tal saldo se calculará como la diferencia entre el Precio Del Contrato y la suma de todo lo que ya se le hubiere pagado o reembolsado al Contratista con motivo y ocasión del Contrato De EPC.

El pago de la compensación y reembolso antes señalados se hará en los plazos y condiciones establecidas en el Contrato De EPC.

26.3 POR INCUMPLIMIENTO DEL CONTRATISTA

La Empresa estará facultada para poner término anticipado del Contrato De EPC en cualquiera de los casos de incumplimiento grave por parte del Contratista previstos en la Sección 25.1 de estas Condiciones Generales. En tal caso, y sin perjuicio de cualquier otro derecho que la Empresa tenga de conformidad con la Ley No. 340-06 y el Contrato De EPC, la Empresa estará facultada para:

a) Retener las Obras ejecutadas a la fecha efectiva de término del Contrato De EPC ("**Fecha De Término**"). Para tal efecto, la Empresa deberá pagar al Contratista la diferencia que resulte entre (y) el saldo del precio correspondiente por las Obras ejecutadas a la Fecha De Término que el Contratista tuviere derecho a recibir de conformidad con el Contrato De EPC y que se encontrare impago a dicha fecha y (z) la suma de los siguientes valores:

   i) Todas las penalidades que la Empresa tuviere derecho a cobrar de conformidad con el Contrato De EPC con motivo del incumplimiento grave que motivare la terminación anticipada del Contrato De EPC;

   ii) Todas las indemnizaciones por daños y perjuicios que el incumplimiento grave que motivare la terminación anticipada del Contrato De EPC le hubiere causado a la Empresa; y

iii) Cualquier monto que la Empresa hubiere anticipado o pagado al Contratista por Obras que no hayan sido ejecutadas/completadas de conformidad con el Contrato De EPC a la Fecha De Término.

Si la operación anterior resultare con un saldo positivo a favor de la Empresa, ésta tendrá derecho a (i) hacer efectiva cualquiera de las garantías del Contrato De EPC para efectos de cobrar dicho saldo y/o (ii) deducir dicho saldo de cualquier dinero en su poder destinado al Contratista.

b) Rechazar todas las Obras ejecutadas a la Fecha De Término. En dicho caso, el Contratista estará obligado a:

i) Reembolsar a la Empresa toda y cualquier suma percibida de ésta con motivo del Contrato De EPC;

ii) Pagar a la Empresa todas las penalidades que la Empresa tuviere derecho a cobrar de conformidad con el Contrato De EPC con motivo del incumplimiento grave que motivare la terminación anticipada del Contrato De EPC;

iii) Pagar a la Empresa todas las indemnizaciones por daños y perjuicios que el incumplimiento grave que motivare la terminación anticipada del Contrato De EPC le hubiere causado a la Empresa; y

La Empresa estará facultada para (i) hacer efectiva cualesquiera de las garantías del Contrato De EPC para efectos de cobrar las sumas a que se refiere esta Sección 26.3(b) y/o (ii) deducir dichos montos de cualquier dinero en su poder destinado al Contratista.

27. PENALIDADES E INDEMNIZACIONES

El incumplimiento por parte del Contratista (i) en el envío o entrega de los documentos contractualmente requeridos, tales como planos, memorias de cálculos y manuales, (ii) en la entrega de partes esenciales del Proyecto, repuestos y herramientas, o (iii) del término del todo o partes de las Obras en los plazos establecidos en el Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas, o que el equipo no cumpla con los valores de funcionamiento o parámetros garantizados en tales documentos, facultará a la Empresa para aplicar y cobrar las penalidades correspondientes que se establecen en esta Sección 27, sin necesidad de puesta en mora.

En ningún caso, el pago de las penalidades contempladas por esta Sección 27 implicará renuncia alguna por parte de la Empresa al derecho a demandar e impetrar, además, el pago de cualesquier indemnización por daños y perjuicios que pudiera ocasionar el Contratista con motivo de la falta de cumplimiento de su obligación de ejecución de las Obras, pudiendo deducir el monto de indemnización de cualquier dinero en su poder destinado o por destinar al Contratista o imputarlo a las garantías del Contrato De EPC; lo anterior se entiende sin perjuicio de cualquier otra forma de resarcimiento a que tenga derecho la Empresa.

El pago de tales penalidades e indemnizaciones no liberará, en todo caso, al Contratista de su obligación de terminar las Obras, ni de ninguna otra de sus obligaciones y responsabilidades establecidas en el Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas.

Las penalidades e indemnizaciones establecidas en esta Sección 27 deberán ser pagadas en la misma moneda en que se encuentren expresadas.

27.1 POR ATRASO EN EL PLAZO TOTAL DE CADA UNIDAD

Si el Contratista es incapaz de dar término a la totalidad de las Obras correspondientes a cada Unidad (incluyendo, sin limitación, todos los trabajos de ingeniería, suministro, construcción, Montaje E Instalación, pruebas y Puesta En Servicio de todos los componentes de dicha Unidad e Instalaciones Comunes Relacionadas) dentro del plazo establecido para tal efecto en el Contrato De EPC (considerando cualquier prórroga que la Empresa haya autorizado expresamente para tal efecto de conformidad con el Contrato De EPC), el Contratista estará afecto a el pago de una pena por cada Día de atraso cuyo monto será equivalente al valor indicado en el Anexo H de estas Condiciones Generales. La pena indicada podrá ser (i) cobrada directamente al Contratista, (ii) descontada de la Solicitud De Pago más próxima que ha de efectuarse al Contratista de conformidad con el Contrato De EPC, (iii) imputada a cualquiera de las garantías del Contrato De EPC y/o (iv) deducida de cualquier dinero en poder de la Empresa destinado o a destinar al Contratista.

27.2 POR FALLA EN EL CUMPLIMIENTO DE LAS PRUEBAS DE ACEPTACIÓN DE CADA UNIDAD

Si el Contratista no cumple con los parámetros de funcionamiento garantizados para el componente del Proyecto respectivo, después de realizar las Pruebas De Aceptación pertinentes de la respectiva Unidad, pero cumpliere con los parámetros mínimos aceptables por la Empresa, según lo establecido en el Anexo

H, entonces el Contratista deberá pagar, a título de penalidad, los montos establecidos en el referido Anexo H de estas Condiciones Generales respecto a la diferencia entre los niveles de funcionamiento realmente alcanzados durante las Pruebas De Aceptación respectivas y los valores garantizados que se establecen en el Contrato De EPC. La penalidad indicada podrá ser (i) cobrada directamente al Contratista, (ii) descontada de la Solicitud De Pago más próxima que ha de efectuarse al Contratista de conformidad con el Contrato De EPC, (iii) imputada a cualquiera de las garantías del Contrato De EPC y/o (iv) deducida de cualquier dinero en poder de la Empresa destinado o a destinar al Contratista.

28. PRUEBAS AL TÉRMINO

Una vez terminada la construcción y Montaje E Instalación de las Obras para cada Unidad y sus Instalaciones Comunes Relacionadas, el Contratista deberá efectuar sus pruebas al término, las que incluirán todos los controles, pruebas funcionales y operacionales que deban efectuarse antes de la Puesta En Servicio de dicha Unidad e Instalaciones Comunes Relacionadas ("**Pruebas Al Término**"). Las Pruebas Al Término tienen como objetivo principal demostrar:

a) La capacidad operacional del equipo;

b) Que el suministro correspondiente esté completo de acuerdo con lo estipulado en el Contrato De EPC, incluyendo, sin limitación, las Especificaciones Técnicas; y

c) Que el Montaje E Instalación se ejecutaron correctamente.

El Contratista notificará a la Empresa por escrito, con quince (15) Días de anticipación, las fechas en que estará listo para llevar a cabo las diferentes Pruebas Al Término de la respectiva Unidad y sus Instalaciones Comunes Relacionadas. Salvo acuerdo expreso en contrario, las referidas pruebas se realizarán dentro del plazo de diez (10) Días a partir de dichas fechas, en el Día o Días escogido(s) por la Empresa, lo cual comunicará por escrito al Contratista.

A más tardar treinta (30) Días antes de la fecha en la cual el primer ítem de las Obras o equipos se encuentre listo para la Prueba Al Término respectiva, el Contratista someterá a la aprobación de la Empresa un Programa revisado de pruebas basado en el Programa de pruebas especificado en la Sección 21.4 de estas Condiciones Generales. Este Programa revisado deberá contener una descripción completa de los métodos y procedimientos propuestos para la realización de las pruebas, incluyendo los listados de instrumentos y equipos a usar.

Todo equipo mecánico e instalación será inspeccionado y probado para determinar su correcta alineación, posicionamiento, ajuste, huelgos y todos aquellos factores que puedan afectar su operación satisfactoria y segura. Todo equipo e instalación eléctrica se inspeccionará y probará para verificar su correcta conexión, instalación, aislación, puesta a tierra, ajuste de protecciones y limitadores, calibración de instrumentos de medida, sentido de rotación de motores, accionamiento, comando y control automático.

29. PUESTA EN SERVICIO

Cuando se hayan (i) completado todas las Obras relativas a una Unidad y sus Instalaciones Comunes Relacionadas de acuerdo con las especificaciones y requisitos del Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas, (ii) terminadas satisfactoriamente las Pruebas Al Término respectivas y (iii) cumplido las demás condiciones pertinentes, entonces se realizará la Puesta En Servicio de dicha Unidad. La Empresa, sin embargo, podrá aceptar que equipos menores, que no tengan incidencia en la seguridad o correcta operación de las Obras, puedan terminarse después de iniciado el período de Puesta En Servicio respectivo, en un plazo de y bajo las condiciones que ella determine.

Las especificaciones técnicas y condiciones específicas mínimas en relación con la Puesta En Servicio y Pruebas De Confiabilidad se indican en las Especificaciones Técnicas.

El período de Puesta En Servicio de cada Unidad se extenderá por el lapso que se indique en el Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas, y terminará con finalización exitosa de las Pruebas De Confiabilidad respectivas.

Durante la primera parte de la Puesta En Servicio de la Unidad respectiva, el equipamiento de dicha Unidad será sometido a las Pruebas De Aceptación.

Sólo una vez completadas exitosamente todas las Pruebas De Aceptación de la Unidad respectiva, las posibles fallas corregidas, cumplidas las demás condiciones que al respecto se señalen el Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas, y que los trabajos estén listos para operarlos en forma normal y segura, el Contratista podrá comenzar con las Pruebas De Confiabilidad de dicha Unidad.

Durante el período de Puesta En Servicio de la Unidad respectiva, el Contratista deberá realizar las pruebas que demuestren que dicha Unidad cumple con los respectivos parámetros o valores garantizados.

Para llevar a cabo las pruebas de Puesta En Servicio de la Unidad respectiva, el Contratista estará obligado a obtener de la Empresa, a través de la Unidad Ejecutora Del Proyecto, su consentimiento previo y por escrito.

Las pruebas operacionales se realizarán tanto sin carga como asimismo en todo el rango de carga y sobrecarga de trabajo garantizado, en la forma más amplia posible de acuerdo con las condiciones vigentes.

Las pruebas funcionales deberán incluir, pero no necesariamente limitarse a, la determinación de pérdidas, rendimientos, potencia o esfuerzo requerido, presiones y temperaturas, vibraciones y control automático, funcionamiento de sistemas de protección, suavidad de funcionamiento, y otras que sean aplicables y/o especificadas para la parte de la instalación sometida a prueba.

El Contratista deberá proveer a su costo el personal, equipo, instrumentos, servicios, repuestos, materiales e insumos que se requieran para realizar una correcta Puesta En Servicio de la Unidad respectiva, preparando y sometiendo a la aprobación de la Empresa un informe completo con los registros y protocolos con los resultados de las mediciones y pruebas.

El Contratista mantendrá la plena responsabilidad por todas las pruebas y operaciones que se efectúen durante el período de Puesta En Servicio de la Unidad respectiva, incluyendo, sin limitación, las Pruebas De Confiabilidad de dicha Unidad.

El Contratista deberá efectuar la mantención y servicio del equipo instalado, llevando los registros correspondientes, hasta el término de la Puesta En Servicio de la Unidad respectiva. Dicho costo estará incluido en el Precio Del Contrato.

29.1 PRUEBAS DE ACEPTACIÓN DE CADA UNIDAD

La comprobación del funcionamiento de todos los equipos y datos o parámetros garantizados de cada Unidad contenidos en los documentos del Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas, será hecha mediante las pruebas de aceptación realizadas antes de las Pruebas De Confiabilidad de la Unidad respectiva ("**Pruebas De Aceptación**").

El alcance específico, duración, normas aplicables y demás condiciones de estas pruebas serán las que se establecen en el Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas.

Las Pruebas De Aceptación de cada Unidad se realizarán bajo todas las condiciones operacionales posibles, para lo cual, todas sus Instalaciones Comunes Relacionadas deberán estar operativas, probadas y en funcionamiento. El Contratista no podrá reemplazar o ajustar partes esenciales de las Obras relativas a dicha Unidad, con motivo de las Pruebas De Aceptación respectivas, sin consentimiento previo y por escrito de la Empresa.

La supervisión y fiscalización de las Pruebas De Aceptación de cada una de las Unidades será realizada, en representación de la Empresa, por el Ingeniero De La Empresa.

En caso de no alcanzarse los valores y parámetros garantizados de funcionamiento de los equipos de cada Unidad, según mediciones y protocolos constatados por la Empresa, el Contratista deberá realizar a su costo los ajustes y correcciones necesarias dentro de un plazo máximo razonable a ser dispuesto por aquélla.

En ningún caso el Contratista tendrá derecho a ningún aumento en los plazos del Contrato De EPC o del Precio Del Contrato por motivo de tales ajustes y repetición de pruebas.

El Contratista y el Ingeniero De La Empresa inspeccionarán minuciosamente todos los equipos y auxiliares de la Unidad respectiva, antes y después de realizar las pruebas correspondientes. Si dicha inspección mostrare daños o desgastes que pudiesen afectar la eficiencia o capacidad de la Unidad respectiva, el Contratista deberá reemplazar dichas piezas dañadas o gastadas sin demora y a su cargo. Si fuese necesario, deberá realizar un diseño nuevo para dichas partes.

Dentro de los veinte (20) Días después de realizadas las Pruebas De Aceptación de la Unidad respectiva, el Contratista enviará tres (3) copias de los protocolos de dichas pruebas a la Empresa, debidamente certificados y firmados por las partes, lo cual será uno de los prerrequisitos para la emisión del correspondiente Certificado De Recepción Provisional.

El informe definitivo con dichos protocolos, deberá ser enviado a la Empresa, también en tres (3) ejemplares debidamente encuadernados y en el formato que defina el Manual De Procedimientos, a más tardar noventa (90) Días después de emitido el correspondiente Certificado De Recepción Provisional.

29.2 PRUEBAS DE CONFIABILIDAD

Una vez terminadas satisfactoriamente las Pruebas De Aceptación de cada Unidad, se iniciarán las pruebas tendientes a verificar la confiabilidad del equipo de la Unidad respectiva ("**Pruebas De**

Confiabilidad"). Las Pruebas De Confiabilidad de cada Unidad tendrán la duración que se acuerde con la Unidad Ejecutora Del Proyecto, la cual no podrá ser inferior a siete (7) Días de operación continua.

Durante las Pruebas De Confiabilidad, cada Unidad se someterá a operación para toda la carga requerida y según requerimientos de la Empresa, de acuerdo con lo estipulado en el Contrato De EPC, particularmente, estas Condiciones Generales y las Especificaciones Técnicas. La confiabilidad y disponibilidad de cada Unidad para uso permanente serán estimadas mediante estas pruebas.

En este período, la operación, control y registro de la Unidad respectiva estará bajo la total responsabilidad del Contratista, bajo la fiscalización y supervisión del Ingeniero De La Empresa.

Si durante el período de Pruebas De Confiabilidad de la Unidad respectiva se descubriesen defectos, los cuales en opinión fundada de la Empresa demostraren que la confiabilidad y disponibilidad para un uso permanente u otros requisitos del Contrato De EPC, particularmente, estas Condiciones Generales y las Especificaciones Técnicas, no han sido cumplidos, entonces el período de Pruebas De Confiabilidad de dicha Unidad se dejará sin efecto y se repetirá hasta que dichas fallas sean corregidas por el Contratista de acuerdo con lo estipulado en dichos documentos.

La Empresa podrá ordenar que se efectúen pruebas adicionales a las establecidas en el Contrato De EPC, particularmente, las Especificaciones Técnicas, y en la Legislación Dominicana aplicable, que considere necesario realizar, durante el período de Pruebas De Confiabilidad de la Unidad respectiva, de acuerdo con lo establecido en la Sección 21.3 de estas Condiciones Generales.

Las Pruebas De Confiabilidad cumplidas con éxito será uno de los prerrequisitos necesarios para la emisión del Certificado De Recepción Provisional de la respectiva Unidad y de sus Instalaciones Comunes Relacionadas, salvo en los casos contemplados en la Sección 30.4 de estas Condiciones Generales.

El Período De Garantía-Unidad E Instalaciones Comunes Relacionadas respectivo comenzará cuando el período de Pruebas De Confiabilidad de todos los equipos de la Unidad respectiva haya finalizado en forma satisfactoria, siempre que se haya cumplido con todas las demás condiciones y se haya emitido el correspondiente Certificado De Recepción Provisional Total para dicha Unidad y sus Instalaciones Comunes Relacionadas.

29.3 INFORME DE PRUEBAS Y MEDICIONES

El Contratista notificará a la Empresa por escrito la fecha en la cual las operaciones, pruebas, mediciones, demostraciones e inspecciones de la Unidad respectiva hayan sido completadas satisfactoriamente y preparará un informe que muestre los resultados de dichas operaciones, pruebas, mediciones, demostraciones e inspecciones. Dentro de los quince (15) Días siguientes, la Empresa deberá, ya sea:

a) Entregar su aceptación por escrito del informe arriba indicado, el cual constituirá un prerrequisito para su aceptación provisional de la Unidad respectiva; o

b) Entregar al Contratista un detalle de las razones que fundamentan su no aceptación.

Después que el Contratista haya completado todas las correcciones que correspondan a las observaciones por las cuales no se aceptó el informe anterior, y después de realizar cualquier nueva prueba que se requiera de acuerdo con lo establecido en el Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas, y las buenas prácticas de ingeniería, someterá a la consideración de la Empresa el informe corregido.

29.4 RECHAZO Y CORRECCIÓN

Si cualquiera de los parámetros medidos durante las Pruebas De Aceptación de la Unidad respectiva (después de (i) realizadas las acciones y trabajos correctivos de acuerdo con la Sección 21.13 de estas Condiciones Generales, (ii) haber realizado el Contratista las modificaciones de diseño correspondientes, (iii) haber realizado el Contratista todas las mejoras y reemplazos de equipos, y (iv) haberse realizado y repetido todas las pruebas correspondientes) quedare fuera del correspondiente rango de aceptación de la Empresa según se indica en el Anexo I, la Empresa podrá declarar el rechazo total de dicha Unidad. En tal caso, se entenderá para todos los efectos del Contrato De EPC que el Contratista ha cometido un incumplimiento grave y, por tal motivo, se aplicarán las disposiciones de la Sección 26 de estas Condiciones Generales.

30. RECEPCIÓN PROVISIONAL

30.1 RECEPCIÓN PROVISIONAL TOTAL DE LAS UNIDADES

Terminada la ejecución de los trabajos encomendados y una vez que todos los componentes de la Unidad respectiva, incluyendo sus Instalaciones Comunes Relacionadas, se encuentren probados y funcionando, esto es, efectuadas y aprobadas las Pruebas De Aceptación y Pruebas De Confiabilidad respectivas y las

demás pruebas que se detallen en el Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas, a plena satisfacción de la Empresa, el Contratista podrá solicitar la recepción provisional total de las Obras correspondientes a dicha Unidad y emisión del certificado respectivo (dicho certificado, "**Certificado De Recepción Provisional Total**").

El Certificado De Recepción Provisional Total lo emitirá la Empresa sólo una vez tenga constancia que la totalidad de las Obras correspondientes a la Unidad respectiva, incluyendo sus Instalaciones Comunes Relacionadas, han sido terminadas y entregadas por el Contratista de conformidad con el Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas, y a plena conformidad de la Empresa. Para los efectos anteriores, las Obras no sólo incluyen el suministro, construcción, Montaje E Instalación, pruebas y Puesta En Servicio del equipamiento de que se trate, sino que también el completo y cabal término de las Obras e infraestructura que contempla, entre otros, las terminaciones de arquitectura, de las obras de urbanización, la limpieza general y exhaustiva de los equipos, recintos e instalaciones, el retiro de escombros, basuras y desechos desde el Sitio, la entrega de los planos As-Built, las recepciones de los organismos fiscalizadores obtenidas por el Contratista, la entrega por parte del Contratista de los manuales definitivos de montaje, operación, mantenimiento y Puesta En Servicio de todos los componentes de la Unidad respectiva y sus Instalaciones Comunes Relacionadas, la entrega en almacenes de la Empresa de los repuestos y herramientas, y terminadas a cabalidad las demás obligaciones incluidas en el alcance del Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas, respecto de la Unidad respectiva y sus Instalaciones Comunes Relacionadas.

En consecuencia, el Contratista sólo podrá solicitar la emisión del Certificado De Recepción Provisional Total respectivo cuando efectivamente se hayan cumplido tales condiciones, careciendo por tanto de validez las que eventualmente planteare sin cumplir tal requisito.

El Certificado De Recepción Provisional Total respectivo será emitido por la Empresa dentro de los treinta (30) Días siguientes a la fecha de su solicitud válida por parte del Contratista. No obstante lo anterior, el Certificado De Recepción Provisional Total respectivo consignará como fecha efectiva de término aquélla en que las Pruebas De Confiabilidad de la Unidad respectiva resultaron satisfactorias y conforme y que la totalidad de las Obras respectivas hubieren sido terminadas a plena satisfacción de la Empresa.

Sin perjuicio de lo anterior, la Empresa podrá emitir el Certificado De Recepción Provisional Total respectivo cuando estimare que las condiciones para ello están cumplidas aun cuando el Contratista no lo hubiere solicitado.

Como prerrequisito para la emisión del Certificado De Recepción Provisional Total respectivo por parte de la Empresa el Contratista deberá garantizar el cumplimiento de sus obligaciones durante el Período De Garantía-Unidad E Instalaciones Comunes Relacionadas respectivo mediante la Garantía De Fiel Cumplimiento o Garantía De Vicios Ocultos, según sea el caso de conformidad con la Sección 33.2 de estas Condiciones Generales.

30.2 RECEPCIÓN PROVISIONAL PARCIAL

Las Unidades y sus Instalaciones Comunes Relacionadas serán objeto de recepciones provisionales parciales de conformidad con los términos y condiciones del Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas. Para tal efecto, la Empresa emitirá el certificado de recepción correspondiente (dicho certificado, "**Certificado De Recepción Provisional Parcial**").

30.3 DEFECTOS MENORES

En forma excepcional, la Empresa podrá emitir, a su sola discreción, el Certificado De Recepción Provisional Total de la Unidad correspondiente y de sus Instalaciones Comunes Relacionadas, por propia iniciativa o a solicitud del Contratista, aún en el caso de que persistan o se hayan detectado defectos menores durante el período de Puesta En Servicio de dicha Unidad, siempre que tales defectos, sin impedir el funcionamiento de tal Unidad, permitan su adecuada operación, a juicio exclusivo de la Empresa.

Asimismo, la calificación de qué será considerado un defecto menor quedará siempre al exclusivo criterio de la Empresa.

La reparación de los defectos menores deberá ser efectuada por el Contratista dentro del plazo de treinta (30) Días a contar de la fecha de otorgamiento del Certificado De Recepción Provisional Total correspondiente y de acuerdo con un Programa de reparaciones a acordar entre las partes y que se adjuntará al respectivo Certificado De Recepción Provisional Total.

En dicho caso, el correspondiente Certificado De Recepción Provisional Total se emitirá sólo contra la entrega por parte del Contratista de una carta de garantía adicional de fiel cumplimiento, por un monto equivalente al valor de los trabajos pendientes.

El Contratista tendrá la obligación de reparar todo defecto, ya sea que la Empresa lo haya detectado y anotado en el Certificado De Recepción Provisional Total correspondiente o que haya omitido hacer una reserva expresa.

En caso que el Contratista no cumpla o corrija los defectos menores dentro del plazo estipulado, la Empresa podrá aplicar, por cada Día de atraso, la penalidad definida en el Sección 27.2 de estas Condiciones Generales y hacer efectiva la garantía señalada precedentemente.

30.4 ATRASO EN LAS CONDICIONES REQUERIDAS PARA LA OPERACIÓN NORMAL

La Empresa podrá emitir el Certificado De Recepción Provisional Total respectivo si una vez terminadas la totalidad de las Obras correspondientes a la Unidad objeto de la recepción provisional respectiva, efectuadas satisfactoriamente las Pruebas Al Término de dicha Unidad (según protocolos de inspección de la Empresa) y satisfechos la totalidad de los demás prerrequisitos establecidos en el Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas, para su emisión, no pudieran realizarse las Pruebas De Aceptación y/o Pruebas De Confiabilidad correspondientes por indisponibilidad de las condiciones normales de operación que permitan ejecutar dichas pruebas, por razones ajenas a la responsabilidad del Contratista.

Asimismo, el Contratista podrá solicitar dicho Certificado De Recepción Provisional Total si después de sesenta (60) Días de terminadas la totalidad de las Obras correspondientes, efectuadas satisfactoriamente las Pruebas Al Término respectivas, según protocolos de inspección de la Empresa y satisfechos la totalidad de los demás prerrequisitos establecidos en el Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas, para su emisión, no se pudieren realizar las Pruebas De Aceptación y/o Pruebas De Confiabilidad correspondientes por las mismas razones antedichas.

En este último caso, la Empresa emitirá el Certificado De Recepción Provisional Total correspondiente dentro del plazo de treinta (30) Días contados desde la solicitud de emisión respectiva.

En ambos casos, el Contratista mantendrá, a su costo, su obligación de asistencia y asesoría para las Pruebas De Aceptación y Pruebas De Confiabilidad correspondientes durante la Puesta En Servicio de la Unidad correspondiente, obligación que quedará cautelada con la Garantía De Fiel Cumplimiento o

Garantía De Vicios Ocultos, según sea el caso de conformidad con la Sección 33.2 de estas Condiciones Generales.

30.5 TRASPASO DE LOS TRABAJOS

La fecha de término indicada en el Certificado De Recepción Provisional Total respectivo marca el momento en que el riesgo de las Obras objeto de dicho certificado, incluyendo, sin limitación, el riesgo de pérdida o destrucción, se transfiere del Contratista a la Empresa, pero sin liberar al Contratista de sus obligaciones establecidas en el Contrato De EPC con respecto al Período De Garantía-Unidad E Instalaciones Comunes Relacionadas respectivo que comienza en ese momento.

En el caso de existir recepciones provisionales parciales, a contar de la emisión del Certificado De Recepción Provisional Parcial respectivo la Empresa podrá empezar a operar el componente del Proyecto objeto de dicho certificado, sin perjuicio de la obligación del Contratista de reparar cualquier defecto que se pudiere detectar en dicho componente hasta la emisión del Certificado De Recepción Provisional Total correspondiente.

De producirse el evento previsto en la Sección 30.4 anterior, la Empresa podrá tomar posesión parcial o total de la Unidad respectiva, previo a la emisión del Certificado De Recepción Provisional correspondiente, sin perjuicio de mantener el Contratista sus obligaciones establecidas en el Contrato De EPC con relación al Período De Garantía-Unidad E Instalaciones Comunes Relacionadas respectivo.

30.6 OPERACIÓN COMERCIAL

Independiente de la recepción provisional total respectiva, terminada la ejecución de las Obras correspondientes a una Unidad y una vez que dicha Unidad, incluyendo sus Instalaciones Comunes Relacionadas, se encuentre probada y funcionando, esto es, efectuadas y aprobadas las Pruebas De Aceptación y Pruebas de Confiabilidad y las demás pruebas que se detallen en el Contrato de EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas, a plena satisfacción de la Empresa, la Unidad correspondiente continuará interconectada con la red entregando su energía al sistema y bajo la operación y mantenimiento de la Empresa o del tercero que ésta contrate para efectos de llevar a cabo la operación y mantenimiento del Proyecto.

Para tales efectos, previamente la Empresa habrá realizado las gestiones correspondientes con el Organismo Coordinador (OC) y la Superintendencia de Electricidad (SIE), estableciéndose las condiciones técnicas y legales para el inicio de la operación comercial de la Unidad correspondiente. Para efectos del Contrato De EPC, la fecha en que la Superintendencia de Electricidad (SIE) haya autorizado la

conexión al Sistema Eléctrico Nacional Interconectado (SENI) de la Unidad correspondiente será referida como "**Fecha de Operación Comercial**".

31. PERÍODO DE GARANTÍA-UNIDAD E INSTALACIONES COMUNES RELACIONADAS

A menos que se establezca un lapso diferente en el Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas, el período de garantía de las Obras correspondientes a cada Unidad, incluyendo sus Instalaciones Comunes Relacionadas, tendrá una duración de doce (12) meses a contar desde la fecha de término indicada en el Certificado De Recepción Provisional Total correspondiente (dicho período, "**Período De Garantía-Unidad E Instalaciones Comunes Relacionadas**").

Durante el Período De Garantía-Unidad E Instalaciones Comunes Relacionadas, las Obras respectivas estarán sujetas a una garantía del Contratista tanto en cuanto al funcionamiento, comportamiento e integridad de las mismas como en lo relativo a los trabajos relacionados con la fabricación, construcción, Montaje E Instalación y Puesta En Servicio de tales Obras y cubrirá todo posible defecto derivado de tales trabajos, de acuerdo con las condiciones que se establecen a continuación:

a) Durante el Período De Garantía-Unidad E Instalaciones Comunes Relacionadas el Contratista deberá, a su propio costo y riesgo y dentro del Programa acordado con la Empresa, completar, corregir y reparar los defectos menores que se hayan detallado en el Certificado De Recepción Provisional Total respectivo, de acuerdo con lo establecido en la Sección 30.3 de estas Condiciones Generales;

b) Durante el Período De Garantía-Unidad E Instalaciones Comunes Relacionadas, la respectiva Unidad y sus Instalaciones Comunes Relacionadas deberán funcionar y operar de acuerdo con las estipulaciones del Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas, sin restricciones ni limitaciones debido a defectos o fallas. Si no se pudiese cumplir durante dicho período con las condiciones anteriores debido a limitaciones, causas y defectos de responsabilidad del Contratista, el Período De Garantía-Unidad E Instalaciones Comunes Relacionadas se prorrogará por un lapso igual al afectado por las limitaciones respectivas. El Período De Garantía-Unidad E Instalaciones Comunes Relacionadas también se prorrogará si, por limitaciones de la Empresa, no se pueden cumplir algunas de las condiciones estipuladas

para esta etapa, siendo sólo en este caso de cargo de la Empresa los costos directos que ello irrogue;

c) Durante el Período De Garantía-Unidad E Instalaciones Comunes Relacionadas, el Contratista deberá reparar a la brevedad posible, a su propio costo y riesgo, todos los defectos y daños que aparezcan, causados por materiales de inferior calidad, defectos en el diseño, fabricación, construcción, Montaje E Instalación u otras causas de su responsabilidad, hasta que el equipo cumpla con las especificaciones del Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas, deberá completar aquella parte de las Obras respectivas no entregada a la fecha de emisión del Certificado De Recepción Provisional Total respectivo;

d) El período de garantía de las partes de equipo o del equipo de reemplazo enviado posteriormente, tendrá la misma duración que el Período De Garantía-Unidad E Instalaciones Comunes Relacionadas y se contará a partir de la fecha de aceptación provisional de dicha parte reparada o equipo reemplazado. Si el reemplazo o reparación de las partes defectuosas origina una paralización, o afecta el funcionamiento conjunto de la respectiva Unidad y sus Instalaciones Comunes Relacionadas, el nuevo plazo de garantía del equipo respectivo o del Período De Garantía-Unidad E Instalaciones Comunes Relacionadas, según sea el caso, será prorrogado por un período igual a esta paralización;

e) Si la Empresa tuviese razones para suponer que existen defectos atribuibles al Contratista, podrá ordenar a éste en cualquier momento, en el Taller del fabricante o en terreno, antes que expire el Período De Garantía-Unidad E Instalaciones Comunes Relacionadas, los desmontajes y remociones necesarios para cerciorarse que los defectos realmente existen. El Contratista deberá efectuar tales trabajos, cuyo costo resultante por concepto de desmontajes, remociones, traslados, montajes, reparaciones o reconstrucciones será por cuenta del Contratista si dichos defectos realmente existen; si no, serán de cargo de la Empresa;

f) El hecho de que la Empresa emita cualquier certificado o inspeccione los materiales o equipos sin plantear observaciones, no liberará al Contratista de sus obligaciones y no modificará en forma alguna las garantías establecidas en el Contrato De EPC;

g) La Empresa podrá usar y explotar, a contar de la emisión del correspondiente Certificado De Recepción Provisional Parcial o Certificado De Recepción Provisional Total, según sea el caso, las Obras correspondientes según estime conveniente, dentro de los límites de operación y de acuerdo con las condiciones de diseño establecidas en el Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas, instrucciones de operación y mantención y las recomendaciones acordadas entre la Empresa y el Contratista; y

h) Las obligaciones de garantía del Contratista no se limitarán al monto de las garantías del Contrato De EPC. El hecho de hacer efectivas las garantías del Contrato De EPC no liberará al Contratista de ninguna de las obligaciones estipuladas en el Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas.

31.2 NOTIFICACIÓN DE DEFECTOS O FALLAS

La Empresa notificará por escrito al Contratista todo defecto, imperfección o falla que se detecte en las Obras respectivas durante el correspondiente Período De Garantía-Unidad E Instalaciones Comunes Relacionadas, debiendo éste tomar las medidas necesarias para proceder al más breve plazo con la reparación, enmienda, reconstrucción, rectificación y reparación que cada caso amerite.

En todo caso, la Empresa estará facultada, en caso de urgencia y después de informar verbalmente, por teléfono o correo electrónico al Contratista, a realizar acciones correctivas por él o por terceros, sin que por ello se afecten las obligaciones de garantía del Contratista.

En el evento de un rechazo de una parte del Proyecto, la Empresa tendrá el derecho, de ser ello técnicamente factible, a usar el Proyecto, o la parte de éste que corresponda, libre de cargo hasta el momento que el Contratista provea un reemplazo adecuado, lo cual deberá efectuar dentro del más breve plazo posible.

31.3 COSTO DE LOS TRABAJOS DE REPARACIÓN

Los trabajos de remoción, reparación y transporte de componentes que hubiere que reemplazar, deberán ser realizados por el Contratista a su propio costo, si éstos se deben al uso de materiales, diseño o mano de obra inadecuados o no concordantes con el Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas, o debido al incumplimiento de cualquier obligación expresa o implícita de dichos documentos, o por negligencia o falta por parte del Contratista.

Los costos resultantes de los trabajos de reparación urgentes efectuados por la Empresa, directamente o a través de terceros, durante el correspondiente Período De Garantía-Unidad E Instalaciones Comunes Relacionadas, deberán ser pagados por el Contratista en un plazo no mayor a treinta (30) Días de la presentación del cobro respectivo por parte de la Empresa.

31.4 MEDIDAS EN CASO DE INCUMPLIMIENTO DEL CONTRATISTA PARA REALIZAR LOS TRABAJOS DE REPARACIÓN

Si el Contratista no hiciese la reparación de los defectos detectados durante el correspondiente Período De Garantía-Unidad E Instalaciones Comunes Relacionadas, o durante el lapso que medie entre la emisión del Certificado De Recepción Provisional Parcial y Certificado De Recepción Provisional Total correspondiente, o no completara las Obras respectivas dentro del plazo requerido por la Empresa, ésta podrá realizar tales Obras, directamente o por intermedio de otros contratistas, sin que lo anterior afecte, de manera alguna, las obligaciones de garantía del Contratista establecidas en el Contrato De EPC.

En tal caso, el Contratista estará obligado a reembolsar a la Empresa los costos incurridos en el plazo que ésta le señale. De no hacerlo, la Empresa estará facultada para descontarlos de cualquier dinero adeudado al Contratista y, si éstos no fuesen suficientes, la Empresa podrá hacer efectiva cualquiera de las garantías del Contrato De EPC e imputar a ellas los montos respectivos.

32. RECEPCIÓN FINAL

Al finalizar el correspondiente Período De Garantía-Unidad E Instalaciones Comunes Relacionadas el Contratista deberá efectuar, con la supervisión del Ingeniero De La Empresa, las mediciones o cálculos necesarios para determinar, sobre la base de los registros de funcionamiento de la Empresa, el grado de disponibilidad de la respectiva Unidad durante dicho Período De Garantía-Unidad E Instalaciones Comunes Relacionadas, la variación que hubieren experimentado (degradación) los parámetros o valores garantizados comprometidos y el pago de las penalidades e indemnizaciones que ello pudiere significar.

La Empresa emitirá el certificado de recepción final de las Obras relacionadas con la Unidad respectiva y sus Instalaciones Comunes Relacionadas ("**Recepción Final**") treinta (30) Días después de terminado el correspondiente Período De Garantía-Unidad E Instalaciones Comunes Relacionadas y, en todo caso, después que (i) todos los trabajos de reparación ordenados durante tal período en virtud de lo establecido precedentemente se hayan terminado a satisfacción de la Empresa y (ii) el Contratista hubiere pagado las multas o compensaciones antes señaladas (dicho certificado, "**Certificado De Recepción Final**").

33. GARANTÍAS

Las garantías que están indicadas en los puntos siguientes sólo pueden ser respaldadas por Entidades Financieras Aceptables. Conforme lo establecido en la Sección 15.2 de las Bases Fase De Ofertas Y Cierre, la garantía debe ser emitida en Dólares con dos cifras decimales al igual que se establece para el monto de las Ofertas Económicas.

La Empresa podrá hacer efectivas estas garantías sin necesidad de autorización o pronunciamiento previo del CMSC o árbitro(s) que se designe(n) de acuerdo con la Sección 34 de estas Condiciones Generales, ni de tribunal alguno. El Contratista no podrá invocar o ejercer ningún derecho o acción tendente a trabar, impedir o dificultar el cobro de los documentos de garantía, sin perjuicio del derecho del CMSC o árbitro(s) que se designe(n) de acuerdo con la Sección 34 de estas Condiciones Generales para conocer todas las demás materias o controversias que se susciten entre las partes con motivo u ocasión del Contrato De EPC.

El monto de las garantías, de hacerse efectivas, deberá ser pagado a la vista, sin deducción de impuestos, gravámenes, tasas, o cualquier otro descuento que pueda afectar la remesa o traspaso de los fondos a la cuenta corriente de la Empresa.

33.1 GARANTÍA DE FIEL CUMPLIMIENTO Y DE BUEN USO DEL ANTICIPO

a) El Contratista proveerá, al momento de la firma del Contrato De EPC, y sin cargo para la Empresa, una garantía de fiel cumplimiento de contrato por un valor total equivalente al cuatro por ciento (4%) del Precio Del Contrato ("**Garantía De Fiel Cumplimiento**").

b) El pago del Anticipo Del Precio Del Contrato al Contratista sólo tendrá lugar una vez que se materialice la entrega por parte de éste y la recepción por la Empresa, a su plena satisfacción, de una carta de garantía bancaria por un monto igual al Anticipo Del Precio Del Contrato ("**Garantía De Buen Uso Del Anticipo**"). Esta Garantía De Buen Uso Del Anticipo junto con la Garantía De Fiel Cumplimiento, "**Garantías De Cumplimiento**". El monto de la Garantía De Buen Uso Del Anticipo será rebajado en la forma y condiciones que se establecen en el Anexo E de estas Condiciones Generales.

En ambos casos, las Garantías De Cumplimiento deberán tener la forma de una fianza o carta de crédito bancaria irrevocable, incondicional y pagadera a la vista, prorrogable a simple requerimiento de la Empresa y emitida por una Entidad Financiera Aceptable, la cual sea aceptada por la Empresa. La Garantía De Fiel Cumplimiento deberá estar vigente hasta sesenta (60) Días después de la fecha prevista

de emisión del Certificado De Recepción Provisional Total de la última Unidad y de sus Instalaciones Comunes Relacionadas. Las Garantías De Cumplimiento deberán establecer expresamente que podrán ejecutarse para el pago de cualquier penalidad, indemnización o monto a que la Empresa tenga derecho de conformidad con el Contrato De EPC.

La Empresa podrá hacer efectiva cualquiera de las Garantías De Cumplimiento en caso de o para, entre otras:

a) Incumplimiento por parte del Contratista de cualquiera de las obligaciones que le impone el Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas;

b) Imputarlas a los gastos en que incurra la Empresa, que sean de cuenta del Contratista, originados por tal incumplimiento;

c) Hacer efectivas las penalidades establecidas en el Contrato De EPC;

d) Imputar el pago de las indemnizaciones por daños y perjuicios contractuales; y/o

e) Pagos derivados del rechazo de las Obras.

Antes de hacer efectiva cualquiera de las Garantías De Cumplimiento, la Empresa comunicará al Contratista las causas que motivan esta acción.

El Contratista se obliga a entregar a la Empresa, con a lo menos quince (15) Días de anticipación a su fecha de vencimiento, los documentos que acrediten la prórroga de la vigencia de la Garantía De Cumplimiento respectiva, lo que será de su costo, en el evento de preverse atrasos en la recepción provisional total de la última Unidad y de sus Instalaciones Comunes Relacionadas. Si tales circunstancias fueren de responsabilidad de la Empresa, el mayor costo que represente la extensión de su plazo de validez será reembolsado por ésta.

La Garantía De Fiel Cumplimiento será devuelta al Contratista, si es que no ha sido cobrada por la Empresa, después de emitido el Certificado De Recepción Provisional Total correspondiente a la última Unidad y sus Instalaciones Comunes Relacionadas y recibida del Contratista la Garantía De Vicios Ocultos.

33.2 GARANTÍA DE VICIOS OCULTOS Y OTRAS GARANTÍAS

Para garantizar el oportuno y fiel cumplimiento de todas y cada una de las obligaciones del Contratista (i) respecto de la primera Unidad y sus Instalaciones Comunes Relacionadas, durante el período que va desde la emisión del Certificado De Recepción Provisional Total correspondiente a la última Unidad y sus Instalaciones Comunes Relacionadas y hasta el vencimiento del Período De Garantía-Unidad E Instalaciones Comunes Relacionadas correspondiente a la primera Unidad y sus Instalaciones Relacionadas y (ii) durante el Período De Garantía-Unidad E Instalaciones Comunes Relacionadas correspondientes a la última Unidad y de sus Instalaciones Relacionadas, el Contratista deberá entregar, como condición previa a los pagos finales que se establezcan en el Contrato De EPC, a la emisión del Certificado De Recepción Provisional Total de cada una de las Unidades y de sus Instalaciones Comunes Relacionadas y a la devolución de la Garantía De Fiel Cumplimiento, una carta de garantía bancaria a la orden de la Empresa por un monto total equivalente al cinco por ciento (5%) del precio final del Contrato De EPC ("**Garantía De Vicios Ocultos**"). Para los efectos descritos, se entenderá como "precio final del Contrato De EPC" el valor que resulte de sumar, al Precio Del Contrato original las cantidades expresamente convenidas por las partes por los aumentos a dicho precio, de conformidad con los términos y condiciones del Contrato De EPC, y de restar las reducciones del mismo que se convinieran expresamente por las partes, de conformidad con los términos y condiciones del Contrato De EPC. La Garantía De Vicios Ocultos deberá ser irrevocable, incondicional, prorrogable a simple requerimiento de la Empresa y pagadera a la vista al primer requerimiento escrito de la Empresa y con vigencia hasta treinta (30) Días después de la fecha prevista para la emisión del Certificado De Recepción Final de la última Unidad y de sus Instalaciones Comunes Relacionadas. La Garantía De Vicios Ocultos deberá establecer expresamente que podrá ejecutarse para el pago de cualquier penalidad, indemnización o monto a que la Empresa tenga derecho de conformidad con el Contrato De EPC. El Contratista deberá entregar la Garantía De Vicios Ocultos a la Empresa por lo menos quince (15) Días antes de expirar la Garantía De Fiel Cumplimiento.

El Contratista se obliga a prorrogar, con a lo menos quince (15) Días de anticipación a su fecha de vencimiento, la vigencia de la Garantía De Vicios Ocultos, a su costo, en el evento de preverse una modificación de cualquiera de los Períodos De Garantía-Unidad E Instalaciones Comunes Relacionadas más allá del período cubierto por la Garantía De Vicios Ocultos. La referida prórroga deberá ser por un período no menor de treinta (30) Días después de la fecha prevista para la extinción del último Período De Garantía-Unidad E Instalaciones Comunes Relacionadas, considerando la referida modificación. Si la circunstancia anterior fuere de responsabilidad de la Empresa, el mayor costo que represente la extensión

de su plazo de validez será reembolsado por ésta. La Garantía De Vicios Ocultos será devuelta al Contratista después de su expiración.

La Empresa podrá hacer efectiva la Garantía De Vicios Ocultos en caso de o para, entre otras causas:

a) Incumplimiento por parte del Contratista de cualesquiera de las obligaciones que le impone el Contrato De EPC, incluyendo, sin limitación, estas Condiciones Generales y las Especificaciones Técnicas, durante cualquiera de los Períodos De Garantía-Unidad E Instalaciones Comunes Relacionadas;

b) Imputarla a los gastos en que incurra la Empresa, que sean de cuenta del Contratista, originados por tal incumplimiento;

c) Hacer efectivas las penalidades establecidas en el Contrato De EPC originados por el referido incumplimiento;

d) Imputar el pago de los daños y perjuicios contractuales originados por el referido incumplimiento; y/o

e) Rechazo de las Obras.

En caso de hacerse efectiva la Garantía De Vicios Ocultos, la Empresa posteriormente comunicará al Contratista la o las causas que motivaron esta acción.

Igualmente el Contratista proveerá, sin cargo para la Empresa y como condición previa a la emisión del Certificado De Recepción Final de la última Unidad y sus Instalaciones Comunes Relacionadas, las cartas de garantía bancarias que cubran el período de garantía de aquellos equipos, piezas o partes que hayan sido reparadas o reemplazadas durante el correspondiente Período De Garantía-Unidad E Instalaciones Comunes Relacionadas o con posterioridad a la emisión del correspondiente Certificado De Recepción Provisional Parcial, según sea el caso.

Estas cartas de garantía deberán cubrir, a lo menos, el costo de los suministros u Obras afectadas y su vigencia corresponderá, asimismo, al lapso del período de garantía respectivo, medido a contar de la fecha de su reposición. Su monto y condiciones se estipularán en el Certificado De Recepción Final de la última Unidad y sus Instalaciones Comunes Relacionadas.

34. RECLAMACIONES, SOLUCIÓN DE CONTROVERSIAS Y ARBITRAJE

34.1 RECLAMACIONES DE CUALQUIERA DE LAS PARTES

Todas las reclamaciones, disputas, diferencias, problemas, desacuerdos o controversias de cualquier tipo que surjan, se relacionen o deriven, de cualquier forma, del Contrato De EPC y de toda enmienda al mismo o relativa al mismo, incluyendo en particular, su formación, validez, obligatoriedad, interpretación, ejecución, incumplimiento o terminación, así como las reclamaciones extra-contractuales derivadas del mismo (en adelante, de manera colectiva, "**Reclamación**") deberán ser resueltas únicamente por medio de los procedimientos establecidos en esta Sección 34. Las Partes se comprometen a establecer un Comité Mixto de Solución de Controversias ("**CMSC**") bajo la modalidad de "Dispute Review Board" (DRB), conforme al Reglamento de la Cámara de Comercio Internacional "relativo a Dispute Boards" vigente a la fecha de firma del Contrato De EPC ("**Normas Del CCCCI**"), las que se considerarán incorporadas al Contrato De EPC. El CMSC poseerá la facultad para resolver cualquier Reclamación. El CMSC estará integrado por tres (3) miembros designados de conformidad con las Normas Del CCCCI. El asiento del CMSC será en Santo Domingo de Guzmán, Distrito Nacional, capital de la República Dominicana El lenguaje a ser usado será el español.

Toda Reclamación deberá presentarse, en primera instancia, al CMSC según lo estipulado en las Normas Del CCCCI. En el caso de cualquier Reclamación, el CMSC emitirá una recomendación al respecto, de conformidad con las Normas Del CCCCI.

Si una de las partes no acatacumple con alguna recomendación emitida por el CMSC, de conformidad con las Normas Del CCCCI, la otra parte podrá someter dicho incumplimiento a arbitraje. Si una parte notifica por escrito la otra y al CMSC su desacuerdo con una recomendación según lo dispuesto en las Normas Del CCCCI, o bien si el CMSC no ha emitido una recomendación en el plazo previsto en las Normas Del CCCCI, o incluso si el CMSC es disuelto conforme a las Normas Del CCCCI, la reclamación resuelta definitivamente mediante arbitraje..

El arbitraje será conducido de conformidad con el Reglamento de Arbitraje de la Cámara de Comercio Internacional vigente al momento en que surja la Reclamación de que se trata. El tribunal arbitral estará integrado por tres (3) árbitros, quienes deberán tener reconocida experiencia respecto de la materia objeto de la Reclamación. Cada una de las partes elegirá un (1) árbitro conforme los plazos previstos en el Reglamento de Arbitraje aplicable y el tercero será elegido de común acuerdo entre las partes, en un plazo máximo de treinta (30) Días, contados a partir de la fecha de nombramiento del segundo árbitro quien fungirá como presidente del tribunal arbitral. En caso de que Las Partes no se pongan de acuerdo en la

designación del tercer árbitro dentro del plazo antes indicado, la Cámara de Comercio Internacional (CCI), hará el nombramiento a solicitud de cualquiera de las Partes. La sede del arbitraje será el Estado de Nueva York, de los Estados Unidos de América y la legislación aplicable será la Legislación Dominicana. El lenguaje a ser usado será el español. El laudo que dicte el tribunal arbitral tendrá el carácter de definitivo. Todas las comunicaciones, avisos, audiencias, órdenes, resoluciones, pruebas e información relacionada con el arbitraje y la Reclamación correspondiente tendrán el carácter de confidencial para todas las partes envueltas en el arbitraje, incluyendo las partes y los árbitros designados. Asimismo, las Partes renuncian al uso del árbitro de emergencia.

Ninguna de las partes estará limitada en cuanto a arbitraje por los puntos de vista, pruebas o argumentos presentados ante el CMSC. Cualquier determinación de un CMSC será admisible como prueba del arbitraje.

Luego de la Recepción Final Del Proyecto, las partes podrán presentar Reclamaciones directamente a arbitraje, lo cual quedará enteramente a su discreción.

35. FUERZA MAYOR

Para efectos del Contrato De EPC, "**Fuerza Mayor**" significará cualquier acontecimiento, evento o circunstancia, o combinación de acontecimientos, eventos o circunstancias, que (a) estén más allá del control razonable de la parte afectada, con carácter impredecible, irresistible e inevitable, y sin que éste envuelva la negligencia o falta de la parte afectada, y (b) que afecten sustancial y adversamente el cumplimiento por dicha parte afectada de sus obligaciones por virtud del Contrato De EPC, siempre y cuando la parte afectada no pueda haber previsto, o habiendo previsto no ha podido evitar, superar o remediar dicho efecto sustancial y adverso, de manera total o parcial, mediante el ejercicio de diligencia o cuidado razonable. Se entenderá que diligencia o cuidado razonable incluye (i) actos y actividades con la finalidad de proteger el desarrollo de las Obras contra un evento de casualidad, (ii) actos y actividades que sean razonables a la luz de la probabilidad de tal evento, (iii) el efecto probable de tal evento, si ocurriese y (iv) la probable eficacia de las medidas de protección.

La parte afectada por un evento de Fuerza Mayor deberá tomar a la mayor brevedad posible, las medidas requeridas para minimizar los efectos/consecuencias de dicho evento.

Se considerará Fuerza Mayor cada uno de los siguientes eventos y circunstancias en la medida en que afecten el cumplimiento de las obligaciones de una de las partes contratantes:

a) Guerra (declarada o no), conflicto armado o amenaza del mismo (incluyendo ataques hostiles, bloqueo, embargo militar, hostilidades, invasión, acto de un enemigo extranjero, importante movilización militar;

b) Guerra civil, disturbios y revolución, usurpación del poder o golpe militar, insurrección, conmoción o desorden civil, violencia colectiva o acto de desobediencia civil;

c) Acto de terrorismo;

d) Caso fortuito, plagas, epidemias y desastres naturales, tales como tormentas violentas, ciclones, tifones, huracanes, tornados, terremotos, derrumbes, maremotos, tsunamis, inundaciones; y

e) Disturbios laborales en la República Dominicana.

Fuerza Mayor no incluirá cualquiera de los eventos siguientes:

f) Dificultades económicas;

g) Cambios de las condiciones del mercado;

h) Declaración en huelga, parálisis de labores, obstaculización del ingreso al Sitio, o cualquier otro conflicto, por cualquier causa o motivo, que pueda tener el personal del Contratista o el de sus Subcontratistas y/o proveedores;

i) Cualquier evento causado por negligencia o acción intencional de la parte que invoca el evento de Fuerza Mayor;

j) Cualquier evento que pudo haber sido tomado en cuenta por la parte afectada al momento de firmar o de ejecutar el Contrato De EPC para evitar incumplimiento de sus obligaciones;

k) Entrega atrasada de maquinaria, equipos, materiales, piezas o bienes para el Proyecto; y/o

l) Las resoluciones emanadas de una Autoridad competente que tengan su origen en actos u omisiones del Contratista, Subcontratistas y/o de sus proveedores, su respectivo personal, en cada caso, que contravengan la Legislación Dominicana vigente o cualquier otra legislación.

Sólo se podrá invocar un evento de Fuerza Mayor cuando el acontecimiento que está demorando, impidiendo o frustrando la realización de los trabajos no puede ser imputado a la parte que lo invoca. Al encontrarse completa o parcialmente incapaz de llevar a cabo sus obligaciones bajo el Contrato De EPC a causa de Fuerza Mayor, la parte afectada deberá (a) notificar a la otra parte sobre la Fuerza Mayor correspondiente tan pronto como sea factible, pero en cualquier caso, a más tardar dentro del plazo de cuarenta y ocho (48) horas después de la ocurrencia del evento de que se trata o desde la fecha en que puedan determinarse razonablemente los efectos de su ocurrencia o veinticuatro (24) horas luego de que sea reanudada alguna manera de proveer notificaciones entre las partes después de dicha ocurrencia ("**Notificación Inicial De Fuerza Mayor**"), y (b) proveer a la otra parte de una segunda notificación que se hará por escrito, con acuse de recibo, y que describa la Fuerza Mayor correspondiente con detalles razonables y al grado en que se pueda determinar al momento de tal notificación ("**Notificación-Detalle De Fuerza Mayor**"). La Notificación-Detalle De Fuerza Mayor deberá ser provista tan pronto como sea posible, pero en cualquier caso a más tardar dentro del plazo de cinco (5) Días luego de la Notificación Inicial De Fuerza Mayor. La Notificación-Detalle De Fuerza Mayor deberá contener (i) una evaluación preliminar de las obligaciones afectadas, (ii) un estimado preliminar del período de tiempo en el cual la parte afectada será incapaz de cumplir con tales obligaciones, (iii) las medidas a ser implementadas para remediar los efectos del evento de Fuerza Mayor, y (iv) cualquier otro asunto, información o documentación de relevancia que permita una adecuada evaluación de la Fuerza Mayor alegada, incluyendo los datos señalados en la sección 14.2 de estas Condiciones Generales. De no notificarse en el tiempo y forma previstos en esta Sección 35, se considerará que la Fuerza Mayor no ha tenido efecto alguno.

Si el evento de Fuerza Mayor llegare a tener una duración que se estime pueda exceder de ciento ochenta (180) Días, las partes estipularán de mutuo acuerdo las condiciones adecuadas para la continuación o término del Contrato De EPC.

La parte en cuyo favor la invocación de la Fuerza Mayor resulte procedente, de conformidad con la presente Sección 35, (a) será liberada de (i) su deber de cumplir con las obligaciones contractuales afectadas por el evento de Fuerza Mayor, durante la duración de dicho evento, (b) de toda responsabilidad por daños o cualquier otro recurso contractual derivado del no cumplimiento de las obligaciones contractuales afectadas por el evento de Fuerza Mayor correspondiente, durante la duración de dicho evento, y (c) podrá solicitar modificación de plazos de conformidad con la Sección 14.2 de estas Condiciones Generales, en ambos casos a partir de la Notificación Inicial De Fuerza Mayor.

36. CONFIDENCIALIDAD

En lo que respecta a la información técnica y de negocios que cada una de las partes reciba de la otra parte, y en los casos en que la parte que proporciona la información expresamente especifique el carácter confidencial de dicha información o cuyo carácter confidencial pueda asumirse con base en las circunstancias en que se proporcionó la información, las partes podrán emplear dicha información únicamente para los propósitos que ésta fue proporcionada, la manejarán como si se tratara de sus propios secretos de negocios, y no la proporcionaran ni la hará disponible a terceros, a menos que la referida información:

a) Esté disponible a nivel general en fuentes públicas o del dominio público;

b) Haya sido proporcionada en cualquier momento por cualquier tercero sin obligación de confidencialidad hacia la otra parte;

c) Haya sido desarrollada de forma independiente por la parte que recibe la información sin basarse en la información confidencial de la otra parte o haya sido del conocimiento de la parte que recibe la información antes de que esta fuera revelada por la otra parte y todo ello sea comprobable; o

d) Deba ser revelada a terceros para efectos de la ejecución del Contrato De EPC, siempre y cuando dichos terceros sean o se vuelvan objeto de una obligación de confidencialidad equivalente.

Independientemente de las disposiciones de la presente Sección, cualquier parte podrá revelar cualquier información confidencial en la medida en que ello sea necesario para cumplir cualquier ley, norma o disposición, cualquier orden, decreto, citatorio, fallo, resolución legal, o cualquier otro proceso similar de cualquier corte, tribunal, tribunal de arbitraje o instrumento gubernamental, o de cualquier bolsa de valores. Antes de que tal información sea revelada, la parte que proporciona la información deberá, notificar por escrito a la parte que inicialmente reveló la información con respecto a cualquier solicitud de ese tipo, de manera que la parte que inicialmente reveló la información pueda obtener una orden de protección o tomar cualquier otra medida apropiada. La parte que proporciona la información deberá cooperar para minimizar la revelación de información confidencial y deberá aunarse a cualquier esfuerzo de la parte que busca proteger la información para obtener un tratamiento privado y confidencial por parte del tercero a quien se revela la información confidencial, o para obtener órdenes de protección que limiten la diseminación y el uso de la información confidencial. Nada de lo aquí estipulado impedirá que

cualquiera de las partes ponga objeciones legítimas a las normas, disposiciones u órdenes que exijan la revelación de información confidencial.

La obligación de confidencialidad que se establece en esta Sección se aplicará tanto a las partes, su respectiva Casa Matriz y Afiliada(s), como a sus asociados, empleados, agentes, consultores y demás personas que necesariamente deban tener conocimiento del Proyecto.

Las publicaciones de cualquier tipo que el Contratista realice y que se refieran al Contrato De EPC y/o a las Obras requerirán la aprobación previa y por escrito de la Empresa.

37. COHECHO, OBSEQUIOS, INCENTIVOS O RECOMPENSAS

Las partes garantizarán, atestiguarán y avalarán en el Contrato De EPC que, a la fecha del mismo, ninguna de ellas, ni sus agentes, funcionarios o cualquier tercero en su nombre ha ofrecido, dado, pedido, solicitado o aceptado ninguna forma de cohecho, obsequio, incentivo o recompensa pecuniaria o cualquier otra ventaja de cualquier tipo (ni insinuado o dado a entender que harían o podrían hacer tal cosa en el futuro) de ninguna manera relacionada con el Contrato De EPC.

Las partes deberán, en todo momento durante el curso del Contrato De EPC, cumplir y garantizar que sus agentes, empleados y funcionarios cumplan con la versión más reciente de las Disposiciones de la Cámara de Comercio Internacional para combatir la extorsión y el cohecho en las transacciones internacionales, las que se entenderán incorporadas al Contrato De EPC como si estuviesen escritas en el mismo en su totalidad.

Independientemente de cualquier ley aplicable, los fraudes u otras conductas ilegales no eximirán a ninguna de las partes de las responsabilidades del Contrato De EPC a menos que tal conducta prive a la otra parte del beneficio total del Contrato De EPC como resultado de la acción denunciada, y siempre y cuando la parte quejosa haya puesto término al Contrato De EPC de conformidad con el mismo.

38. MODIFICACIONES A LAS CONDICIONES DEL CONTRATO DE EPC; PROHIBICIÓN O INVALIDACIÓN DE ALGUNA CLÁUSULA

Sin perjuicio de las atribuciones establecidas en el Artículo 31 de la Ley No. 340-06, cualquier modificación al Contrato De EPC deberá hacerse por escrito. Ninguna modificación ni acción por escrito de cualquiera de las partes será efectiva para modificar el Contrato De EPC a menos que las partes así lo hayan acordado expresamente o reconocido en comunicaciones escritas entre ellas emitidas de conformidad con el Contrato De EPC.

En caso de que cualquier disposición o condición del Contrato De EPC y/o cualquiera de sus anexos fuera prohibida o invalidada, tal prohibición o invalidación no afectará la validez o cumplimiento de cualquier otra disposición o condición del Contrato De EPC correspondiente o ejecución del mismo en una jurisdicción donde no sea prohibida o invalidada. Asimismo,, la disposición o condición respectiva será reemplazada mediante (i) un acuerdo entre las partes, (ii) una recomendación del CMSC, o (iii) una decisión del tribunal arbitral, por una disposición o condición válida o aplicable que provea el mismo resultado o uno similar.

39. ALEGATO DE FALTA DE CAPACIDAD

Cada parte garantizará a la otra que una vez que las Obras hayan comenzado de conformidad con el Contrato De EPC, no alegará que la persona o personas que suscribieron el Contrato De EPC en nombre de esa parte carecía(n) de la capacidad o autoridad para celebrar el mismo, o que existió alguna otra causa formal de invalidación o incapacidad que afecta la validez o cumplimiento del Contrato De EPC. En particular, la falta real o presunta de autorizaciones o permisos de órganos corporativos, gubernamentales o administrativos no excusará el incumplimiento del Contrato De EPC en que incurriera cualquiera de las partes.

Si alguna de las partes no posee personalidad jurídica propia conforme a las leyes que rigen su estatuto, la definición de parte obligada por el Contrato De EPC incluirá a cualquier organización de la que ésta sea parte y que si tenga una personalidad jurídica propia.

40. CESIÓN DE CONTRATO DE EPC

Ninguna de las partes podrá, ceder ni traspasar a ningún tercero, ni en todo ni en parte, los derechos, beneficios y obligaciones, relativos al Contrato De EPC, sin contar con la aprobación expresa, previa y por escrito de la otra parte.

La subcontratación, en los términos del Contrato De EPC, no se considera como cesión.

[El resto de la página ha sido dejado en blanco de manera intencional]

ANEXO A

PERMISOS DE RESPONSABILIDAD DEL CONTRATISTA

1. Permisos municipales;
2. Permisos viales;
3. Permisos para el manejo y acopio de combustibles durante la construcción del Proyecto;
4. Permisos sanitarios durante la construcción del Proyecto;
5. Permisos para descarga de efluentes al mar durante la construcción del Proyecto; y
6. Todos los permisos relacionados con la construcción del Proyecto derivados del Estudio de Impacto Ambiental del Proyecto.

ANEXO B

PERMISOS DE RESPONSABILIDAD DE LA EMPRESA

1. Licencia Ambiental;
2. Concesiones marítimas para el puerto y obras marinas;
3. Permisos de construcción de obras marinas;
4. Concesión eléctrica;
5. Servidumbres eléctricas; y
6. Servidumbres de acceso al Terreno.

ANEXO C

CONDICIONES PARA LA VIGENCIA Y VALIDEZ DEL CONTRATO DE EPC

1. La aprobación del Contrato De EPC por el Congreso Nacional de la Republica Dominicana.

2. Otras a ser establecidas durante el proceso de negociación del Contrato De EPC.

ANEXO D

CONDICIONES PARA EL INICIO DE LAS OBRAS

1. Que la Empresa haya recibido, a su entera satisfacción, las Garantías De Fiel Cumplimiento;

2. Que la Empresa haya entregado al Contratista un certificado estableciendo que se encuentra facultada para efectuar cualquier pago de sus obligaciones bajo el Contrato De EPC, presentes y futuras, a ser efectuados con fondos provenientes del(de los) Contrato(s) De Financiamiento;

3. Que el Contratista haya recibido la posesión del Sitio para efectos de llevar a cabo las Obras pertinentes;

4. Que el Contratista haya recibido el pago del Anticipo Del Precio Del Contrato;

5. Que el Contratista haya acreditado a satisfacción de la Empresa la contratación de todos y cada uno de los seguros establecidos en la Sección 17 de estas Condiciones Generales;

6. Que el Contratista haya recibido, de conformidad con el Contrato De EPC, la correspondiente orden de proceder con las Obras por parte de la Empresa ("**Orden De Proceder**"); y

7. Que se encuentren otorgados los permisos, certificaciones ambientales y autorizaciones necesarias para el inicio de las Obras de conformidad con la Sección 3.4 de estas Condiciones Generales.

ANEXO E

CONDICIONES Y FORMA DE PAGO DEL PRECIO DEL CONTRATO

1. El monto del Contrato será el de la Oferta Económica Adjudicada, el cual deberá formularse en base a los precios vigentes al mes anterior al de la fecha de dicha Oferta.

2. La Empresa procederá a realizar un primer pago correspondiente al Anticipo, el cual será por el monto de Ciento Cincuenta millones de Dólares (US$150,000,000.00) acorde incluido en el Presupuesto de Ingresos y Ley de Gastos Públicos para el año 2013. Este pago se hará en una sola partida dentro de los treinta (30) días posteriores a la fecha en que el Estado Dominicano concluya los contratos de adjudicación y se obtenga la aprobación Congresual correspondiente.

3. La entrega del Anticipo del Oferente Adjudicatario se hará contra la entrega por parte de éste de la Garantía de Buen Uso del Anticipo correspondiente a la totalidad del Anticipo.

4. La suma restante será pagada en pagos parciales, en base a los hitos definidos y a cubicaciones mensuales por Obras y suministros realizados, por costos fijos mensuales (unidad por mes) o como avance de las partidas presupuestadas acorde al Precio adjudicado.

5. Todos los pagos serán realizados oportunamente en Dólares de los Estados Unidos de América, según se determine en el Contrato y conforme al avance de Obras, que será legitimado mediante informes certificados por la Supervisión del Proyecto.

ANEXO F

IMPUESTOS Y EXENCIONES

Para fines de este documento, los temas referentes a Impuestos y Exenciones recibirán un tratamiento similar al establecido en la sección 7.1 del documento Bases Fase De Oferta Y Cierre

ANEXO G

LÍMITES DE LOS SEGUROS

Para fines de este Anexo G, los limites y montos aquí incluidos deberán ser considerados indicativos, ya que los mismos serán revisados con un asegurador local aceptado por las Partes.

Seguro	Especificaciones Aplicables
* Seguro Responsabilidad Civil-Vehículos (USD)	*[USD 150.000]*
* Seguro de Equipo Móvil (USD)	*[USD 2.000.000]*
* Seguro de Todo Riesgo de Construcción y Montaje	
-Límite	Monto Total del Precio Del Contrato
-Cobertura Mínima por Amplio Mantenimiento(Años)	5 Años
- Cobertura de Responsabilidad Civil	USD 20.000.000
* Todo Riesgo de Construcción y Montaje-Extensiones (USD):	
-Remoción de Escombros	5% de la pérdida con un máximo de US$ 30.000.000.
-Gastos de aceleración incluyendo flete aéreo	US$ 10.000.000
-Transporte terrestre y almacenamiento fuera de obra para suministros nacionales	10% del valor asegurado
-Honorarios profesionales	US$ 4.000.000

-Reposición archivos, planos y documentos	US$ 3.000.000
* Cobertura Seguro ALOP por Seguro Todo Riesgo de Construcción y Montaje	[A ser calculado en base a: USD/Año x Meses]
* Seguro de Transporte Marítimo/Aéreo/Terrestre de Importación.	Equivalente a su valor CIF. Deducible no superior a USD20.000 por evento.
* Seguro ALOP	[A ser calculado en base a: USD/Año x Meses]

ANEXO H

MONTO DE LAS PENALIDADES

Monto por Día de Atraso Respecto de:

1. Plazo Total:	0.05% del Precio del Contrato
Máximo:	10% del Precio Del Contrato

Indemnización por Falla en el Cumplimiento de las Pruebas de Aceptación	**Sección 00 43 23 de las Especificaciones Técnicas**
Capacidad (Potencia) Neta Garantizada- kW	[10,500.00USD/kW] Dólares por cada kW de menor potencia alcanzada respecto del valor de garantía ofrecido por el Contratista bajo las condiciones de las Especificaciones Técnicas
Rechazo	Deficiencia de hasta 5% de menor potencia neta respecto del valor garantizado (Formulario TS-01)
Capacidad (Potencia) Neta Mínima de Operación Continua y en Automático de la Unidad –kW	[2,000.00USD/kW] Dólares por cada kW de mayor potencia alcanzada respecto del valor de garantía ofrecido por el Contratista bajo las condiciones de las Especificaciones Técnicas
Rechazo	Si la potencia mínima excede en 10% el valor garantizado (Formulario TS-01)
Rendimiento Térmico (Heat Rate) Neto Garantizado- BTU/kWh	[446,000.00USD/(BTU/kWh)] Dólares por cada BTU/kWh de mayor Heat Rate Neto alcanzado respecto del valor de garantía ofrecido por el Contratista bajo las condiciones de las Especificaciones Técnicas
Rechazo	Si el mayor Heat Rate excede de 5% el valor garantizado (Formulario TS-01)
Consumo de Cal para Desulfurización (lb/hr)	[8,000.00USD/(lb/hr)] Dólares por cada lb/hr de mayor consumo de cal alcanzado respecto del valor de garantía ofrecido por el Contratista bajo las condiciones de las

	Especificaciones Técnicas.
Rechazo	Si el consumo de cal excede de 20% en valor garantizado (Formulario TS-01)
Valores de Emisión de PM, SO2 y NOx	Se considerará como no aceptable el desempeño del(de los) equipo(s) correspondiente(s) si el valor de emisión medido respecto del valor de garantía ofrecido por el Contratista bajo las condiciones de las Especificaciones Técnicas, excede el valor garantizado correspondiente. En ese caso deberá corregir el funcionamiento del(de los) equipo(s) correspondiente(s) o pagar el equivalente al costo de reemplazo del(de los) equipo(s) y materiales requeridos.
Límite de Indemnización	**20% del Precio Del Contrato**

ANEXO I

RANGOS DE ACEPTACIÓN

De acuerdo con la Sección 01 45 16-Page 2-"L" de las Especificaciones Técnicas.

TABLE 1 – PLANT GUARANTEES*		
	UNITS	CONTRACTOR DATA
PERFORMANCE GUARANTEES (Each Per Unit)		
Guaranteed Net Electrical Output (Measured on the 345 kV side of the Unit Generator Step-up Transformer)	kW	
Guaranteed Minimum Load (Measured on the 345 kV side of the Unit Generator Step-up Transformer)	kW	
Guaranteed Net Heat Rate	Btu/kWh	
CONSUMPTION GUARANTEES (Each Per Boiler Unless Otherwise Noted)		
Guaranteed Lime Consumption	lb/hr	
GUARANTEED EMISSIONS (Each Per Boiler)		
NOx	mg/Nm^3	
SO_2	mg/Nm^3	
PM	mg/Nm^3	
* Guarantees based on Guarantee Conditions specified in Section 01 45 16.		

TABLE 2 – PLANT PERFORMANCE* (EACH UNIT)				
	Units	Maximum Continuous Rating (MCR)	75% Load	Minimum Load
PERFORMANCE PREDICTED				
Gross Electrical Output (measured at generator output terminals)	kW			
Net Electrical Output (measured on 345 kv side of unit generator step-up transformer)	kW			
Unit auxiliary power consumption	kW			
Unit auxiliary power (kW) = Gross Electrical Output (kW) – Net Electrical Output Unit auxiliary loads exclude site auxiliary loads served from the site utility service switchgear.				
Net heat rate	Btu/KWh			
Turbine heat rate	Btu/KWh			
Coal consumption	lb/hr			
OFF FREQUENCY OPERATION CAPABILITY				
Provide data and associated capability curves as an attached document to the proposal to demonstrate off frequency operation capability of the Unit.				
GUARANTEED EMISSIONS				
NOx	mg/Nm^3			
SO_2	mg/Nm^3			
PM	mg/Nm^3			
*Based on Guarantee Conditions specified in Section 01 45 16.				

TABLE 3 – STEAM GENERATING PERFORMANCE (EACH BOILER)					
Based on Performance Fuel unless noted otherwise	Units	MCR	Guaranteed Load	75% Load	Minimum Load
BOILER EFFICIENCY					
Heat Input	MBtu/hr				
Excess air at Economizer Outlet	%				
Boiler Efficiency	%				
STEAM AND WATER FLOWS					
Economizer Inlet	lb/hr				
Continuous Blowdown	lb/hr				
Finishing Superheater Outlet	lb/hr				
Superheater Attemperator Inlet	lb/hr				
Reheater Attemperator Inlet	lb/hr				
Reheater Outlet	lb/hr				
STEAM AND WATER PRESSURES (excluding static head, unless noted otherwise)					
Economizer inlet	psia				
Drum	psia				
Superheater Outlet	psia				
Reheater Inlet	psia				
Reheater Outlet	psia				
STEAM AND WATER TEMPERATURES					
Economizer inlet	°F				
Superheater Outlet	°F				
Reheater Outlet	°F				
GAS AND AIR TEMPERATURES					
Furnace Exit Gas Temperature	°F				
Economizer Outlet/Air Heater Inlet Gas	°F				
Air Heater Outlet Gas (undiluted)	°F				
Air Heater Outlet Gas (diluted)	°F				
Scrubber Outlet/Baghouse Inlet	°F				
Primary and Secondary Air at Fan Inlet	°F				
Primary Air at Air Heater Outlet	°F				
Secondary Air at Steam Coil Air Heater Outlet/Air Heater Inlet	°F				
Secondary Air at Air Heater Outlet	°F				
Air Heater Average Cold End Temperature	°F				
GAS AND AIR FLOWS					
Economizer Outlet/Air Heater Inlet	lb/hr				
Air Heater Outlet/Polishing Scrubber Inlet	lb/hr				
Primary Air at Fan Outlet/Air Heater Inlet	lb/hr				
Primary Air at Air Heater Outlet	lb/hr				
Secondary Air at Fan Outlet/Air Heater Inlet	lb/hr				
Secondary Air at Air Heater Outlet	lb/hr				

TABLE 4 –FUEL, ASH, AND REAGENT CONSUMPTION (EACH BOILER)			
	Unit	MCR with Performance Fuel	MCR with worst case Design fuel
Coal	lb/hr		
Economizer ash	lb/hr		
Fly ash	lb/hr		
Bottom ash	lb/hr		

TABLE 5 – STEAM GENERATING EQUIPMENT (EACH BOILER)		
	Units	
EXPECTED SUPPLIER		
Primary		
FUEL EQUIPMENT		
Number of Fuel Silos	Ea.	
Active Storage (Performance Fuel at MCR)	Hours	
Active Storage (Performance Fuel at MCR)	cu. ft	
Number of Fuel Feeders	Ea.	
Number of Fuel Feeders required (Performance Fuel at MCR)		
Maximum Capacity of each Fuel Feeders	lb/hr	
Fuel Feeder Turndown Ratio		
Number of Startup Burners	Ea.	
Maximum Capacity of each Startup Burners	MBtu/hr	
Startup Burners Turndown Ratio		
PRIMARY AIR FAN		
Number of Fans Furnished	Ea.	
Number of Fans Required	Ea.	
Mass Flow Rate (115% minimum Test Block margin)	lb./hr	
Volume Flow Rate	ACFM	
Pressure Head	in H20	
Fan Total Efficiency	%	
Power at Fan Shaft	bhp	
Fan Speed	rpm	
Fan Motor Power	hp	
SECONDARY AIR FAN		
Number of Fans Furnished	Ea.	
Number of Fans Required	Ea.	
Mass Flow Rate (115% minimum Test Block margin)	lb./hr	
Volume Flow Rate	ACFM	
Pressure Head	in H20	
Fan Total Efficiency	%	
Power at Fan Shaft	bhp	
Fan Speed	rpm	
Fan Motor Power	hp	
INDUCED DRAFT FAN		
Number of Fans Furnished	Ea.	
Number of Fans Required	Ea.	
Mass Flow Rate	lb./hr	
Volume Flow Rate	ACFM	
Pressure Head	in H2O	
Fan Total Efficiency	%	
Power at Fan Shaft	bhp	
Fan Speed	rpm	
Fan Motor Power	hp	
MISCELLANEOUS		
Minimum load for boiler emissions control	% MCR	

TABLE 5 – STEAM GENERATING EQUIPMENT (EACH BOILER)		
	Units	
Minimum load for AQCS emissions control	% MCR	
Minimum load for stable operation without gas burners on Design Fuel	% MCR	
Maximum ramp rate	% load/min	
Furnace width	ft	
Furnace depth	ft	
Furnace height	ft	
Volumetric liberation rate	Btu/hr/cu. ft.	
Effective Projected Radiant Surface (EPRS) release rate	Btu/hr/sq. ft.	
Input per plan area	Btu/hr/sq. ft.	

TABLE 6 – AIR QUALITY CONTROL EQUIPMENT DATA		
	Units	Data
AIR QUALITY CONTROL SYSTEM (AQCS) DESIGN BASIS (PER UNIT)		
Inlet Gas Mass Flow	lb/hr	
Inlet Gas Volumetric Flow	acfm	
Inlet Gas Design Temperature (for 60 minutes duration)	°F	
Inlet Gas Minimum Operating Temperature	°F	
Inlet Gas Maximum Operating Temperature	°F	
Structural Design Temperature (excursion temperate for air heater stopped rotor not exceeding 10 minutes)	°F	
Inlet Particulate	lb/hr	
Draft Pressure Design Baghouse	in H2O	
BAGHOUSE EQUIPMENT (PER UNIT)		
Gross Air-to-Cloth Ratio (Performance Fuel at MCR, all compartments in service)		
Net Air-to-Cloth Ratio (one compartment out of service)		
Bag Continuous Temperature Rating	°F	
Bag Short Term Duration Temperature Rating	°F for __ min	
Number of Hoppers	Ea.	
Hopper Slope	Degrees	
Hopper Heater Power per Hopper	kW	
Hopper capacity each (Performance Fuel at MCR)	Hr	
Hopper capacity each (Performance Fuel at MCR)	cu. Ft	
BRINE EQUIPMENT (PER BOILER)		
Brine Tank Capacity	gal	
HYDRATED LIME EQUIPMENT (PER BOILER)		
Number of Hydrated Lime Silos	Ea.	
Active Storage (worst case Design Fuel, MCR) each	lb.	
Active Storage (worst case Design Fuel, MCR) each	cu. ft	
Number of Hydrated Lime Feeders	Ea.	
Capacity of each Hydrated Lime Feeder	lb/hr	
Number of Hydrated Lime Feeders Required (Performance Fuel at MCR)	Ea.	
Hydrated Lime Feeder Turndown		
AQCS FLUIDIZING AIR EQUIPMENT (PER BOILER)		
Number of Low Pressure Fluidizing Air Blowers	Ea.	
Low Pressure Fluidizing Air Blower Capacity each	lb./hr	
Number of Low Pressure Fluidizing Air Heaters	Ea.	
Capacity of Low Pressure Fluidizing Air Heaters each	kW	
Number of Medium Pressure Fluidizing Air Blowers	Ea.	
Medium Pressure Fluidizing Air Blower Capacity each	lb./hr	
Number of Medium Pressure Fluidizing Air Heaters	Ea.	
Capacity of Medium Pressure Fluidizing Air Heaters each	kW	
AQCS ASH RECIRCULATION EQUIPMENT (PER UNIT)		
Number of Ash Surge Bins	Ea.	
Capacity of Ash Surge Bins (Performance Fuel at MCR, 2 hr) each	lb.	
Capacity of Ash Surge Bins (Performance Fuel at MCR, 2 hr) each	cu. ft	
ELEVATOR (PER UNIT)		
Number of Elevators	Ea.	
Manufacturer		
Net Capacity	lb.	
Speed	fpm	
Platform Size (L x W)	ft	

TABLE 6 – AIR QUALITY CONTROL EQUIPMENT DATA		
	Units	
Cab Height	ft	
No. of Stops	qty	

TABLE 7 – STEAM TURBINE CYCLE EQUIPMENT DATA (EACH UNIT)		
	Units	Data
STEAM TURBINE		
Expected Supplier(s)		
Primary		
Secondary		
Heaviest piece handled after erection	lb	
Nameplate Capacity	kW	
Turbine Speed	rpm	
Throttle Steam Pressure	Psig	
Throttle Steam Temperature	Deg F	
Length of last stage blading	in.	
Size of Low Pressure (LP) exhaust opening	ft.-in.	
Maximum allowable turbine back pressure for stable operation	in. HgA	
Performance		
Turbine generator gross output at Guarantee Conditions for Net Heat Rate	kW	
Turbine heat rate at Guarantee Conditions for Net Heat Rate	Btu/kWh	
Calculated capacity at Valves Wide Open (VWO), and Guarantee Conditions for Net Heat Rate	kW	
Average LP exhaust velocity at Guarantee Conditions for Net Heat Rate	fps	
Approximate minimum load for which unit can operate continuously.	kW	
Expected no-load throttle flow	lb/hr	
Minimum cooling steam flow	lb/hr	
Maximum exhaust temperature at no-load throttle flow	°F	
Generator rating, kVA with full stator cooling water flow at hydrogen pressure	kVA	
Expected hydrogen usage	cubic ft./day	
BALANCE OF PLANT (BOP) EQUIPMENT		
Piping Materials		
Main Steam		
Hot Reheat		
Cold Reheat		
Boiler Feedwater		
Condenser		
Expected Supplier(s)		
Primary		
Secondary		
Tube Material		
Hotwell Active Storage Volume	Cubic ft	
Condensate Pumps		
Expected Supplier(s)		
Primary		
Secondary		
Number and capacity	%	
Boiler Feed Pumps		
Expected Supplier(s)		
Primary		

TABLE 7 – STEAM TURBINE CYCLE EQUIPMENT DATA (EACH UNIT)		
	Units	
Secondary		
Number and capacity	%	
Booster Boiler Feed Pumps (if required)		
Expected Supplier(s)		
Primary		
Secondary		
Number and capacity	%	
Feedwater Heaters		
Expected Supplier(s)		
LP Feedwater Heaters		
High Pressure (HP) Feedwater Heaters		
Deaerator		
Capacity of Deaerator Storage Tank	gallons	
Circulating Water Pumps		
Expected Supplier(s)		
Primary		
Secondary		
Number and capacity	%	
CONTROL PLATFORM		
Plant Distributed Control System	Manufacturer	

TABLE 8 – SITE EQUIPMENT DATA		
	Units	
MATERIAL HANDLING		
Overall storage pile dimensions	feet (length, width and height)	
Overall storage pile quantity	tons	
Covered storage pile dimensions	feet (length, width and height)	
Covered storage pile	tons	
Time required to fill coal silos of a boiler	hours	
Crushers		
Number of crushers supplied		
Capacity of each crusher	tons/hr	
Belt Feeders		
Number		
Capacity, minimum	tons/hr	
Capacity, maximum	tons/hr	
Belt speed, minimum	fpm	
Belt speed, maximum	fpm	
Belt width	in	
Drive motor size	hp	
Drive motor voltage	volts	
Drag Chain Feeders		
Number		
Capacity, minimum	tons/hr	
Capacity, maximum	tons/hr	
Chain speed, minimum	fpm	
Chain speed, maximum	fpm	
Belt width	in	
Drive motor size	hp	
Drive motor voltage	volts	
Bucket-wheel stacker/reclaimer		
Manufacturer		
Stacking capacity	tons/hr	
Reclaiming capacity	tons/hr	
Boom length, stacking distance	ft	
Maximum boom height	ft	
Pile height	ft	
Belt conveyor belt width	in	
Travel distance	ft	
Total rail length	ft	
Rail spacing	ft	

TABLE 9 – ASH EQUIPMENT (EACH UNIT)		
	Units	
FLY ASH SYSTEM		
System type, positive or negative pressure		
System transport rate	tons/hr	
Line size at pickup points	In	
Line size at silo	In	
Exhauster/blower quantity operating per unit	qty	
Exhauster/blower flowrate	acfm	
Exhauster/blower pressure	in hg	
Exhauster/blower operating power	bhp	
Exhauster/blower motor horsepower	hp	
BOTTOM ASH SYSTEM		
Manufacturer		
Type		
Capacity	tons/hr	
Ash storage dimensions, L x W x H	ft	
Drive type		
Drive motor power	hp	

TABLE 10 – PIER		
	Units	
PIER		
Length	ft	
Width	ft	
Height above mean sea level	ft	
Deck construction	type	
Subcontractor, if any		

TABLE 11 – BELT CONVEYORS		
	Units	
BELT CONVEYOR (Complete for each conveyor provided)		
Belt conveyor number		
Capacity	tons/hr	
Belt speed	Fpm	
Belt width	In	
Conveyor belting	Model	
Total maximum belt operating tension,	pounds per inch of width	
Belt tension rating	pounds per inch of width	
Number of plies	Qty	
Conveyor drive motor size	Hp	
Conveyor drive motor voltage	Volts	
Conveyor inclination angle	Degree	
Concave or convex vertical curve radius	ft	
Idlers		
Type		
CEMA class		
Size	in	
Trough angle	degrees	

TABLE 12 – WATER TREATMENT		
	Units	
WATER TREATMENT		
Demineralized water		
Storage tank capacity	gallons	
Demineralized water train capacity	gpm	
Equipment manufacturer		
Condensate storage tank capacity	gallons	
Service / fire water storage tank capacity	gallons	

TABLE 13 – SILOS (EACH UNIT)		
	Units	
ASH SILOS		
Eave height	ft	
Internal diameter	ft	
Cylinder height	ft	
Bottom style, cone or flat		
Support structure type, column or skirt		
Active storage volume	ft^3	
quantity		
LIME SILOS		
Eave height	ft	
Internal diameter	ft	
Cylinder height	ft	
Bottom style, cone or flat		
Support structure type, column or skirt		
Active storage volume	ft^3	
quantity		
COAL SILOS		
Eave height	ft	
Internal diameter	ft	
Cylinder height	ft	
Cone angle	degrees	
Active storage volume	ft^3	
Quantity per boiler

END OF DOCUMENT

PART 1 GENERAL

1.01 CONTRACT DESCRIPTION

A. Work of this Engineer Procure Construct (EPC) contract includes geotechnical investigation, surveying, engineering, design, procurement, local and international transport, insurance, construction, commissioning, start-up, and testing, for two 300 MW (+/-20%) net coal-fired electric generating units and plant site support facilities located at Hatillo, Azua, Dominican Republic for Empresas Distribuidoras, leadered and coordinated by Corporación Dominicana de Empresas Eléctricas Estatales (CDEEE), Owner.

B. Perform Work of Contract under a lump sum contract with the Owner in accordance with the Conditions of Contract.

1.02 WORK BY OTHERS

A. Owner will award contracts for other work as described below:
1. Preliminary Geotechnical Investigation:
   a. Geotechnical contractor will drill 14 soil borings and perform 21 cone penetration tests.
   b. Geotechnical report will provide:
      1) Discussion of foundation types.
      2) Recommended soil parameters.
      3) Recommended soil and rock properties.
      4) Pile and drilled pier recommendations.
      5) Seismic study.
      6) Earth resistivity.
      7) Other items.
   c. Report will be provided to Contractor for information. Contractor shall conduct own geotechnical studies as required to verify site conditions.
2. Environmental Studies:
   a. Owner and Owner's Consultants will conduct studies of proposed power plant site and compile the following information for use by Contractor.
   b. Climate and meteorological data for a period not less than 15 years:
      1) Wind speeds and directions.
      2) Temperature data.
      3) Precipitation.
      4) Storm phenomena.
   c. Site survey:
      1) Topography.
      2) Mapping.
      3) Surface structures.
   d. Hydrology:
      1) Ground water.
      2) Location surface drainage channels.
      3) Potential flood flows.
   e. Terrestrial biota:
      1) Flora and terrestrial vegetation.
      2) Fauna.

3) Wildlife inventories.
4) Identification of protected species.

f. Aquatic:
1) Characteristic of dredged area for pier:
a) Water depth.
b) Volume of dredged material.
c) Disposal of dredged material.
2) Characterization of seawater temperature and quality including dissolved and suspended matter.
3) Normal and storm currents, waves and tidal fluctuations.
4) Direction of incidence for reflection and direction of normal waves and hurricanes, including maximum levels and storm tide.
5) Characterization beach dynamics and patterns.
6) Modeling of ocean currents after pier construction.
7) Costal marine biota:
a) Vegetation.
b) Coral reefs.
c) Unique marine areas.
d) Identify coastline and seabed presence of invertebrates, reptiles, mollusks, algae, corals, rare, endemic and endangered species.
8) Habitats such as lagoons, reefs, mangroves and dunes.
9) Bathymetry data.

g. Other environmental studies as required for funding by World Bank or World Bank affiliates.

PART 2 PRODUCTS

NOT USED

PART 3 EXECUTION

NOT USED

END OF SECTION

PART 1 GENERAL

1.01 RELATED SECTIONS

A. Bid documents: Quotation of cost of each alternate.

B. Agreement between Owner and Contractor: Alternates accepted by Owner for incorporation into Work.

C. Sections of Specifications identified in each Alternate.

1.02 PROCEDURES

A. Alternates will be exercised at option of Owner.

B. Coordinate related Work and modify surrounding Work as required to complete Work, including changes under each Alternate, when acceptance is designated in Agreement between Owner and Contractor.

1.03 ALTERNATE NO. 1 - COVERED COAL STORAGE

A. Provide covered coal storage area for 60 days active and long term capacity. Refer to Section 01 36 00, Article 1.37, paragraph F.6.e.

PART 2 PRODUCTS

NOT USED

PART 3 EXECUTION

NOT USED

END OF SECTION

PART 1 GENERAL

1.01 DESCRIPTION OF PROJECT

A. The facility will be comprised of two 300 MW (+/-20%) net units . Each unit will be comprised of a pulverized coal (PC) boiler with dedicated air quality control equipment and a dedicated steam turbine-generator and associated balance of plant equipment as defined further herein.

B. The Site: The facility will be installed on a green field site located on Ocoa Bay, in Hatillo, Azua, Dominican Republic.

1.02 MINIMUM FACILITY REQUIREMENTS

A. Buildings include, but are not limited to, the following:
1. Turbine building.
2. Boiler building.
3. AQCS building.
4. Guard houses.
5. Office and shop building.
6. Warehouses (8).
7. Vehicle maintenance building.
8. Water treatment building.
9. Sewage treatment building.
10. Baghouse electrical buildings.
11. Substation control building.
12. Site electrical utility building.
13. Pier electrical service building.
14. Fire pump house.
15. Water intake building.
16. Transfer towers.
17. Crusher building.
18. Continuous emissions monitoring system (CEMS) buildings.

B. Nonbuilding structures include, but are not limited to, the following:
1. Pier.
2. Site perimeter security fencing.
3. Pipe racks.
4. Pipe, duct and cable tray supports.
5. Conveyor galleries and supports.
6. Equipment supports.
7. Tanks, silos, ducts, bins, chutes and hoppers.
8. Chimney.
9. Material handling facilities and equipment support structures.
10. Vehicle bridges.
11. Access platforms.
12. Underground tunnels, vaults and manholes.
13. Retaining and flood walls.
14. Basins and water treatment plants.
15. Air quality control systems (AQCS) support structures.
16. Foundations.
17. Light poles and vehicle barriers.
18. Vehicle service pits and lifts.
19. Bridge cranes, jib cranes, monorails, hoists and lifting rigs.
20. Elevators.
21. Spill containment structures.
22. Temporary facilities and structures required for construction.

C. The Site will be arranged to accommodate these two units and the optimization of the land considering future installations according to Drawing 24761_XC01R0.

D. Each unit shall allow space for the future addition of Mercury and NOx control equipment. The reserved space for future AQCS equipment shall be shown on the General Arrangements.

E. Water supply: The water supply will originate from Ocoa Bay. Contractor will treat the water as necessary for service water, fire water, boiler makeup, and potable uses.

F. Systems, in general, shall be dedicated to a unit with the following systems have common equipment to Units 1 and 2:
1. Fire protection.
2. Fuel oil.
3. Water treatment.
4. Wastewater treatment.
5. Demineralized water.
6. Condensate storage.
7. Service water.
8. Potable water.
9. Coal handling.
10. Hydrogen and carbon dioxide storage.

G. Facility shall be designed for an expected service life of 30 years or greater.

1.03 DEFINITIONS

A. "Area": A particular space within the facility allocated for a specific purpose. Such areas are identified in the following conceptual drawings listed in Section 00 01 15.

B. "Unit": One 300 MW (+/-20%) net steam turbine generator, with a single boiler, the Air Quality Control System (AQCS) for such boiler, and all equipment and auxiliaries comprising such generators, boilers and steam turbines.

C. "Common Facilities": Equipment and systems that serve all the Units and are required for such units to achieve the requirements of the EPC Contract including Minimum Acceptance Criteria.

D. "N+1": Number of pumps, heat exchangers, etc. required to be in operation to achieve maximum unit load plus one additional operational spare.

E. "Plant" or "Main Plant" All the units to be built under this document.

F. "Balance of Plant": The plant, except boiler, turbine and AQCS.

G. "Capacity": When used to define the required capacity of a piece of equipment, the use of the term "capacity" herein (e.g., "50% capacity", "100% capacity" and similar references) refers to the capacity requirements for the applicable type of equipment (e.g, flow, volume, etc.) to support the operation of the single unit when talking about Unit 1 or Unit 2 and to support the complete facility when is related to common facilities in accordance with the requirements of the EPC Contract.

H. "Provisions": When used (e.g., "removal provisions" or "provisions for") means design and engineering services, equipment and any other Work items necessary to address design, constructability or operational concerns in accordance with the requirements of EPC Contract.

I. "Codes and Standards": Products, Workmanship, and Procedures specified by trades, organizations, rules, regulations, ordinances, laws or other consensus standards. Comply with Codes and Standards in effect on date for receiving bids.

J. "Facility": Plant or generating station.

1.04 FACILITY DESIGN REQUIREMENTS

A. Each Unit shall be sized for a net output of 300 MW (+/-20%)

B. Each Unit shall have minimum load of 35% MCR.

C. Throttle condition of steam turbine:
1. Main steam:
   a. 2,520 psig.
   b. 1,000°F.
2. Hot reheat: 1,000°F.
3. Boiler ramp: 5% per minute or greater.
4. Main steam attemperator flow rated from 75% to MCR – 5% of steaming rate maximum.

D. Emissions: In accordance with International Finance Organization – World Bank Group - Environmental, Health and Safety Guidelines for Thermal Power Plants the required design emissions are:
1. PM – 30 mg/Nm^3
2. SO_2 – 900 mg/Nm^3
3. NO_X – 510 mg/Nm^3
4. Stated limits dry gas, excess O2 content 6%.

1.05 OFF FREQUENCY OPERATION CAPABILITY

A. The turbines and generators shall be designed to have capability to operate over a wider nominal operating voltage and frequency ranges. Contractor shall obtain from the manufacturer and provide the Unit's (steam turbine and generator) permissible operating voltage and frequency ranges and corresponding time limits for which the Unit can operate at maximum output without causing thermal stress, damaging vibration, reduction of life, or damage to the Unit, according to the Dominican Republic Electrical Law (Reglamento Ley 125-01 article 150).

B. As a minimum, the generator shall be thermally capable of continuous operation within the confines of its reactive capability curve over the ranges of voltage and frequency as defined in IEEE STD. C50.13 - IEEE Standard for Cylindrical-Rotor 50 Hz and 60 Hz Synchronous Generators Rated 10 MVA and Above.

C. Contractor shall develop agreement with Owner for operation over the wider range of voltage and frequency as defined by the IEEE STD. C50.13 or beyond the manufacturer's specific capability of the Unit.

1.06 COAL AND LIME ANALYSES

A. Coal analysis:

	Unit	Performance	Design
Moisture	Wt%	14.5	8.3-15.5
Ash	Wt%	15.4	5.5-16.0
Sulfur	Wt%	2.2	0.4-3.7
Carbon	Wt%	54.9	54.2-70.8
Hydrogen	Wt%	3.71	3.5-5.3
Nitrogen	Wt%	1.2	0.9-1.5
Oxygen	Wt%	8.05	7.9-9.4
Chlorine	Wt%	0.04	0.01-0.05
Total	Wt%	100	
Higher Heating Value	Btu/lb	10,500	10,400-12,500-
Lower Heating Value	Btu/lb	10,137	9,720-11,600
Hardgrove Index	HGI	45	42-57

B. Coal size: Later, provided by Owner.

C. Lime analysis: Later, provided by Owner.

1.07 ENVIRONMENTAL DESIGN CRITERIA

A. Meteorology: Plant shall be capable of operation at extreme outdoor ambient design temperatures in accordance with:
   1. Ambient temperature (last 5 years):
      a. Maximum: 93.2° F (34° C)
      b. Minimum: 87.1° F (30.6° C)
      c. Average: 89.8° F (32.1° C)
      d. Design: 98.6° F (37° C)
   2. Seawater design: 75.2° F to 86° F (24° C through 30° C)
   3. Relative humidity:
      a. Maximum: 85.6%
      b. Average: 82.9%
   4. Barometric pressure: 29.91 in Hg (1,013 millibar)
   5. Average precipitation: 5.60 in/month (142.2 mm/month)
   6. Average annual precipitation: 27.4 in (695.6 mm)

B. Refer to Section 01 32 13 for wind and seismic structural loads.

C. Other meteorological data required for design shall be developed by Contractor and submitted with Bid.

1.08 NOISE

A. 85 dBA 3' from equipment.

1.09 CHIMNEY

A. Height: two and one half times boiler building height and as required to meet emission requirements.

B. Unit 1 and 2 flues in single chimney.

C. Elevator to instrumentation platforms, test platforms and maintenance platforms.

D. Design Chimney per American Concrete Institute 307-08

1.10 PIER

A. Quantity: 1.

B. Requirements:
   1. Accept equipment deliveries during and after construction.
   2. Accommodate two ships at a time; one on each side of pier. One ship shall be for coal delivery and the second ship will be for general cargo or fuel oil delivery.
   3. Delivery ship type: refer to specifications (HandyMax and SupraMax).
   4. Electrical building for pier services: located on land at base of pier.
   5. Coal handling equipment incorporated into design.
   6. Fuel oil receiving equipment incorporated into design.
   7. Provide with traversing gangways.

1.11 UNITS OF MEASUREMENT

A. All documents and drawings shall have dual English and metric units.

B. Installed instrumentation shall indicate the following units:
   1. Pressures shall be stated in bars.
   2. Temperatures shall be stated in degrees Celsius.
   3. Bulk material flows shall be stated in tons/hr.
   4. Tank level:
      a. Large tanks: Meters.

b. Small tanks: Millimeters.
5. Other instrumentation: as directed by Owner.

1.12 MAINTENANCE AND OPERATING ACCESS

A. Contractor shall provide access to equipment and components for maintenance and operation. To the extent practicable, this will include access via stairs or vertical ladders to equipment and components which require access as a normal process of operating the facility. Stairs shall be provided unless there is insufficient space and/or their use will result in crowded or unsafe situations. General access requirements are described as follows.

B. In routing the pipes, Contractor shall ensure that valves may be accessed by maintenance and operations. For instance, control valve stations, motor operated valves, and safety/relief valves shall be accessible directly from permanent floors or platforms to the greatest extent practical. Manual process valves provided for normal system operation will be directly accessible from floors or platforms, except where Contractor's normal pipe routing and platform arrangements result in direct access being impractical.

C. Where direct access is not practical, Contractor shall provide portable ladders, man-lifts, or other access assist devices as approved by Owner in writing. Contractor and Owner will review such access and reach agreement as to the approach. Where direct access is not provided, space shall be allowed for safe placement of portable access assist devices. Use of chain wheels on manual valves is acceptable where no other practical means of access can be provided. Manual valves for venting, draining, shutdown isolation, and instrument root valves, plus check valves and automatic air release valves, shall all be accessible from permanent floors or platforms, from permanent stairways or ladders, or from portable ladders, man-lifts, or other access assist devices as approved by Owner in writing. Use of portable ladders and man-lifts should be limited to valves 15 feet or less above the floor or platform, unless approved by Owner in writing.

D. Contractor shall ensure that the facility design includes adequate access and space to maintain equipment and components that require removal from the installed location. For instance, where removal requires moving equipment or components to access ways, overhead clearance for lifting and aisles shall be kept reasonably free of obstructions and designed for the equipment to be transported through the aisle in a safe manner. Design of floors and platforms shall include all expected live loads for maintenance and removal activities, including applicable cribbing and hoist loads, with such areas indicated on the floor and platform loading drawings. Items which are infrequently removed may require some removal of piping, lighting, individual conduits/cables, and other miscellaneous items to gain full access, but Contractor shall ensure that such items are not blocked by the cable tray or other major equipment. The Work includes removal provisions for the following equipment and components
1. Condenser tubes: Removal provisions shall be included for the condenser water boxes and tube replacement. Provisions shall include removable wall panel sections, removable pipe sections, and similar considerations.
2. Condensate pumps: Access hatches in the mezzanine and operating floors shall be provided to allow for the removal of the condensate pumps with the turbine overhead bridge cranes.
3. Lube oil pumps: Access hatches, as required in the turbine operating deck, shall be provided to allow pumps to be removed with the turbine overhead bridge cranes.
4. Feedwater heaters: A method of removal for each feedwater heater shall be provided, including but not limited to, providing a monorail for bundle removal. This shall include Drawings or other documentation describing the loads included in the floor design, the temporary rigging required, the temporary rigging loads included in the design, and how the heater is removed from the building. The descriptions shall include Drawings depicting the removal route. Floor layout shall be designed to allow for in-place re-tubing of feedwater heaters.
5. Coal mills: Cranes, hoists, and monorails shall be provided to maintain the mills and drive units. Contractor shall include a maintenance bay adjacent to the mills.
6. Primary air and secondary air fans: Hoists and monorails shall be included for maintenance of the fans and drive motors. Contractor shall provide aisle ways necessary to move motors and fan rotors from the building.
7. Induced draft fans: Contractor shall provide suitable stable areas for mobile crane equipment.

8. Air heater: Hoists and monorails shall be provided for replacement of air heater baskets. Contractor shall include aisles, hoistways and other equipment necessary to move baskets to and from the air heater.
9. AQCS scrubber: Cranes, hoists, and monorails shall be provided for maintaining all elements of the scrubber and supporting equipment. Provisions shall include description and Drawings for removal and replacement of each element of equipment.
10. Baghouse: Hoists and monorails shall be provided for replacement of baghouse bags. Contractor shall include provisions for access and hoistways and other equipment that may be used to remove and replace bags.
11. Fly ash silo: Hoists and monorails shall be provided for maintenance of the unloader floor equipment and a jib crane for maintenance of the silo vent filter equipment.
12. Bulk material handling: Hoists and monorails shall be provided for maintenance of all conveyor drive units, coal crushers, and motors. Contractor shall provide hoistways and aisles for removal from buildings and placement at ground elevation.
13. Switchgear: Switchgear shall have free space in front as required by equipment size and code requirements to allow for safe removal of breakers.
14. Heat exchangers: Provide tube pull areas free of piping and electrical equipment to allow for pulling of tube bundles.
15. Feedwater Pump and Motor: Hoists and monorails shall be included for maintenance of the pumps and drive motors. Contractor shall provide aisle ways necessary to move motors and pumps from the building.
16. Water intake structure: Hoists and monorails shall be provided for maintenance of screens, trash racks, circulating pumps and motors.
17. Contractor shall provide equipment not listed above where a specific procedure or sequence needs to be followed to remove components due to structural or other equipment placement considerations.
18. Equipment layout shall allow proper clearance space in accordance with manufacturer's recommendation.

E. Equipment access aisleways and personnel maintenance aisleways will be shown on the facility arrangement Drawings and will have the following clear space measurements:
   1. Forklift access aisles will measure a minimum of 8 feet wide x 10 feet tall.
   2. Personnel maintenance aisle ways will measure a minimum of 3 feet wide x 7 feet, 6 inches tall.

1.13 BRIDGE CRANES

A. Bridge crane systems shall be installed in the turbine bay for equipment maintenance and construction.

B. Capacity: As required to lift the heaviest part during turbine generator outage. Provide separate trolleys for main and secondary hoists.

C. Electric powered for both horizontal traverse directions, as well as vertical.

D. Cranes shall be able to travel the full length of the turbine bay. Provide access walkway at crane support girder elevation, along conductor side of bridge crane, for full length of bridge crane travel. Provide hoistways to lower items from operating floor to intermediate and ground floors.

E. Cranes shall comply with applicable requirements of Crane Manufacturers Association of America (CMAA) "Specification #70 for Electric Overhead Traveling Cranes", ANSI B20.2, ANSI B30.16, HMI-100 and OSHA. Provide CMAA Class A cranes.

F. Refer to shops and vehicle maintenance building descriptions for additional bridge cranes required.

1.14 3D MODEL

A. Contractor shall develop 3D computer model of power plant including, as a minimum, piping, buildings, foundations, equipment and tanks, ducts and chimneys for Turbine Building, Boiler Building, and AQCS Buildings.

1.15 ARCHITECTURAL

A. In general, site support facility building structures shall be pre-engineered metal building systems with pre-insulated (foam core) metal wall panels and insulated standing seam metal roof systems. Building systems shall be complete with all standard components, including flashing, trim, gutters, and downspouts.

B. All rooms within the enclosed occupied spaces shall be enclosed with CMU partitions. All ancillary rooms within the plant shall receive concrete block where required by applicable law or applicable Codes and Standards, Comply with the most stringent requirement. Remainder of interior walls shall be metal wall panel systems. Partitions shall be fire-rated as required as per building code.

C. Doors:
   1. Large overhead doors: Insulated metal slat, roll-up type with wind lock, motor-operated.
   2. Other doors:
      a. Flush hollow metal with baked on prime coat.
      b. Hollow metal frames.
      c. Vision panels and louvers as required.
      d. Doors and frames shall be fire-rated, where required by IBC.
      e. Provide closers on exterior doors, doors to air conditioned areas, and on doors where required by code.
      f. Hardware as required for each door.
   3. Finishes:
      a. Walls: Main plant and accessory buildings:
      b. Pre-finished metal wall panels.
      c. Painted CMU.
   4. Floors:
      a. Sealed concrete.
      b. Habitable spaces: Colored urethane floor coating.
      c. Restroom and janitor room: Colored epoxy floor coating.
   5. Ceilings:
      a. Occupied spaces: Suspended acoustical ceiling tiles.
      b. Non-occupied spaces: Exposed, painted.

D. Turbine building:
   1. Fully enclosed with siding and membrane roof system. Siding including all flashings and trim shall be factory finished in accordance with manufacturer's requirements consisting of primer coat, and polyvinylidene fluoride finish coating with a minimum of 70% resins conforming to American Architectural Manufacturers Association (AAMA) specification 2605.
   2. Exterior wall shall be combination of split-face concrete masonry units to 8'-0" above floor with insulated metal wall panels from top of masonry to top of parapet.
   3. Turbine building shall include, but are not limited to, the following rooms:
      a. Control room.
      b. Bathrooms: Men's and women's.
      c. Locker rooms shall be a separated area, sized for approximately 24 employees and shall include:
         1) Men's and women's lockers.
         2) Area shall include single tier metal lockers, benches and all shower, toilet and restroom accessories.
      d. Break room shall include cabinets, sinks, counter space and required fixtures for a fully functional space.
      e. DCS/electrical room.
      f. UPS and battery room.
      g. Electrical switchgear room.
      h. Communication room.
      i. Utility rooms.
      j. Equipment and supplies storage.
      k. Sample chemistry analytical laboratory.

E. Boiler building shall have a suitable roof system with burners enclosed.

F. AQCS building:
   1. AQCS penthouse shall be enclosed with siding and suitable roof system.
   2. AQCS scrubber shall have a suitable roof system.

G. Office/shop building:
   1. Office /shop building (40,500 ft^2 +/-) shall be in close proximity to the turbine building and shall include an administration area and shop areas; and plant employee locker, shower and restrooms.
   2. Administration area (15,000 ft^2 +/-) shall be sized to accommodate approximately 25 office employees and shall include the following:
      a. Vestibule, reception and lobby area.
      b. Offices: 15.
      c. Executive offices: 3.
      d. Conference room: 1.
      e. Meeting rooms: 2.
      f. Break room.
      g. Restrooms.
      h. Janitor room.
      i. Storage space.
      j. Copy, drawing files, and general open office space.
      k. Additional areas required for a fully functioning office complex.
      l. Employee locker area (5,500 ft^2 +/-) shall be a separated area, sized for approximately 200 employees and shall include:
         1) Men's and women's lockers.
         2) Restroom facilities.
         3) Break room.
         4) Janitor and storage.
         5) Area shall include single tier metal lockers, benches and all shower, toilet and restroom accessories.
      m. Shop area (20,000 ft^2 +/-) shall be adjacent to the employee locker area and shall include the following:
         1) Tool storage.
         2) Welding area.
         3) Mechanical shop.
         4) Instrument repair.
         5) Records.
         6) Electrical shop with clean room.
         7) Work shop.
         8) General storage.
         9) One bridge crane with fifteen ton capacity.
   3. Office area construction shall be of gypsum board partitions walls, suspended acoustical ceilings (min. 9'-0" high), ceramic tile floors in vestibule and restroom areas, and colored finished concrete floors in other office areas. Provide windows in each office and conference room. Complete with all additional finishes, cabinets, air conditioning/heating, etc. for a completed space.
   4. Break rooms shall include cabinets, sinks, counter space, and required fixtures and space for a refrigerator, microwave and oven/stove. Break rooms shall include air conditioning for a fully functional space.
   5. Employee locker areas shall be of painted concrete masonry wall construction, moisture resistant ceilings and ceramic tile floors throughout, complete with all additional accessories including air conditioning for complete space.
   6. Shops shall be constructed of painted concrete masonry walls, floor drains, sealed concrete floors and exposed painted construction ceilings, complete with all additional accessories and ventilation for a completed space. Instrument shop shall include air conditioning, and electrical shop shall include an air conditioned clean room.
   7. Mechanical and electrical, telephone and communication rooms as per Applicable Codes and Standards.

H. Vehicle maintenance building:
   1. Provide office, break room, restroom, locker room, showers, janitor/storage room, air compressor room, parts room, lubricant storage room and equipment storage, in addition to maintenance bays.
   2. Provide 3 bays with rollup doors for servicing ash haul trucks, dozers, front end loaders and scrapers. Floors shall be suitable for heavy and tracked material handling equipment. One vehicle bay shall include metallic aggregate topping on floor suitable for tracked vehicles. One subfloor maintenance pit suitable for accessing bottom of vehicles.
   3. Provide three bays with rollup doors for servicing forklifts, pickups and other equipment; one sub-floor maintenance pit suitable for accessing bottom of vehicles; and one vehicle hoist, suitable for lifting trucks up to 20,000 lb weight.
   4. One bridge crane with 5-ton capacity for servicing vehicles.
   5. Locker rooms shall be a separated area, sized for approximately 24 employees and shall include:
      a. Men's and women's lockers.
      b. Area shall include single tier metal lockers, benches and all shower, toilet and restroom accessories.
   6. Break room shall include cabinets, sinks, counter space and required fixtures for a fully functional space.

I. Guard houses: Control room with windows for monitoring access in/out of facility.
   1. Provide 2 work areas for main guard house; one for construction entrance guard house.
   2. Unisex bathroom.
   3. HVAC as required.
   4. Storage room.
   5. Mechanical/electrical room.

J. Other building requirements: Provide unisex restrooms in the sewage treatment building.

K. Building envelope (including siding, roofing, doors, windows and flashing), life safety and egress requirements shall be designed and drawings sealed by professional architect licensed in accordance with Dominican Republic law; retained by Contractor.

PART 2 PRODUCTS

NOT USED

PART 3 EXECUTION

NOT USED

END OF SECTION

PART 1 GENERAL

1.01 SOURCE QUALITY CONTROL

A. Contractor shall give Owner, or a third party to be designated by Owner access to products for inspection upon request.

B. Contractor shall fully cooperate with inspections.

C. Inspections shall include manufacturing or shop testing.

1.02 QUALITY CONTROL AND CONTROL OF INSTALLATION

A. Monitor quality control over suppliers, manufacturers, products, services, site conditions, and workmanship, to produce Work of specified quality.

B. Comply with manufacturers' instructions, including each step in sequence.

C. Should manufacturers' instructions conflict with Contract Documents, request clarification from Owner before proceeding.

D. Comply with specified standards as minimum quality for the Work except where more stringent tolerances, codes, or specified requirements indicate higher standards or more precise workmanship.

E. Perform Work by persons qualified to produce required and specified quality.

F. Verify that field measurements are as indicated on Shop Drawings or as instructed by manufacturer.

G. Secure attach products in place with positive anchorage devices designed and sized to withstand stresses, vibration, physical distortion, or disfigurement.

1.03 BUILDING CODES AND PERMITS

A. Owner will provide licenses and permits necessary for Project execution.

B. Give all notice and comply with all laws, ordinances, building and construction codes, rules, and regulations applicable to Work. If Contractor observes that Specifications or Drawings are at variance therewith, give Owner prompt written notice thereof, and any necessary changes shall be adjusted by appropriate Modification.

C. If Contractor performs any Work knowing or having reason to know that it is contrary to such laws, ordinances, rules, and regulations, and without such notice to Owner, Contractor shall bear all costs arising therefrom.

1.04 REFERENCES

A. Project design, engineering, procurement, and construction activities shall be in accordance with codes and industry standards, applicable laws, regulations, codes and ordinances of the local Government.

B. For products or workmanship specified by association, trade, or other consensus standards, comply with requirements of the standard, except when more rigid requirements are specified or are required by applicable codes.

C. Conform to reference standard by date of issue current on date for receiving bids, except where a specific date is established by code.

D. Obtain copies of standards where required by product specification sections.

E. Should specified reference standards conflict with Contract Documents, request clarification from the Owner before proceeding.

F. Neither the contractual relationships, duties, or responsibilities of the parties in Contract nor those of the Owner shall be altered from the Contract Documents by mention or inference otherwise in any reference document.

G. Abbreviations used in Drawings and Specifications are as specified in ANSI Y1.1 and IEEE 260.

H. Schedule of references:
1. AASHTO – American Association of State Highway and Transportation Officials
2. ABMA - American Bearing Manufacturers Association
3. ACI - American Concrete Institute
4. AGMA - American Gear Manufacturers Association
5. AISC - American Institute of Steel Construction
6. AMCA - Air Movement and Control Association
7. ANSI - American National Standards Institute
8. API - American Petroleum Institute
9. APWA – American Public Works Association

I. Other recognized standards shall be utilized as required to serve as design, fabrication, and construction guidelines when not in conflict with the above listed standards.

1.05 DEFINITIONS

A. Addenda--Written or graphic instruments issued prior to the opening of Bids which clarify, correct, or change the Bidding Requirements or the proposed Contract Documents.

B. Commercial Operation--shall mean the time at which all of the following have occurred:
1. Work or portions of the Work are sufficiently complete to allow continuous operation of the unit, except for those items of Work which do not affect the operability, safety, or mechanical and electrical integrity of the unit.
2. Unit is mechanically and electrically sound, i.e., interruption of use for normal commissioning and testing activities is not expected.
3. Unit has demonstrated full-load operation not less than 95% of the Guaranteed Load.
4. Unit can be operated at any load between full load and minimum load without hazard or damage to the unit or any other property and without hazard or injury to any person.

C. General Requirements--Sections of Division 01 of the Specifications. The General Requirements pertain to all sections of the Specifications.

D. Liens--Charges, security interests, or encumbrances upon Project funds, real property, or personal property.

E. Milestone--A principal event specified in the Contract Documents relating to an intermediate completion date or time prior to Substantial Completion of all the Work.

F. Progress Schedule--A schedule, prepared and maintained by Contractor, describing the sequence and duration of the activities comprising the Contractor's plan to accomplish the Work within the Contract Times.

G. Samples--Physical examples of materials, equipment, or workmanship that are representative of some portion of the Work and which establish the standards by which such portion of the Work will be judged.

H. Schedule of Submittals--A schedule, prepared and maintained by Contractor, of required submittals and the time requirements to support scheduled performance of related construction activities.

I. Schedule of Values--A schedule, prepared and maintained by Contractor, allocating portions of the Contract Price to various portions of the Work and used as the basis for reviewing Contractor's Applications for Payment.

J. Supplier--A manufacturer, fabricator, supplier, distributor, materialman, or Manufacturer having a direct contract with Contractor or with any Subcontractor to furnish materials or equipment to be incorporated in the Work by Contractor or any Subcontractor.

1.06 TERMINOLOGY

A. The following words or terms are not defined but, when used in the Bidding Requirements or Contract Documents, have the following meaning.
   1. Intent of certain terms or adjectives:
      a. The Contract Documents include the terms "as allowed," "as approved," "as ordered," "as directed" or terms of like effect or import to authorize an exercise of professional judgment by Owner. In addition, the adjectives "reasonable," "suitable," "acceptable," "proper," "satisfactory," or adjectives of like effect or import are used to describe an action or determination of Owner as to the Work.
      b. It is intended that such exercise of professional judgment, action or determination will be solely to evaluate, in general, the Work for compliance with the requirements of and information in the Contract Documents and conformance with the design concept of the completed Project as a functioning whole as shown or indicated in the Contract Documents (unless there is a specific statement indicating otherwise).
      c. The use of any such term or adjective is not intended to and shall not be effective to assign to Owner any duty or authority to supervise or direct the performance of the Work or any duty or authority to undertake responsibility contrary to the provisions of Article 9 of the General Conditions or any other provision of the Contract Documents.
   2. Defective: The word "defective," when modifying the word "Work," refers to Work that is unsatisfactory, faulty, or deficient in that it:
      a. does not conform to the Contract Documents, or
      b. does not meet the requirements of any applicable inspection, reference standard, test, or approval referred to in the Contract Documents, or
      c. has been damaged prior to Owner's recommendation of final payment (unless responsibility for the protection thereof has been assumed by at Substantial Completion).
   3. Furnish, install, perform, provide:
      a. The word "furnish," when used in connection with services, materials, or equipment, shall mean to supply and deliver said services, materials, or equipment to the Site (or some other specified location) ready for use or installation and in usable or operable condition.
      b. The word "install," when used in connection with services, materials, or equipment, shall mean to put into use or place in final position said services, materials, or equipment complete and ready for intended use.
      c. The words "perform" or "provide," when used in connection with services, materials, or equipment, shall mean to furnish and install said services, materials, or equipment complete and ready for intended use.
   4. When "furnish," "install," "perform," or "provide" is not used in connection with services, materials, or equipment in a context clearly requiring an obligation of Contractor, "provide" is implied.

B. Unless stated otherwise in the Contract Documents, words or phrases which have a well-known technical or construction industry or trade meaning are used in the Contract Documents in accordance with such recognized meaning.

1.07 ELECTRONIC DATA

A. Copies of data furnished by Owner to Contractor or Contractor to Owner that may be relied upon are limited to the printed copies (also known as hard copies). Files in electronic media format of text, data, graphics, or other types are furnished only for the convenience of the receiving party. Any conclusion or information obtained or derived from such electronic files will be at the user's sole risk. If there is a discrepancy between the electronic files and the hard copies, the hard copies govern.

B. Because data stored in electronic media format can deteriorate or be modified inadvertently or otherwise without authorization of the data's creator, the party receiving electronic files agrees that it will perform acceptance tests or procedures within 60 days, after which the receiving party shall be deemed to have accepted the data thus transferred. Any errors detected within the 60-day acceptance period will be corrected by the transferring party.

C. When transferring documents in electronic media format, the transferring party makes no representations as to long term compatibility, usability, or readability of documents resulting from the use of software application packages, operating systems, or computer hardware differing from those used by the data's creator.

PART 2 PRODUCTS

NOT USED

PART 3 EXECUTION

3.01 EXAMINATION

A. Verify that existing site conditions and substrate surfaces are acceptable for subsequent Work. Beginning new Work means acceptance of existing conditions.

B. Verify that existing substrate is capable of structural support or attachment of new Work being applied or attached.

C. Examine and verify specific conditions described in individual specification sections.

D. Verify that utility services are available, of the correct characteristics, and in the correct locations.

3.02 PREPARATION

A. Clean substrate surfaces prior to applying next material or substance.

B. Seal cracks or openings of substrate prior to applying next material or substance.

C. Apply manufacturer required or recommended substrate primer, sealer, or conditioner prior to applying any new material or substance in contact or bond.

END OF SECTION

PART 1 GENERAL

1.01 SITE CONDITIONS

A. Power block elevation: Ground floor is approximately 6" (150 mm) above grade and minimum 65' (20 m) above mean sea level.

1.02 STRUCTURAL DESIGN CRITERIA

A. Building code: 2009 International Building Code (IBC).

B. Building Occupancy Category: III (IBC Table 1604.5).

C. Following loads are considered minimum requirements. Where more stringent load conditions are required by code or based on past experience or judgment, such more stringent conditions shall be used.

D. Wind loads:
1. Code: ASCE 7-05, IBC 2009.
2. Basic Wind Speed (V): 145 miles per hour (3-second gust) at 33' (10 m) above ground. (ASCE 7-05, Figure 6-IA).
3. Wind Exposure Category: C.
4. Importance Factor, I_W = 1.15 (ASCE 7-05, Table 6-1).
5. Design shall include effect of wind pressures and wind-borne debris.

E. Seismic loads:
1. Code: ASCE 7-05 and IBC 2009.
   a. Project Latitude: 18.4 degrees.
   b. Project Longitude: -70.567 degrees.
   c. Mapped Spectral response acceleration coefficients (ASCE 7-05):
      1) S_s = 1.736.
      2) S_1 = 0.695.
2. Importance Factor, I_E = 1.25 (ASCE 7-05, Table 11.5.1).
3. Site Class = D. Assumed, to be verified by Geotechnical investigation

F. Snow loads: None.

G. Ice loads: None.

H. Rain loads:
1. Rainfall intensity for a 25-year, 24-hour storm for this area.
2. Refer to ASCE 7-05, IBC 2009 Code for effects of ponding due to rain loads on buildings and structures.

I. Live loads:
1. Code: ASCE 7-05, IBC 2009, and the following, whichever is more stringent.
2. Floor live loads as indicated below are minimums. Where equipment is located on a floor, structure shall be designed for larger of equipment weight or displaced specified floor live load.
   a. Elevated floors:
      1) Above floor live load:
         a) Grated floors: larger of 100 psf or equipment erection/equipment assembly area during maintenance (laydown) load.
         b) Concrete floors: larger of 150 psf or equipment erection/maintenance laydown area load.
         c) Turbine floor: 600 psf.
      2) Hanging load: Allowance based on calculated suspended equipment, piping and electrical utility weights but not less than 25 psf. Pipe and equipment loads greater than 1,000 lb shall be accounted for individually.

3) Roving nonaccumulating point load applied to mid-span of beams to account for disproportional concentration of hanging loads: based on rational analysis of hanging loads, but not less than 2,000 lb.

3. Stair minimum live loads: 100 psf uniform load; 300 lb concentrated load applied over 1' x 1' (300 mm x 300 mm) area.
4. Roof minimum live load: 30 psf on top of roof plus 15 psf hanging live load.
5. Roof 2,000 lb roving, non-accumulating point load. Apply to mid-span of roof beams.
6. Equipment live loads.
7. Equipment laydown loads during servicing and maintenance.
8. Moving equipment loads during operations, installation, repairs and replacement.
9. Conveyed and stored material loads.
10. Erection and construction loads.
11. Loads due to thermal movement of structures and equipment. Provide for movement of structures due to ambient temperature extremes of 50°F to 140°F.
12. Monorails and cranes: Design for crane/hoist self-weight, vertical hoist load, lateral and longitudinal loads, including impact.
13. Bulk materials:
    a. Following bulk densities are considered minimum requirements for structural design. Where greater densities are required by code or based on past experience or test results, such more stringent conditions shall be used.
        1) Bituminous coal: 65 pcf.
        2) Lime: 90 pcf.
        3) Fly ash: 90 pcf.
        4) Bottom ash: 100 pcf.
    b. Following bulk densities are considered minimum requirements for volumetric design.
        1) Bituminous coal: 45 pcf.
        2) Lime: 65 pcf.
        3) Fly ash: 45 pcf.
        4) Bottom ash: 100 pcf.

J. Enclosure dead loads: Actual material and component weights.

K. Vibration control:
1. Design structural members to resist impact and dynamic loads imposed by equipment.
2. Design structural members subject to fatigue loading in accordance with AISC and ACI requirements.
3. If vibrations, exceed equipment manufacturer recommendations or cause excessive vibration of structures or adjacent equipment, during operation of equipment, provide additional stiffening of vibrating members or replace members to satisfaction of Owner as required.
4. Isolate structures supporting vibration-sensitive equipment as required by equipment manufacturer.
5. Dynamically balance equipment in accordance with ISO 1940-1, or equipment manufacturer's requirements, whichever is more stringent.
6. Foundations for dynamic equipment shall comply with ACI 351.3R-04.

1.03 STRUCTURAL REQUIREMENTS

A. Design, furnish and install foundations and structures, and temporary systems required for project. Comply with specified strength and serviceability requirements.

B. Design and construction standards:
1. Concrete structures and foundations: ACI 2009 Manual of Standard Practice.
2. Precast prestressed concrete piles: PCI 2004 Bridge Design Manual Chapter 20.
3. Steel structures: AISC Steel Construction Manual, 13th Edition, and AISC 2005 Seismic Provisions for Structural Steel Buildings.
4. Ductwork: ASCE Structural Design of Air and Gas Ducts for Power Stations and Industrial Boiler Applications.
5. Loads on structures during construction: ASCE 37-02.
6. Flood resistant design and construction: ASCE 24-05.

7. Piers: Unified Facilities Criteria UFC 4-152-01 and ACI Guide for Design and Construction of Fixed Offshore Concrete Structures ACI 357R-84.
8. Occupational Safety and Health Administration (OSHA).

C. Structures shall be shop-assembled prior to shipment to greatest extent practicable. Minimize field assembly.

D. Structures and foundations shall be durable and designed for site conditions. Concrete structures and foundations shall comply with ACI 318-08 Chapter 4 durability requirements.

E. Steel structures shall be designed as special concentrically braced frames. Eccentrically braced frames are not permitted without Owner's approval.

F. Boiler building frame shall be structurally isolated from Turbine building frame. Boiler building loads shall not be applied to Turbine building.

G. Metal form and roof deck: Galvanize in accordance with ASTM A653/A653M G90.

H. Grating, plates welded to grating, and grating saddle clips shall be galvanized. Use serrated grating at exterior locations and sloping walking surfaces.

I. Checkered plate shall be galvanized. Checkered plate is not permitted for flooring in egress routes, and sloping walking surfaces.

J. Galvanize uninsulated duct and pipe supports and hangers.

K. Design elevated concrete floor slabs. Floor slabs shall include form deck, reinforcement, welded studs, edge plates and sleeves for floor penetrations. Elevated concrete floors shall have 6 inch minimum thickness and reinforcement in top and bottom of slab in each direction. Floor slabs shall not be relied upon as a diaphragm to distribute lateral loads. Furnish permanent structural steel horizontal diagonal bracing at floor levels as necessary to distribute lateral loads. Floor slabs shall not be relied upon for composite action with steel beams to resist bending moments in beams. Coordinate slab design with floor penetrations.

L. Live load placards: Conspicuously post floor and platform design live load placards in each part of each story that applies. Identify areas specifically designed for equipment laydown loads. Engineering plan drawings shall indicate design live loads and allowable equipment laydown areas.

M. Analysis shall be based upon established, accepted, published design procedures. Use 3D computer model for analyzing and designing building structure.

N. Structures shall be identical for each unit, as much as possible. Variations between units are only permitted if approved by Owner.

O. Design shall take into account all equipment and piping systems.

P. Prepare drawings showing structure loads applied to foundation (provide unfactored loads for each load case, and Allowable Stress Design load combinations at each support point).

Q. Personnel access requirements:
1. Walkway connecting each boiler building to respective Air Quality Control System (AQCS).
2. Walkways connecting each boiler to other boilers, at major floor and platform levels.
3. Extend boiler walkways to each floor level in turbine building at following:
   a. Intermediate floor.
   b. Operating floor.
   c. Deaerator floor.
   d. Deaerator heater platform.
4. Walkway access to turbine building roof from boiler.
5. Walkway and stair access to elevator machine room and boiler roof.

6. Stair tower on each side of boiler from grade up to highest operating level, in each boiler area. Stair width shall be a minimum of 3'-8" (1.1 m) and include guardrail and handrail.
7. Exit routes and egress shall comply with OSHA and 2009 IBC, whichever is more stringent.
8. Connect platforms located at same elevation by a walkway.
9. Platforms requiring access from elevator shall extend to elevator entrance.
10. Provide emergency escape ladders from any platforms and walkways having dead ends longer than 20'-0" (6 m).
11. Provide platforms to access valves and equipment, including all areas defined as Class 1, Class 2, Class 3 and Class 4 access areas.
12. Platform and walkway locations are subject to review by Owner.
13. Personnel access includes following four classes of requirements.
    a. Class 1 access areas include areas requiring cart access for maintenance and for installation of scaffold in furnace. Class 1 access areas shall have operating platforms which are fully accessible by 3' (1 m) wide x 6' (2 m) long cart from elevator landing without ascending or descending any stairs. Operating platforms and main access walkways shall be in accordance with following:
        1) Wide enough to facilitate equipment maintenance and shall not be less than 44" (1.1 m) in unobstructed width.
        2) Minimum of 7'-6" (2.3 m) of clear headroom. Provide adequate allowance for installation of piping, conduit, and lighting fixtures above 7'-6" (2.3 m) clear space.
        3) Platforms shall have access walkways to stair towers.
        4) Ladders and ships' ladders are not permitted for Class 1 areas.
    b. Class 2 access areas include regularly attended access areas that have operating platforms which are fully accessible from an elevator landing without ascending or descending more than one floor level or two flights of stairs. Regularly attended access areas shall include any equipment requiring access during operation and for normal day-to-day inspection, operation and maintenance. Sootblower platform shall be considered as Class 2. Operating platforms, main access walkways, and stairs shall be in accordance with following:
        1) Operating platforms and main access walkways shall be wide enough to facilitate equipment maintenance and shall not be less than 44" (1.1 m) in unobstructed width.
        2) Stairs shall not be less than 44" (1.1 m) in width.
        3) Provide minimum of 7'-6" (2.3 m) of clear headroom. Adequate allowance shall be provided for installation of piping, conduit, and lighting fixtures above 7'-6" (2.3 m) clear space.
        4) Platforms with elevator stops shall have access walkways to stair tower.
        5) Ladders and ships' ladders are not permitted for Class 2 areas.
    c. Class 3 access areas include maintenance areas that have access platforms accessible by stairs and maintenance access walkways. Maintenance access areas include areas requiring access only monthly or less, furnace hatches and observation ports, backpass hatches, safety valves for high energy piping, cold reheat drip pot and ductwork hatches. Access platforms, maintenance access walkways and stairs shall be in accordance with following:
        1) Maintenance access walkways shall not be less than 36" (1 m) in unobstructed width.
        2) Stairs shall not be less than 44" (1.1 m) in width.
        3) Provide minimum of 7'-6" (2.3 m) clear headroom. Less headroom may be provided in locations where acceptable to Owner and shall conform to OSHA. Adequate allowances shall be provided for installation of piping, conduit, and lighting fixtures above 7'-6" (2.3 m) clear space.
        4) Size access platforms to allow 2 persons to work simultaneously; 12 sq ft minimum.
        5) No ladders or ships' ladders permitted, except for large field-erected tanks and secondary means of egress from isolated areas. Where placement of stairs is not practical, caged ladder may be used with Owner's approval.
    d. Class 4 access areas include maintenance areas where access is only required for painting, reinsulation, or replacement of components which have a service life of 10 years or more. Access to these areas shall be met by providing facilities to enable Owner to erect scaffolding (30' high maximum), temporary ladders, platforms and necessary equipment to safely perform work involved.

R. Bridge cranes, monorails, hoists and hoistways:
   1. Provide bridge cranes, crane runways, monorails, electric hoists and hoistways necessary for maintenance of equipment and plant operations.
   2. Capacity of hoisting systems shall be such that hoist can safely handle heaviest piece of equipment at each location.
   3. Monorails
      a. Monorail design shall include effects of hoist and trolley weight.
      b. Monorails, hoists and trolleys shall comply with applicable requirements of HMI-100, ANSI B30.16, ANSI/ASME B30.11 and OSHA.
      c. Provide removable stops at ends of monorails.
      d. Stencil paint design lift capacity on monorail in yellow paint.
      e. Monorail may be curved but must conform to hoist manufacture's recommendations on minimum curvature.
      f. Monorail to be American Standard I beams were possible.
      g. Provide eyebolts or lifting lugs on equipment to be used with monorails and cranes.
      h. Locate monorail over center of gravity of equipment.
      i. Monorail maximum deflection shall be L/450 vertically and L/400 laterally.
      j. Impact and lateral loads minimum 10% of lifted load.
      k. Hoist speed at full rated load: 10 fpm minimum.
   4. Provide unobstructed hoistways with monorails and hoists for maintenance purposes. Hoistway locations shall include:
      a. Boiler area: Hoistway with monorail and hoist located adjacent to elevator shaft and running from top of boiler building down to grade elevation. Monorail and electric hoist shall be rated for a minimum 5-ton lift.
      b. AQCS area: Provide hoistway from top of unit to ground floor with jib crane and electric hoist rated for a minimum 1.5 ton lifting capacity.
      c. Hoistways shall be accessible from adjacent platforms. Adjacent platforms shall be at least 4' (1.2 m) larger than hoistway. Provide removable guardrail sections at platforms adjacent to hoistway.
   5. Locate hoists and monorails in areas that meet following requirements:
      a. Access using mobile equipment for equipment removal is not feasible.
      b. Above rotating equipment components weighing over 220 lb.
      c. Allow equipment to be removed and lowered to grade in no more than 2 lifts.
      d. Provide hoistways and monorails in other locations where necessary to maintain equipment.

S. Chemical resistant coatings: Provide suitable chemical resistant coatings on concrete and steel surfaces that are subject to continuous, intermittent or occasional exposure to chemicals. Surfaces requiring coatings include floors, curbs, pads and framing located in battery rooms, chemical rooms, labs and acid tank containment areas.

1.04 PIER DESIGN REQUIREMENTS

A. Tides: Design to accommodate tidal variation and wave action loading.

B. Vessel data:
   1. Design vessel type: HandyMax and SupraMax ships.
   2. Cargo: General cargo, coal, and fuel oil.
   3. Length overall: 900'
   4. Beam: 105'
   5. Draft: 45'
   6. Moulded depth: 60'
   7. Displacement: 70,000 tons.

C. Provide cathodic protection for metallic structural elements at pier, plant areas located within 250' (76 m) of ocean and other structures and foundations subject to exposure to seawater and brackish water. Protect structural elements including reinforcing steel, structural and miscellaneous steel, piles and other metallic items.

D. Provide fendering and mooring systems for design vessels.

E. Provide approximately 50' (15 m) dredge depth for design vessel.

F. Provide reinforced concrete pier deck.

G. Provide prestressed concrete piles or steel pipe piles to support the concrete pier deck. Piles shall have suitable protective coating to prevent corrosion.

H. Navigation lighting shall be provided in accordance with local regulations.

I. Use UFC 4-152-01 or ACI 357R-84, whichever is more stringent for pier design.

1.05 FOUNDATIONS

A. Design in accordance with IBC 2009 and ACI 2009 Manual of Concrete Practice.

B. Owner will provide a preliminary geotechnical report for the project. Foundation design shall comply with report recommendations. Additional information required by the Contractor shall be obtained by the Contractor with additional geotechnical investigation.

C. Foundations shall be designed using reinforced concrete to resist loading imposed by the building, structure and equipment being supported.

D. Comply with geotechnical recommendations for foundation design, including:
1. Soil bearing capacities.
2. Deep foundation capacities.
3. Lateral earth pressures.
4. Settlements.
5. Other recommended geotechnical criteria.

E. Foundation design shall include effects of following:
1. Structure, equipment and environmental loads.
2. Equipment performance criteria.
3. Access and maintenance.
4. Temporary construction loading.
5. Dead, live, wind, seismic, equipment, and flood loads.
6. Soil liquefaction.
7. Static and dynamic loads due to wave action.
8. Environmental conditions including seawater and groundwater chloride and sulfate exposure.

F. Spread footing foundations shall be designed using static analysis techniques assuming rigid elements and linear pressure distribution so that allowable settlement and bearing pressure criteria and not exceeded. Foundations shall be proportioned so the resultant of the soil pressure coincides as nearly as possible with the resultant of the vertical loading. Minimum factors of safety against overturning and sliding shall be at least 1.5 and 1.2 respectively.

G. Geotechnical exploration, testing and analysis information shall be used to determine the most suitable foundation system. Elastic (short term) and consolidation (long term) foundation settlements shall be calculated and limited to the following design values:
1. Total settlement: 1" (25 mm).
2. Differential settlement: 0.1% slope between adjacent column support points.
3. Allowable settlement is higher for large tanks. These settlements shall be calculated on an individual basis.

H. Furnish and install test piles as necessary to evaluate pile capacity. Perform pile load tests on each type of pile system proposed for project. Installation of test piles and testing will be witnessed by Special Inspector retained by Owner.

I. Special foundations requirements for chimneys:
   1. Foundations for the chimney shall be a circular or polygon shaped pier, pile, or ground supported reinforced concrete foundation. The foundation shall be proportioned so that the bearing and allowable settlement criteria shall not be exceeded. No uplifts and no increase in allowable bearing are permitted.
   2. Design settlement, elastic plus consolidation shall be limited to 1" (25 mm).

J. Special foundation requirements for rotating equipment
   1. Foundations systems for major rotating equipment, fans and turbines shall be sized and proportioned so as not to exceed the bearing and settlement criteria and to ensure satisfactory performance of the equipment. In addition to a static analysis, a dynamic analysis shall be performed to determine fundamental frequencies of the foundation system.
   2. To preclude resonance, fundamental frequencies of the foundation shall be 25% removed from the operational frequency of the equipment. Should the foundation system not meet this criteria, the dynamic behavior of the foundation will be evaluated and compared to ISO 10816, "Mechanical Vibration Evaluation of Machine Vibration by Measurements on Non-rotating Part, Part 1 through Part 6. The resultant vibration level shall not exceed the limit for evaluation of this standard.
   3. Design foundation system to meet the manufacturer's requirements.

K. Tank foundations: Comply with AWWA D100, AWWA D103 and API 650 as appropriate, and these specifications.

1.06 STEEL FRAMING

A. Design in accordance with good engineering practice, applicable building codes and local regulations and the requirements of this section. Design in accordance with AISC 360-05 and AISC 341-05.

B. Maximum deflection for floor and roof beams shall be 1/240 x span.

C. Frame members into members of equal or greater nominal depth.

D. Equipment Loading: Structures that support rotating, reciprocating or vibrating machinery shall be designed for static loading plus impact. Maximum oscillation of supporting members shall be in accordance with the manufacture's recommendations. Equipment loads to include hydrostatic test loads where applicable.

E. Back-to-back angle (double angle) or double tee construction will not be allowed.

F. Provide seal welded closure plates on the ends of structural pipes and tubing.

G. Provide shear bars on the bottom of column base plates to transfer shear into the concrete foundation. Shear lugs shall be used to resist lateral loads greater than 20 kips.

H. Allow for 1-1/2" to 2" (38 mm to 50 mm) of grout under all equipment bases and steel base plates.

I. Bar grating shall not be considered as lateral support for beams or monorails.

J. Design and furnish steel framing to support enclosure siding and roofing. Framing includes roof purlins, girts and miscellaneous steel to enclose areas specified in Section 01 30 00.

K. Elevator shaft, elevator machine room, and elevator vestibule: Provide miscellaneous steel to frame openings for doors, louvers, HVAC equipment and other penetrations.

L. Elevator and stairtower walls shall be fire-rated, where required by 2009 IBC. Provide adequate space around framing to accommodate walls and fire-rated panels. Support framing for elevator shaft liner shall allow for continuous liner.

M. Elevator vestibule shall extend from ground floor up to top elevator landing. Vestibule shall be located in front of elevator doors to protect elevator from weather. Interior dimensions of vestibule shall be at least 5' x 7' (1.5 m x 2.1 m).

N. Boiler area conveyor enclosure and tripper area arrangements:
   1. Tripper room:
      a. Tripper room shall be enclosed with roofing, siding and concrete floor.
      b. Design to prevent deflagrations in accordance with NFPA 654 and NFPA 68.
   2. Boiler tripper room and enclosure floor slabs shall be sloped to drains and include concrete curb around perimeter of room to accommodate frequent wash down.
   3. Dust collector shall be supported above the tripper room roof with duct system penetrating through roof. Extend building steel framing up through roof to support dust collector. Provide guardrails around roof edge where required by 2009 IBC.
   4. Provide adequate space for operating and maintaining conveying equipment. Coordinate wall and roof penetrations with conveyor equipment.

1.07 TRACTION PASSENGER ELEVATOR

A. Provide one elevator in each boiler area. Provide machine room at top of elevator.
   1. Net capacity: 5,000 lb.
   2. Speed: 350 ft/min.
   3. Platform size: 9'-0" x 6'-0".
   4. Cab height: 10'-0".
   5. Stainless steel walls, floor and doors.
   6. Travel: As determined by design.
   7. Number of openings and stops: As determined to serve all floors and landing of boiler area, and turbine area floors including intermediate, operating, and deaerator floors.
   8. Entrance opening size: 4'-0" x 7'-0".
   9. Door operation: Single-speed; center opening.

B. Elevator shall comply with requirements of ASME A17.1, ASME A17.2, 2009 IBC, and OSHA requirements. Obtain necessary approvals and permits.

C. Provide temporary protective liner over cab interior walls and floor. Remove liner after completion of project. Maintain entire elevator installation for period of 12 months after date of Substantial Completion of Contract.

1.08 LICENSING REQUIREMENTS

A. Structures and foundations shall be designed and drawings sealed by a professional structural engineer licensed in accordance with Dominican Republic law; retained by Contractor.

PART 2 PRODUCTS

NOT USED

PART 3 EXECUTION

NOT USED

END OF SECTION

PART 1 GENERAL

1.01 REQUIREMENTS INCLUDE

A. For systems and equipment as appropriate, provisions shall be made for chemical cleaning, steam blowing, complete drainage, nitrogen blanketing, hydrostatic testing, isolation and bypass for maintenance, and other similar provisions for conditions to which systems and equipment may be subject.

B. Equipment designed to provide enough operating margin at guaranteed load so that normal and expected equipment performance degradation does not restrict unit output.

C. Pipe and valves subject to flashing or cavitating service shall have materials selected to provide 40 years of service. Pipe materials and velocities shall be selected to minimize effects of flow accelerated corrosion.

D. Fifty percent capacity, when used in conjunction with required equipment size, shall mean that at Guaranteed Load, with two 50% capacity pieces of equipment operating, each 50% capacity piece of equipment shall be rated for 50% of flow (or other applicable capacity measure) at appropriate associated conditions (pressure, temperature, etc.).

E. Design shall be in compliance ASME Turbine Water Induction Prevention TDP-1.

1.02 VALVE DESIGN

A. Control valve stations shall be provided with inlet and outlet isolation valves, and bypasses.

B. Valve automation:
   1. Valves performing control functions automatically or that are interlocked shall have power operators.
   2. Valves that will have to be frequently, remote-manually positioned because they perform control functions shall have power actuators.
   3. Valves 8" and larger that have to be isolated during plant shutdowns or that have to be operated during frequent startups shall have power operators.
   4. Feedwater heater condensate/feedwater isolation and bypass valves shall have power operators.

C. If a shutoff valve used for maintenance creates a low point, a drain shall be provided in piping upstream of such a valve. Control valves that create a low point when closed, will have a drain upstream of valve even if a low point drain is provided downstream of this valve.

D. Systems which have design conditions above ASME pressure class 600 shall be provided with double isolation valves on vents and drains.

E. All branch piping shall be provided with shutoff valves at main headers.

1.03 PIPING DESIGN

A. Piping systems shall be designed in accordance with ASME B31.1 and following criteria;
   1. Design pressure shall be based on maximum sustained operating pressure.
   2. Design temperature shall be based on maximum sustained operating temperature.
   3. Required wall thickness shall be determined in accordance with requirements of ASME B31.1. Additional thickness value (A) shall generally be zero except when additional thickness is considered necessary due to service. For threaded piping, minimum value of A shall be equal to depth of thread.

B. Piping systems shall include provisions for complete venting and draining.

1.04 HVAC DESIGN

A. Requirements for the facility shall be in accordance with ASHRAE Handbook: HVAV Applications, Chapter 27, Table 1.

1.05 MECHANICAL DESIGN CRITERIA

A. Contractor shall provide the design criteria that will be used for the facility to the extent that such criteria is not addressed in specifications, with Bid The following is the design criteria that shall be addressed as a minimum by the Contractor:
   1. Margins:
      a. General margin for BOP systems and equipment.
      b. Pump and fan margins.
      c. Piping pressure loss.
      d. System design temperature and pressure.
      e. Pipe corrosion allowances.
   2. Equipment redundancy.
   3. Pipe stress analysis support design.
   4. Cold and hot bending.
   5. Insulation, jacketing, and lagging.
   6. Valve selection criteria.
   7. General design and selection for piping/tubing:
      a. Material.
      b. Sizing.
   8. Cleaning and flushing:
      a. Steam blows.
      b. Lube oil flushes.
      c. Boiler cleaning.
      d. Pre-boiler flushing and cleaning.
   9. HVAC design criteria in accordance with building and/or enclosure:
      a. Indoor temperatures (maximum/minimum).
      b. Humidity control.
      c. Ventilation rates.
      d. Pressurization.
      e. Redundancy.

1.06 MECHANICAL EQUIPMENT REDUNDANCY

Equipment	Level of Redundancy	Comment
Circulating Water Pumps	N + 1	Per Unit
Condensate Pumps	2-100%	Per Unit
Feedwater Pumps	3-50%	Per Unit
Closed Cycle Cooling Pumps	3-50%	Per Unit
Condensate Transfer Pumps	N + 1	Common to Units 1 and 2
Demineralized Transfer Pumps	N + 1	Common to Units 1 and 2
Fuel Transfer Pumps	N + 1	Common to Units 1 and 2
Condenser Vacuum Pumps	2 -100%	Per Unit
Air Compressors	N+1	Per Unit
Instrument Air Driers	N+1	Per Unit

1.07 MAIN STEAM SYSTEM DESCRIPTION

A. Main steam system shall deliver high pressure, superheated steam from superheater outlet to high pressure (HP) section of steam turbine. Main steam bypass shall be provided for startup to dump main steam to condenser and bypass turbine. Drip legs shall be included near turbine stop valve and at low points in piping run. Condensate collected in drip legs shall be piped to blowdown tank.

B. Main steam system shall consist of following major equipment:
   1. Main steam relief valve(s).
   2. Main steam stop valve.
   3. Electro-pneumatic valve.

C. Main steam shall also supply steam to following systems:
   1. Main steam system is also a source for auxiliary steam system.
   2. Turbine steam seals during low load.

1.08 MAIN STEAM BYPASS SYSTEM DESCRIPTION

A. Main steam bypass system shall function during startup to keep boiler from overheating while turbine and associated piping temperatures are raised. System shall be designed for use during startups (cold, warm, or hot) to closely match steam-to-turbine metal temperatures, to reduce plant startup times. Main steam bypass shall not be designed for use during load rejections.

B. System shall bypass turbine stop control valve and turbine and dump steam into condenser. Bypass shall be outfitted with a pressure reducing/desuperheating valve to meet condenser requirements. Main steam bypass shall be capable of bypassing 25%, minimum, of rated turbine throttle flow. Reheat bypass shall be capable of passing main steam bypass flow plus attemperating water. Bypass system shall be capable of operating under all load conditions from startup to 25%, minimum, load. System shall be arranged to allow steam system to operate during start-up without turbine-generator in service. Desuperheating spray water shall come from boiler feedwater booster pump discharge, or main boiler feedwater interstage take-off, as required.

C. Main steam bypass system shall consist following major equipment:
   1. Main steam bypass to condenser block valve.
   2. Main steam bypass to condenser steam conditioning valve.

1.09 COLD REHEAT SYSTEM DESCRIPTION

A. Cold reheat steam system shall transfer steam from outlet of high pressure (HP) section of the high pressure/intermediate pressure (HP/IP) turbine and return steam to boiler for reheat. Once flow passes through reheater, it is delivered to intermediate pressure (IP) section of high pressure/intermediate pressure (HP/IP) turbine (hot reheat system). Line from HP/IP turbine to boiler shall contain reheat attemperator, which shall provide protection of reheater against high temperature. Drip legs shall be included near turbine stop valve and at low points in piping run. Condensate collected in drip legs shall be piped to condenser.

B. Cold reheat system shall include following major equipment:
   1. Cold reheat header safety valves as required by boiler manufacturer.
   2. Reheat attemperator.

C. Cold reheat shall also supply steam to following systems:
   1. High pressure feedwater heater, if required by heat balance.
   2. Plant auxiliary steam.

1.10 HOT REHEAT SYSTEM DESCRIPTION

A. Hot reheat steam system shall transfer reheated steam from boiler reheater connection to IP section of turbine (reheater stop valve). Drip legs shall be included near IP turbine inlets and at low points in piping run. Condensate collected in drip legs shall be piped to condenser.

B. Hot reheat steam system shall include following major equipment: Hot reheat header relief valve as required by boiler manufacturer.

1.11 AUXILIARY STEAM SYSTEM DESCRIPTION

A. Auxiliary steam system shall be supplied from main steam, and shall provide reduced pressure and attemperated steam to miscellaneous users as required for plant operation and startup. Auxiliary steam system shall provide inerting steam to coal mills.

B. Auxiliary steam system shall consist of following major equipment: Auxiliary steam attemperator.

C. Auxiliary steam shall supply steam to following:
1. Deaerator warming or pegging steam.
2. Low load hot well heating, as required.
3. Coal mill inerting steam.
4. Soot blowing.
5. Other miscellaneous users as required.

1.12 CONDENSATE SYSTEM DESCRIPTION

A. Condensate system shall pump condensed steam from condenser hotwell to deaerator through turbine gland seal condenser, condensate polishers, and feedwater heaters. Bypass line shall be included around each feedwater heater and each heater shall be isolated and bypassed remotely with motor-operated bypass valves and isolation valves.

B. A minimum flow recirculation line shall be included between gland seal condenser and first feedwater heater, and shall recirculate to condenser. Minimum flow line shall be modulating and shall allow pumps to run at low load without falling below required minimum flow.

C. Seal water for condensate pumps shall be supplied from condensate makeup water pumps during startup, and shall be supplied from condensate pump discharge after pump startup. Condensate flow to deaerator shall be controlled by modulating level in deaerator storage tank. Provisions shall be included for deaerator to manually drain to both condensate storage tanks and plant drainage system.

D. Condensate system shall consist of following major equipment:
1. Condenser.
2. Condensate pumps and inlet strainers.
3. Gland steam condenser.
4. Feedwater heaters.
5. Deaerator.

E. Condensate shall supply following systems:
1. Auxiliary steam system attemperator.
2. Gland steam condenser attemperator.
3. Closed cycle cooling water head tank.
4. Boiler cycle chemical feed system make-up water.
5. Vacuum pump seals.
6. Turbine exhaust hood sprays.
7. Turbine bypass curtain spray.
8. Vacuum beaker seal water.
9. Boiler feed system fill supply.

F. System design criteria: Condenser shall have titanium tubes with compatible tube sheet material.

1.13 CONDENSATE POLISHING SYSTEM DESCRIPTION

A. The condensate polishing systems (one system per power generating unit) shall be of the deep bed, mixed ion exchange resin bed type, designed with sufficient flow capacity to polish the full flow of condensate produced at maximum steam load conditions. The condensate polishing system serves two functions.

1. The more critical function is to capture dissolved ions contaminating the condensate in the event of a surface condenser seawater cooling water leak into the steam cycle. The intent is to afford sufficient time for an orderly shutdown of steam turbine generator equipment to effect condenser repairs without suffering the damaging effects of boiler feedwater contaminants on both boiler and turbine.
2. The second function of condensate polishing is the continuous capture and removal of iron oxide corrosion products to prevent their redeposition on boiler heat transfer surfaces. This helps maintain efficient heat transfer and extends the amount of unit run time before off-line steam generator chemical cleaning is necessary.

B. System design criteria for full flow, deep bed, mixed bed condensate polishing system. Each system shall include:
1. Deep bed, mixed bed ion exchange resin condensate polishing vessels of sufficient capacity to treat 100% of condensate flow at full load operation: 3 at 50%.
2. Ion exchange resin separation and regeneration equipment capability external to the mixed bed condensate polishing vessels.
3. Cation resin regenerant chemical storage, chemical metering pump skid, and regenerant chemical dilution water mixing equipment systems.
4. Anion resin regenerant chemical storage, chemical metering pump skid, regenerant chemical dilution water mixing equipment systems.
5. Ion exchange resin separation and regeneration equipment area shall have spill/leak containment and chemically resistant coatings suitable to regenerant chemicals to be used.
6. Spent regenerant chemical neutralization system capability shall be provided.

1.14 BOILER FEEDWATER SYSTEM DESCRIPTION

A. Boiler feedwater system shall deliver preheated feedwater from deaerator storage tank to boiler economizer through feedwater heaters.

B. Feedwater is first pumped from deaerator to boiler feedwater main pumps by boiler feedwater booster pumps. Main pumps increase feedwater pressure as required by boiler manufacturer at economizer inlet, plus friction losses. Bypass line shall be included around each feedwater heater.

C. Each heater shall be isolated and bypassed remotely with motor operated isolation and bypass valves. Minimum flow recirculation lines shall be included for each pump and shall transfer feedwater from discharge of main pumps to deaerator. Minimum flow lines shall be modulating and shall allow pump trains to run at low load without falling below required minimum flow of booster or main pump.

D. Boiler feedwater system shall consist of following major equipment:
1. Deaerator.
2. Feedwater heaters.
3. Booster feedwater pumps.
4. Main feedwater pumps.
5. Hydraulic fluid couplings.

E. Boiler feedwater shall also supply feedwater to following systems:
1. Main steam bypass attemperator.
2. Reheat attemperator.
3. Main steam attemperators.

F. System design criteria:
1. Main feedwater pump shall be horizontal, double-cased, multi-stage, diffuser type, centrifugal pump.
2. Main feedwater pump shall be provided with a hydraulic coupling for speed control.
3. Deaerator shall have a minimum storage volume on 7.5 minutes at normal water level.

1.15 DEMINERALIZED WATER SYSTEM DESCRIPTION

A. Demineralized water system shall store demineralizer water makeup from water treatment system. Demineralized water pumps shall transfer demineralized water from demineralized water tank to condensate storage tank, via condenser.

B. Demineralized water system shall consist of following major equipment:
   1. Demineralized storage tank; one 500,000 gallons.
   2. Demineralized transfer pumps.

1.16 CONDENSATE STORAGE AND MAKE-UP SYSTEM DESCRIPTION

A. Condensate storage and make-up shall transfer high purity condensate from condensate storage tank to condenser hotwell. During normal operation, condensate make-up shall bypass transfer pump and vacuum drag from condensate storage tank to condenser.

B. Condensate transfer pump shall pump condensate to condenser when sufficient static head is not available for gravity flow, during emergency makeup scenarios, and initial filling of hotwell prior to startup. Condensate transfer pumps shall also supply seal water to each condensate pump during startup. Condensate storage tank shall provide a location for condensate dump from condensate system.

C. Cycle make-up system shall consist of following major equipment:
   1. Condensate storage tank; one 500,000 gallons.
   2. Condensate transfer pumps.

D. Cycle make-up system shall also supply following systems:
   1. Condensate system fill.
   2. Condensate pump seal water.

1.17 SAMPLING SYSTEM DESCRIPTION

A. Seawater intake sampling system: Provide free chlorine residual monitoring capability.

B. Water production plant sampling system.
   1. Mixed media filter influent: Free chlorine residual, specific conductance.
   2. Mixed media filter effluent: Turbidity (manifold to a single analyzer, each filter and combined flows from all in-service filters).
   3. Seawater reverse osmosis (SWRO) influent: Oxidation/reduction potential (ORP).
   4. SWRO permeates: Specific conductance.
   5. SWRO rejects: Specific conductance.
   6. Remineralization filters influent: Free chlorine residual.
   7. Brackish water reverse osmosis (BWRO) influent: pH.
   8. BWRO permeate: Specific conductance (each skid).
   9. BWRO rejects: Specific conductance (each skid).
   10. Electrodeionization (EDI) effluents: Specific conductance (each skid).
   11. EDI rejects: Specific conductance (each skid).
   12. Demineralized water tank pump effluent: Specific conductance, silica, sodium.

C. Steam and water sampling system:
   1. An analytical chemistry laboratory including water sampling systems shall be provided at a location central to both operating units. This laboratory shall be suitable to service the analytical chemistry operating needs of both generating units. Capabilities for the proper handling and analysis of water, fuel, and ash samples shall be included. HVAC equipment and utility services appropriate to maintaining a clean laboratory environment shall be provided.
   2. Water and steam sampling system shall be capable of adjusting the pressure and temperature conditions of each flowing liquid water sample to enable in-line sensors to consistently produce accurate measurements. Sample conditioning shall also contribute to the safety of operating

personnel responsible for collecting water and condensed steam samples for laboratory analyses necessary for monitoring and control of operating plant equipment.

3. Each sample point pressure, temperature, and water quality parameters to be measured shall be accurately specified as the basis for proper selection of component parts suitable to each sample to be conditioned and measured.
4. Steam and water sampling systems shall include at a minimum the following sample points and respective monitored parameters for each of the two units:
   a. Condensate pump discharge: Specific conductance, cation conductivity, pH, dissolved oxygen.
   b. Condensate polisher effluent: Specific conductance, cation conductivity.
   c. Deaerator storage tank effluent: Dissolved oxygen, pH, specific conductance.
   d. Economizer inlet: pH, specific conductance, cation conductivity, dissolved oxygen.
   e. Boiler drum water: Specific conductance, silica, pH, phosphate.
   f. Saturated steam: Specific conductance, cation conductivity.
   g. Main steam: Specific conductance, cation conductivity, sodium, silica.
   h. Reheat steam: Specific conductance, cation conductivity, sodium.

D. Seawater cooling effluent sampling system: Seawater once-through cooling water effluent after dechlorination: grab sample free chlorine residual, temperature

E. Wastewater treatment sampling system:
1. SWRO reject effluent discharge - parameters as required by environmental regulations and discharge permits.
2. Package sanitary sewage treatment plant effluent: grab samples: parameters as required by environmental regulations and discharge permits.
3. Oil/water separator effluent: grab sample - parameters as required by environmental regulations and discharge permits.
4. Wastewater settling basin effluent: pH, specific conductance, grab sample - parameters as required by environmental regulations and discharge permits.

F. System design criteria:
1. ASME PTC 19.11: 2008: Steam and Water Sampling Conditioning and Analysis In The Power Cycle.
2. As required by all applicable environmental rules, regulations, discharge permits.

1.18 WASTEWATER TREATMENT SYSTEMS DESCRIPTION

A. Water production plant waste waters from SWRO reject wastewater and filter backwashing wastewater shall be routed through the Wastewater Settling Basin for discharge from plant site.

B. Plant drains from all maintenance areas including but not limited to, maintenance buildings, vehicle maintenance building, maintenance shops, main plant and general area wash-down wastewaters will be routed through oil water separator(s) and then to the wastewater settling basin for discharge from plant site.

C. Sanitary waste waters shall be accumulated and routed to a package sewage treatment process and wastewater effluent routed to discharge from the plant site in accordance with all applicable environmental permits, rules, regulations and laws.

D. Coal pile rainfall runoff water shall be routed to the fuel storage runoff basin for treatment and discharge from the plant site.

E. Provide separate containment or sump for air heater washing.

F. Design and construction of a compliant wastewater treatment process in accordance with all applicable environmental permits, rules, regulations and laws shall be the responsibility of the Contractor.

1.19 WATER TREATMENT SYSTEMS DESCRIPTION

A. Water treatment process flow diagrams (Drawings No. XP04 and XP05) are included as an attachment. This water process flow diagram provides preliminary conceptual arrangement of water treatment unit process operations. Water flow rate values shall be established by Contractor in the detail design process. Water treatment unit processes are selected and designed to improve critical water quality parameter values to meet or exceed the requirements and specifications of facility water using equipment essential to operating an electric power generation plant.

B. Raw seawater supply source and uses:
   1. All site water supply will be from seawater based upon the facility needs for once-thru condenser cooling water, fire protection water, plant service water uses, steam cycle make-up water, potable water uses, ash handling, as well as periodic service water uses for dust suppression, maintenance cleaning, and landscaping upkeep.
   2. Seawater supply will also be chlorinated to control downstream microbiological growths. Seawater will contain varying amounts of total suspended solids (TSS). This water quality is acceptable for once-thru condenser cooling water, but not for other plant water uses.

C. Water treatment plant: Multiple water treatment unit processes will be necessary to meet the water quality requirements of each of the various plant uses: cycle demineralized makeup water, potable water, plant service water, and fire protection water.
   1. Chemical coagulant injection to seawater to increase total suspended solids (TSS) particle size.
   2. Filtration in pressure vessels containing beds of mixed media to remove coagulated TSS.
   3. Dechlorination chemical injection to protect downstream RO membranes from chemical oxidation degradation.
   4. Scale inhibitor chemical injection to protect downstream RO membranes from mineral deposit fouling.
   5. Seawater reverse osmosis process (SWRO) to reduce salinity total dissolved solids (TDS). SWRO process equipment includes:
      a. Cartridge filters.
      b. High pressure water pumps.
      c. SWRO semipermeable membranes housed in pressure vessels.
      d. Skid that can be cleaned in-place, designed to be capable for SWRO configuration.
      e. Controls instrumentation package.
      f. SWRO influent water flow is split by SWRO membranes:
      g. Lower quality concentrate water (increased TDS) reject stream may be reused as pressure filter backwash water supply, or discharged directly as wastewater
      h. Higher quality permeate water (reduced TDS) product water flow is divided between two downstream treatment processes:
         1) Potable water, service water, fire protection water.
         2) Cycle makeup water.
      i. Potable water, service water/fire protection water are treated:
         1) Remineralization filter process.
         2) by Chlorination chemical injection for disinfection and microbiological growth control.
         3) Flow is split between 2 tanks (potable water storage or service/fire water storage) based upon tank water level controls actuating flow control valves.
      j. Cycle makeup water is treated:
         1) Brackish water reverse osmosis process (BWRO).
            a) Scale inhibitor chemical feed.
            b) Sodium hydroxide solution fed to BWRO feedwater for pH control.
            c) BWRO high pressure water pumps.
            d) BWRO semipermeable membranes housed in pressure vessels.
            e) Clean-in-place skid designed capable for BWRO configuration.
            f) Controls instrumentation package.
            g) BWRO permeate is supply water to electrodeionization process.
            h) BWRO concentrate reject water phase is recycled to filtered water storage tank.
         2) Electrodeionization (EDI) process for cycle makeup water: BWRO permeate water is polished for additional TDS reduction through EDI process to meet Electric Power Research Institute (EPRI) water quality guidelines.
            a) EDI treated water flows to demineralized makeup water tank by pressure of BWRO high pressure pump.

b) EDI reject water phase is recycled to SWRO permeate break water tank.

D. System design criteria:
1. Number of pressure filter vessels shall be N+2.
2. Pressure filter vessel construction shall be per ASME Code Section VIII, steel vessel with rubber internal lining and epoxy coated exterior surfaces corrosion resistant to seawater conditions.
3. Pressure filter performance shall produce filtered water with silt density index (SDI) consistently <3.
4. Number of SWRO skids shall be N+1.
5. SWRO high pressure pumps and piping shall be constructed of duplex stainless steel, and pressure vessels shall be constructed of materials suitable to heavy duty seawater service.
6. SWRO membranes shall reduce total dissolved solids by at least 99% with 86 °F temperature water supply. SWRO permeate water shall contain total dissolved solids less than 500 mg/l at all times.
7. Number of BWRO skids shall be N+1.
8. BWRO performance shall reduce permeate water total hardness to less than 1.0 mg/l as $CaCO_3$.
9. Number of EDI units shall be N+1.
10. EDI effluent water shall meet applicable EPRI guidelines for cycle makeup water quality for steam generation systems operating at design boiler steam drum operating pressure.

1.20 CHEMICAL STORAGE, FEED, AND CONTROL SYSTEM DESCRIPTION

A. Water production plant, chemical storage, feed and control system is a common system to Units 1 and 2, unless noted otherwise.

B. There are a number of individual water treatment chemical applications required to maintain efficient and reliable plant equipment systems operations. Functions include microbiological growth control, coagulation of colloidal suspended solids for filtration, dechlorination to prevent damage to equipment components or effluent discharge permit compliance, mineral scale inhibition, neutralization of dissolved CO2, corrosion prevention, and deposit control.

C. Provide for following chemical applications:
1. Seawater chlorination at in-take.
   a. Sodium hypochlorite bulk storage tank.
   b. Dual metering pump skids:
      1) Intermittent feeds to once through cooling water actuated by feed event frequency and duration timer system.
      2) Continuous feeds to seawater supply flow to water production plant.
   c. Analyzer / controller capabilities.
2. Seawater coagulant chemical feed upstream of pressure filters.
   a. Coagulant chemical storage tank.
   b. Dual metering pump skid with proportional feed control capability.
   c. Water flow proportional feed capability.
3. SWRO dechlorination chemical feed:
   a. Sodium bisulfite storage tank.
   b. Dual metering pump skid with proportional feed control capability.
   c. Analyzer / controller capability.
4. SWRO scale inhibitor chemical feed:
   a. Scale inhibitor chemical storage tank.
   b. Dual metering pump skid with proportional feed control capability.
   c. Water flow proportional feed control capability.
5. SWRO clean-in-place (CIP) chemicals storage area:
6. Service water, fire water, potable water chlorination.
   a. Sodium hypochlorite storage tank.
   b. Dual metering pump skids with proportional feed control capability.
   c. Free chlorine analyzer / controllers.
7. Brackish water RO sodium hydroxide solution feeds.
   a. Chemical supply storage.
   b. Dilution mix tank with demineralized water supply.

c. Dual metering pump skid with proportional feed control capability.
d. pH control system.

8. Steam cycle chemical feed systems (separate system for Unit 1 and Unit 2):
   a. Oxygen scavenger chemical:
      1) Chemical supply storage.
      2) Solution mix tank with condensate water supply.
      3) Dual metering pump skid.
   b. Phosphate chemical solution:
      1) Chemical supply storage.
      2) Solution mix tank with condensate water supply.
      3) Dual metering pump skid.
   c. Ammonia chemical solution:
      1) Chemical supply storage.
      2) Solution mix tank with demineralized water supply.
      3) Dual metering pump skid.
9. Effluent condenser cooling water dechlorination chemical feed system:
   a. Sodium bisulfite storage tank.
   b. Dual metering pump skid with proportional feed control capability.
   c. Analyzer / controller capability.

1.21 CIRCULATING WATER SYSTEM DESCRIPTION

A. Circulating water system shall supply cooling water for plant steam cycle and other miscellaneous users. Waste heat shall be rejected into sea. Circulating water pumps intake design shall minimum uptake of sand and sediment into the system. Circulating water pumps transfer seawater through condenser and discharge seawater back to sea. Circulating water system shall be able to operate during all plant loads. System shall be sized for MCR conditions.

B. Intake structure shall provide a shelter for pumps and provide suitable hydraulic and environmental conditions at pump intake. Multiple screens shall filter debris, including a passive coarse screen (set at 45° angle), and vertical traveling screens upstream of collection basin. A debris filter shall also be included upstream of closed cycle cooling heat exchangers with automatic backwash capability controlled by differential pressure. The intake structure design shall take into account variations in sea level for pump submergence and NPSH. Stop logs shall be located to isolate each bay of intake structure from sea water for maintenance.

C. Circulating water system shall discharge through an outfall structure that shall include a seal well and discharge channel. The seal well shall be located at an elevation to prevent flashing of seawater inside condenser water box, while taking advantage of siphon effect. The discharge out of seal well shall be controlled by a weir with stop log.

D. Circulating water system shall also provide cooling water for closed cycle cooling water heat exchangers. This separate line shall connect to main circulating water header and operate in parallel with condenser. Each heat exchanger shall have isolation valves and bypass lines.

E. Water hammer analysis shall be performed for typical operating scenarios in circulating water system, and components shall be designed accordingly for effects of water hammer.

F. Motor-operated isolation valves shall be located at outlet of circulating water pumps to isolate each pump independently during plant operation. Isolation valves shall also be located at inlet and outlet of each condenser water box to independently isolate a water box while online. Air vent valves shall also be included at local high points in system, including both sides of each water box, to remove air during filling of system. A priming system shall be included at high points in water boxes to remove dissolved gases from sea water during normal operation.

G. Piping and power operated valves shall be provided to reverse flow through the condenser online.

H. Materials in circulating water system shall be compatible with severely corrosive characteristics of seawater.

I. Circulating water system shall consist of following major equipment:
   1. Circulating water pumps.
   2. Closed cycle cooling water heat exchangers.
   3. Condenser.
   4. Seal well.
   5. Automatic backwash screens.
   6. Passive and vertical traveling intake screens.
   7. Traveling screen backwash pumps.

J. System design criteria:
   1. To meet World Bank requirements the discharge outfall shall be designed to not exceed a 3°C seawater temperature rise measured 100 meters from outfall.
   2. Dedicated piping line shall be provided from circulating water pumps to each unit.
   3. Below ground circulating water piping shall be pre-stressed concrete embedded cylinder pipe.

1.22 CONDENSER AIR EXTRACTION SYSTEM DESCRIPTION

A. Condenser air extraction system shall provide ability to rapidly remove air from condenser shell before plant startup (hogging operation). System shall remove non-condensable gases and maintain turbine backpressure during normal operation (holding operation).

B. Vacuum pumps shall exhaust to outdoors. Vacuum breaker valve shall be included and may open during turbine trip to minimize turbine roll-down time. Condensate from discharge of condensate pumps shall be a source of seal water to vacuum pumps.

C. Condenser air extraction system shall consist of following major equipment:
   1. Liquid ring vacuum pump skids.
   2. Condenser vacuum breaker valve.

D. System design criteria:
   1. HEI Standard for Steam Surface Condenser.
   2. HEI Performance Standard for Liquid Ring Vacuum Pumps.

1.23 CLOSED CYCLE COOLING WATER SYSTEM DESCRIPTION

A. Closed cycle cooling water (CCCW) system shall transfer heat rejected by various equipment through CCCW heat exchangers to circulating water system. Water shall be pumped by one of CCCW Pump in a closed loop through CCCW heat exchangers and various equipment heat exchangers.

B. CCCW head tank shall be located and sized to maintain required system head, and accommodate surging and thermal expansion. Head tank shall be vented to atmosphere.

C. Water bypass line with modulating control valve shall be included between supply and return header to maintain a constant differential pressure and adequate cooling water flow.

D. Makeup water to CCCW system shall be provided from condensate system, or equal quality water, and shall be regulated by maintaining level in CCCW head tank.

E. Closed cycle cooling water system shall consist of following major equipment:
   1. Closed cycle cooling water pumps.
   2. CCCW heat exchangers.
   3. CCCW atmospheric head tank.
   4. Batch chemical shot feeder.
   5. Pressure modulating bypass line.

F. Closed cycle cooling water shall provide cooling water to following systems and equipment:
   1. Generator hydrogen coolers.
   2. Feedwater pump and feedwater booster pump seals.
   3. Feedwater pump lube oil coolers.

4. Feedwater pump fluid coupling working oil coolers.
5. Turbine lube oil and electrohydraulic control system coolers.
6. Coal mill gear box lube oil coolers.
7. Bottom ash coolers.
8. Air compressors.
9. Boiler sample panel coolers.
10. Miscellaneous heat exchangers and VFDs as required.

1.24 EXTRACTION STEAM SYSTEM DESCRIPTION

A. Extraction steam system shall supply steam to all feedwater heaters and heat condensate or boiler feedwater flowing in tube side of feedwater heaters, and shall provide heating steam for deaerator.

B. Steam shall be extracted from cold reheat, HP/IP turbine, LP turbine as required to match steam cycle heat balance. Deaerator pegging steam shall be provided from plant auxiliary steam.

C. Nonreturn check valves shall be located to meet steam turbine generator manufacturer's extraction steam energy requirements.

D. Motor operated isolation valve closing time shall be in accordance with HEI and ASME TDP-1 to prevent turbine water induction.

E. Extraction steam system shall consist of following major equipment in each extraction line:
1. Power assisted nonreturn check valve(s) for turbine over-speed protection.
2. Motor operated isolation valve for feedwater heater isolation and as required to meet ASME TDP-1.
3. Air operated automatic drain valves before and after each nonreturn check valve. Automatic drain valve shall be located at all low points as required to meet ASME TDP-1.

F. System design criteria: Extraction steam system shall meet following requirements.
1. ASME TDP-1.
2. HEI Standards for Closed Feedwater Heaters.
3. HEI Standards and Typical Specifications for Deaerators.
4. Steam turbine manufacturer requirements.

1.25 FEEDWATER HEATER CYCLE DRAINS SYSTEM DESCRIPTION

A. Feedwater cycle drains are cascading drains that remove condensed extraction steam from shell side of feedwater heaters. Each drain line shall include level control valves, and shall cascade from higher pressure heaters to lower pressure heaters. During normal operation, high pressure drains shall cascade through HP heaters, to deaerator, and low pressure drains shall cascade through LP heaters, to condenser.

B. Each drain line shall have an emergency bypass branch to condenser with a level control valve used for emergency draining, startup, and heater bypass. HP heaters emergency drains may drain to deaerator heater.

C. Level control valves and drain piping shall be sized for increased flow due to heater outage or upset conditions. Piping shall be sized to prevent flashing upstream of control valve at all operating loads. Control valves shall be located adjacent to feedwater heaters, deaerator, and condenser to minimize downstream piping.

D. Feedwater cycle drains system shall consist of following major equipment:
1. Feedwater heaters.
2. Deaerator.
3. Automatic level control system in accordance with ASME TDP-1.

E. System design criteria: Feedwater cycle drain systems shall meet following requirements.
1. ASME TDP-1.

2. HEI Standards for Closed Feedwater Heaters.
3. HEI Standards and Typical Specifications for Deaerators.

1.26 FEEDWATER HEATER VENTS AND DRAINS SYSTEM DESCRIPTION

A. Feedwater heater vents and drains system shall include feedwater heater shell and channel relief valve vent piping, shell non-condensable vents (vent off-take system), deaerator heater relief valve vents, and miscellaneous maintenance drains.

B. Shell relief valve vents shall be sized for flashing flow and include relief valve bellows type vent seals where required. Shell relief valve vents shall discharge into main vent stack. Deaerator relief valve vents shall discharge through turbine building roof. Channel relief valve vents shall discharge into plant drain system.

C. Drain piping shall slope continuously to plant drains system. A loop seal with fill line shall be supplied in main vent stack to prevent steam from entering plant drain system. Turbine seals system relief valve and miscellaneous receiver tank vent shall tie into main vent stack.

D. Feedwater heater non-condensable vents shall be designed per equipment manufacturer and HEI requirements.

E. Only continuous and startup vents from same heater may be manifolded together if header is sized for all vents operating at once. HP heaters shall vent to deaerator. LP Heaters shall vent to condenser. Deaerator shall vent to atmosphere.

F. Feedwater heater vents and drains system shall consist of following major equipment:
1. Feedwater heaters.
2. Deaerator.

G. System design criteria:
1. HEI Standards for Closed Feedwater Heaters.
2. HEI Standards and Typical Specifications for Deaerators.

1.27 LUBE OIL SYSTEM DESCRIPTION

A. Lube oil system shall consist of piping to transfer lube oil from turbine lube oil system to clean/dirty lube oil storage tank. Tank shall include separate compartments for dirty and clean turbine lube oil.

B. Each tank compartment shall have working capacity to accommodate volume associated with lube oil system for one steam turbine generator, including main turbine lube oil tank, lube oil cooler, lube oil conditioner, plus 10% margin.

C. The system shall include all necessary piping and valves for lube oil to gravity drain from turbine lube oil system into clean/dirty lube oil storage tank. A lube oil transfer pump shall be included to transfer lube oil from either clean or dirty compartments of tank to turbine lube oil system for either one steam turbine generator unit or the other unit . Pump shall have ability to transfer from clean compartment to dirty compartment, and vice versa.

D. Clean/dirty lube oil storage tank shall include a truck fill connection that connects into suction side of transfer pump. Dirty and clean compartments shall each have a separate vent line to outdoors with flame arrestor, overflow line, and drain line.

E. Tank shall be located in a containment area, sized for total volume of tank compartments and piping.

F. Lube oil system shall consist of following major equipment:
1. Clean/dirty lube oil storage tank.
2. Lube oil transfer pump.
3. Lube oil conditioner to clean and filter oil.

1.28 BOILER VENTS AND DRAINS SYSTEM DESCRIPTION

A. Boiler vents and drains system shall include piping to connect vents and drains from boiler and steam systems to blowdown tank or plant drains system. Drains above 140°F that cannot be routed to condenser, shall be routed to blowdown tank.

B. Boiler drum safety valve vents shall be routed outside building to a safe location. Drain piping shall continuously slope to blowdown tank or plant drains. Blowdown tank drain shall be cooled with service water, and shall be controlled by maintaining blowdown tank outlet temperature below 140°F.

C. Drain and vent pipe sizes shall be equal to, or larger than boiler terminal point size, and shall be sized as not to limit required flows during startup or normal operation. Individual drain lines routed to blowdown tank shall be manifolded together unless prohibited by boiler manufacturer.

D. Blowdown tank shall have a minimum of two headers, one for boiler drains, and one for steam system drains. Loop seal with vacuum breaker shall be supplied in blowdown tank drain to prevent steam from entering plant drain system. Blowdown tank, tank vent, and loop seal shall be sized to prevent carryover of condensed steam out vent, and shall prevent excessive noise, and prevent loop seal blow out during startup, shutdown, and at all operating loads.

E. Boiler vents and drains system shall consist of following major equipment: Blowdown tank.

F. System design criteria: National Board Rules and Recommendations for Design and Construction of Boiler Blowoff Systems.

1.29 FUEL OIL SYSTEM DESCRIPTION

A. The fuel oil system shall receive fuel oil from ships at the pier or from tanker trucks.

B. Fuel oil system shall transfer fuel oil from ships or tanker trucks to the bulk storage tanks.

C. Fuel oil system shall transfer fuel oil from bulk storage tanks to boiler fuel oil module for startup fuel.

D. Two (2) 250,000 gallon fuel oil tanks shall be provided.

E. Fuel oil equipment and piping shall be designed to startup both boilers simultaneously. Below-grade pipe shall have sealed secondary containment, vented to atmosphere. Relief valves in system shall discharge to fuel oil storage tank, or to a designated fuel oil relief valve tank.

F. Fuel oil system shall consist of following major equipment:
1. Receipt terminal on pier.
2. Fuel oil storage tank.
3. Fuel oil transfer pumps.
4. Fuel oil unloading station.
5. Fuel oil relief valve tank.

G. System design criteria:
1. API 650: Welded Tanks for Oil Storage.
2. NFPA 30: Flammable and Combustible Liquids Code.
3. NFPA 85: Boiler and Combustion Systems Hazard Code.
4. Fuel oil tank containment shall be sized for tank volume plus volume of 24 hours of a 25-year rain event.

1.30 SERVICE WATER SYSTEM DESCRIPTION

A. Service water system shall deliver water from combined service water/fire protection water tank to various non-potable plant users as required for plant operation.

B. Service water pumps shall be protected from low water level when fire water pumps are in operation. Each service water pump shall have a dedicated, modulating minimum flow recirculation line back to service water storage tank.

C. Service water hose bibbs shall be placed at approximately 50 ft. radius intervals at all elevations inside turbine building, at each elevation of the boiler building and to maintenance buildings.

D. Coal handling washdown hose bibs shall be spaced a maximum 50 ft intervals.

E. Service water system shall deliver water to following equipment and users:
1. Water cannon pump, if required.
2. Air heater.
3. Coal handling wash down area wash down headers.
4. Fly ash unloading.
5. Water treatment system.
6. Hose bibbs.
7. Pyrite hoppers.
8. Pulverizer wash water.
9. Pump seals.
10. Bottom ash conveyor.
11. Blowdown tank cooling water.
12. Scrubber cooling water.
13. Miscellaneous non-potable plant users as required for plant operation.

F. Service water system shall consist of following major equipment:
1. Service water/fire protection tank.
2. Service water pumps.

1.31 POTABLE WATER SYSTEM DESCRIPTION

A. Potable water system shall provide water for plumbing, sanitary, laboratory, and emergency shower and eyewash stations.

B. Potable water pumps shall transfer water from potable water tank to various users throughout both units.

C. Backflow preventers shall be located as required by applicable codes to prevent contamination of system.

D. System shall be disinfected in accordance with provisions of International Plumbing Code and other local requirements.

E. Potable water system shall consist of following major equipment:
1. Potable water tank.
2. Potable water transfer pumps.
3. Water heaters.
4. Emergency shower and eyewash stations.
5. Expansion tanks.
6. Water hammer arresters.

F. System design criteria:
1. International Plumbing Code.
2. International Building Code.
3. NSF/ANSI Standard 61.
4. Plumbing and Draining Institute (PDI) Standard WH-201.

1.32 FIRE PROTECTION SYSTEM DESCRIPTION

A. Fire protection system shall provide monitoring and alarm capabilities to protect and notify plant personnel of a plant fire and to provide adequate water to yard fire mains, fire hydrants, hose stations, sprinklers, and fire department connections.

B. Fire pumps shall transfer water from service water/fire protection tank, and shall be sized to meet system demands and pressure as required. An underground loop header shall be installed around Boiler and steam turbine buildings. Hose stations and portable fire extinguishers shall be included where required.

C. Booster pumps shall be included to meet pressure requirements for hose station and fire department connections at higher elevations. Fire protection equipment shall be UL-listed and FM-approved.

D. Fire protection system shall protect following major equipment, systems, and areas as a minimum. Type of fire detection system shall depend on equipment and area being protected.
1. Silo fill floor.
2. Regenerative air heater.
3. Lube oil reservoirs, handling equipment, and oil piping.
4. Fuel oil tanks, handling equipment, and piping.
5. Turbine generator bearings.
6. Exciter housing.
7. Electrical and DCS/Electrical rooms.
8. Battery rooms.
9. Control room.
10. Accessible stairwell for control room.
11. Outdoor oil insulated transformers.
12. Coal handling areas and equipment including crusher buildings, coal silos, coal unloading, dust collectors, conveyors, and silo fill floor.
13. Pulverizers.
14. Fire protection pump room.

E. Fire protection system shall consist of following major equipment:
1. Service water/fire protection storage tank.
2. Main fire electric water pumps.
3. Main fire diesel water pumps.
4. Fire water jockey pump.
5. Fire water booster pumps.
6. Carbon dioxide hose reels.
7. Portable fire extinguishers.

F. System design criteria: Fire projection system shall be subject to requirements of Owner's insurance carrier and Authorities Having Jurisdiction, and shall be designed in accordance with following codes:
1. International Building Code.
2. NFPA 13: Standard for the Installation of Sprinkler Systems.
3. NFPA 15: Standard for Water Spray Fixed Systems for Fire Protection.
4. NFPA 20: Standard for the Installation of Stationary Fire Pumps for Fire Protection.
5. NFPA 24: Installation of Private Fire Service Mains and Their Appurtenances.
6. NFPA 72: National Fire Alarm Code.
7. NFPA 75: Standard for the Protection of Electronic Computer/Data Processing Equipment.
8. NFPA 850: Recommended Practice for Fire Protection for Electrical Generating Plants and High Voltage Direct Current Converter Stations.

1.33 HYDROGEN AND CARBON DIOXIDE SYSTEM DESCRIPTION

A. Hydrogen system shall to deliver pressurized hydrogen gas from a bulk storage tank to turbine gas control system through a regulating station for generator cooling.

1. Hydrogen storage system shall have enough volume to complete four generator purges and fills plus continuous makeup to both generators for a period of 30 days.
2. System shall include connections for filling tank and tube trailers.
3. Hydrogen storage system shall be protected from sunlight and weather with an open walled shelter.

B. Carbon dioxide system shall deliver conditioned carbon dioxide gas from a bottle rack to turbine gas control system through a regulating station.
1. Carbon dioxide is supplied to generator for hydrogen purges and fills.
2. Carbon dioxide storage system shall have enough volume to complete four generator purges.
3. One complete purge shall be defined by turbine-generator manufacturer.
4. Storage volume shall only include available volume in bottle, and shall not include volume that freezes upon expanding.
5. Carbon dioxide system shall be protected from sunlight and weather with an open walled shelter.

C. Hydrogen and carbon dioxide system shall consist of following major equipment:
1. Hydrogen storage tank.
2. H_2 pressure control station.
3. Carbon dioxide bottle rack.
4. CO_2 pressure control station.

D. System design criteria: ASME B31.12 Hydrogen Piping and Pipelines.

1.34 SERVICE AIR SYSTEM DESCRIPTION

A. Service air system shall provide compressed air to plant equipment and systems that require non-instrument quality air, and shall also provide make-up to instrument air driers. Makeup air to air compressors shall be ambient air, drawn through inlet air filters.

B. Compressors shall be variable speed controlled and discharge through a common header into an air receiver tank. Air compressor outlet headers and air receiver shall be equipped with safety valves. Traps shall be included at all low points in system and with air receiver to remove condensate.

C. Service air and instrument air shall be separate systems. Automatic isolation valves shall be included to isolate all nonessential users of service air prior to instrument air header pressure dropping below minimum requirement for operation of instrument air devices.

D. Quick disconnect hose connections with isolation valves shall be placed at approximately 50 ft. radius intervals in following areas:
1. Boiler building at all elevations.
2. Turbine building at all elevations.
3. Maintenance areas.
4. Coal handling areas at all elevations.
5. Adjacent to all major equipment.
6. Outbuildings with maintenance areas, mechanical or chemical equipment.

E. Service air system shall consist of following major equipment:
1. Inlet air filters.
2. Air compressors with safety valves and sound attenuation.
3. Air receiver tank with safety valves.
4. Quick hose disconnects with flow limiting devices.

F. Service air shall also supply following systems and equipment:
1. Instrument air.
2. Regenerative air heater rotary drive.
3. Atomizing air for fuel oil burners.
4. Miscellaneous equipment required for plant operation.

1.35 INSTRUMENT AIR SYSTEM DESCRIPTION

A. Instrument air system shall provide compressed air to all equipment and instrumentation that requires dry and filtered air.

B. Instrument air loop headers shall be located to minimize length of branch piping to instruments. Loop headers shall be arranged with isolation valves spaced at a maximum 50' to minimize amount of piping to be isolated during maintenance.

C. Instrument air system shall consist of following major equipment: Air driers and filters.

D. Instrument Air shall also supply following systems and equipment:
1. Air operated instruments.
2. Steam turbine relay dump valves.
3. Isolated phase bus duct.
4. Continuous emissions monitoring system (CEMS).
5. Baghouse pulsejet air receiver.
6. Fly ash vacuum system.
7. Fly ash silo fluidizing.
8. Other equipment requiring dried, compressed air as required for plant operation.

E. System design criteria: ISA Standard S7.0.01.

1.36 BUILDING SERVICES

A. Plant drains:
1. Equipment drains shall be adjacent to all major equipment.
2. Floor drains shall be located near feedwater heaters.
3. Floor drains shall be located on tripper floor for washdown.
4. Trench drains shall be located around various equipment on ground floor.
5. System shall discharge to plant drain system.
6. Drains which can be contaminated with oil shall be piped to separate drain system.
7. Provisions such as floor drains, trenches, and curbs shall be made in all fire areas of the plant for removal of liquids directly to safe area.
8. Floor drainage from areas containing flammable or combustible liquids shall be trapped to prevent the spread of burning liquids beyond the fire area.

B. Roof drains:
1. Primary system shall discharge to storm drain system.
2. Overflow system shall discharge to surface. Use scupper system where possible.

C. Heating, air conditioning, and ventilation:
1. HVAC systems shall be in accordance with NFPA 90A and 90B.
2. Air conditioning for the control room shall provide a pressurized environment to preclude the entry of smoke in the event of a fire outside the control room.
3. Do not use plastic ducts .
4. Fire dampers compatible with the rating of the barrier shall be provided at the duct penetrations in accordance with NFPA 90A.
5. Locate fresh air supply intakes to all areas to minimize the possibility of drawing products of combustion into the plant. Separate fresh air supply intakes from exhaust air outlets.

D. Do not provide smoke and heat vents

1.37 COAL HANDLING

A. Coal handling system shall receive coal from ships and transport to the storage pile and the boiler coal silos. Coal from the ships will be transported via belt conveyors directly to the coal pile, boilers coal bunkers or both at the same time.

B. Coal handling system will accept coal from self-unloading ships via a receipt hopper on the pier.

C. Coal storage pile will consist of active and compacted storage. A portion of the coal storage pile will be covered. The storage pile is generated by the bucket-wheel stacker reclaimer that will transverse on rails down the middle of the storage area with storage piles located on both sides of the traversing rails. Coal is reclaimed from the pile using either the bucker-wheel stacker reclaimer or ground mounted drag chain reclaimers.

D. Coal handling system shall consist of the following major equipment as outlined on the coal handling process flow diagrams:
   1. Conveyors.
   2. Feeders.
   3. Crushers.
   4. Bucket-wheel stacker reclaimer.
   5. Ground mounted drag chain reclaimers.
   6. Surge bins and hoppers.

E. Coal handling system shall also interface with the following systems or equipment:
   1. Boiler coal bunkers.
   2. Site drainage and coal pile runoff pond.

F. System design criteria:
   1. Conveyors shall be in accordance with ASME B20.1.
   2. Maximum belt conveyor incline angle: 14 degrees.
   3. Belt conveyor maximum belt speed: 600 feet per minute.
   4. Minimum transfer rate from ships: 3,000 tons per hour.
   5. Deliver coal from ships or from storage to fill the boiler coal bunkers for the two units in a maximum system operating time of 5.5 hours per day based on boiler coal usage for the two boilers at maximum load for 24 hours.
   6. Coal pile storage capacity:
      a. Basis: 2 units at 100% load.
      b. Active storage: 30 days.
      c. Total storage: 60 days.
      d. Base Bid: Covered storage: 30 days active and long term.
      e. Alternate Bid: Covered storage: 60 days active and long term.
   7. Dust collection and suppression equipment shall be provided to minimize fugitive dust and meet Dominican Republic Environment Agency (SEMARENA) and EPA requirements.
   8. Dust collection discrete emissions limit: 0.01 gr/dscf.

PART 2 PRODUCTS

NOT USED

PART 3 EXECUTION

NOT USED

END OF SECTION

PART 1 GENERAL

1.01 REQUIREMENTS INCLUDE

A. The scope of work includes furnishing, receiving, storing, installing, commissioning and placing in service all electrical equipment and distribution systems as described in this Section. Electrical design requirements defined herein shall form the basis of the design for project electrical components and systems. More-specific design information shall be developed during detailed design to support equipment and erection specifications. It is not the intent of this Section to present the detailed design information for each component and system, but rather to summarize the codes, standards, and general criteria to be used on the project.

B. The Contractor shall be responsible for the design, engineering, fabrication, assembly, and performance of the electrical system and all integral components, including compliance with all applicable standards, codes, rules, and regulations of governing bodies having jurisdiction.

C. Refer to the Technical Specifications for specific detailed requirements.

1.02 QUALITY ASSURANCE

A. Electrical work shall comply with the requirements of NFPA 70 (National Electrical Code), the National Electrical Safety Code (NESC), and NFPA 70E. Design criteria and practices shall conform to Institute of Electrical and Electronic Engineers IEEE design standards.

B. Equipment and components shall be listed and labeled by Underwriter's Laboratories (UL) or other nationally recognized testing laboratory. Equipment shall comply with all applicable (IEEE) standards. Components for use in hazardous locations shall be UL-listed or Factory Mutual (FM)-approved for the hazardous classification, division, and group.

C. Electrical equipment enclosure construction, material and protective treatment shall be listed as suitable for installation in humid, salt-laden air environment.

D. Electrical components, equipment and systems shall satisfactorily pass all applicable factory and field tests in accordance with the relevant standards specified in each item. Copies of all test certificates and supporting documentation shall be supplied to the Owner during the execution of the Work.

E. See Section 01 40 00 for applicable codes and standards.

1.03 DESIGN ANALYSIS AND DOCUMENTATION

A. Contractor shall submit drawings and engineering data in accordance with the submittal requirements and schedule to assure compliance with the project requirements, overall construction schedule, and the project in service date. During the design submittal process, the Contractor shall provide required design analysis.

B. Contractor's design shall give consideration to economics, safety of operation, acceptable performance, reliability, interchangeability of parts, O&M familiarity, and other benefits.

1.04 EQUIPMENT IDENTIFICATION

A. Electrical equipment, device or enclosure shall be with manufacturer's nameplate and properly labeled with equipment identification and equipment tag number.

B. Nameplates shall be durable plastic, laminated white phenolic engraving stock with black core, or 2 ply vinyl white with reverse engraved black fill, or other suitable means as approved by the Owner.

C. Nameplates for equipment installed outdoor and in the process area shall be stamped Type 316 stainless steel and shall be attached with stainless steel hardware.

D. Electrical raceways (2" and larger conduits, direct buried conduits, underground duct bank cells, cable trays, pull boxes and junction boxes containing multiple circuits) shall be labeled with segment identification to document circuit cables routings.

1.05 SYSTEM DESCRIPTION

A. Site electrical distribution system characteristics:

Electrical System Level (AC)	Nominal Operating Voltage	Frequency (Hz)
Project Site Incoming Supply Voltage	345 kV	60
Backup Incoming Supply Source	138 kV	60
Site Primary Distribution Voltage	6.9 kV	60
Secondary Unit Substation and MCC plant auxiliary loads	480 V	60
General Facility Power Distribution: HVAC, lighting, receptacle, and other branch circuit loads	208Y/120 V	60
DC Power Distribution	125 VDC	N/A

B. Electrical system configuration and grounding method:

Electrical System/ Equipment	Configuration	Grounding Method
345 kV incoming line and high side of GSU	3-phase, 3-wire	Effectively Grounded
138 kV incoming line and high side of SST	3-phase, 3-wire	Effectively Grounded
Generator unit terminal bus , 18 kV	3-phase, 3-wire	Ungrounded
Unit auxiliary medium-voltage distribution system, 6.9 kV	3-phase, 3-wire	Low-impedance Grounded
Plant site primary distribution system, 6.9 kV	3-phase, 3-wire	Low-impedance Grounded
Plant site low-voltage distribution system, 480 V	3-phase, 3-wire	High-impedance Grounded
Plant site low-voltage distribution system, 208Y/120V	3-phase, 4-wire	Solidly Grounded

C. Electrical supply and load segregation:
1. Auxiliary loads dedicated to the unit shall be supplied from the electrical switchgear dedicated to the unit.
2. Auxiliary load or spare capacity equipment that supports both units shall be supplied from the electrical switchgear dedicated to shared unit equipment.
3. Site supporting facilities and site utility loads not dedicated to just one particular unit or both units shall be served from site utility service switchgear.
4. Redundant auxiliary loads shall be split between two switchgear busses, Bus A and Bus B. The splitting of redundant auxiliary loads between two switchgear sources shall be applied to redundant loads at all voltage levels.

D. Generator system:
1. The generator is supplied as part of the steam turbine-generator package. The generator has a rated terminal voltage of 18.0 kV. Refer to steam turbine generator documentation for coordination of the design and installation requirements.
2. The steam turbine generator shall provide its rated output to the 18.0 kV side of the Generator Step-up Transformer (GSU) through an 18.0 kV nominal generator breaker. The high voltage side of the GSU is connected to 345 kV overhead line circuit to the plant site 345 kV Substation.

3. Capability: To match steam turbine across its operating range. The turbine generator shall be capable of providing its maximum rated output to the low voltage side of a three phase, 60 Hz, two winding generator step-up transformer.
4. Exciter: Static type with power potential transformer and rectifiers, associated controls, and protection systems.
5. Synchronization of the generator to the 345 kV system shall be accomplished across the 18.0 kV generator breaker. Synchronization controls shall be automatic; manual synchronization is not required.
6. A tap in the isolated phase bus duct shall be between the turbine generator and the generator step-up transformer capable of feeding the generator unit auxiliary transformers.

E. Generator Breaker:
1. The generator breaker provided shall meet the approval of the turbine/generator supplier. The rated voltage shall be at least 105% of the generator rated terminal voltage at the guaranteed values and shall be capable of continuously carrying the full rated current of the unit.
2. The generator breaker shall be SF6 design and be capable of breaking the maximum available fault current without sustaining damage.
3. The breaker shall be capable of isolated phase bus duct connection to the generator terminals and load side to the GSU.

F. Generator Step-up (GSU) Transformer:
1. GSU shall step the steam turbine generator terminal output voltage up from 18.0 kV nominal to the utility system voltage of 345 kV.
2. GSU shall be designed and fabricated to operate satisfactorily with the generator equipment. The transformer shall be capable of withstanding, without injury, mechanical and thermal stresses caused by through faults on external terminals of any winding, up to 125% of its rated voltage in accordance with IEEE C57.116. Thermal and time duration shall be as stated in ANSI C57.12.00. Transformer shall be capable of operating 10% above rated secondary voltage at no-load and 5% at full load.
3. GSU shall be rated for ONAN/ONAF/ONAF cooling, at 55 degrees Celsius, and shall be sized to carry the maximum gross generator output without exceeding a 65 degree Celsius temperature rise at the top ONAF rating.
4. Each transformer base impedance shall be selected that optimizes 100% MVA output and bus voltage regulation during worst case motor starting while maintaining the short circuit current within the equipment capabilities and with minimum transformer losses. Calculations shall be submitted which confirm the proper selection of the impedance's.

G. Unit auxiliary transformer (UAT):
1. UAT shall supply power to the auxiliary switchgear dedicated to the generator unit. The UAT shall be step the steam turbine generator terminal voltage down from 18.0 kV nominal to 6.9 kV plant distribution voltage.
2. UAT shall be designed and fabricated to operate satisfactorily with the generator equipment. The transformer shall be capable of withstanding, without injury, mechanical and thermal stresses caused by through faults on external terminals of any winding, up to 125% of its rated voltage in accordance with IEEE C57.116. Thermal and time duration shall be as stated in ANSI C57.12.00. Transformer shall be capable of operating 10% above rated secondary voltage at no-load and 5% at full load.
3. Auxiliary loads of each generator unit will be served from two unit auxiliary transformers. Each UAT transformer shall be rated ONAN/ONAF/ONAF, at 55 degrees Celsius and shall be designed to supply the maximum expected auxiliary load for the entire unit at full unit output without exceeding a 65 degree Celsius temperature rise, at the top ONAF rating.
4. Each transformer base impedance shall be selected that optimizes 100% MVA output and bus voltage regulation during worst case motor starting while maintaining the short circuit current within the equipment capabilities and with minimum transformer losses. Calculations shall be submitted which confirm the proper selection of the impedance's.

H. Station service transformer (SST):
1. SST shall supply power to site auxiliary services that are not dedicated to a particular unit.

2. SST shall step the black start source supply voltage down from 138 kV nominal to 6.9 kV plant distribution voltage.
3. SST shall be designed and fabricated to operate satisfactorily with the generator equipment. The transformer shall be capable of withstanding, without injury, mechanical and thermal stresses caused by through faults on external terminals of any winding, up to 125% of its rated voltage in accordance with IEEE C57.116. Thermal and time duration shall be as stated in ANSI C57.12.00.
4. SST shall be rated ONAN/ONAF/ONAF, at 55 degrees Celsius and shall be designed to supply the maximum expected load connected to the 6.9 kV, main station service switchgear without exceeding a 55 degree Celsius temperature rise, at the top ONAF rating.
5. Each transformer base impedance shall be selected that optimizes 100% MVA output and bus voltage regulation during worst case motor starting while maintaining the short circuit current within the equipment capabilities and with minimum transformer losses. Calculations shall be submitted which confirm the proper selection of the impedance's.

I. Isolated-phase bus duct:
1. Isolated phase bus duct shall extend from the generator bushings to the line side of the generator breaker, and from the load side of the generator breaker to the low voltage bushings of the GSU. Taps shall be provided for; surge arresters, instrument transformers, neutral grounding cubicle, unit auxiliary transformers, and other equipment as required for a complete installation. A removable link shall be furnished at the tap for the unit auxiliary transformer to provide the ability to isolate the transformer if needed.
2. Bus duct shall be rated to not inhibit the full capabilities of the turbine and generator. It shall be braced for both the maximum symmetrical and asymmetrical fault capability of either the generator, or the interconnected system, whichever is greater.

J. Plant substation/interconnection:
1. The 345kV switchyard shall be configured in a "Breaker-and-One-Half" scheme to serve two, including one future, incoming 345kV transmission lines and two generator step-up transformers. The 345kV switchyard shall contain two main buses with multiple line bays consisting of three circuit breakers each connected between the two main buses. There shall be at least two circuit breakers between transmission line connections as well as between generator step-up transformer connections. No transmission lines or generator step-up transformers are to be connected directly to the main buses. The 345kV switchyard shall be designed to allow both main buses to be expanded for up to six future generator step-up transformer connections and six 345kV transmission line connections.
2. The 138kV switchyard shall be configured in a straight bus and shall include a line disconnect switch and circuit switcher to serve the station service transformer (SST).
3. Incoming transmission lines and transformer connections shall be designed to terminate on reduced tension structures located close to the transformers served. Structures shall be made from wide flange or tubular steel.
4. Each incoming transmission line, transformer connection, and both sides of circuit breakers shall be provided with disconnect switches.
5. Each incoming transmission line connection shall be provided with station class surge arresters.
6. Line terminal, circuit breaker, and transformer protection and control equipment shall be provided and contained in a control equipment enclosure located in the substation area. SCADA and communication equipment to allow for remote control and monitoring of the substation electrical equipment and protection devices shall also be provided in the control enclosure.
7. Electrical considerations:
   a. Maximum Rated Voltages:
      1) 345kV System: 362kV
      2) 138kV System: 145kV
   b. Basic Impulse Insulation Levels (BIL):
      1) 345kV System: 1,470kV
      2) 138kV System: 750kV
   c. Bus Ampacities:
      1) 345kV System: 3,000 amperes
      2) 138kV System: 1,200 amperes
   d. Short-Circuit Current (Symmetrical):
      1) 345kV System: 63,000 amperes

2) 138kV System: 40,000 amperes
e. Design Bus and Line Clearances: In accordance with design BIL ratings and NESC and NEMA SG-6 requirements.
f. Incoming transmission line(s):
1) Conductor type: All Aluminum Alloy Concentric Lay (AAAC).
2) Conductor size: 559.5 MCM
3) Number of conductors per phase: 3.
4) Code name of conductor: Darien.
5) Static line protection: OPGW & Alumoweld 7 #9 AWG

8. Substation equipment:
a. Power circuit breakers:
1) Type: Dead Tank
2) Insulating Medium: SF6 Gas
3) Rated Voltage: 372kV
4) Continuous Current: 3,000 amperes
5) Short-Circuit Current: 63,000 amperes
6) Basic Impulse Level (BIL): 1,470kV
7) Auxiliary Voltages:
a) Control: 125V DC
b) Operating mechanism: 125V DC
c) Motors and/or compressors: 240V AC, single-phase
b. Circuit Switcher
1) Type: Three-pole, group-operated, vertical "candlestick" interrupter, without disconnect
2) Insulating Medium: SF6 Gas
3) Rated Voltage: 145kV
4) Continuous Current: 1,200 amperes
5) Short-Circuit Current: 40,000 amperes
6) Basic Impulse Level (BIL): 750kV
7) Auxiliary Voltages:
a) Control: 125V DC
b) Operating mechanism: 125V DC
c) General usage: 120V AC, single-phase
c. 345kV Disconnect Switches
1) Use: Transmission lines disconnect switches, circuit breaker isolation, transformer isolation.
2) Type: Three-phase, group-operated, double-end break, equipped with standard arcing horns.
3) Rated Voltage: 362kV
4) Continuous Current: 3,000 amperes (1,200 amperes for transformer isolation)
5) Momentary Current Withstand: 63,000 amperes
6) Basic Impulse Level (BIL): 1,470kV
7) Operating Mechanism: Motor-operated with 125V DC controls
d. 138kV Disconnect Switches
1) Use: Circuit switcher isolation
2) Type: Three-phase, group-operated, vertical break, equipped with standard arcing horns.
3) Rated Voltage: 145kV
4) Continuous Current: 1,200 amperes
5) Momentary Current Withstand: 40,000 amperes
6) Basic Impulse Level (BIL): 750kV
7) Operating Mechanism: Manual, swing-handle, with worm gears.
e. 345kV Coupling Capacitor Voltage Transformers
1) Type: Outdoor, single-bushing, oil-filled CCVT with two tapped secondary winding (X and Y).
2) Nominal Primary Voltage: 345kV, line-to-line
3) Nominal Secondary Voltage: 115/67V
4) Ratio: 1800/3000:1:1
5) Minimum Capacitance: 2,150 pF
6) Basic Impulse Level (BIL): 1,470kV

7) Location: Three (3) single-phase CCVT's for each line/transformer terminal and one (1) single-phase CCVT for each bus

f. 138kV Coupling Capacitor Voltage Transformers
1) Type: Outdoor, single-bushing, oil-filled CCVT with two tapped secondary winding (X and Y).
2) Nominal Primary Voltage: 138kV, line-to-line
3) Nominal Secondary Voltage: 115/67V
4) Ratio: 700/1200:1:1
5) Minimum Capacitance: 6,000 pF
6) Basic Impulse Level (BIL): 750kV
7) Location: Three (3) single-phase CCVT's for each line terminal

g. 345kV Surge Arresters
1) Type: Station class, gapless, metal oxide, silicone rubber, high energy handling.
2) Ratings: 220kV MCOV, 276kV duty cycle
3) Location: Each incoming transmission line

h. 138kV Surge Arresters
1) Type: Station class, gapless, metal oxide, silicone rubber, high energy handling.
2) Ratings: 88kV MCOV, 108kV duty cycle
3) Location: Each incoming transmission line

9. Control Equipment Enclosure:
a. Control enclosure shall be in accordance with the latest version of the IBC, NESC, and NEC. The enclosure shall be sized for the complete substation configuration, including all future substation expansion.
b. Substation field wiring shall be routed to relay and control panels in the control equipment enclosure.
c. The control equipment enclosure shall include, but not be limited to, the following equipment:
1) 480V-120/240V power transformers.
2) 120/240 VAC, single-phase distribution panels.
3) 120/240 VAC automatic transfer switch (ATS).
4) 125 VDC distribution panels.
5) At least two 120 VAC outlets per wall.
6) 125-volt flooded-cell type battery with rack, battery charger, battery disconnect fuses, DC power distribution block, and timer controlled battery area ventilation fan.
7) Protective relaying and control panels with insulated terminals.
8) All control wire shall be shielded.
9) Telephone board and telephone protection equipment. Telephone receptacle near control enclosure double doors.
10) Overhead roof-supported, ladder-type aluminum cable tray.
11) Drawing laydown/work area and drawing storage cabinet, telephone, desk, chair and storage cabinet.
12) Fire extinguisher.
13) Roof-supported, industrial-type fluorescent lighting fixtures with 70 foot-candle rated interior lighting.
14) Wall-mounted DC emergency lighting fixtures, 60 watt, 125V DC.
15) Contactor for yard lighting, on wall near control enclosure double doors.
16) Portable eye-wash (near batteries).
17) Exterior lighting shall be Lithona TWAC, 100 watt HPS or equal mounted above each door.

d. Communications:
1) Fiber optic communication, via OPGW on the 345kV transmission lines, shall be terminated on the substation transmission dead-end structures via a fiber optic splice box and run to the control equipment enclosure. Fiber shall be compatible with incoming OPGW meeting ITU-TG 652. Incoming OPGW has 48 fibers.
2) Provide fiber distribution panels in the control equipment enclosure to distribute fiber optic cable to communication equipment as required.
3) Communications control panel in the control equipment enclosure shall include, but not limited to, the following:
a) NovaTech OrionLX remote terminal unit (RTU).

b) Schweitzer SEL-3354 HMI, complete with display monitor, keyboard, and tracking ball/mouse.
c) Schweitzer SEL-2032 communication processor(s).
d) GPS clock.
e) Ethernet router switches.

10. Bus and Fittings:
    a. Design Capacity: 3,000 amperes for 345kV bus and 1,200 amperes for 138kV bus.
    b. Rigid aluminum tube and ACSR for jumpers and vibration dampening.
    c. Design shall be based on IEEE 605, ASCE 7-05, and ASCE 113.
    d. Bus and insulators shall be designed for the following loading conditions (stress check only):
        1) Wind and Seismic - Refer to Section 01 32 13.
        2) Extreme Short Circuit - short circuit of 63,000 amperes acting alone.
    e. Bus shall be designed for the following loading conditions (deflection check only):
        1) Bus Dead Load - no wind, no short circuit, no ice, no seismic, bus and internal damper weight only.
        2) Maximum bus vertical dead load deflection shall be limited to the smaller of the following:
            a) 1/100 of span length
            b) Bus outside diameter
    f. Fittings/Connections:
        1) Bus: Welded
        2) Cable: Compression and/or welded
        3) Bus or cable connections to bushing studs or switches: Compression or welded terminal fittings with NEMA pads for bolting to equipment terminals.
        4) Bolted connections for terminal pads: Aluminum bolts with two large flat washers and lock washer on each bolt.
        5) Provide for bus expansion as required where connections are made between rigid bus and equipment terminals.
        6) Corona rings or other suitable means shall be furnished at each electrical connection on the 345kV bus. The complete installation RIV level, including connection hardware, shall not exceed 250 micro-volts.
11. Insulators: Station post; NEMA standard:
    a. 345kV: 14,700 kV BIL, standard or high strength.
    b. 138kV: 750kV BIL, standard strength

K. Unit auxiliary electrical distribution system:
1. During all modes of plant operation (unit off-line, during startup, and normal operation) the Unit Auxiliary Transformers (UAT) shall be supplied from the 345 kV switchyard through the GSU.
2. Power shall be distributed through the UAT to main plant medium voltage distribution switchgear at 6.9 kV. The main plant medium voltage distribution switchgear shall supply power to medium voltage motors and secondary unit substations (SUS) transformers.
3. Secondary unit substations transformers shall supply power to the 480 V, low-voltage switchgear. The low-voltage, switchgear shall distribute the power to the power panelboards (PP's) and motor control centers (MCC's).

L. Site electrical distribution system:
1. Plant site electrical distribution system is supplied from site main station service switchgear at 6.9 kV. The main station service switchgear shall supply power to site auxiliary services that are not dedicated to a particular unit. The site auxiliary services include Water Production Plant, Waste Water Plant, Coal Handling Yard, Coal Discharge Port, Warehouse, Administrative Buildings, Security Gates, and other miscellaneous facilities on plant site.
2. Site auxiliary service switchgear shall supply power to medium voltage motors and secondary unit substations (SUS) transformers. The secondary unit substations transformers shall supply power to the 480 V low-voltage switchgear. The low-voltage, switchgear will distribute the power to the power panelboards (PP's) and motor control centers (MCC's).
3. Plant site electrical distribution system shall be via concrete encased underground duct bank system.
4. Site auxiliary service switchgear shall have a 6.9 kV circuit connection to each of the unit auxiliary switchgear and connection from the Station Service Transformer. The Station Service

Transformer should be connected from the source that can provide plant site with black start capability.

M. Back-up emergency generator:
1. Containerized, packaged engine generator units shall be furnished for use as a source of power for critical plant loads during the interruption of the normal power source. Provide 20% spare capacity.
2. Unit shall be designed for 48 hours of continuous operation of the critical loads without the need for refueling, designed for outdoor installation and shall consist of a diesel engine directly coupled to a generator.

N. Power for critical systems:
1. Vital AC/DC system and uninterruptible power supply (UPS) system shall be dedicated to the specific unit. The system may have back up tie connection between the units, but the system shall not be a common system.
2. Electrical service to essential and critical plant functions shall be fed directly from emergency generator, vital AC/DC system or uninterruptible power supply (UPS) system.
3. Emergency lighting system shall be supplied from emergency lighting UPS being supplied from source with connection to the back-up emergency generator source.
4. Vital AC system shall be fed from two independent sources via automatic transfer switch between normal AC source (Primary) and from DC battery charger/inverter system (Backup) supplied from power source with connection to the back-up emergency generator source. The following equipment shall be fed from vital AC sources:
   a. Critical instrumentation not directly powered from the DCS.
   b. Critical electrically actuated drives.
   c. Other critical controls.
5. Provide Uninterruptible Power Supply (UPS) for the support of critical automatic data processing, communications, electronic security, and safety equipment and systems that require continuous (no-break) electrical power for proper operation. Uninterruptible AC Power Supply (120 VAC) shall consist of 2 x 100% capacity with 15% margin for future growth. The following equipment shall be fed from UPS sources:
   a. Distributed Control System (DCS) cabinet process controllers and power supplies
   b. DCS communications equipment.
   c. Plant communication and mass notification system.
   d. Electronic access control and CCTV security system.
   e. All critical controls.
6. Provide DC supply source the following electrical equipment:
   a. Medium-voltage switchgear.
   b. Low-voltage metal-enclosed switchgear.
   c. DC backup motors.
   d. Other equipment requiring DC supply source.

O. Medium-voltage metal-clad switchgear:
1. Equipment will be designed to operate on a 6.9 kV, 3-phase, 3 wire, 60 Hz, impedance grounded system (at the UAT).
2. Switchgear bus ampacity shall be designed to be able to supply the maximum expected auxiliary load plus 25% spare capacity.
3. Each of the medium voltage switchgear line-up shall have one spare feeder breaker, and physical space to add one additional vertical section to the line-up. This is in addition to breaker pre-identified for future circuit connections. The medium voltage switchgear line-up connected by a tie-breaker is considered a separated switchgear line-up.

P. Secondary unit substations:
1. Transformers shall be encapsulated, dry-type and installed indoors. The high voltage side shall be delta connected and capable of accepting connection from a 6.9kV switchgear transformer feeder breaker and the low voltage shall be a high resistance grounded wye.
2. Switchgear main bus shall be designed to carry continuously the maximum capable rated current of the connected transformer without exceeding temperature rise requirements specified in IEEE and NEMA standards.

3. Each SUS shall be provided with the following:
   a. Two (2) main circuit breakers.
   b. A tie-breaker.
   c. Metering and relaying compartment(s).
   d. Feeder breakers for motor control centers.
   e. Feeder breakers for 480V distribution power panels.
   f. Two (2) spare feeder circuit breakers on each side of the tie-breaker switchgear bus.
4. The control power shall be 125Vdc, supplied from the station battery system.
5. Each breaker (electrically operated) shall be equipped with a solid-state microprocessor based trip unit that incorporates true RMS sensing. The trip units shall be programmable that allows proper coordination between all devices. The trip units shall incorporate system monitoring functions that include; power factor, voltage, current, harmonic distortion values, and wave form capture. The units shall have communications capability.

Q. Motor Control Centers (MCC).
1. Each motor control center main horizontal and vertical bus shall be copper bar, designed to carry continuously the currents specified for the motor without exceeding temperature rise requirements specified in IEEE and NEMA standards. A copper bar ground bus with a continuous current rating as required in the performance section shall be furnished through the entire length of each motor control center.
2. MCCs shall be furnished with the ratings necessary to continuously carry the full load current of the connected load, plus an additional 25% spare capacity. Standard factory supplied bus ratings shall be furnished for continuous and short circuit current ratings.
3. MCCs shall be factory tested in accordance with NEMA standards and ANSI C37.17, together with any additional tests which may be required to ensure that the wiring is correct and that all equipment is in a satisfactory operating condition.
4. Electronic RMS trip circuit breakers (molded case circuit breakers [MCCBs] 100 amps or larger) shall incorporate current transformers and solid state circuitry to monitor current and initiate tripping. The settings shall be possible from switches on the front of the breaker and by programming electronically with a hand held device.
5. Operating mechanisms shall be quick make, quick break, and be trip free.
6. MCCBs shall bear a UL label and utilize a quick-make, quick-break trip free mechanisms. All breakers shall include an external mechanical operating mechanism with padlockable capability. The mechanism shall be interlocked with the unit door to avoid opening the door while load terminals are energized.
7. Instantaneous only motor circuit protectors (MCPs) shall be used for all MCC and separately mounted combination starter units. They shall comply with UL 489. They shall have adjustable instantaneous trip elements accessible for adjustment without having to remove or disconnect the device. They shall provide protection of motor low level faults with a clearing time of less than one (1) cycle and all three (3) phases shall clear simultaneously.
8. Combination full voltage starters shall include disconnecting and branch circuit overcurrent protective devices; control power transformers; and three-phase, 60 Hz contactors with adjustable electronic overload relays.
9. Combination starter units which require line voltage to energize the main contactor operating coils shall be equipped with auxiliary contactors for use in the operating coil circuit. Each auxiliary contactor will be operated from the control transformer circuit.
10. Each MCC shall be provided with the following spares:
    a. Two 100-ampere feeder breakers.
    b. One 200-ampere feeder breaker.
    c. Two Size 1 FVNR starter.
    d. One Size 2 FVNR starters.
    e. Cubicle space to add one Size 3 FVNR starters.
    f. Physical space to add one vertical section.

1.06 ELECTRICAL SYSTEM PROTECTION

A. Provide electrical protective relay devices, instrumentations, and protective schemes to limit damage to faulted equipment, possibility of fire or explosion, and hazards to personnel. The protective relaying

scheme shall be designed to isolate and/or alarm abnormal occurrences on equipment and electrical distribution system.

B. Design and implementation of the electrical system protection shall consider measures to reduce incident energy level and to enhance personnel safety with consideration to practical design limitations, available technology, and industry practice.

C. Provide surge protective devices (SPDs) to provide surge protection for sensitive or critical electronic equipment or when specifically required. When a lightning protection system is included, typically SPD is required on the service entrance equipment in accordance with NFPA 780 to meet the UL Lightning Protection Inspection Certificate requirements. SPD equipment must be listed by Underwriters Laboratories UL 1449 and UL 1283, and designed, manufactured, tested and installed in compliance with IEEE C62.41, IEEE C62.45, NFPA 70, NFPA 75, and NFPA 780.

D. Refer to Specification 33 72 00 for detailed requirements.

1.07 OIL CONTAINMENT

A. Fire protection for outdoor transformer: Providing minimum separation distances from adjacent structures and from each other by firewalls, spatial separation, or other approved means for the purpose of limiting the damage and potential spread of fire from a transformer failure in accordance with NFPA 850 Recommended Practice for Fire Protection for Electric Generating Plants and High Voltage Direct Current Converter Stations.

B. Transformer containment:
   1. Provide outdoor liquid-filled transformers with spill containment to prevent accidental release of the transformer fluid to the ground or in to unprotected building and/or equipment.
   2. Design the spill containment system in accordance with the IEEE STD 980 (Guide for Containment and Control of Oil Spills in Substations) or equivalent standard.
   3. Extend the containment perimeter at least 5 ft (1.5 m) beyond fluid-containing components, including any external coolers, for transformers with up to 1,000 gal (3.8 m3); and 8 ft (2.4 m) for transformers with more than 1,000 gal (3.8 m3).
   4. Provide a system for removal of rainwater from the containment area.

1.08 POWER MANAGEMENT AND CONTROL SYSTEM (PMCS)

A. Power Management and Control System (PMCS) for centralizing data monitoring, control, disturbance recording and data collection of metering and protection devices across the power plant facilities.

B. PMCS shall cover the following electrical equipment:
   1. 345 kV Substation Breakers and Switches.
   2. Generators.
   3. Generator Breakers.
   4. Generator Step-up Transformers.
   5. Unit Auxiliary Transformers.
   6. Station Service Transformers.
   7. Plant Medium-voltage Switchgears.
   8. Plant Secondary Unit Substations.
   9. Plant DC Battery System.
   10. Plant UPS systems.
   11. Plant Emergency Generator System.

1.09 MOTORS

A. Operating voltages:

Motor Size	System Voltage (volts)	Nameplate Voltage (volts)	Frequency (Hz)	No. Phases
< 0.75 hp	120	115	60	1
0.75 ≤ hp < 200	480	460	60	3
hp ≥ 200	6900	6600	60	3
MOV's	480	460	60	1 or 3
All DC Motors	125	120	n/a	1

B. NEMA MG-1 Motors. Motors installed indoor or in environmentally controlled enclosure non-corrosive environment shall conform to NEMA MG-1.

C. IEEE 841 Motors. Motors installed outdoor, exposed to ambient salt-laden air, or in corrosive environment shall conform to IEEE 841.

D. Nameplate Rating. The nameplate horsepower multiplied by the nameplate service factor shall be at least 15% greater than the driven equipment maximum brake horsepower. All motor nameplate data shall conform to NEMA MG 1 requirements.

E. Windings and Insulation. Insulated windings will have Class F non-hygroscopic insulation systems with Class B temperature rise and ambient temperature in accordance with NEMA MG1 or IEEE 841 standards.

F. Special Applications. Special requirements for individual motors are to be included in individual specification technical sections and shall have precedence over these general motor requirements.

G. MOV's. Motor operated valves shall be sized in accordance with the valve manufacturer recommendations.

H. Low Voltage Fractional Horsepower Motors. Type, design, and construction of each general, special, and definite purpose fractional horsepower motor shall be coordinated with the driven equipment requirements and shall be in accordance with the requirements of NEMA MG1 or IEEE 841.

I. Direct Current Machines. Direct current machines shall be designed and constructed for continuous operation and in accordance with the requirements of NEMA MG1. DC emergency motors shall operate continuously at the nominal system voltage with any supply voltage between 80% and 112% of the nominal system voltage.

J. Motor Operators for Non-modulating Valve, Gate, and Damper Service. Motors shall be designed for high torque, reversing service in a 50 degree Celsius ambient temperature and shall be in accordance with the requirements of NEMA MG 1 and MG 2.

K. Hoist, HVAC, and Miscellaneous Motors. Motors not related to power production shall conform to applicable requirements of NEMA MG 1 and shall otherwise be manufacturer's standard.

L. Starters. Motors shall be designed for full voltage starting and frequent starting where required and shall be suitable for continuous duty in the specified ambient conditions. Intermittent-duty motors shall be selected where recognized and defined as standard by the equipment standards and codes. Provide reduce voltage starter to limit impact on system voltages within acceptable operating range during the motor start.

M. Variable Frequency Drive. Provide variable frequency drive for motor requiring soft start and variable speed control.

N. Torque and Acceleration. The torque characteristics of all induction motors shall be as required to accelerate the inertia loads of the motor and driven equipment to full speed without damage to the motor or the equipment at any voltage from 90% to 110% of motor nameplate voltage except those to

be individually considered. A voltage drop greater than 10% from the specified motor nameplate rating shall be individually considered for proper motor starting and operating.

O. Space Heaters. In general, space heaters shall be furnished for all outdoor motors, all totally enclosed motors, and all open drip-proof motors in damp locations and for motor sizes greater than 75 hp.
   1. Space heaters shall be sized as required to maintain the motor internal temperature above the dew point when the motor is idle. Motor space heaters shall not cause winding temperatures to exceed rated limiting values or cause thermal protective device over-temperature indication when the motor is not energized.
   2. Space heaters rated 1,200 watts and less shall be suitable for operation on 120 volts, single-phase, 60 Hz. Heaters rated above 1,200 watts shall be suitable for operation on 208 volts, 3-phase, 60 Hz.

1.10 POWER AND CONTROL WIRING

A. Refer to Section 26 05 00.

B. Cables shall be run in conduits, cable trays, or other acceptable raceways. Cables shall not be hung in free air without being contained in raceway system.

C. Special Cable. This type of cable shall include cable supplied with equipment, prefabricated cable, coaxial cable, communication cable, fiber-optic cable, etc. Special cable shall normally be supplied by a particular manufacturer. Special cable shall be routed in accordance with manufacturer's recommendations.

D. Cable Separation.
   1. The following general practices for cable separation shall be used for all levels of cabling:
      a. Cables of like signal levels and power levels must be grouped together in like raceways.
      b. Different voltage class group levels must run in separate raceways.
      c. Circuit cables dedicated to the unit shall be run in separate raceways from other unit.
      d. Redundant power supply circuit cables shall not be run in same raceway.
      e. If wires are the same level and same type signal, group those wires from one cabinet to any one specific location together in multi-conductor cables.
      f. When unlike signals must cross in trays or conduit, cross them in 90° angles at maximum spacing. Where it is not possible to maintain spacing, place a grounded steel barrier between unlike levels at the crossover point.
   2. Voltage class group level to be used for cable separation:
      a. MV – Medium-voltage
      b. P – Power Low-voltage
      c. C – Control Power (discrete signal, loop power, < 120V control power)
      d. S – Low Level Signal (analog and digital data)
   3. Voltage class group minimum cable separation distance:

	MV	P	C	S
MV	0"	6"	12"	24"
P	6"	0"	12"	12"
C	12"	12"	0"	12"
S	24"	12"	12"	0"

1.11 CABLE TRAYS

A. The design and specifications for the raceway and conduit systems used in supporting and protecting electrical cable shall meet the provisions of all code enforcement agencies.

B. Cable trays shall be of ladder type construction, unless required otherwise, with a rung spacing of 6 inches, nominal depths of 4 or 6 inches, standard widths as required. There shall be a maximum spacing of 8 feet between cable tray supports, except fittings (elbows, tees, etc.) which shall be

supported in accordance with NEMA standards. Solid bottom trays shall be provided for all special noise-sensitive circuits and analog instrumentation circuits.

C. Cable tray segregation: Individual tray systems shall be established for the following services:
   1. Medium voltage power cables.
   2. Low voltage power cables.
   3. Control cables.
   4. Low level signal, noise-sensitive circuits or instrumentation cables.
   5. Further subdivision of tray systems shall be provided where justified by the quantity of tray required so that cables associated with duplicate equipment or redundant control devices can be routed in separate trays to provide isolation.

D. The minimum design vertical spacing for trays shall be 12 inches measured from the bottom of the upper tray to the top of the lower tray. At least a 9 inch clearance shall be maintained between the top of a tray and beams, piping, or other obstacles to facilitate installation of cables in the tray. A working space of not less than 24 inches shall be maintained on at least one side of each tray.

E. Ventilated covers shall be provided for vertical trays. Solid covers with a peak shall be provided for solid bottom trays, for outdoor trays, and for trays located under grating floor and in areas where dust or oil might accumulate.

1.12 UNDERGROUND DUCT BANKS

A. Duct Banks. Underground duct banks shall be used for cable routed around the units and to the site support facilities on the plant site.
   1. Underground duct banks shall consist of PVC conduit encased in reinforced concrete.
   2. Medium-voltage power circuits, low-voltage power circuits, and communication shall all be in separate duct banks and separate manholes/handholes.
   3. Conduit from manholes to equipment at remote locations shall transition to rigid steel prior to emerging from below grade. The steel conduit shall be encased in concrete.
   4. Underground duct banks shall have at least 25% spare ducts.

1.13 GROUNDING

A. The station grounding system shall be an interconnected network of bare copper conductor and copper-clad ground rods. The system shall be provided to protect plant personnel and equipment from the hazards which can occur during power system faults and lightning strikes.

B. The station grounding grid shall be designed for adequate capacity to dissipate heat from ground current under the most severe conditions in areas of high ground fault current concentrations, with grid spacing such that safe voltage gradients are maintained.

C. In the plant area, grounding stingers shall be brought through the ground floor and connected to the building steel and selected equipment. The grounding system shall be extended, by way of stingers and conductor installed in cable tray, to the remaining plant equipment. Equipment grounds shall conform to the NEC and NESC.

D. Major electrical equipment, such as switchgear, secondary unit substations, motor control centers, power distribution panels and control panels, shall be provided with integral ground buses which shall be connected to the station ground grid.

E. Electronic panels and equipment, where required, shall be grounded utilizing an insulated ground wire connected in accordance with the manufacturer's recommendations. In some situations, a separate small grid and ground rod, isolated from the main ground, shall be required.

F. Motor supply circuits to 460 volt motors, which utilize three-conductor cable with a ground in the interstices, shall utilize this ground for the motor ground.

G. Medium-voltage motors shall have a minimum of one 1/0 AWG bare copper ground conductor connected between the motor frame and the station ground grid.

H. Remote buildings and outlying areas with electrical equipment shall be grounded by establishing local subgrade ground grids and equipment grounding systems in a manner similar to the plant area. Remote grids, where practical, shall be interconnected with the station ground grid to reduce the hazard of transferring large fault potentials to the remote area through interconnecting instrumentation and communication cable shields.

I. Calculations shall be performed in accordance with IEEE standards.

1.14 SPACE CRITERIA

A. Equipment Space Allocation. Facility designs will provide dedicated space for the housing of electrical and electronic/communications equipment and components. Electrical and electronic/communications equipment rooms and closets, as appropriate, will be provided separately from spaces used to house mechanical and other non-electrical and non-electronic equipment and components.

B. Space Conditioning. Electrical and electronic/communications equipment rooms and closets will be provided with the environmental air quality necessary to maintain proper temperature and, where necessary, relative humidity levels required for the safe and effective operation of the equipment to be housed therein without deterioration of that equipment.

C. Clearances. Clear space will be provided around electrical switchboards, panel boards, transformers, switches, and controllers, electronic consoles, equipment, and other items, for normal maintenance and operation as required by NFPA 70, National Electrical Code.

D. Accessibility. All junction boxes, pull boxes, and similar points will be readily accessible. Clearly identified access panels will be provided as necessary for the proper maintenance and operation of the electrical distribution system when wiring runs are above ceilings or corridors, or in pipe chases or in trenches.

1.15 LIGHTING

A. Provide lighting system that produce illuminance level appropriate to the environment and work tasks considering the important lighting quality including task visibility, limitation of direct glare, surface luminances, uniformity, and the importance of daylight on human health and productivity. The lighting system shall provide personnel with adequate illumination for plant operation under normal conditions, means of egress under emergency conditions, and back-up lighting in the control room to perform manual operations during a power outage of the normal power source. The interior and exterior lighting systems and controls design follow the generally recommendations of the Illuminating Engineering Society of North America's (IESNA) Lighting Handbook Reference and Application.

B. Power Source. The normal source of power for the general lighting system shall be from 208Y/120 volt general lighting and appliance panelboards. Battery packs integral to fixtures, and stand-alone units, shall be capable of providing minimum required lighting levels for at least one (1) hour. Power used to supply outdoor roadway and area lighting fixtures shall be at 480 volt.

C. Standards. The lighting system shall be designed in accordance with the Illuminating Engineering Society (IES) to provide illumination levels recommended by the following standards and organizations:
   1. ANSI/IES RP-7, Industrial Lighting.
   2. ANSI/IES RP-8, Roadway Lighting.
   3. Occupational Safety and Health Act (OSHA).

D. Fixtures and Lamps. Fixture selections shall be based on the applicability of the luminaries for the area under consideration.
   1. Four (4) different lamp types shall be utilized for the luminaries in the lighting system; fluorescent, metal-halide, and Light Emitting Diode (LED), halogen.

2. Light fixture housing shall be suitable for the installed environment.
3. Indoor unfinished areas comprise areas such as electrical equipment rooms and storage rooms. These areas shall generally be lighted using industrial fluorescent fixtures. As ceiling height increases metal halide low bay and high bay fixtures shall be utilized.
4. Outdoor areas include lighting of equipment located outdoors and outdoor platforms. Metal halide fixtures suitable for use in wet locations shall be used.
5. Roadway and area lighting shall be designed using metal halide light sources. The light fixtures shall be installed on poles or adjacent buildings.
6. Emergency egress and back-up lighting systems shall be used for such areas as the control room where illumination is required to perform manual operations during a power outage of the normal source. The egress and back-up lighting shall be powered from the normal ac source and transferred to an integral battery pack upon failure of the normal power source. The control room general area lighting and control area lighting shall be indirect dimmable fluorescent fixtures with battery back-up. Emergency egress lighting outside the control room area shall be battery pack halogen fixtures. Emergency egress lighting units with self-contained batteries and halogen lamps shall also be used in normally occupied buildings that are remote from the control area. The emergency egress lighting shall be normally "off;" the control room lighting shall automatically come on, and bypass the dimmers upon loss of normal power.

E. Light Emitting Diode (LED) shall be utilized for exit signs, step lighting, nightlights, and other low level lighting applications.

F. Illumination Levels. Provide illumination levels for each of the area as indicated in the table below.

MINIMUM LIGHTING LEVEL FOR GENERATING STATION		
Location	lux	foot-candles
GENERATING STATION		
Air-conditioning equipment, air preheater, and fan area	55	5
Auxiliaries, battery areas, boiler feed pumps, tanks, and compressors	160	15
Boiler platforms	55	5
Burner platforms	110	10
Cable room	160	15
Chemical laboratory	270	25
Coal conveyor, crusher, feeder, scale area, pulverizer, and transfer tower	55	5
Condensers, deaerator floor, and feedwater heater floors	55	5
Centralized control room	270	25
Hydrogen and carbon dioxide manifold area	160	15
Baghouse	55	5
Soot blower platform	55	5
Steam headers and throttles	55	5
Switchgear, power	270	25
Telephone equipment room	270	25
Turbine bay sub-basement	110	10
Turbine room	160	15
Water treatment area	160	15
Catwalks	22	2
UNIT EXTERIOR		
Covered coal-storage area	2.2	0.2
Coal unloading:		
Pier	110	10

MINIMUM LIGHTING LEVEL FOR GENERATING STATION		
Location	lux	foot-candles
Transfer tower and other coal handling buildings	110	10
Conveyers	22	2
Main entrance	110	10
Construction entrance	22	2
Pedestrian entrance	110	10
Fuel-oil delivery headers	55	5
Oil storage tanks	11	1
Open yard	2.2	0.2
Platforms—boiler, turbine deck	55	5
ROADWAY		
Between or along buildings	11	1
Not bordered by buildings	5.5	0.5
SUBSTATION		
General horizontal	22	2
Substation perimeter fence	2.2	0.2
Specific vertical (on disconnects)	22	2

MINIMUM ILLUMINATION FOR OTHER SITE SUPPORT FACILITIES		
	Intensity	
Functional Areas	lux	foot-candles
General Office Spaces	540	50
Conference Rooms	325	30
Lobbies	160	15
Lounges	160	15
Auditoriums	215	20
Cafeterias	270	25
Computer Rooms	540	50
Drafting Rooms	810	75
Accounting Rooms	810	75
Examination Rooms	810	75
Laboratory Rooms	810	75
Kitchens	750	70
Storage Rooms	55	5
Toilet Facilities	215	20
Janitor's Closets	55	5
Mechanical, Electrical, and Communication Rooms	160	15
Elevator Machine Rooms	160	15
Emergency Generator Rooms	160	15
Stairways	215	20
Corridors	108	10
Garage Driving and Parking Areas	55	5

MINIMUM ILLUMINATION FOR OTHER SITE SUPPORT FACILITIES		
Functional Areas	Intensity	
	lux	foot-candles
Garage Entrances	325	30
Parking Lots	5	0.5
Warehouse - Active-Bulk	108	10
Warehouse - Inactive	55	5
Mechanical Material Handling:		
Accumulation Conveyor Lines Unmanned	108	10
Control Centers and Stations	325	30
Loading and Unloading Areas	215	20
Rack	215	20
At exits, exterior steps and ramps	10.8	1
Crawl spaces with utility services, utility tunnels, and walk-in pipe chases	10.8	1

G. Emergency Lighting Illumination Levels.
1. Emergency illumination shall be provided for a period of 1½ hours in the event of failure of normal lighting. Emergency lighting facilities shall be arranged to provide initial illumination that is at least an average of 1 foot-candle and a minimum at any point of 0.1 foot-candle measured along the path of egress at floor level.
2. The floors and other walking surfaces within an exit and within portions of the exit access and exit discharge shall be illuminated to values of at least 1 foot-candle measured at the floor.
3. In the event of power supply failure, an emergency electrical system shall automatically illuminate the following areas: path of egress, exit access corridors, exit stairways passageways, and aisles in rooms and spaces.
4. Illumination levels shall be maintained at adequate levels to perform emergency response tasks and functions for critical plant operation area such as control room, DCS rooms, electrical rooms, security and communication room, and others critical areas during an outage.

H. Construction Lighting. When any construction or maintenance restricts the natural lighting from the sun or foot-candle levels in the working area approach minimum OSHA requirements, construction lighting shall be placed in operation immediately and kept in continuous operation during work in progress.

I. Temporary Lighting. Temporary lighting shall be required in enclosed areas during construction before permanent panelboards, raceway, and light fixtures are installed. Temporary lighting shall consist of portable cords and guarded lamps.

J. Aviation Lighting. Aviation obstruction lighting shall be provided in accordance with the latest advisory circulars of the International Aviation Codes.

K. Installation. Permanent lighting shall be installed in areas where construction of the structure is complete and installation of light fixtures, conduit, and panelboards can be installed without interference of other trades. Also included are areas not congested with field routed piping and raceway and do not require hoists or cranes for equipment erection, such as battery rooms, chemical laboratory, and control room. Removal of electrical conduit, wire, fixtures, fixture hangers, etc., shall not be required to perform maintenance or repair.

L. Switching. Electric power to light fixtures shall be switched with wall mounted light switches in areas where the light can be "off' when the area is not occupied. Wall mounted switches shall be provided at the entrance to storage, battery, and equipment rooms.
1. Electric power to light fixtures in the process areas shall be switched at the panelboard, switch rated breakers shall be furnished.

2. Electric power to light fixtures located outdoors shall be switched with lighting contactors and controlled by an astronomical, digital time clock with manual override. Photocells integral to the fixtures are not acceptable.

1.16 DEVICES, BOXES, AND COVERS

A. Convenience Receptacles. Grounding type convenience outlets shall be provided throughout the indoor areas of the plant, and in the outlying structures. Convenience outlets shall be suitable for the location in which they are installed. The outlets shall be spaced to provide access to almost any point in the plant or structure by use of a 50 foot extension cord.

B. Welding Receptacles. Welding receptacles shall be furnished to accommodate maintenance and repair of the equipment.

C. Disconnect Switches. Fusible disconnect switches should be used only where special considerations require their use. Utilize non-fused disconnect switches as local disconnects only, properly protected by an upstream protective device. Provide heavy duty type safety switches on systems rated for greater than 240V.

D. Control Switches. Control switches used throughout the plant shall be rated for 125% of the connected load with enclosures suitable for the location in which they are installed. Boxes shall be permanently and clearly identified as to the use, panel, and circuit number.

E. Devices Enclosures. Use NEMA 4X enclosures for electrical devices located on building exteriors in areas where salt spray or extended high humidity is a concern.

F. Nonprocess Facilities Wiring Devices.
1. Wiring devices and faceplate colors must match and be consistent with the interior wall types and colors. Use grounding type wiring devices. Outlet boxes must not be placed back to back. Provide a minimum of 12 inch (300 mm) of separation between outlet boxes located on opposite sides on common walls.
2. Switches. Toggle switches must be specification grade, quiet type, and rated minimum 120/277V, 20A, totally enclosed with bodies of thermoplastic and/or thermoset plastic and mounting strap with grounding screw. Use silver-cadmium contacts and one-piece copper alloy contact arm.
3. Receptacles. Provide general purpose convenience outlets that are specification grade, 20A, 120V, duplex. In addition to the location requirements specified by NFPA 70, locate general purpose and dedicated outlets in accordance with the following:
   a. Mechanical equipment: Provide receptacle within 25 ft (7.6 m) of mechanical equipment on the interior and exterior of buildings.
   b. Office, staff-support spaces, and other workstation locations: One receptacle for each workstation with a minimum of one for every 10 ft (3 m) of wall space. When less than 10 ft (3 m) of wall at the floor line, provide a minimum of two receptacles spaced appropriately to anticipate furniture relocations. Limit loads to a maximum of four (4) workstations per 20A circuit.
   c. Provide power outlets throughout the building to serve ancillary equipment such as wall mounted television monitors, printers, faxes, plotters, and shredders. Provide dedicated circuits where warranted.
   d. Conference rooms and training rooms: One for every 12 ft (3.6 m) of wall space at the floor line. Ensure one receptacle is located next to each voice/data outlet. Provide one receptacle above the ceiling to support video projection device. Extend circuit to wall location for connection to motorized screen. When it is expected that a conference room table will be specifically dedicated to floor space in a conference room, locate a floor-mounted receptacle under the table. This receptacle may be part of combination power/communications outlet.
   e. In each telecommunications room provide a dedicated 20A circuit with a receptacle adjacent to each rack or backboard for each of the CCTV, voice and data systems.
   f. All other rooms: One for every 25 ft (7.6 m) of wall space at the floor line. When 25 ft (7.6 m) or less of wall at the floor line exists in a room, provide a minimum of two receptacles spaced appropriately to anticipate furniture relocations.
   g. Provide GFI protection of outlets per the requirement of the National Electrical Codes.

h. Building exterior: One for each wall, GFI protected and weatherproof.
i. Special purpose receptacles: Coordinate with the user to provide any special purpose outlets required.

1.17 HAZARDOUS AREAS

A. Areas where flammable and combustible liquids, gases, and dusts are handled and stored shall be classified for the purpose of determining the minimum criteria for design and installation of electrical equipment to minimize the possibility of ignition.

B. Project construction drawings will outline the extent of each hazardous location, describing the applicable vertical and horizontal limits of the hazards and identifying each hazardous location by NEC Class, Division and Group. Designation of either specific maximum operating temperature of equipment or temperature ranges will also be indicated. Every effort will be made to locate electrical equipment in nonhazardous areas of facilities having hazardous locations.

C. Electrical equipment in areas classified as hazardous shall be constructed and installed in accordance with the requirements of the National Electrical Code. References for use in classification of areas, as well as specification of requirements for electrical installation in such areas, include the following:
1. National Electrical Code ANSI/NFPA 70, National Fire Protection Association.
2. NFPA 70E, Standard for Electrical Safety in the Workplace: National Fire Protection Association.
3. NFPA 30, Flammable and Combustible Liquids Code.
4. NFPA 50A, Standard for Gaseous Hydrogen Systems at Consumer Sites.
5. NFPA 497, Recommended Practice for the Classification of Flammable Liquids, Gases, or Vapors and of Hazardous Classified Locations for Electrical Installations in Chemical Process Areas.
6. NFPA 499, Recommended Practice for the Classification of Combustible Dusts and of Hazardous Classified) Locations for Electrical Installations in Chemical Process Areas.
7. NFPA 650, Standard for Pneumatic Conveying Systems for Handling Combustible Particulate Solids.
8. NFPA 654, Standard for the Prevention of Fire and Dust Explosions from the Manufacturing, Processing, and Handling of Combustible Particulate Solids.
9. NFPA 820, Standard for Fire Protection in Wastewater Treatment and Collection Facilities.

1.18 LIGHTNING PROTECTION

A. The lightning protection system shall be designed and constructed in accordance with the latest applicable requirements of NFPA Standard 780, ANSI/UL Standard 96A, and all local applicable codes and standards. Provide a lightning protection system, in accordance with NFPA-780 and IEEE-998, if the risk analysis indicates that it is necessary.

B. Location. A lightning protection system, including air terminals, shall be provided for plant structures not included within the zone of protection of another structure. The structures requiring lightning protection shall be determined during detailed design; however, the main plant building, plant chimney stack, hazardous/flammable storage facilities, and electrical equipment enclosures shall be protected regardless.

C. Installation. The material length, diameter, and location of any air terminals and conductor for the lightning protection system shall be determined by detailed design of each individual structure. The structure height, material, and service shall determine the building classification. The zone of protection provided by the lightning protection system shall be analyzed for all structures on the plant site.

1.19 PAGE/PARTY COMMUNICATION

A. Provide public address system covering the different areas of the power plant and substations for maintenance activities and for the security of the installations. The system is critical in case of emergency situations where staff should be informed and/or accessed very quickly.

B. The public address system shall include all of the necessary handsets, headsets, amplifiers, and cable, plus any other equipment required for a complete, satisfactorily operating system.

C. Components used in hazardous locations defined by the National Electrical Code, articles 500 through 503, shall be listed and or approved by a Ministerio de Medio Ambiente y Recursos Naturales of Dominican Republic.

D. Equipment shall be suitable for use in the following general types of surroundings as applicable:
   1. Extremely noisy, as high as 115 dB sound pressure level.
   2. Humid locations tropicalization treatment.
   3. Dusty environment.
   4. Hazardous Areas Class I, II, and III, Division 1 and 2.
   5. Outdoors equipment listed as outdoor or weatherproof only.
   6. Constant vibration.

E. The system shall provide facilities for both page and common-talking party line operation at various locations throughout the system. Two-way conversations shall take place between stations using telephone type handsets. Handsets shall perform in areas as high as 115 dB Sound Pressure Level ambient noise without the use of acoustical enclosures or booths not to exceed 115 dB SPL.

F. Each station shall be capable of switching between the page line and five common-talking party lines.

G. Page channel shall broadcast speech over all of the system speakers. Where necessary, to prevent acoustic coupling, the speaker adjacent to the handset station shall be automatically muted when wired accordingly in enclosure during installation when the handset is removed from its cradle and the page channel is selected.

H. Party line channels shall provide two-way conversation capability without interference or crosstalk between channels; conversation will not be heard over the speaker system.

I. The public address system shall cover the following areas:
   1. Throughout the Unit 1 Plant Facility.
   2. Unit 1 AQCS.
   3. Throughout the Unit 2 Plant Facility.
   4. Unit 2 AQCS.
   5. By-product handling areas.
   6. Crusher Buildings.
   7. Transfer Towers.
   8. Chimney.
   9. On-site 345 kV Substation.
   10. Electrical Buildings.
   11. Office and Shops Building.
   12. Vehicle Maintenance Building.
   13. Warehouses.
   14. Guard Houses.
   15. Water Treatment Building.
   16. Sewage Treatment Building.
   17. Coal Handling Areas.
   18. Water Intake Building.
   19. Pier.

1.20 CATHODIC PROTECTION

A. Cathodic protection and protective coatings shall be provided for the following buried or submerged ferrous metallic structures:
   1. The exterior surface of underground welded carbon steel pipe, copper pipe, stainless steel pipe, cast iron and ductile iron pipe.
   2. Underground tanks and the bottoms of surface mounted steel tanks.

3. Measures shall be taken for the control of corrosion so as not to materially reduce the total effectiveness of the plant electrical safety grounding systems.
4. It is expected that buried bare copper ground grid components shall be in close proximity to, but not in contact with, underground welded steel piping and welded steel tank bottoms.

B. Contractor shall conduct all predesign surveys, cathodic protection designs, and acceptance surveys performed by a person that is accredited or certified by the National Association of Corrosion Engineers (NACE) as a NACE Accredited Corrosion Specialist or a NACE certified CP Specialist or be a registered professional engineer who has certification or licensing that includes education and experience in corrosion control of buried or submerged metallic piping and tank systems.

1.21 FIRE ALARM AND DETECTION SYSTEM

A. Provide complete and fully functioning fire detection and alarm systems for power plant facilities and site support facilities based on the Contractor's Fire and Life Safety Analysis and per applicable codes and standards.

B. The fire detection and alarm systems shall include all initiating devices detectors, manual pulls, etc., indicating devices bells, horns, strobes, etc., panels annunciator, local supervisory, etc., controls, wiring, conduit, instrumentation, and testing equipment as required for a complete system.

C. Detection system shall be provided for coal conveying system. Detectors shall be suitable for detecting moving fires in coal conveyors and at least one linear detector shall be provided for each of the conveyor. Detection system shall trip the running coal conveyor in case of detection of fire as well as give audio-visual annunciation locally and as well in fire alarm panel.

D. The detector shall be outdoor type weather proof and shall be able to function continuously in heavily coal-dust prone atmosphere without regular maintenance.

E. The detector shall be designed to reject deceptive phenomenon such as electric arc, heaters, or artificial light sources.

F. The alarm and detection system shall cover the following areas:
1. Unit 1.
2. Unit 2.
3. By-product handling areas.
4. Crusher Buildings.
5. Transfer Towers.
6. Chimney.
7. On-site 345 kV Substation Control Building.
8. Electrical Buildings.
9. Office and Shops Building.
10. Vehicle Maintenance Building.
11. Warehouses.
12. Guard Houses.
13. Water Treatment Building.
14. Sewage Treatment Building.
15. Coal Handling Areas.
16. Water Intake Building.
17. Pier.

1.22 SITE SECURITY AND ACCESS CONTROL

A. Provide complete and fully functioning security and access control systems for the following area and/or facilities:
1. Guard gates – Gate security card access control and CCTV cameras.
2. 345 kV Substation - CCTV cameras.
3. Water Intake building – CCTV cameras.
4. Unit Control Room - Door security card access control.

5. DCS/Electrical Rooms - Door security card access control.
6. Pier – CCTV camera.

END OF SECTION

PART 1 GENERAL

1.01 REQUIREMENTS INCLUDE

A. General instrumentation and controls requirements defined herein form the basis of design for the Project instrumentation and controls components and systems. More specific design information shall be developed during detailed design to support equipment and erection specifications. It is not the intent of this Section to present detailed design information for each component and system, but rather to summarize codes, standards, and general criteria to be used on Project.

B. Project design, engineering, procurement, and construction activities shall be in accordance with codes and industry standards, applicable laws, regulations, codes and ordinances of the local Government. Following general codes and industry standards will be used in design and construction.

C. Refer to Specifications for specific detailed requirements.

1.02 SYSTEM ARCHITECTURE

A. Arrange DCS such that common plant systems are assigned to a site common unit designated as Unit 0 Site Common.
1. Unit 0 systems are those systems that provide services to the plant, but are not dedicated to any specific unit or pairs of units (i.e., Units 1 and 2).
2. Only Unit 0 Site Common I/O shall be assigned to the Unit 0 Site Common I/O system.

B. Arrange DCS such that unit-specific systems are assigned to a dedicated Unit.
1. Unit systems are those systems that provide services to only that unit, (i.e., Unit 1, Unit 2, etc.).
2. Only unit-specific I/O shall be assigned to a dedicated unit I/O system.

C. Arrange DCS such that shared-unit systems are assigned to a shared-unit.
1. Shared-unit systems are those systems that provide services dedicated only to a specific pair of units (i.e., Units 1 and 2, Units 3 and 4, etc.).
2. Only shared-unit I/O shall be assigned to the respective shared-unit I/O system.

D. Refer to plant control system conceptual network diagrams for additional details. See Drawing 24761-XI02.

1.03 CONTROL SYSTEMS

A. Plant control system:
1. Primary plant control and monitoring shall be accomplished from DCS operator stations located in control room.
2. Processors and power supplies shall be redundant.
3. Network communications shall be redundant, with exception of data link communications to programmable logic controller (PLC) systems.

B. Turbine control system:
1. TCS shall consist of a triple modular redundant (TMR) design.
2. Turbine controls shall consist of manufacturer-furnished TCS with HMI-based operator workstations located in both Control Room and DCS Room.
3. Turbine control interface shall be from TCS HMI workstations and DCS workstations.
4. Supervisory signals (via Ethernet data link between DCS and TCS) will be utilized for coordinated turbine/boiler control.

C. Coal handling:
1. Coal handling system shall be controlled by a stand-alone PLC control system.
2. Coal handling system main control shall be performed in the coal handling control room via HMI operator displays.
3. Coal handling control room shall be located in vehicle maintenance building.
4. Coal handling network cabinet shall be located in the vehicle maintenance building.

5. PLC I/O cabinets shall be located in the following locations:
   a. Bucket wheel stacker/reclaimer.
   b. Crusher house for Units 1 and 2.
   c. Future: Bucket wheel stacker/reclaimer.
6. PLC I/O cabinets shall have a local HMI operator display.
7. Data link connection shall be established between plant DCS Unit 0 Site Common control system and coal handling network cabinet for monitoring and trending purposes only.
8. There shall be no remote control capability from the DCS.

D. Water treatment plant:
   1. Water treatment plant shall be controlled by a stand-alone PLC control system.
   2. Data link connection shall be established to the plant DCS Unit 0 Site Common control system for monitoring and trending purposes only.
   3. There shall be no remote control capability from the DCS.

E. Wastewater treatment plant:
   1. Wastewater treatment plant shall be controlled by a stand-alone PLC control system.
   2. Data link connection shall be established to plant DCS Unit 0 Site Common control system for monitoring and trending purposes only.
   3. There shall be no remote control capability from the DCS.

1.04 EQUIPMENT LOCATIONS AND SPECIAL FEATURES

A. Control room:
   1. Units 1 and 2 shall share the same control room and be centrally located.
   2. Hard-wired emergency trip pushbuttons shall be provided to allow tripping of each boiler and turbine independent of DCS.
   3. Dedicated boiler remote drum level indication for each unit shall be provided independent of DCS.

B. DCS/Electrical room.
   1. Units 1 and 2 shall share the same DCS/Electrical room, preferably located directly below the control room.
   2. DCS cabinets and other unit-specific equipment shall be grouped separately for each unit.
   3. Following unit-specific DCS cabinets shall be located in this room:
      a. Combustion control system (CCS) I/O cabinets.
      b. Burner management system (BMS) I/O cabinets.
      c. Master fuel trip (MFT) panel.
      d. Balance of plant (BOP) I/O cabinets.
      e. Network cabinet.
   4. Shared unit common I/O cabinet shall also be located in this room.
   5. Turbine Control System (TCS) cabinets.
   6. Other electrical systems and related equipment as necessary.

C. Baghouse electrical room: Baghouse I/O cabinets.

D. Unit 0 Site Common Remote I/O cabinets shall be located in, including but not limited to the following Site buildings:
   1. Water Treatment Building.
   2. Wastewater Treatment Building.
   3. Crusher Building.
   4. Pier Service Building.
   5. Substation Building.

E. Common unit switchgear building: Following common unit DCS cabinets shall be located in this building:
   1. Unit 0 Site Common I/O cabinets.
   2. Unit 0 Site Common network cabinet.

1.05 PROGRAMMABLE LOGIC CONTROLLERS (PLC)

A. Systems controlled by PLCs shall not be used unless specifically approved by the Owner in writing, with exception to the following systems:
   1. Air compressors.
   2. Bottom ash handling.
   3. Coal feeders.
   4. Coal handling.
   5. Fly ash handling.
   6. Wastewater treatment.
   7. Soot blowing.
   8. Water treatment.

1.06 INSTRUMENTATION

A. Local instrumentation:
   1. Each pump shall have local pressure gages on the suction and discharge piping located on the pump side of any isolation or check valve.
   2. Pressure and temperature indication shall be furnished on all systems at locations where either fluid pressure or temperature varies in the system.
   3. Heat exchangers shall have local temperature and pressure gages on each inlet and each outlet.
   4. Strainers (for main process systems only) shall have differential pressure measurement utilizing transmitters.
   5. Additional local indicating devices, pressure gauges, flow meters, thermometers, etc., shall be furnished for local monitoring to aid in system performance monitoring and troubleshooting.
   6. Key system process parameters shall be available for remote monitoring in the DCS.

B. Redundancy:
   1. At a minimum, triple redundant instrumentation shall be provided for the following:
      a. Condenser vacuum.
      b. Condenser water level.
      c. Steam drum water level.
      d. Deaerator water level.
      e. Boiler furnace pressure.
      f. Induced draft (ID) fan inlet pressure.
      g. FD, PA, and ID Fan lube oil supply pressure.
      h. Boiler Feedwater Pump lubricating oil supply pressure.
      i. Feedwater heater drain levels.
      j. Steam flow (turbine first-stage steam pressure).
      k. Baghouse and scrubber critical parameters such as inlet/outlet pressures and temperatures.
      l. Steam turbine lubricating oil pressures, hydraulic oil pressures, lubricating oil tank level, and other necessary protection.
   2. Under no circumstances shall lack of redundancy in the instrumentation and control system reduce the redundancy requirements of the main systems and equipment.

C. Turbine water induction prevention: Design of turbine instrumentation and controls shall satisfy recommendations of ASME-TDP-1 - Recommended Practices for Prevention of Water Damage to Steam Turbines Used for Electric Power Generation: Fossil-Fuel Plants.

D. Provide instruments required for performance testing. Performance test instruments shall meet the requirements of the applicable test codes.

E. Instrumentation and control components furnished shall be in accordance with the technical specification requirements and shall be constructed to withstand temperatures, pressures and environmental conditions encountered in actual service.

F. Hazardous area type construction components approved and marked for use in hazardous class locations shall be provided where required by applicable code or if specifically detailed in the specifications. Nuclear source instruments are prohibited and alternative solutions shall be provided.

G. Where available from the manufacturer, provide a factory calibration certificate for each Contractor-furnished instrument.

H. Use of switch type instrumentation for measurement of process parameters shall be avoided unless required by code requirements or specifically approved by the Owner. In all cases, transmitters shall be utilized with indication of the process value and alarms prior to each shutdown condition.

1.07 CONTINUOUS EMISSIONS MONITORING SYSTEM (CEMS)

A. Design CEMS to read stack emission parameters of each unit such as CO_2, SO_2, NO_x, Particulate Monitor (PM), Opacity, and gas flow through the stack.

B. Each unit shall have a separate CEMS building located near the base of common unit (i.e., Units 1 and 2) chimney.

PART 2 PRODUCTS

NOT USED

PART 3 EXECUTION

NOT USED

END OF SECTION

PART 1 GENERAL

1.01 SITE CONDITIONS

A. Existing site lies on the south side of Highway 2 and is bounded to the west by Ocoa Bay (Bahia de Ocoa). Existing site elevations drop off from the road to the bay in the southwesterly direction. The majority of the site is covered with local shrubs, trees, and vegetation except for approximately 110 acres (44.5 hectares) which is farmland.

1.02 EARTHWORK

A. Embankment construction:
   1. Compact embankments for roads, drives, parking areas, any area subject to vehicular traffic, or any area to be paved to a minimum of 95% of maximum dry density as determined by ASTM D1557.
   2. Compact other embankments to a minimum of 90% of maximum dry density as determined by ASTM D1557.

B. Earth excavation:
   1. In cuts for roads, drives, parking areas, any area subject to vehicular traffic, or any area to be paved, proof roll subgrade with a fully loaded tandem-axle dump truck to detect localized zones of unstable material.
   2. Remove unstable material encountered and replace with suitable material.

1.03 ROADS, PARKING AND OTHER SITE PAVING

A. Concrete materials:
   1. Cement: ASTM C150, Type I or Type II.
   2. Aggregate: ASTM C33 for both fine and course aggregate.
   3. Water: Clean, free from injurious amounts of oil, alkali, acid, salts, organic materials, or other substances that may be deleterious to concrete or steel.
   4. Admixtures: ASTM C494.
   5. Reinforcement:
      a. Dowel bars: ASTM A615, Grade 40.
      b. Tie bars: ASTM A615, deformed, Grade 40, epoxy coated.

B. Concrete design:
   1. Strength: Minimum 28 day flexural strength of 650 psi (4.48 MPa).
   2. Slump: 3" (75mm) maximum.
   3. Adjust water-cement factor to compensate for poor quality aggregates and sea water exposure.

C. Hot weather concreting: Concrete mix design and placement shall follow practices found in ACI 305R.

D. Asphalt:
   1. Aggregate:
      a. Coarse aggregate:
         1) Percentage of loss shall not be greater than 40% after 500 revolutions when tested in accordance with ASTM C131.
         2) Clay lumps and friable particles shall not exceed 0.3%, by weight, when tested in accordance with ASTM C142.
      b. Fine aggregate:
         1) All individual fine aggregate sources shall have a sand equivalent value not less than 45 when tested in accordance with ASTM D2419. Beach sand prohibited. Sand shall be free of salt.

2) Fine aggregate portion of the blended aggregate shall have an uncompacted void content not less than 45% when tested in accordance with ASTM C1252 Method A.
3) Quantity of natural sand (noncrushed material) added to the aggregate blend shall not exceed 25% by weight of total aggregate.
4) Clay lumps and friable particles shall not exceed 0.3%, by weight, when tested in accordance with ASTM C142.

c. Mineral filler: Nonplastic material meeting the requirements of ASTM D242.

E. Aggregate:
1. Material retained on the No. 4 (5mm) sieve shall have a percentage of wear not to exceed 50% after 500 revolutions as determined by ASTM C131.
2. Portion of completed aggregate surface course passing the No. 40 (0.425 mm) sieve shall have a minimum liquid limit of 35 and a plasticity index of 4 to 9.

F. Cross-section slope, minimum: 1%. 2% is preferred.

G. Grading slopes/profile, maximum: 8% for main plant roads.

H. Width:
1. Main plant roads: Two 12' (3.5 m) (minimum) lanes with 3' (1 m) aggregate shoulders.
2. Secondary plant roads: Two 10' (3 m) (minimum) lanes with 3' (1 m) aggregate shoulders.
3. Bucket wheel stacker reclaimer access drive: One 12' (3.5 m) (minimum) lane.

I. Loads: Main plant roads, access roads to ash landfill and pier shall be designed for AASHTO HS-20 truck loading and occasional loading from 150 ton (136 metric ton) wheel mounted maintenance crane.

1.04 SITE UTILITIES

A. Potable water:
1. Potable water infrastructure shall be installed, disinfected and tested per AWWA standards.
2. Pipes and fittings carrying potable water transmission and distribution shall be high density polyethylene (HDPE) and in accordance with AWWA C-906.
3. Pipes and fittings shall be protected against salt water.

B. Sanitary sewer:
1. Pipes for sanitary sewer shall be HDPE and in accordance with AWWA C-906.
2. Sanitary structures shall be circular or rectangular precast concrete, ASTM C478.
   a. Sanitary structures shall be treated with an exterior epoxy coating or polyurethane elastomeric membrane to protect against salt water.
   b. Frame openings shall have a minimum clear opening of 24" (600 mm).
   c. Structures deeper than 4 feet (1.2 m) shall have polypropylene encapsulated manhole steps conforming to ASTM C478. Steps shall be uniformly spaced 12" to 16" (300 to 400 mm) with the first step no more than 36" (900 mm) from top of surface.

C. Pipe cover shall depend on pipe material and surface loading. Follow pipe manufacturer's recommendations. Under no circumstances shall pipe cover be less than 24" (600 mm) from finished grade in unpaved areas and 24" (600 m) from the bottom of pavement in paved areas. In areas subject to traffic, provide sufficient cover to withstand AASHTO HS-20 truck loading and occasional loading from 150 ton (136 metric ton) wheel mounted maintenance crane.

1.05 SITE DRAINAGE

A. Design storm event: 25-year, 24-hour event.

B. Culverts:
1. Reinforced concrete (ASTM C76) or high density polyethylene (HDPE.)

2. Minimum diameter: 18" (450 mm)

C. Manholes and catch basins:
1. Circular or rectangular precast concrete, ASTM C478 with exterior epoxy coating or polyurethane elastomeric membrane to protect against salt water.
2. Frame openings shall have a minimum clear opening of 24" (600 mm).
3. Structures deeper than 4 feet (1.2 m) shall have polypropylene encapsulated manhole steps conforming to ASTM C478. Steps shall be uniformly spaced 12" to 16" (300 to 400 mm) with the first step no more than 36" (900 mm) from top of casting.

1.06 FENCING

A. Substation:
1. Height: 7' 0" (2.1 m) plus 1' 0" (300 mm), 3 strands of barbed wire at top for a total height of 8' 0" (2.5 m).
2. Fabric:
   a. ASTM A392, Class 2, zinc-coated steel wire with minimum coating weight of 2.0 ounces/square foot (610 grams/square meter) of coated surface or ASTM A491, Type I, aluminum-coated steel wire.
   b. 2" (50 mm) diamond mesh, 9-gage (4 mm).
3. Barbed Wire:
   a. ASTM A121 zinc-coated, Type Z, Class 3, or aluminum-coated, Type A with 12.5 gage (2 mm) wire with 14 gage (1.6 mm), 4-point barbs spaced on 5" (125 mm) centers.
   b. Composed of 3 lengths of barbed wire attached to 45° extension arms.
4. Framework:
   a. Round steel pipe and rail: ASTM Group 1A Table 3 Heavy Industrial Fence Framework, schedule 40 galvanized pipe per ASTM F1083. Exterior zinc coating Type A, interior zinc coating Type A. Regular Grade or High Strength 83000 Grade.
   b. Bottom of fence shall have a bottom rail.
5. Tension Wire: 7 gage (4.5 mm) Type I or Type II tension wire, Class 5 coating in accordance with ASTM A824.
6. Swing Gates:
   a. Galvanized steel welded fabrication in conformance with ASTM F900.
   b. Provide gate frame conforming to strength and coating requirements of ASTM F1083 for Group IA, schedule 40, steel pipe, with external coating Type A.
   c. Provide either intermediate members and diagonal truss rods or tubular members as necessary to provide rigid construction, free from sag or twist for gate leaves 8' (2.5 m) wide or more.
   d. Provide either intermediate braces or truss rods as necessary to provide rigid construction, free from sag or twist for gate leaves less than 8' (2.5 m) wide.
7. Match gate fabric to that of the fence system.
8. Space line posts a maximum of 10' (3 m) on center and embed in concrete.
9. Secure chain link fabric to line post and rail at a maximum of 12" (300 mm) on center using 9 gage tie wire.
10. Design Life: 20 years (minimum).
11. Grounding: Fence shall form continuous conductive path with a ground grid and bonded to every bay/panel. All aspects of fence grounding shall be in accordance with the latest editions of the National Electrical Code (NEC), National Electrical Safety Code (NESC), and Institute of Electrical and Electronics Engineers (IEEE) Standards 80 and 81.
12. Warning signs: Fences and gates shall be equipped with "Danger High Voltage" signs as required by the NEC and NESC. "Danger High Voltage" signs shall be installed in accordance with applicable requirements of the NEC and the NESC in effect at the time of construction.

B. Site perimeter:
1. Height: 7' 0" (2 m) plus 1' 0" (300 mm), 3 strands of barbed wire at top for a total height of 8' 0" (2.5 m).
2. Fabric:

a. ASTM A392, Class 2, zinc-coated steel wire with minimum coating weight of 2.0 ounces/square foot (610 grams/square meter) of coated surface or ASTM A491, Type I, aluminum-coated steel wire.
b. 2" (50 mm) diamond mesh, 9-gage (4 mm).

3. Barbed wire:
   a. ASTM A121 zinc-coated, Type Z, Class 3, or aluminum-coated, Type A with 12.5 gage (2 mm) wire with 14 gage, 1.6 mm) 4-point barbs spaced on 5" (125 mm) centers.
   b. Composed of 3 lengths of barbed wire attached to 45° extension arms.
4. Framework:
   a. Round steel pipe and rail: ASTM Group 1A Table 3 Heavy Industrial Fence Framework, schedule 40 galvanized pipe per ASTM F1083. Exterior zinc coating Type A, interior zinc coating Type A. Regular Grade or High Strength 83000 Grade.
   b. Bottom of fence shall have a bottom rail.
5. Tension Wire: 7 gage (4.5 mm) Type I or Type II tension wire, Class 5 coating in accordance with ASTM A824.
6. Swing gates:
   a. Galvanized steel welded fabrication in conformance with ASTM F900.
   b. Provide gate frame conforming to strength and coating requirements of ASTM F1083 for Group IA, schedule 40, steel pipe, with external coating Type A.
   c. Provide either intermediate members and diagonal truss rods or tubular members as necessary to provide rigid construction, free from sag or twist for gate leaves 8' (2.5 m) wide or more.
   d. Provide either intermediate braces or truss rods as necessary to provide rigid construction, free from sag or twist for gate leaves less than 8' (2.5 m) wide.
7. Match gate fabric to that of the fence system.
8. Space line posts a maximum of 10' (3 m) on center and embed in concrete.
9. Secure chain link fabric to line post and rail at a maximum of 12" (300 mm) on center using 9 gage tie wire.
10. Grounding: Provide fence grounding per the requirements of NEC and NESC.

1.07 GENERAL SYSTEM REQUIREMENTS

A. Site elevation control and survey:
   1. Survey and design elevations shall be in the following datums:
      a. Horizontal Datum– WGS84 UTM Zone 19 North – International Foot.
      b. Vertical Datum – EGM 96 (Earth Gravitational Model 1996) - International Foot.
   2. A minimum of 4 survey monuments shall be set on the site. Monuments shall be located in areas away from major construction traffic routes and areas reserved for future Units construction. Monuments shall be of substantial, permanent (reinforced concrete, structural steel, etc.) construction. Monuments shall include a brass survey marker or similar construction firmly anchored to the monument structure and which includes a scribed "X" and permanent, stamped or raised lettering defining the elevations and coordinates.

B. Site clearing and grubbing:
   1. Clear areas needed for final site design and temporary construction needs.
   2. Trees, shrubs and other vegetation cleared from the site may be left at an on-site location approved by the Owner.

C. Earthwork:
   1. Perform all rough grading and finish grading required for final site design and temporary construction needs.
   2. Grade shall be set 6" (150 mm) (minimum) below building finish floor elevations and shall slope away from the structure to prevent water accumulation along foundations.
   3. Maintain proper drainage at all times.
   4. Suitable soils for embankments and backfill shall be as determined by the Geotechnical Report.

D. Storm drainage system:

1. Design final storm drainage system. System shall comply with applicable local and national regulations.
2. Storm drainage system shall collect run-off water from(non-process areas of the plant) (areas of the plant without process systems) via sheet flow, ditches, culverts, and underground drainage piping. No runoff water coming into contact with oil, ash, or other process material shall be conveyed to the storm water system. Runoff from the coal storage area shall go to a fuel storage runoff basin.
3. Collect runoff from the ash silo area and deposit into an adjacent basin. Basin shall be a reinforced concrete structure with a sloped ramp for end loader access to remove accumulated solids. Decant the liquid in the basin and drain to the fuel storage runoff basin or the wastewater settling basin.

E. Roads and paving:
1. Design and construct all temporary and permanent access roads, drives, and parking areas necessary for the Contractor's overall arrangement.
2. Provide for aggregate around the far limits of the warehouses to allow for vehicular access.
3. Provide aggregate access drive paralleling the tracks for the bucket wheel stacker reclaimer.
4. Roads subject to loaded ash trucks (trucks loaded with ash) shall be portland cement concrete.
5. Other site roads shall be either asphalt cement concrete or portland cement concrete.
6. Provide a concrete storage lane for a minimum of one ash truck waiting at the ash silos.

F. Provide ash storage area
1. Size adequate for one year on ash based on two boilers at maximum load.
2. Maximum pile height of 60'.
3. Incorporate access and drainage requirements into area design.
4. Subgrade seepage and area drainage to comply with Dominican Republic law.

G. Parking: Site and building parking shall be aggregate or paved with enough room to accommodate the number of vehicles listed in the table below.

Building/Location	No. of Vehicles (Min)
Office and Workshops Building	125
Water Treatment Building	2
Vehicle Maintenance Building	12
Wastewater Treatment Building	2
Water Intake Building	3
Guard House (Each)	2
Crusher Tower	3
Transfer Tower	2
Substation	3
Pier	12

H. Site entrances:
1. Provide a main entrance and a separate construction entrance.
2. Normal plant access shall be through the main entrance. All vehicles entering the property shall be required to check in at the guard house before being allowed on-site.
3. Construction vehicles, delivery trucks, and any semi-trucks shall access the site via the construction entrance. All vehicles entering the property shall be required to check in at the guard house before being allowed on-site.
4. Provide vehicle barrier gates at each entrance.

I. Site utilities:
1. Site utilities shall not be installed in areas designated as future build out on the drawings.
2. Provide underground utility marking tape for site utilities.
   a. Provide solid aluminum foil core tapes for protection, location, and identification of underground utility installations.
   b. Meet or exceed industry standards for APWA color code.

c. Resist degradation from acids and alkalis found in soil.
d. Contain environmentally safe lead-free pigments and organic lead-free ink identifying type of utility line it protects.
e. Provide width of tape appropriate for detection of conduit at required depth of installation

J. Soil erosion and sedimentation control:
1. Comply with all local requirements for erosion prevention and sediment discharge.
2. Place structural controls to prevent sediment from moving off-site.
3. If construction activities are not planned to occur in a disturbed area, the contractor shall stabilize area.
4. Contractor shall control dust by frequently watering excavated or filled areas during construction.

K. Chain link fence and gates:
1. Lockable gates shall be provided at the following locations:
   a. Main Entrance
   b. Construction Entrance
   c. Substation Entrances
   d. Any location the site fencing crosses the site roads.
   e. Water Intake Building.
   f. Pier Electrical Service Building.
   g. Pier Access Gate.
2. The substation fence shall be designed such that, any structures or fixtures that might aid a person climbing the fence, are positioned clear of the fence.
3. The substation fence shall have a pedestrian gate and double swing vehicular gates. The vehicular gates shall be internally accessed via the pedestrian gate. The design shall allow for the possibility of fire, severe equipment failures and other emergencies to ensure the safe egress of personnel. The clearance between energized equipment and other structures shall meet or exceed the latest requirements of NESC, NEC, and IEEE STD 1119.
4. The substation fence shall not form a continuous conductive path with any other metallic object adjacent to and or beyond the substation perimeter. Where a continuous metallic structure is in contact with the fence then an insulating section shall be included in the design (of either the fence or the structure) to stop transfer potentials through into and out of the metallic structure.
5. Personnel gates shall have a minimum opening width of 4' (1.2 m).
6. Double swing gates shall have a minimum opening width of 4' (1.2 m) wider than the road or drive they cross.

PART 2 PRODUCTS

PART 3 EXECUTION

NOT USED

END OF SECTION

PART 1 GENERAL

1.01 WELDING REQUIREMENTS

A. Welding shall be performed by qualified welding operators using procedures which have been qualified in accordance with applicable codes and standards:
1. ANSI B31 Code for Pressure Piping.
2. ASME Boiler and Pressure Vessel Code.
3. AWS D1.1 Structural Welding Code
4. AWS D1.6 Structural Welding Code Stainless Steel.
5. AWS D9.1 Sheet Metal Welding Code.

1.02 PROCEDURE QUALIFICATION

A. Contractor, Subcontractor, or fabricator performing welding under jurisdiction of referenced codes shall be responsible for obtaining and qualifying welding procedures. Structural welding procedures conforming to AWS D1.1 are prequalified as defined in AWS D1.1, Clause 3.

B. Contractor shall maintain records, and make available to Special Inspector when requested, certifying successful completion of procedure qualification tests.
