1.03 PERFORMANCE QUALIFICATION

A. Contractor, Subcontractor, or fabricator performing welding under jurisdiction of referenced codes shall be responsible for testing and qualifying its welding operators in accordance with applicable codes, using qualified procedures. Welding to structural steel shall be performed by state-certified welders.

B. Welding operator's qualification as specified in code shall be considered as remaining in effect indefinitely unless welder has not engaged in given process of welding for which welding operator is qualified for period of 6 months.

C. Special Inspector reserves right to require any welder to retake tests when, in opinion of Special Inspector, work of welder creates reasonable doubt as to welder's proficiency; Special Inspector reserves right to witness any required retesting; conduct such tests at no additional expense to Special Inspector.

1.04 SUBMITTALS

A. Except for procedures exempted to AWS D1.1, Clause 3, submit 1 copy of each welding procedure to Special Inspector with certificate demonstrating successful qualification of welding procedures for each welding process performed in field: AWS D1.1 - Form N-1, or ASME QW-483.

B. Prior to execution of any field welding, submit to Special Inspector 1 copy of welder qualification form for each individual performing field welding: AWS D1.1 Form N-4 or ASME QW-484.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Manufacturer's technical personnel responsibilities.

1.02 RESPONSIBILITIES FOR CONTRACTOR-FURNISHED EQUIPMENT

A. Contractor shall provide qualified manufacturer's technical personnel(s), as necessary to:
1. Instruct and advise Contractor regarding proper method for unloading, erecting, and installing equipment to assure installation in accordance with manufacturer's instructions.
2. Respond to installation Contractor's Requests for Information (RFI's).
3. Evaluate condition of delivered materials.
4. Assure that alignment and clearances of equipment are checked and adjusted to allowable tolerances.
5. Inspect completed installation to assure that apparatus is in operating condition, making such detailed checks of equipment installation as are necessary to ascertain that equipment is assembled, installed, aligned, connected, lubricated, and prepared for operation in accordance with manufacturer's instructions and recommendations.
6. Provide Owner with duplicate copies of final alignment and clearance measurements on all rotating or reciprocating equipment. Measurements shall clearly identify each piece of equipment.
7. Supervise preliminary operation of equipment and necessary adjustments.
8. Fully instruct Owner's operating personnel in operation and maintenance of equipment.
9. Witness acceptance tests and assist in their performance.

B. Presence of manufacturer's technical personnel will in no way relieve Contractor of any responsibility assumed under EPC contract.

C. Contractor shall include in Bid Price time and expenses as necessary to complete manufacturer's technical personnel's responsibilities defined in this Section.

D. Work and abilities of manufacturer's technical personnel shall be subject to review of Owner. If Owner determines that any manufacturer's technical personnel is not properly qualified, Contractor shall replace manufacturer's technical personnel upon written notification by Owner.

E. Contractor shall provide continuity in assignment of manufacturer's technical personnel to Work. In event substitution of manufacturer's technical personnel is made which is not at request of Owner, substitute's time for "familiarization" shall be at Contractor's expense.

F. Manufacturer's technical personnel(s) shall be provided by manufacturers of following equipment:
1. Steam turbine generator.
2. Boiler and AQCS.
3. Elevator.
4. Fuel and lime feeders.
5. Large fans.
6. Large motors.
7. Pulverizers.
8. Regenerative air heater.
9. Sootblowers.
10. Burner systems.
11. Coal handling equipment.

PART 2 PRODUCTS

END OF SECTION

PART 1 GENERAL

1.01 SUBMITTAL REQUIREMENTS

A. Contractor shall submit detailed test procedures to the Owner for review and approval not less than 6 months prior to performance tests. Test procedures shall address relevant aspects of testing as recommended by applicable test codes and standards. Contractor and Owner shall mutually agree to test procedures.

B. Within a period not to exceed thirty (30) days following successful completion of the tests, the Contractor shall submit the test report to the Owner.
   1. Files of the original test data and copies of the original data sheets and log sheets shall be available to the Owner upon request.
   2. Raw data shall be exchanged in an acceptable electronic format at the site immediately following the completion of the tests.

C. Correction curves or equations used to adjust test results.

PART 2 PRODUCTS

NOT USED

PART 3 EXECUTION

3.01 PERFORMANCE TESTING REQUIREMENTS

A. Performance tests shall consist of the following tests:
   1. Net electrical output test.
   2. Net heat rate test.
   3. Lime consumption test.
   4. Minimum load test.
   5. Emissions tests.

B. Contractor shall conduct performance testing following the startup and commissioning activities. Performance tests shall be scheduled as soon as practicable after all associated equipment has been placed in "on-line" generating service, proven capable for continuous normal operation, and adjusted for proper operation; however the boilers shall have operated a minimum of four weeks at a minimum of 75% load to allow the heat transfer surfaces to become fouled to a normal operating level.

C. During performance tests, equipment shall be operated in full automatic control, in accordance with the manufacturers operating and maintenance instructions, and within the design limits established by the manufacturer and Contractor for the equipment and systems. Equipment shall be operated in a manner consistent with continuous-duty operation. The following conditions shall not occur during testing:
   1. Components overheating.
   2. Excessive vibration.
   3. Excessive component power consumption.
   4. Operation beyond design limits.
   5. Unsafe operation.
   6. Operation requiring manual intervention.

D. Contractor may make minor adjustments to equipment prior to testing, but shall not be allowed to disassemble equipment for purposes such as cleaning or polishing blading, or adjusting or replacing turbine-generator seals.

E. Preliminary test runs may be performed prior to the actual tests for the purpose of checking and making adjustments to the equipment and familiarizing test personnel with the facility and equipment.

F. Tests shall be performed at the expense of the Contractor, including:

1. Test procedure/test protocol development.
2. Test personnel.
3. Test equipment.
4. Test instrumentation.
5. Test instrumentation calibration.
6. Laboratory analysis.
7. Test calculations.
8. Test reporting.

G. Testing shall be performed by a third-party testing subcontractor and a third-party stack testing subcontractor mutually agreeable to Contractor and Owner.

H. Tests may be witnessed by the Owner and a third party representative retained by the Owner, at the Owner's discretion.

I. Testing shall be conducted in accordance with ASME PTC 46, MIMARENA and EPA test procedures and methodologies, except that tolerances or uncertainties will not be considered when comparing test results to Guarantees. Emissions tests shall comply with local and national regulatory agency requirements and environmental permit requirements.

J. Net electrical output, net heat rate, and lime consumption test results shall be corrected to guaranteed conditions prior to comparison to guaranteed values. Correction curves or equations used to adjust test results for deviations from guarantee conditions shall be prepared by Contractor and submitted to Owner for review and approval. Corrections shall be based upon engineering principals and data. Shape of each correction curve shall be smooth with no discontinuities in slope. Minimum load and emissions test results shall not be corrected.

K. If equipment or system fail to function properly, or guaranteed performance is not indicated, Contractor shall make necessary corrections, including replacement, at no cost to Owner, and after such corrections are completed, demonstrate to Owner that equipment or system functions properly and guaranteed performance is obtained.

L. Minimum performance standards shall be as follows:
1. Net electrical output: 95% of guaranteed net electrical output.
2. Net heat rate: 105% of guaranteed net heat rate.
3. Lime consumption: 120% of guaranteed lime consumption.
4. Minimum load: 110% of guaranteed minimum load.
5. Emissions: Guaranteed emission limits.

M. If minimum performance standards are met, but guaranteed performance is not achieved, damages shall be in accordance with the Agreement. If minimum performance standards are not met, Contractor shall correct Work and retest unit(s).

3.02 NET ELECTRICAL OUTPUT, NET HEAT RATE, LIME CONSUMPTION, AND MINIMUM LOAD TESTS

A. A minimum of three 4-hour test runs shall be conducted as close as practical to guaranteed net electrical output for net electrical output, net heat rate, and lime consumption tests.

B. A minimum of one 4-hour test run shall be conducted as close as practicable to minimum load for the minimum load test.

C. Test results for net electrical output, net heat rate, and lime consumption shall be corrected to test reference conditions prior to comparison to guaranteed performance.

D. Test reference conditions are as follows:
1. Ambient dry bulb temperature at air inlets: 90ºF.
2. Ambient wet bulb temperature at air inlets: 88ºF.
3. Sea water intake temperature: 81ºF.
4. Power factor: 0.90 lagging.

5. Barometric pressure: 29.91 inches Hg abs.
6. Fuel analysis: Performance Coal analysis as presented in Section 01 30 00.
7. Lime analysis: Design lime analysis as presented in Section 01 30 00.
8. Minimum excess air at economizer outlet: 17% by weight.
9. Minimum AQCS flue gas approach to adiabatic saturation temperature: 30 F.

E. Tests shall be conducted under the following test operating conditions:
1. Sootblowing: Off.
2. Cycle makeup: Off.
3. Cycle blowdown: Off.
4. Air preheat coils (if provided): Off.
5. Fuel: 100% Performance Coal.
6. Support fuel: Off.
7. Baghouse: "Gross" condition with all compartments in service.
8. Installed spare equipment: Off.
9. Auxiliaries in service: Normal operation for all unit auxiliary equipment and systems except that batch systems such as coal handling, ash handling, demineralized makeup water treatment, and wastewater treatment need not be in service. Standby equipment such as fire pumps need not be in service.
10. Site support facilities and site support auxiliary loads shall be served by site utility service switchgear.
11. Emission limits shall be continuously achieved during tests as demonstrated by CEMS/COMS.

F. Each unit may be tested individually.

G. Net electrical output and minimum load (net minimum load) shall be measured at the high side (345 kV) of each generator step-up transformer.
1. Current transformers: Class 0.2 accuracy, according to ANSI C12.11.
2. Voltage transformers: Class 0.2 accuracy, according to ANSI C12.11.
3. Metering devices; Class 0.2 s accuracy, according to ANSI C12.16.

H. Net heat rate shall be calculated by dividing boiler heat input by net electrical output.

I. Boiler heat input shall be calculated using measured boiler heat output and boiler efficiency:
1. Boiler heat output shall be calculated based on feedwater, main steam, and reheat steam flows, pressures, and temperatures.
2. Primary flow measurement devices for feedwater and attemperator sprays shall meet the requirements of ASME PTC 6.
3. Boiler efficiency test (BET) shall be performed in accordance with ASME 4.1-1964 edition including 1968 and 1969 addenda, last reaffirmed in 1991, (heat loss method-abbreviated efficiency test-short form), which results in fuel efficiency value based on higher heating value (HHV).
4. Boiler fuel efficiency calculations will be made and adjusted in accordance with ASME 4.1 including corrections for deviations from guaranteed conditions.
5. Losses to be measured for ASME PTC 4.1 protocol are those specified below (other losses or heat credits not listed below will not be considered when calculating boiler efficiency):
a. Dry gas.
b. Combustion of hydrogen.
c. Moisture in fuel.
d. Moisture in air.
e. Unburned combustible in refuse.
f. Radiation loss.
g. Unaccounted for and unmeasured (stipulated at 0.5%)

3.03 EMISSIONS TESTS

A. A minimum of three 1-hour test runs shall be conducted as close to guaranteed net electrical output as reasonably practical.

B. Tests shall be conducted under the following test operating conditions:
   1. Site ambient conditions: Any combination of conditions within the specified minimum to maximum ranges.
   2. Fuel: 100% Coal with any combination of constituents within the specified minimum to maximum ranges.
   3. Support fuel: Off.

C. Any normal combination of auxiliaries and support systems may be in service or out of service, at Owner's discretion.

D. Each unit may be tested individually.

E. Tests shall be witnessed by the Owner and appropriate regulatory officials.

F. Temporary test instrumentation shall be used, or CEMS/COMS instrumentation may be used if allowed by the regulatory officials, and the CEMS/COMS instrumentation has been certified as accurate by means of a relative accuracy test audit.

G. Emissions tests shall include tests for each guaranteed emission limit including emissions from the boiler main stack.

3.04 RETESTING OR SUPPLEMENTAL TESTING

A. Contractor shall perform retesting or supplemental testing as necessary to demonstrate to Owner that equipment or system functions properly and guaranteed performance is obtained.

B. All costs shall be borne by Contractor.

C. Owner shall render bill to be paid by Contractor covering incremental Owner costs incurred due to retesting or supplemental testing. Billings to Contractor for Owner's costs shall be paid directly to Owner within 30 calendar days from receipt by Contractor.

END OF SECTION

PART 1 GENERAL

1.01 TESTING LABORATORY SERVICES

A. Owner will employ and pay for services of independent testing laboratory to perform specified testing.
   1. Contractor shall cooperate with laboratory to facilitate execution of its required services.
   2. Employment of laboratory shall in no way relieve Contractor's obligations to perform Work of Agreement.

1.02 QUALIFICATION OF LABORATORY

A. Meet "Recommended Requirements for Independent Laboratory Qualifications," published by American Council of Independent Laboratories.

B. Meet basic requirements of ASTM E329, "Standards of Recommended Practice for Inspection and Testing Agencies for Concrete and Steel as Used in Construction."

C. Submit copy of report of inspection of facilities made by Materials Reference Laboratory of National Bureau of Standards during most recent tour of inspection, with memorandum of remedies of any deficiencies reported by inspection.

D. Testing equipment; calibrated at reasonable intervals by devices of accuracy traceable to either:
   1. National Bureau of Standards.
   2. Accepted values of natural physical constants.

1.03 LABORATORY DUTIES

A. Cooperate with Owner and Contractor; provide qualified personnel after due notice.

B. Perform specified inspections, sampling, and testing of materials and methods of construction:
   1. Comply with specified standards.
   2. Ascertain compliance of materials with requirements of EPC Contract Documents.

C. Promptly notify Owner and Contractor of observed irregularities or deficiencies of Work or products.

D. Promptly submit written report of each test and inspection; one copy each to Owner and Contractor, and one copy to record documents file. Each report shall include:
   1. Date issued.
   2. Project title and number.
   3. Testing laboratory name, address, and telephone number.
   4. Name and signature of laboratory inspector.
   5. Date and time of sampling or inspection.
   6. Record of temperature and weather conditions.
   7. Date of test.
   8. Identification of product and applicable Specification Section.
   9. Location of sample or test in Project.
   10. Type of inspection or test.
   11. Results of tests and compliance with EPC Contract Documents.
   12. Interpretation of test results, when requested by Owner.

E. Perform additional tests as required by Owner.

1.04 LIMITATIONS OF AUTHORITY OF TESTING LABORATORY

A. Laboratory is not authorized to:

1. Release, revoke, alter, or enlarge on requirements of EPC Contract Documents.
2. Approve or accept any portion of Work.
3. Perform any duties of Contractor.

1.05 CONTRACTOR'S RESPONSIBILITIES

A. Cooperate with laboratory personnel. Provide access to Work and to manufacturer's operations.

B. Secure and deliver to laboratory adequate quantities of representational samples of materials proposed to be used and which require testing.

C. Provide laboratory preliminary design mix proposed to be used for concrete, and other materials mixes which require control by testing laboratory.

D. Furnish copies of products test reports as required.

E. Furnish incidental labor and facilities:
1. To provide access to Work to be tested.
2. To obtain and handle samples at Project Site or at source of product to be tested.
3. To facilitate inspections and tests.
4. For storage and curing of test samples.

F. Notify laboratory sufficiently in advance of operations to allow for laboratory assignment of personnel and scheduling of tests. When tests or inspections cannot be performed after such notice, reimburse Owner for laboratory personnel and travel expenses incurred due to Contractor's negligence.

G. Employ and pay for services of separate, equally qualified independent testing laboratory to perform additional inspections, sampling, and testing required:
1. For Contractor's convenience.
2. When initial tests indicate Work does not comply with Contract Documents.

H. Make arrangements with laboratory and pay for additional samples and tests required for Contractor's convenience.

PART 2 PRODUCTS

NOT USED

PART 3 EXECUTION

NOT USED

END OF SECTION

PART 1 GENERAL

1.01 REQUIREMENTS INCLUDE

A. Special inspections and structural observations required by IBC 2009.

1.02 DEFINITIONS

A. Building official: Officer or its duly authorized representative charged with administration and enforcement of adopted building code.

B. Continuous: Full time observation of work requiring special inspection by an approved Special Inspector who is present in area where work is being performed.

C. Fabricator: Contractor who fabricates members and assemblies on premises of Contractor's shop.

D. Field quality control testing: Tests and inspections that are performed on-site for installation of Work and for completed Work.

E. Inspection: Evaluation of systems, primarily requiring observation and technical adjustment.

F. Installer/applicator/erector: Contractor or another entity engaged by Contractor as an employee, Subcontractor, or Subsubcontractor, to perform a particular construction operation, including installation, erection, application, and similar operations.

G. Periodic: Part-time or intermittent observation of work requiring special inspection by an approved Special Inspector who is present in area where work is being performed. The periodic inspection intervals shall be at beginning of work, at times of significant work, prior to work being concealed, and at completion of work.

H. Preconstruction testing: Tests and inspections that are performed specifically for Project before products and materials are incorporated into Work to verify performance or compliance with specified criteria.

I. Product testing: Tests and inspections performed by Nationally Recognized Testing Laboratory (NRTL), National Voluntary Laboratory Accreditation Program (NVLAP), or testing agency qualified to conduct product testing and acceptable to authorities having jurisdiction, to establish product performance and compliance with industry standards.

J. Special Inspector (SI): Experienced person who is educated and qualified in conducting, supervising, and evaluating tests and/or inspections.
   1. Where tests or inspections are required to be performed by a certified individual, SI shall have required certifications.
   2. Where tests or inspections are required to be performed by a registered engineer, SI shall be a registered engineer or shall be under direct supervision of a registered engineer experienced with type of work requiring special testing and inspection.

K. Special testing and inspection services: Items required by building code, and other items identified which in professional judgment of engineer, are critical to integrity of building structure. Services are required of materials, installation, fabrication, erection, or placement of components and connections requiring special expertise to ensure compliance with approved Contract Documents and referenced standards.

L. Source quality control testing: Tests and inspections that are performed at source, i.e., plant, mill, factory, or shop.

M. Testing: Evaluation of systems, primarily requiring physical manipulation and analysis of materials, in accordance with approved standards.

N. Testing agency: Established and approved independent testing agency acceptable to Owner and Building Official and as noted below:
   1. Authorized to operate in state in which project is located and experienced with requirements and testing methods specified in Statement of Special Inspection.
   2. Testing equipment shall be calibrated at reasonable intervals by devices of accuracy traceable to either National Bureau of Standards, or to accepted values of natural physical constants.

1.03 SPECIAL INSPECTOR(S)

A. More than one Special Inspector (SI) may be required to provide varied knowledge and experience necessary to adequately test and inspect all categories of work requiring special inspection.

B. SIs shall perform their duties independent from construction quality control staff employed by Contractor. SI services do not relieve Contractor of responsibility for compliance with requirements of contract documents.

C. Owner will employ and pay for specified services of SI(s).

1.04 INFORMATIONAL SUBMITTALS

A. Qualification Data: Special Inspector shall submit information to Building Official as required to get Building Official approval of Special Inspector's qualifications. Special Inspector shall submit letter to Owner documenting acceptance of qualifications by Building Official.

B. Schedule of Tests and Inspections: Prepared in tabular form by Special Inspector, to submit to Owner and Contractor, and including following:
   1. Specification Section number and title.
   2. Description of test and inspection.
   3. Identification of applicable standards.
   4. Identification of test and inspection methods.
   5. Number of tests and inspections required.
   6. Time schedule or time span for tests, inspections, and submittal of reports.
   7. Requirements for obtaining samples.
   8. Unique characteristics of each quality-control service.

C. Reports: Prepare and submit certified written reports that include following:
   1. Date of issue.
   2. Project title and number.
   3. Name, address, and telephone number of testing agency.
   4. Dates and locations of samples and tests or inspections.
   5. Names of individuals making tests and inspections.
   6. Description of Work and test and inspection method.
   7. Identification of product and Specification Section.
   8. Complete test or inspection data.
   9. Test and inspection results and an interpretation of test results.
   10. Record of temperature and weather conditions at time of sample taking and testing and inspecting.
   11. Comments or professional opinion on whether tested or inspected Work complies with Contract Document requirements.
   12. Name and signature of Special Inspector.
   13. Recommendations on retesting and re-inspecting.

D. Submit reports to Owner, Building Official, and Contractor weekly. A final report of inspections documenting required special inspections and correction of discrepancies shall be submitted periodically.

1.05 QUALITY ASSURANCE

A. Special Inspector acting as Owner's Representative may require testing and inspection of work at plant, before shipment. Owner reserves right to reject material not complying with Contract Documents.

B. Regulatory requirements:
   1. Perform special inspections, tests, and structural observations in accordance with IBC Chapter 17 and in accordance with requirements of this section.
   2. Testing and inspection shall be performed in accordance with industry standard used as reference for specific material or procedure unless other criteria are specified. In absence of a referenced standard, tests shall be accomplished in accordance with generally accepted industry standards.
   3. Work shall be checked as it progresses, but failure to detect any defective work or materials shall in no way prevent later rejection if defective work or materials are discovered, nor shall it obligate Owner to accept such work.

C. Qualifications: Following paragraphs establish minimum qualification levels required; individual Specification Sections specify additional requirements.
   1. Installer: A firm or individual experienced in installing, erecting, or assembling work similar in material, design, and extent to that indicated for this Project, whose work has resulted in construction with a record of successful in-service performance.
   2. Manufacturer: A firm experienced in manufacturing or producing products or systems similar to those indicated for this Project and with a record of successful in-service performance, as well as sufficient production capacity to produce required units.
   3. Engineer: Professional Engineer legally qualified to practice in jurisdiction where Project is located and who is experienced in providing engineering services of kind indicated. Engineering services are defined as those performed for installations of system, assembly, or products that are similar to those indicated for this Project in material, design, and extent.
   4. Specialists: Certain sections of Specifications require that specific construction activities shall be performed by entities who are recognized experts in those operations. Specialists shall satisfy qualification requirements indicated and shall be engaged for activities indicated. Requirement for specialists shall not supersede building codes and regulations governing Work.
   5. Testing agency: NRTL, an NVLAP, or independent agency with experience and capability to conduct testing and inspecting indicated, as documented according to ASTM E548; and with additional qualifications specified in individual Sections; and where required by authorities having jurisdiction, that is acceptable to authorities.
      a. NRTL: Nationally recognized testing laboratory according to 29 CFR 1910.7.
      b. NVLAP: Testing agency accredited according to NIST National Voluntary Laboratory Accreditation Program.
   6. Factory-Authorized Service Representative: Authorized representative of manufacturer who is trained and approved by manufacturer to inspect installation of manufacturer's products that are similar in material, design, and extent to those indicated for this Project.

D. Conflicting requirements:
   1. If compliance with two or more standards is specified and standards establish different or conflicting requirements for minimum quantities or quality levels, comply with most stringent requirement. Refer uncertainties and requirements that are different, but apparently equal, to the Owner for a decision before proceeding.
   2. Minimum quantity or quality levels: Quantity or quality level shown or specified shall be minimum provided or performed. Actual installation may comply exactly with minimum quantity or quality specified, or it may exceed minimum within reasonable limits. To comply with these requirements, indicated numeric values are minimum or maximum, as appropriate, for context of requirements.

1.06 RESPONSIBILITIES

A. Special Inspector:
1. Attend a pre-construction meeting to review scope of special testing and inspection.
2. Test or inspect work specified for conformance with approved design Drawings, Specifications, and applicable material and workmanship provisions of code.
3. Perform testing and inspection in a timely manner to avoid delay of work. Coordinate sequence of activities to accommodate required quality assurance and quality control services with minimum of delay and to avoid necessity of removing and replacing construction to accommodate testing and inspecting.
4. Schedule times for tests, inspections, obtaining samples, and similar activities.
5. Bring discrepancies to immediate attention of Contractor for correction, then, if uncorrected after a reasonable period of time, to attention of Owner and Building Official.
6. Submit test and inspection reports to Building Official, Contractor, and other designated persons.
7. Limits of authority: Special Inspectors may not waive or alter Contract requirements, or approve or accept any portion of Work unless specifically authorized by Owner. SIs may not assume any duties of Contractor, and they have no authority to stop or reject Work.

B. Contractor's Engineer:
1. Identify items requiring special testing and inspection specified.
2. Provide Statement of Special Inspection, as required by 2009 IBC.
3. If requested, attend a pre-construction meeting to review scope of special structural testing and inspection.
4. Review summary reports submitted by Special Inspectors.

C. Contractor
1. Attend preconstruction meeting to review scope of special testing and inspection.
2. Provide SI access to approved Drawings and Specifications at job Site.
3. Review reports submitted by SIs.
4. Retain at job Site reports submitted by SIs for review by Building Official upon request.
5. Correct in a timely manner, deficiencies identified in inspection and testing reports. Allow adequate time for corrective work, re-inspection, and documentation.
6. Provide SI safe access to work requiring inspection or testing.
7. Provide labor and facilities to provide access to Work and to obtain, handle and deliver samples, to facilitate testing and inspection and for storage and curing of test samples.
8. Verify conformance of Work within specified construction tolerances.
9. Pay costs of retesting and reinspecting construction that replaces or is necessitated by work that failed to comply with Contract Documents.
10. Maintain a log of tests and inspections at Site.

D. Building Official (typical responsibilities; noted for information only):
1. Determine work which, in its opinion, involves unusual hazards or conditions in accordance with IBC.
2. Approve fabricators of assemblies as it deems fit.
3. Review and approve SI qualifications.
4. Review reports and recommendations submitted by SIs.
5. Review "final signed reports" submitted by SIs. Documents should be accepted and approved by building official prior to issuance of a Certificate of Occupancy.

E. Owner:
1. Establish funding to provide for cost of special testing and inspection services.
2. Provide SI with approved design Drawings and Specifications and with reviewed Shop Drawings.

1.07 NOTICE OF INSPECTIONS

A. Provide adequate notice for inspections performed by Building Official, as required by building code and other local codes.

B. Provide adequate notice for inspections performed by SI.

PART 2 PRODUCTS

NOT USED

PART 3 EXECUTION

3.01 TEST AND INSPECTION LOG

A. Prepare record of tests and inspections. Include:
1. Date test or inspection was conducted.
2. Description of Work tested or inspected.
3. Identification of testing agency or SI conducting test or inspection.

B. Maintain log at Project Site. Post changes and modifications as they occur. Provide access to test and inspection log for reference during normal working hours.

3.02 REPAIR AND PROTECTION

A. On completion of testing, inspecting, sample taking, and similar services, repair damaged Work and restore substrates and finishes to eliminate deficiencies, including deficiencies in visual qualities of exposed surfaces, as judged solely by Owner. Provide materials and comply with installation requirements specified in other Specification Sections.

B. Protect work exposed by or for testing and/or inspection and protect repaired work. Repair and protection is Contractor's responsibility, regardless of assignment of responsibility for testing and/or inspection.

3.03 STATEMENT OF SPECIAL INSPECTION AND TESTS

A. Attached Statement of Special Inspections and Tests outlines inspections and tests that will be performed by Special Inspector in accordance with IBC 2009 Chapter 17. Additional information on tests and inspections is included in referenced Specification Sections.

B. Tests and inspections listed in Statement of Special Inspection and Tests are in addition to those required by Contractor's quality control program.

C. The Contractor's registered design professional responsible for the structural design shall complete the Statement of Special Inspection and Tests.

END OF SECTION

As required by 2009 IBC Building Code 1704.1.1, Engineer has completed following Statement of Special Inspections and Tests. Completion of Statement of Special Inspections and Tests and submission to Building Official is a condition for issuance of Building Permit.	
Project Title:	
Project No.:	
Project Address:	
Architect/Engineer:	
Name of Person Completing this Statement:	Mr. Ms._____, P.E.
Phone:	
Date:	MMMM/DD/YYY.

STATEMENT OF SPECIAL INSPECTIONS AND TESTS

INSPECTION AND TESTING (Continuous and Periodic as Defined by IBC)	CONTINUOUS	PERIODIC	REFERENCE STANDARD	IBC REFERENCE	REFERENCED SPECIFICATION SECTION
A. Inspection of Fabricators:				1704.2	
1. Inspection of steel fabricators shop and shop fabricated items		X			
2. Inspection of precast concrete shop and shop fabricated items		X			
3. Inspection of fabrication shop for pre-fabricated wood elements and shop fabricated items		X			
B. Steel Construction:				1704.3	
1. Material verification of high-strength bolts, nuts and washers.					
a. Identification markings to conform to ASTM standards specified in approved construction documents		X	Applicable ASTM material specifications; AISC 360, Section A3.3		
b. Manufacturer's certificate of compliance required		X			
2. Inspection of high-strength bolting.			AISC 360, Section M2.5	1704.3.3	
a. Snug-tight bolts		X			
b. Pre-tensioned and slip-critical joints using turn-of-nut with match-marking, twist-off bolt or direct-tension indicator methods of installation.		X			
c. Pre-tensioned and slip-critical joints using turn-of-nut without match-marking or calibrated wrench methods of installation.	X				
3. Material verification of structural steel and cold-formed steel deck.				1704.3, 1708.4	
a. For structural steel, identification markings to conform to AISC 360		X	AISC 360, Section M5.5		
b. For other steel, identification markings to conform to ASTM standards specified in the approved construction documents		X	Applicable ASTM material standards		
c. Manufacturer's certified test reports.		X			
4. Material verification of weld filler materials.				1704.3	
a. Identification markings to conform to AWS specification in the approved construction documents		X	AISC 360, Section A3.5 and applicable AWS A5 documents		
b. Manufacturer's certificate of compliance required		X

b. Grouting of bonded prestressing tendons in seismic-force-resisting system.	X					
10. Erection of precast concrete members.		X	ACI 318: Ch. 16			
11. Verification of in-situ concrete strength, prior to stressing of tendons in post-tensioned concrete and prior to removal of shores and forms from beams and structural slabs.		X	ACI 318: 6.2			
12. Inspect formwork for shape, location and dimensions of concrete member being formed		X	ACI 318: 6.1.1			
D. Masonry Construction:					1704.5	
L1 = Level 1 Inspection required for nonessential facilities. L2 = Level 2 Inspection required for essential facilities.			ACI 530/ ASCE 5/TMS 402, Ch. 35	ACI 530.1/ ASCE 6/TMS 602, Ch. 35		
1. Compliance with required inspection provisions of the construction documents and approved submittals shall be verified		L1 L2		1.5		
2. Verification of f'm and f'AAC prior to construction and for every 5,000 square feet during construction		L1 L2		1.4B		
3. Verification of slump flow and VSI as delivered to the site for self-consolidating grout	L1 L2			1.5B.1.b.3		
4. Verification of proportions of materials in premixed or preblended mortar and grout as delivered to the site		L2		1.5B		
5. The following shall be verified to ensure compliance:						
a. Proportions of site prepared mortar and grout		L1 L2		2.6A		
b. Placement of masonry units and construction of mortar joints.		L1 L2		3.3B		
c. Placement of reinforcement and connectors.		L1 L2	1.15	3.4		
d. Grout space prior to grouting	L2	L1		3.2D		
e. Placement of grout	L1 L2			3.5		
f. Size and location of structural elements		L1 L2		3.3F		
g. Type, size, and location of anchors, including other details of anchorage of masonry to structural members, frames or other construction.	L2	L1	1.2.2(e), 1.16.1,			
h. Specified size, grade, and type of reinforcement and anchor bolts..		L1 L2	1.15	2.4, 3.4		
i. Welding of reinforcing bars.	L1 L2		2.1.9.7.2 3.3.3.4(b)			
j. Preparation, construction and protection of masonry during hot weather (temperature above 90ºF)		L1 L2		1.8C, 1.8D	2104.3, 2104.4	

STATEMENT OF SPECIAL INSPECTIONS AND TESTS						
INSPECTION AND TESTING (Continuous and Periodic as Defined by IBC)	CONTINUOUS	PERIODIC	REFERENCE STANDARD		IBC REFERENCE	REFERENCED SPECIFICATION SECTION
6. Preparation of grout specimens, mortar specimens, and/or prisms shall be observed.	L2	L1		1.4	2105.2.2, 2105.3	
7. Verification of prestressed masonry to ensure compliance.						
a. Proportions of site prepared prestressing grout for bonded tendons		L1 L2		2.6B		
b. Specified size, grade, and type of prestressing tendons and anchorages.		L1 L2		2.4		
c. Placement of prestressing tendons and anchorages.		L1 L2		3.6A		
d. Placement of prestressing grout	L2	L1		3.6C		
e. Application and measurement of prestressing force.	L2	L1		3.6B		
E. Wood Construction:					1704.6,	
1. Inspect field-fabricated items for compliance with contract documents: High-load diaphragms.		X			1704.6.1	
F. Soils:					1704.7	
1. Verify materials below shallow foundations are adequate to achieve design bearing capacity		X				
2. Verify excavations are extended to proper depth and have reached proper material		X				
3. Perform classification and testing of controlled fill material		X				
4. Verify use of proper materials, densities and lift thicknesses during placement and compaction of compacted fill	X					
5. Prior to placement of fill, observe subgrade, and verify site has been prepared properly		X				
G. Driven Deep Foundation Elements:					1704.8	
1. Verify element materials, sizes and lengths comply with requirements	X					
2. Determine capacities of test elements and conduct additional tests as required	X					
3. Observe driving operations and maintain complete records for each element	X					
4. Verify placement locations and plumbness, confirm type and sizes of hammers, record number of blows per foot of penetration, determine required penetrations to achieve design capacity, record tip and butt elevations and document any damage to foundation element	X

U. Other (list)					

PART 1 GENERAL

1.01 TEMPORARY ELECTRICAL UTILITIES

A. Contractor shall furnish all electrical temporary facilities, equipment, materials, and supplies required for the execution of the Work including temporary electrical service and/or local generators, lighting, and communication. Provide and pay for power service required from local utility source and/or fuel for the local generators as needed for construction operation.

B. Temporary electrical facilities shall conform to applicable safety and code requirements, shall be constructed to provide proper clearances and minimum interference with construction.

C. Provide temporary lighting and lighting control during construction operation. The lighting type and illumination shall be suitable for the work tasks in the respective areas. Adequate site security lighting shall also be provided at site security gates, equipment and materials storage areas, and other areas as required.

D. All temporary utilities shall be removed, prior to final payment, subject to coordination and approval of the Owner.

1.02 TEMPORARY WATER SERVICE

A. Existing water service is not available at the project site. Provide and pay for suitable quality water service as needed to maintain specified conditions for construction operations.

1.03 TEMPORARY SANITARY FACILITIES

A. Existing sanitary facilities are not available at the project site. Provide and maintain required facilities and enclosures. Provide at time of project mobilization.

1.04 FACILITIES PROVIDED TO OWNER

A. Contractor supplied construction office space for Owner on-site.
1. Contractor shall provide the following construction office space and office equipment to Owner:

Type	Number Required	Minimum Size	Equipment Provided by Contractor
Secretary, located near entrance door	1	8 ft x 10 ft	Desk & Chair, 4 drawer file lockable cabinet, 8ft x 3 ft bookshelf, 6ft x 3ft table
Plant Manager Office with lockable door	1	10 ft x 12 ft	Desk & Chair, 4 drawer file lockable cabinet, Two 8ft x 3 ft bookshelves, Two 6ft x 3ft tables, 6 ft wide whiteboard, two guest chairs
Offices with lockable doors	3	10 ft x 10 ft	Desk & Chair, 4 drawer file lockable cabinet, Two 8ft x 3 ft bookshelves, Two 6ft x 3ft tables, 6 ft wide whiteboard, two guest chairs
Project Administrator Office with lockable door	1	10 ft x 12 ft	Desk & Chair, Two 4 drawer file lockable cabinet, Two five drawer x 42 inch wide lateral file cabinets (lockable), Two 6ft x 3ft tables, 6 ft wide whiteboard, two guest chairs
Open Offices	20	10 ft x 10 ft	Desk & Chair, 4 drawer file cabinet, Two 8ft x 3 ft bookshelves, 6ft x 3ft tables, 6 ft wide whiteboard, two guest chairs
Kitchenette	1	10 ft x 10 ft	Stove with oven, 18 cubic ft refrigerator, microwave, coffeemaker, water cooler, counter and cupboards
Meeting room	1	35 ft x 20 ft	Meeting room with tables and chairs capable of seating 30 people, 10 ft whiteboard,

Type	Number Required	Minimum Size	Equipment Provided by Contractor
			teleconference phone, computer projector and screen
Bathroom Facilities	1		Men's & women's bathrooms, at least two toilets each. Each shall have two sinks. Men's shall also have two urinals.
File area	1	30 ft x 20 ft	Six 8 ft x 3 ft bookshelves, eight drawing racks, Twelve 4 drawer file cabinets, 8 ft long drawing review table

2. Each desk in the offices listed above shall have a separate phone line and internet connection.
3. Each desk shall be at least 54" x 30" and have at least four drawers. Two of these drawers shall be capable of using letter sized hanging files. Desk chairs shall be of swivel armchair type.
4. Provide two eight foot tall storage cabinets for Owner office supplies.
5. Provide 30 parking spaces on site adjacent to Owner's construction offices for Owner's construction staff.
6. Owner offices shall be adjacent to Contractor offices.
7. Provide utilities for Owner's construction offices
   a. Electricity.
   b. Phone service.
   c. Broadband internet.
   d. Temporary water.
   e. Temporary sanitary facilities.
   f. Cooling.
8. Lighting for offices: 50 footcandles at desktop height.
9. Provide fire extinguishers.
10. Provide daily janitorial services for Owner's offices.
11. Maintain approach walks free of mud and water.
12. Provide office space prior to start of construction.
13. Construction offices and facilities supplied for Owner shall remain on Site after Final Completion, unless Owner approves Contractor's removal of such offices and facilities.

B. Utility vehicles
   1. Provide and maintain four utility vehicles for Owner's construction staff on site.
   2. Supply fuel for utility vehicles.

C. Radios
   1. Provide Owner's construction staff with radios set to the frequencies that Contractor is using on site for construction and commissioning.
   2. Coordinate number of radios required with Owner.

1.05 VEHICULAR ACCESS

A. Construct temporary access roads from public thoroughfares to serve construction area, of a width and load bearing capacity to provide unimpeded traffic for construction purposes.

B. Construct temporary bridges and culverts to span low areas and allow unimpeded drainage.

C. Extend and relocate as Work progress requires, provide detours as necessary for unimpeded traffic flow.

D. Provide unimpeded access for emergency vehicles. Maintain 20' (6 m) width driveways with turning space between and around combustible materials.

E. Provide means of removing mud from vehicle wheels before entering Highway 2.

1.06 PARKING

A. Construct temporary gravel surface parking areas to accommodate construction personnel.

B. Do not allow heavy vehicles or construction equipment in parking areas.

C. Do not allow vehicle parking on existing highway.

D. Designate 12 parking spaces for the Owner.

E. Maintenance:
1. Maintain traffic and parking areas in a sound condition free of excavated material, construction equipment, products, and mud.
2. Maintain existing paved areas used for construction; promptly repair breaks, potholes, low areas, standing water, and other deficiencies, to maintain paving and drainage in original, or specified, condition.

F. Removal, repair:
1. Remove temporary materials and construction before Substantial Completion.
2. Remove underground work and compacted materials to a depth of 2" (600 mm); fill and grade site as specified.
3. Repair permanent facilities damaged by use, to specified condition.

1.07 PROGRESS CLEANING AND WASTE REMOVAL

A. Maintain areas free of waste materials, debris, and rubbish. Maintain site in a clean and orderly condition.

B. Remove debris and rubbish from pipe chases, plenums, attics, crawl spaces, and other closed or remote spaces, prior to enclosing the space.

C. Broom and vacuum clean interior areas prior to start of surface finishing, and continue cleaning to eliminate dust.

D. Collect and remove waste materials, debris, and rubbish from site weekly and dispose off-site.

E. Open free-fall chutes are not permitted. Terminate closed chutes into appropriate containers with lids.

1.08 PROJECT IDENTIFICATION

A. Project identification sign: Provide painted signs with project information shown in English and Spanish.

B. Finishes, painting: Adequate to withstand weathering, fading, and chipping for duration of construction.

C. Maintenance: Maintain signs and supports clean, repair deterioration and damage.

D. Removal: Remove signs, framing, supports, and foundations at completion of Project and restore area.

1.09 TRAFFIC REGULATION

A. Flaggers: Provide trained and equipped flaggers to regulate traffic when construction operations or traffic encroaching on public traffic lanes.

B. Haul routes:
   1. Consult with authority having jurisdiction, establish public thoroughfares to be used for haul routes and site access. Determine haul roads with approval of agency having jurisdiction over proposed roadway.
   2. Confine construction traffic to designated haul routes.
   3. Provide traffic control at critical areas of haul routes to regulate traffic, to minimize interference with public traffic.
   4. Make condition survey of haul roads prior to use and document with necessary photographs and written descriptions.
   5. Keep reasonably free from dirt, dust, mud, and other debris from construction operations.
   6. Clean a minimum of twice a week.
   7. Repair damaged haul routes to match existing conditions before use.

1.10 BARRIERS

A. Provide barriers to prevent unauthorized entry to construction areas.

1.11 ENCLOSURES AND FENCING

A. Construction: Contractor's option.

1.12 SECURITY

A. Security program:
   1. Protect Work existing premises and Owner's operations from theft, vandalism, and unauthorized entry.
   2. Initiate program in coordination with Owner.
   3. Maintain program throughout construction period until Owner acceptance.

B. Entry control:
   1. Restrict entrance of persons and vehicles into Project site.
   2. Allow entrance only to authorized persons with proper identification.
   3. Maintain log of workers and visitors, make available to Owner on request.
   4. Contractor shall control entrance of persons and vehicles related to Owner's operations.
   5. Coordinate access of Owner's personnel to site in coordination with Owner's security forces.

C. Personnel identification:
   1. Provide identification badge to each person authorized to enter premises.
   2. Maintain a list of accredited persons, submit copy to Owner on request.
   3. Require return of badges at expiration of their employment on the Work.

D. Security service: Employ uniformed armed guard service to provide watchpersons at site twenty four hours a day, seven days a week.

1.13 WATER CONTROL

A. Grade site to drain. Maintain excavations free of water. Provide, operate, and maintain pumping equipment.

B. Protect site from puddling or running water. Provide water barriers as required to protect site from soil erosion.

1.14 DUST CONTROL

A. Execute Work by methods to minimize raising dust from construction operations.

B. Provide positive means to prevent air-borne dust from dispersing into atmosphere.

1.15 EROSION AND SEDIMENT CONTROL

A. Plan and execute construction by methods to control surface drainage from cuts and fills, from borrow and waste disposal areas. Prevent erosion and sedimentation.

B. Minimize amount of bare soil exposed at one time.

C. Provide temporary measures such as berms, dikes, and drains, to prevent water flow.

D. Construct fill and waste areas by selective placement to avoid erosive surface silts or clays.

E. Periodically inspect earthwork to detect evidence of erosion and sedimentation; promptly apply corrective measures.

1.16 POLLUTION CONTROL

A. Provide methods, means, and facilities to prevent contamination of soil, water, and atmosphere from discharge of noxious, toxic substances, and pollutants produced by construction operations.

1.17 REMOVAL OF TEMPORARY UTILITIES, FACILITIES, AND CONTROLS

A. Remove temporary utilities, equipment, facilities, materials, prior to Final Application for Payment inspection.

B. Clean and repair damage caused by installation or use of temporary work.

PART 2 PRODUCTS

NOT USED

PART 3 EXECUTION

NOT USED

END OF SECTION

PART 1 GENERAL

1.01 CLOSEOUT (FINALIZATION) PROCEDURES

A. Submit written certification that EPC Contract Documents have been reviewed, Work has been inspected, and that Work is complete in accordance with EPC Contract Documents and ready for Owner's review.

B. Provide submittals to Owner that are required by governing or other authorities.

C. Owner will occupy all of the facility.

1.02 FINAL CLEANING

A. Execute final cleaning prior to final project assessment.

B. Clean surfaces; remove temporary labels, stains and foreign substances, polish transparent and glossy surfaces.

C. Clean equipment and fixtures to a sanitary condition with cleaning materials appropriate to the surface and material being cleaned.

D. Clean filters of operating equipment.

E. Clean debris from roofs, gutters, downspouts, and drainage systems.

F. Clean site; sweep paved areas, rake clean landscaped surfaces.

G. Remove waste and surplus materials, rubbish, and construction facilities from the site.

1.03 STARTING OF SYSTEMS

A. Coordinate schedule for start-up of various equipment and systems.

B. Notify Owner 15 days prior to start-up of each item.

C. Verify that each piece of equipment or system has been checked for proper lubrication, drive rotation, belt tension, control sequence, and for conditions which may cause damage.

D. Verify tests, meter readings, and specified electrical characteristics agree with those required by the equipment or system manufacturer.

E. Verify that wiring and support components for equipment are complete and tested.

F. Execute start-up under supervision of applicable manufacturer's representative in accordance with manufacturers' instructions.

G. When specified in individual specification Sections, require manufacturer to provide authorized representative to be present at site to inspect, check, and approve equipment or system installation prior to start-up, and to supervise placing equipment or system in operation.

H. Submit a written report that equipment or system has been properly installed and is functioning correctly.

1.04 TESTING, ADJUSTING AND BALANCING

A. Independent firm will perform services as specified and required by codes and standards.

B. Reports will be submitted by the independent firm to the Owner indicating observations and results of tests and indicating compliance or non-compliance with the requirements of the Contract Documents.

1.05 PROTECTING INSTALLED CONSTRUCTION

A. Protect installed Work and provide special protection where specified in individual specification sections.

B. Provide temporary and removable protection for installed products. Control activity in immediate work area to prevent damage.

C. Provide protective coverings at walls, projections, jambs, sills, and soffits of openings.

D. Protect finished floors, stairs, and other surfaces from traffic, dirt, wear, damage, or movement of heavy objects, by protecting with durable sheet materials.

E. Prohibit traffic or storage upon waterproofed or roofed surfaces. If traffic or activity is necessary, obtain recommendations for protection from waterproofing or roofing material manufacturer.

F. Prohibit traffic from landscaped areas.

1.06 PROJECT RECORD DOCUMENTS

A. Maintain on site one set of the following record documents; record actual revisions to the Work:
1. Drawings.
2. Specifications.
3. Addenda.
4. Change Orders and other modifications to the Contract.
5. Reviewed and approved shop drawings, product data, and samples.
6. Manufacturer's instruction for assembly, installation, and adjusting.

B. Ensure entries are complete and accurate, enabling future reference by Owner.

C. Store record documents separate from documents used for construction.

D. Record information concurrent with construction progress, not less than weekly.

E. Specifications: Legibly mark and record at each product section description of actual products installed, including the following:
1. Manufacturer's name and product model and number.
2. Product substitutions or alternates utilized.
3. Changes made by Addenda and modifications.

F. Record Drawings: Legibly mark each item to record actual construction including:
1. Measured depths of foundations in relation to finish first floor datum.
2. Measured horizontal and vertical locations of underground utilities and appurtenances, referenced to permanent surface improvements.
3. Measured locations of internal utilities and appurtenances concealed in construction, referenced to visible and accessible features of the Work.
4. Field changes of dimension and detail.
5. Details not on original Contract Drawings.

G. Submit documents to Owner.

1.07 PRODUCT WARRANTIES AND PRODUCT BONDS

A. Obtain warranties and bonds executed in duplicate by responsible subcontractors, suppliers, and manufacturers, within ten days after completion of the applicable item of work.

B. Execute and assemble transferable warranty documents and bonds from subcontractors, suppliers, and manufacturers.

C. Verify that documents are in proper form, contain full information, and are notarized.

D. Co-execute submittals when required.

E. Provide Table of Contents and assemble in 3-D side ring binder with durable plastic cover.

F. Submit prior to final Application for Payment.

PART 2 PRODUCTS

NOT USED

PART 3 EXECUTION

NOT USED

END OF SECTION

PART 1 GENERAL

1.01 OPERATING AND MAINTENANCE DATA REQUIREMENTS

A. Compile product data and related information appropriate for Owner's maintenance and operation of equipment furnished under this Contract.

B. Prepare operating and maintenance data as specified in this section and as referenced in other pertinent sections of Specifications.

C. Instruct Owner's personnel in maintenance of products and in operation of equipment and systems.

1.02 QUALITY ASSURANCE

A. Preparation of data shall be done by personnel:
1. Trained and experienced in maintenance and operation of described products.
2. Familiar with requirements of this section.
3. Skilled as technical writers to extent required to communicate essential data.
4. Skilled as draftsmen competent to prepare required drawings.

1.03 FORM OF SUBMITTALS

A. Prepare data in form of an instructional manual for use by Owner's personnel.

B. Format:
1. Size 8-1/2" x 11".
2. Paper: 20 lb minimum, white, for typed pages.
3. Text: Manufacturer's printed data, or neatly typewritten.
4. Drawings:
   a. Provide reinforced punched binder tab, bind in with text.
   b. Fold larger drawings to size of text pages.
5. Provide fly-leaf for each separate product, or each piece of operating equipment.
   a. Provide typed description of product, and major component parts of equipment.
   b. Provide indexed tabs.
6. Cover: Identify each volume with typed or printed title "OPERATING AND MAINTENANCE INSTRUCTIONS." Refer to diagram at end of this Section. List:
   a. Title of Project.
   b. Identity of separate structure as applicable.
   c. Identity of general subject matter covered in manual.
7. Binders:
   a. Commercial quality post-type binders with durable and cleanable plastic covers.
   b. Maximum size: 3".
   c. When multiple binders are used, correlate data into related consistent groupings.

1.04 CONTENT OF MANUAL

A. Neatly typewritten table of contents for each volume, arranged in systematic order.
1. Contractor, name of responsible principal, address, and telephone number.
2. List of each product required to be included, indexed to content of volume.
3. List, with each product, name, address, and telephone number of:
   a. Subcontractor or installer.
   b. Maintenance contractor, as appropriate.
   c. Identify area of responsibility of each.
   d. Local source of supply for parts and replacement and list of recommended spare parts.
4. Identify each product by product name and other identifying symbols, including nameplate information and shop order numbers for each item of equipment furnished.

B. Product data:

1. Include only those sheets which are pertinent to specific product.
2. Annotate each sheet to:
   a. Clearly identify specific product or part installed.
   b. Clearly identify data applicable to installation.
   c. Delete references to inapplicable information.

C. Drawings:
1. Supplement product data with Drawings as necessary to clearly illustrate:
   a. Relations of component parts of equipment and systems.
   b. Control and flow diagrams.
2. Coordinate Drawings with information in Project record documents to assure correct illustration of completed installation.
3. Do not use Project record documents as maintenance Drawings.

D. Written text, as required to supplement product data for particular installation.
1. Organize in consistent format under separate headings for different procedures.
2. Provide logical sequence of instructions for each procedure.

E. Copy of each warranty, bond, and service contract issued. Provide information sheet for Owner's personnel, giving:
1. Proper procedures in event of failure.
2. Instances which might affect validity of warranties or bonds.

1.05 MANUAL FOR EQUIPMENT AND SYSTEMS

A. Submit 5 hard copies and 1 electronic copy on compact disc (CD) of complete manual in final form.

B. Contents, for each unit of equipment and system, as appropriate:
1. Description of unit and component parts:
   a. Function, normal operating characteristics, and limiting conditions.
   b. Performance curves, engineering data, and tests.
   c. Complete nomenclature and commercial number of replaceable parts.
2. Operating procedures:
   a. Provide operating procedures in both Spanish and English languages.
   b. Startup, break-in (repetitive use), routine, and normal operating instructions.
   c. Regulation, control, normal stopping, emergency shutdown, and emergency instructions.
   d. Special operating instructions.
3. Maintenance procedures:
   a. Routine operations.
   b. Guide to "trouble-shooting."
   c. Disassembly, repair, and reassembly.
   d. Alignment, adjusting, and checking.
4. Servicing and lubrication schedule: List of lubricants required.
5. Manufacturer's printed operating and maintenance instructions.
6. Description of sequence of operation by control manufacturer.
7. Original manufacturer's parts list, illustrations, assembly drawings, and diagrams required for maintenance.
   a. Predicted life of parts subject to wear.
   b. Items recommended to be stocked as spare parts. Provide part numbers for recommended spare parts.
8. As-installed control diagrams by controls manufacturer.
9. Chart of valve tag numbers, with location and function of each valve.
10. List of original manufacturer's spare parts, manufacturer's current prices, and recommended quantities to be maintained in storage.
11. Other data as required under pertinent sections of Specifications.

C. Content, for each electrical and electronic system, as appropriate.
1. Description of system and component parts:
   a. Function, normal operating characteristics, and limiting conditions.

b. Performance curves, engineering data, and tests.
c. Complete nomenclature and commercial number of replacement parts.

2. Circuit directories of panelboards:
   a. Electrical service.
   b. Controls.
   c. Communications.
3. As-installed wiring diagrams.
4. Operating procedures:
   a. Provide operating procedures in both Spanish and English languages.
   b. Routine and normal operating instructions.
   c. Sequences required.
   d. Special operating instructions.
5. Maintenance procedures:
   a. Routine operations.
   b. Guide to "trouble-shooting."
   c. Disassembly, repair, and assembly.
   d. Adjustment and checking.
6. Manufacturer's printed operating and maintenance instructions.
7. List of original manufacturer's spare parts, manufacturer's current prices, and recommended quantities to be maintained in storage.
8. Other data as required under pertinent sections of Specifications.

D. Prepare and include additional data when need for such data becomes apparent during instruction of Owner's personnel.

E. Additional requirements for operating and maintenance data: Respective sections of Specifications.

NUMERO DE VOLUMEN*		14 pt 14 pt

1. Imprinting shall be in Arial font.
2. Spine printing shall be 12-point.
3. Cover printing shall be in point sizes indicated.

* Provide separate manual for specific systems and equipment.

** If more than one volume is necessary, imprint cover with volume numbers.

PART 1 GENERAL

1.01 REQUIREMENTS INCLUDE

A. Contractor shall train Owner personnel to operate and maintain the plant, including all equipment on Site. Contractor shall develop the proposed written materials to be used in the training program, and submit materials to Owner for Owner's approval.

B. Contractor shall provide both classroom and field training to familiarize Owner personnel with the operation and maintenance of the plant and the equipment in accordance with good engineering and construction practices and applicable codes and standards. Training shall be oriented toward actual installed site specific equipment.

C. Specific training shall be provided in operation, routine maintenance, and normal and emergency shutdown of all equipment installed at the plant. Operator training program shall be scheduled prior to the plant and Unit commissioning activities.

D. System descriptions and operating instructions shall be prepared for all site specific operating systems. Documents shall make up a major portion of the training materials that Contractor will use to conduct the training. The system descriptions and operating instructions shall include the following information:
   1. System descriptions.
   2. System startup and shutdown.
   3. Operational prerequisites and interfacing systems.
   4. Site-specific operating instructions.
   5. Physical location of specific equipment on site.
   6. References.
   7. Maintenance procedures.

E. A suggested breakdown of training parties is located in Table 1 at the end of this Section.

F. It is anticipated that the training classes will be approximately 8 weeks with each subject presented 4 times to a class of no more than 25 participants, or as mutually agreed to by Contractor and Owner. Training schedule will be coordinated by the Contractor with subcontractors/sub-subcontractors.

G. Applicable subcontractor/sub-subcontractor training programs shall address the operation of the relevant equipment. Subcontractor/sub-subcontractor's training program shall include all equipment within the subcontractors/sub-subcontractor's scope of supply, and will address the knowledge required by operating personnel to operate the equipment.

1.02 TRAINING DOCUMENTS

A. Contractor shall submit its formal training program for review. The training program submittal shall include, but not be limited to, the following:
   1. Course objective and outline for each session.
   2. Detailed lesson plans including subcontractor's lesson plans, as applicable, for review and comment.
   3. Training manual for review and comment.
   4. A list of training aids to be used (e.g., actual equipment, equipment manuals, view graphs). A duplicate set of training aids is required to be delivered as part of the training program for future training needs.
   5. Preliminary training schedule, including proposed duration(s), based on job site assembly and testing, and completion of training on or before plant energization. The schedule should identify each segment, if the program will be conducted at various times and locations.
   6. A listing of any special prerequisite training or knowledge level of the personnel attending the training program.
   7. The complete details of any proposed off-Site training.

1.03 TRAINING MANUAL

A. The training manual shall address the operation of all equipment in the respective scope of supply. The training program will involve the development of quizzes that will test the participants' level of comprehension.

B. The participant's training manual shall incorporate, at a minimum the following elements:
1. Lesson objectives - what the participant is required to learn.
2. System overview - general description.
3. Safety and hazard.
4. Major component description – details and specifications - functional description using equipment drawings.
5. Location of major equipment (e.g. equipment procured under major subcontracts) components in the plant.
6. Flow path and controls - flow paths, instrumentation, controls, and interlocks.
7. Principles of operation - operating parameters, start-up, normal operation, shutdown, and infrequent operation.
8. Support and Interface Systems - Systems needed for operation, including interface with control Systems (DCS, PLC, etc.), as applicable.
9. Figures and tables (as required).
10. Startup, normal operation, shutdown, and infrequent operation procedures.
11. 3-D Model tutorial and operation.

1.04 QUIZZES

A. A list of test questions with appropriate answers shall be developed by the Contractor for each session. The test questions will reflect the lesson objectives only. The questions will be in the form of multiple choice, matching, drawing, rearrangement, and true/false. An answer key shall be developed by Contractor.

1.05 SITE SYSTEM REVIEW

A. plant system reviews should be conducted to familiarize the participant with the physical location of the equipment and acquaint the participant with equipment features, controls, and displays.

B. If equipment is not installed at the time of training, the instructor should be prepared to use photographs of a similar installation to augment the physical review.

1.06 PROGRAM REVIEW

A. Training submittal requirements:
1. Course outline: 4 months prior to training.
2. Detailed lesson plans: 2 months prior to training.
3. List of training aids: 4 months prior to training.
4. Training schedule:
   a. Preliminary: Upon award.
   b. Final: 4 months prior to training.
5. List of prerequisite training of knowledge level: 4 months prior to training.

B. Owner reserves the right to monitor and record (video and audio) the training programs (whether conducted by Contractor or its subcontractors or sub-subcontractors).

1.07 INSTRUCTORS

A. Contractor, major subcontractors and other applicable subcontractors/sub-subcontractors shall supply qualified personnel as instructors. Personnel designated as instructors should have previous experience in classroom and field environments or equivalent qualifications and instructional training.

B. Personnel designated as instructors will be made available for training purposes only and will not be assigned to other areas of the overall program during their assigned classroom training period, such as commissioning and testing, unless mutually agreed with Contractor and Owner.

1.08 TRAINING SCHEDULE

A. Training programs are to be consistent with installation of the equipment and the overall startup schedule. If Contractor or supplier recommends a segmented program, the benefits that will be derived by segmenting shall be identified.

B. Final training schedules shall be established by Contractor and provided to Owner for approval approximately 4 months prior to training. The overall project training program schedule will be the responsibility of Contractor with input and support by Owner.

1.09 TRAINING FACILITIES

A. Training will be conducted in location agreed to by Owner and Contractor. Contractor shall provide all training aids, handouts, audio visual equipment and materials.

TABLE 1

Estimated Training Durations
(as managed by Contractor)

Item No.	Equipment Description	Training Party	Duration (Days)	Sessions	Total Days
1.	Boiler (including subsystems)	OEM*	5	4	20
2.	Steam Turbine /Generator (including subsystems)	OEM	5	4	20
3.	Baghouse	OEM	1	4	4
4.	Flue gas path including ID fans	OEM	3	4	12
5.	DCS	Contractor	Operators: 2 Technicians: 3	4 1	8 3
6.	Makeup/Demineralized Water System	Contractor	2	4	8
7.	Water Treatment Systems	Contractor	1	4	4
8.	Ash Handling	Contractor	3	4	12
9.	Material Handling	Contractor	3	4	12
10.	Stack Gas Monitoring (CEMS)	Contractor	1	1	1
11.	Wastewater Treatment System	Contractor	2	4	8
13.	Overall Engineered Systems (remaining Balance of plant as designed by Contractor)	Contractor	10	4	40
				OVERALL TOTAL	166 (33 weeks)

**OEM refers to the subcontractor or sub-subcontractor that was the original equipment manufacturer.*

END OF SECTION

PART 1 GENERAL

1.01 SUBMITTAL PROCEDURES

A. Deliver submittals to Owner as shown in Section 01 83 10. Specifics will be provided after award of Contract.

B. Submittals shall be in English and Spanish languages.

C. Weights, measures, and units shall be English units with SI metric values following in parenthesis.

D. Symbols and drawings shall conform to ANSI Y32.2/IEEE 315/CSA Z99.

1.02 CONTRACTOR RESPONSIBILITIES

A. Review submittals prior to submission.

B. Determine and verify:
1. Field measurements.
2. Field construction criteria.
3. Catalog numbers and similar data.
4. Conformance to Specifications.

C. Coordinate each submittal with other submittals and with requirements of Work and of Contract Documents.

D. Notify Owner in writing, at time of submission, of any deviations in submittals from requirements of Contract Documents. Any such deviations permitted by Owner will require modifications of Contract Documents.

E. Provide space on Shop Drawings for Contractor and Owner stamps.

F. When Shop Drawings are revised for resubmission, identify all changes made since previous submission.

G. Submittals containing language imposing duties on others (such as verification of dimensions or supply of related information) inconsistent with contract language shall be null and void.

H. Submittals shall not be used as media for inquiries for information or for verification of information that must be supplied by others to Contractor. Inquiries or verification of information shall be made by separate Contractor submittal using Request for Information (RFI) process.

I. Begin no fabrication or Work which requires submittal review until return of submittals by Owner with stamp, as either "Reviewed", "Reviewed as Noted", or "Reviewed as Noted-Resubmit."

J. Distribute copies of reviewed submittals that carry Owner stamp as either "Reviewed" or "Reviewed as Noted" as appropriate. Instruct parties to promptly report any inability to comply with requirements.

K. Submittals not requested will not be recognized or processed.

1.03 OWNER DUTIES

A. Review required submittals with reasonable promptness and in accord with schedule, only for general conformance to design concept of Project and compliance with information given in Contract Documents. Review shall not extend to means, methods, sequences, techniques, or procedures of construction or to safety precautions or program incident thereto. Review of a separate item as such will not indicate approval of assembly in which item functions.

B. Affix stamp and initials or signature, and indicate requirements for resubmittal, or review of submittal. Owner's action on submittals is classified as follows:
   1. Reviewed: Submittal has been reviewed and appears to be in conformance to design concept of Project and Contract Documents. Contractor may proceed with fabrication of work in submittal.
   2. Reviewed As Noted: Submittal has been reviewed and appears to be in conformance to design concept of Project and Contract Documents, except as noted by reviewer. Contractor may proceed with fabrication of work in submittal with modifications and corrections as indicated by reviewer.
   3. Reviewed As Noted-Resubmit: Submittal has been reviewed and appears to be in conformance to design concept of Project and Contract Documents, except as noted by reviewer. Contractor may proceed with fabrication of work in submittal with modifications and corrections as indicated by reviewer. Contractor shall make any corrections indicated by reviewer and resubmit for review.
   4. Resubmit: Submittal has been reviewed and appears not to be in conformance to design concept of Project or with Contract Documents. Contractor shall not proceed with fabrication of work in submittal, but instead shall make any corrections required by reviewer and resubmit for review.
   5. Returned without Review: Submittal is being returned without having been reviewed because: 1) not required by Contract Documents; 2) grossly incomplete; 3) indicates no attempt at conformance to Contract Documents; 4) cannot be reproduced; 5) lacks Contractor's completed approval stamp; or 6) lacks design professional's seal when required by law or Contract Documents. If submittal is required by Contract Documents, Contractor shall not proceed with Work as detailed in submittal, but instead shall correct defects and resubmit for review.
   6. For Information Only: Submittal has not been reviewed but is being retained for informational purposes only.
   7. Void: Submittal is voided because it is no longer required or has been superseded by another submittal.

C. Return 1 copy of submittals to Contractor. Contractor shall make additional copies as required.

D. Reviewer will return signed submittal stamp with written description of Review's comments.

E. Review of submittals shall not relieve Contractor from responsibility for any variation from Contract Documents unless Contractor has, in writing, called Owner's attention to such variation at time of submission, and Owner has given written concurrence pursuant to Contract Documents to specific variation, nor shall any concurrence by Owner or other reviewer relieve Contractor from responsibility for errors or omissions in submittals.

1.04 SHOP DRAWINGS SUBMITTALS

A. Submit for review for limited purpose of checking for conformance to information given and design concept expressed in Contract Documents. Produce copies and distribute in accordance with article "Submittal Procedures" and for record documents purposes as described in Section 01 70 00.

B. Designate in construction schedule, or in separate coordinated submittal schedule, dates for submission and dates that reviewed submittals will be needed.

C. Make submittals promptly in accordance with approved schedule, and in such sequence as to cause no delay in Work.

D. Present in clear and thorough manner, complete with respect to dimensions, design criteria, materials of construction, and like information to enable review of information as required.

E. Details shall be identified by reference to sheet and detail, schedule or room numbers shown on Drawings.

F. Indicate special utility and electrical characteristics, utility connection requirements, and location of utility outlets for service for functional equipment and appliances.

G. Equipment which is identified on Contract Documents with tag number or name shall be identified on Shop Drawing with same tag.

H. Schedule submittals to expedite Project. Coordinate submission of related items.

I. For each submittal for review, allow 15 days excluding delivery time to and from Contractor.

J. Identify variations from Contract Documents and product or system limitations which may be detrimental to successful performance of completed Work.

K. Final Shop Drawings shall be submitted in electronic format in addition to requirements below.
1. Submit electronic copy on CD, E-mail files, or post in FTP site Details to be provided after award.
2. Text documents shall be submitted in .pdf format.
3. Drawings shall be submitted in .pdf format.
4. Electronic submittal shall be suitable for reproduction in black and white.

L. Number required:
1. Submit number of opaque reproductions which Contractor, Owner and/or approving agency (ies) requires.
2. Submit 2 opaque reproductions of each Shop Drawing.
3. Copies of Shop Drawings submitted shall be black line on white background.
4. Reviewer will reproduce additional copies of Shop Drawings as required for internal distribution.
5. Shop Drawings shall be suitable for reproduction in black and white. Shop Drawings submitted which are not suitable for reproduction will not be reviewed.
6. Samples: Submit number stated in each Specification section.
7. Drawings larger than 8-1/2" x 11" shall be rolled.

M. Submittals shall contain:
1. Date of submission and dates of any previous submissions.
2. Project title and number.
3. Contract identification.
4. Names of:
   a. Contractor.
   b. Supplier.
   c. Manufacturer.
5. Identification of product, with Specification section number and article number.
6. Field dimensions, clearly identified as such.
7. Relation to adjacent or critical features of Work or materials.
8. Applicable standards, such as ASTM or Federal Specification numbers.
9. Identification of deviations from Contract Documents.
10. Identification of revisions on resubmittals.
11. An 8" x 3" blank space for Contractor and reviewer stamps.
12. Indication of Contractor's approval, initialed or signed, with wording substantially as follows:

    "Contractor represents to Owner that Contractor has either determined and verified all quantities, dimensions, field construction criteria, materials, catalog numbers, and similar data, or assumes full responsibility for doing so and has reviewed or coordinated each submittal with requirements of Work and Contract Documents."

13. If Contract Documents include performance specifications stating required results which can be verified as meeting stipulated criteria, so that further design by Contractor prior to fabrication is necessary, Submittal depicting such design must be prepared under seal of professional engineer registered in the Dominican Republic and submittal shall be signed and sealed in accordance with applicable regulations and with following certification statement:

    "I hereby certify that this engineering document was prepared by me or under my direct personal supervision, that I am a duly registered professional engineer under the laws of the Dominican Republic and I accept responsibility for adequacy of this document to meet criteria stipulated in Contract Documents."

N. Product Data:
   1. Mark each copy to identify applicable products, models, options, and other data. Supplement manufacturers' standard data to provide information specific to this Project.
   2. Indicate product utility and electrical characteristics, utility connection requirements, and location of utility outlets for service for functional equipment and appliances.

O. Design data:
   1. Submit to Owner.
   2. Submit for information for limited purpose of assessing conformance with information given and design concept expressed in Contract Documents.

P. Data sheets:
   1. Data sheets may require information not known until Contractor's engineering is complete. Furnish estimated values based on good engineering judgment. Estimated values shall be identified by placement of "(est.)" next to value.
   2. Data Sheets shall be updated and resubmitted by Contractor once final values are known.
   3. Do not leave items blank or labeled "To Be Determined" or "Later."
   4. Do not submit manufacturer Product Data instead of completed data sheets.

Q. Test reports:
   1. Submit to Owner.
   2. Submit test reports for information for limited purpose of assessing conformance with information given and design concept expressed in Contract Documents.

R. Certificates:
   1. When specified, submit certification by manufacturer, installation/application subcontractor.
   2. Indicate material or product conforms to or exceeds specified requirements. Submit supporting reference data, affidavits, and certifications as appropriate.
   3. Certificates may be recent or previous test results on material or product, but must be acceptable to reviewer.

S. Other submittals as specified.

1.05 RESUBMISSION REQUIREMENTS

A. Make any corrections or changes in submittals required by Owner and resubmit until stamped as either "Reviewed," "Reviewed as Noted," or "For Information Only."

B. Text and depictions changed on Submittal shall be back-circled (clouded).

C. Owner will assume that portions of Submittal not back-circled have not been changed by Contractor from previous submission.

D. Indicate revision number and date in document revision block.

1.06 DISTRIBUTION

A. Distribute reproductions of Shop Drawings which carry Owner stamp as either "Reviewed" or "Reviewed as Noted" to:
   1. Job site file.
   2. Record Documents file.
   3. Other affected contractors.
   4. Subcontractors.
   5. Supplier or fabricator.

B. Distribute Samples which carry Owner stamp as either "Reviewed" or "Reviewed as Noted" as directed by Owner.

1.07 CONSTRUCTION PROGRESS DOCUMENTATION

A. Construction progress schedules:
   1. Submit initial schedules to within 15 days after date established in Notice to Proceed. After review, resubmit required revised data within ten days.
   2. Submit revised Progress Schedules with each Application for Payment.
      a. Distribute copies of reviewed schedules to Project site file, subcontractors, suppliers, and other concerned parties.
      b. Instruct recipients to promptly report, in writing, problems anticipated by projections indicated in schedules.

B. Form of schedules:
   1. Prepare schedules in form of horizontal bar chart.
      a. Provide separate horizontal bar for each trade or operation.
      b. Horizontal time scale: Identify first work day of each week.
      c. Scale and spacing: To allow space for notations and future revisions.
      d. Sheet size: 11" x 17".

C. Prepare construction progress schedules weekly.

D. Construction progress schedule shall show:
   1. Complete sequence of construction by activity, with Contract Price breakdown at each stage.
   2. Dates for beginning, and completion of, each major element of construction specifically listing:
      a. Site clearing.
      b. Site utilities.
      c. Foundation Work.
      d. Structural framing.
      e. Subcontractor Work.
      f. Equipment installations.
      g. Cleaning and finishing.
      h. Testing and commissioning activities.
   3. Projected percentage of completion for each item, as of first day of each month.

E. Submittal schedule shall show dates for Contractor's submittals.

F. Products delivery schedule: Show delivery dates.

G. Provide subschedules to define critical portions of prime schedules.

H. Progress revisions:
   1. Indicate progress of each activity to date of submission.
   2. Show changes occurring since previous submission of schedule:
      a. Major changes in scope of the Work.
      b. Activities modified since previous submission.
      c. Revised projections of progress and completion.
      d. Other identifiable changes.
   3. Provide narrative report as needed to define:
      a. Problem areas, anticipated delays, and impact on schedule.
      b. Corrective action recommended, and its effect.
      c. Effect of changes on schedules of other prime contractors.

I. Distribution copies of reviewed schedules to:
   1. Job site file.
   2. Subcontractors.
   3. Other concerned parties.

J. Instruct recipients to report promptly to Contractor, in writing, any problems anticipated by projects shown in schedules.

1.08 SAFETY PROCEDURES MANUAL

A. Prepare and submit to Owner safety procedures manual defining Contractor's safety program for work on site. Manual shall include:
   1. Safety responsibilities of Contractor's personnel.
   2. Description of Contractor's safety program.
   3. Requirements of use of personal protective equipment.
   4. General safety-related rules of conduct.
   5. Fire prevention measures.
   6. Accident reporting procedures.
   7. Procedures for hot work (welding, cutting, etc.), overhead work, and work in enclosed, confined spaces (tank, boiler, etc.).

PART 2 PRODUCTS

NOT USED

PART 3 EXECUTION

NOT USED

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Operation and maintenance (O&M) work to operate, maintain, and repair plant facility including:
1. Labor
2. Equipment
3. Materials
4. Consumables
5. Furnishings
6. Supplies
7. Chemicals
8. Tools
9. Transportation
10. Management
11. Coordination
12. Supervision
13. Security
14. Engineering

B. O&M work includes activities associated with facility, on site, furnished or installed by Contractor.

1.02 WORK BY OTHERS

A. Owner will enter in to contracts for, and will pay for, supply of coal, fuel oil, and lime. Contractor shall manage and coordinate coal, fuel oil, and lime contracts as needed to maintain agreed-upon inventories on site. Contractor shall be responsible for demurrage charges for any delay in unloading fuel or lime attributable to Contractor.

B. Owner will purchase major capital spare parts identified and priced by Contractor in proposal. All other spare parts shall be provided by Contractor.

1.03 DURATION OF SERVICES

A. Contractor shall provide O&M services prior to date of Commercial Operation and for a period of five years following Commercial Operation.

B. O&M services may be extended beyond five years if Contract extension is mutually agreed to between Contractor and Owner.

1.04 GENERAL REQUIREMENTS

A. Contractor shall operate and maintain the facility in accordance with applicable laws and regulations, permits, Contract requirements, equipment manufacturers' instructions and recommendations, industry standards and codes, and prudent industry practices.

B. Contractor shall operate and maintain the facility such that all warranties remain in full force and effect.

C. Contractor shall maintain the facility in the same condition as existed at date of Commercial Operation with punch list items corrected, less allowances for normal ageing, wear, and tear.

D. Contractor may, at Contractor's expense, install capital improvements for the benefit of Contractor. Such capital improvements are subject to approval by Owner and shall generally be of similar construction to original plant construction. Capital improvements will be property of Owner.

E. Capital improvements necessitated by a change in laws, regulations, or other causes beyond Contractor's control, shall be the responsibility of the Owner. Contractor shall identify and notify Owner in a timely manner of any such capital improvements required.

F. Inventories of spare parts, consumables, supplies, chemicals, tools, equipment, and furnishings shall be established, maintained, and replenished by Contractor. Spare parts, consumables, supplies, chemicals, tools, equipment, and furnishings, including inventory replenishments, shall become property of Owner at the end of the Contract.

G. Contractor shall provide and maintain office space with furnishings and supplies, for two Owner representatives to be permanently assigned to the facility. Owner's representatives shall have free access to facility and O&M records.

H. At any time, Owner may inspect the facility and O&M records and develop a deficiency list. Contractor shall correct each deficiency in a reasonable time.

1.05 EQUIVALENT AVAILABILITY FACTOR GUARANTEE

A. Contractor shall propose an Equivalent Availability Factor (EAF) guarantee for each period of the O&M contract.

B. EAF Guarantee shall be based on the following conditions:
1. Units will be base-loaded with no outages of power generation other than for planned or forced maintenance.
2. Contractor shall define planned outages proposed by period.
3. EAF definition shall be as specified in Technical Evaluation Criteria document. See IEEE 762.
4. Partial or forced outages due to causes outside of the plant (transmission and distribution, dispatch, fuel supply, lime supply, force majeure, etc.) will count as available.

1.06 RESPONSIBILITIES OF CONTRACTOR

A. Contractor shall provide resources as required to operate, maintain, and repair facility.
1. Management:
a. Manage total work effort to assure fully adequate and timely completion of O&M work, including planning, scheduling, cost accounting, report preparation, establishing and maintaining records and inventories, and quality control.
b. Provide an adequate staff of qualified and trained personnel with the necessary management, operations, and maintenance expertise to assure the performance of the work in accordance with sound and efficient management, operations, and maintenance practices.
c. Provide staffing and management plan including authorities, responsibilities, and qualifications for each position, and reporting structure for each position.
d. Establish initial and refresher training program as required for management, operations, and maintenance personnel. Maintain and submit records of training.
e. Implement necessary work control procedures to ensure timely accomplishment of work requirements, as well as to permit tracking of work in progress. The Contractor is responsible for planning and scheduling work to assure material, labor, and equipment are available to complete work requirements within the specified time limits and in conformance with the quality standards established herein.
f. Schedule and arrange work to cause the least interference with the normal dispatching of the plant. In those cases where some interference may be unavoidable, the Contractor shall make every effort to coordinate with Owner's dispatch and minimize the impact of the interference.
g. Maintain management, operation, and maintenance records (print and electronic copies) including complete record versions of documentation on plant (drawings, manuals, specifications, databases, etc.). Provide electronic copies to Owner upon request.
h. Prepare and submit management, operation, and maintenance reports as set forth in Table 1.
i. Establish, maintain, and replenish recommended inventories of spare parts, consumables, supplies, chemicals, tools, equipment, and furnishings required for timely O&M activities.
j. Provide site and facility security including procedures, provisions, and security staffing to control access to the site, control access to sensitive areas within the site, and control access to systems (control systems, information systems, etc.) to maintain secure facility and prevent losses.

k. Assist Owner in obtaining and maintaining permits, licenses, easements, rights-of-way, authorizations, contracts, etc. that must be issued in Owner's name and are required to construct, operate, or maintain the facility.
l. Obtain and maintain permits, licenses, easements, rights-of-way, authorizations, contracts, etc. that may be issued in Contractor's name and are required to construct, operate, or maintain the facility.

2. Operations:
   a. Operation of the facility includes the start-up and shutdown of equipment, operator maintenance and inspection, and the efficient, economical, and reliable production of electricity to assure its availability at the lowest practical cost. This work also includes record keeping of operations and conditions, analysis of records to correct non-optimal practices, water treatment, monitoring warranties, testing operations and capabilities of the plant, periodic operation and inspection of idle equipment, purchasing of supplies other than fuel and lime, managing and coordinating the fuel and lime contracts, and cleaning, preservation, lubrication, and adjustment of plant equipment.
   b. Contractor shall maintain complete control of the plant operation by preparation and adherence to written operating procedures.
   c. The operating procedures shall be prepared by the Contractor in accordance with the following, in order of precedence:
      1) applicable laws and regulations,
      2) permits,
      3) Contract requirements,
      4) equipment manufacturer's instructions and recommendations,
      5) industry standards and codes,
      6) prudent industry practices.
   d. As a minimum the procedures shall include:
      1) Plant and systems operating instructions including a detailed description of the observations and adjustments to be made, the minimum frequency of the observations and adjustments.
      2) Plant system startup, normal shutdown, and emergency shutdown procedures.
      3) Operator responses to alarms and trips.
      4) Troubleshooting procedures.
      5) Plant equipment operating schedule.
      6) Water treatment plan.
      7) Emergency procedures.
      8) Safety/accident procedures.
      9) Equipment layup procedures.
   e. Procedures shall identify responsible operator (Control Room Operator, Auxiliary Operator, Coal Yard Operator, etc.) for each activity or evolution.
   f. Procedures shall be submitted to Owner for approval. Contractor shall update and revise plant operation and maintenance procedures on a continuing basis as required by physical or operational changes.
   g. Results: Plant personnel shall routinely analyze operation of each unit and track key performance indicators. Deviations from predicted or expected performance shall be reported to Owner. Corrective operations and maintenance activities shall be identified and implemented to restore units to performance as existed at Commercial Operation less allowances for normal ageing, wear, and tear. Normal ageing, wear, and tear shall not include degradation due to improper operations, operation outside of recommended water or steam chemistry limits, operation outside of normal conditions (such as temperature, pressure, level, voltage, speed, vibration), or other operation outside those allowed by design, written operating procedures, and manufacturer's instructions and recommendations.
3. Maintenance:
   a. Maintenance of the plant shall include normal maintenance, preventive maintenance, major maintenance, normal repairs, and major repairs as required, and as recommended by equipment manufacturers, to provide efficient, economical, and reliable production of electricity to assure its availability at the lowest practical cost.
   b. Contractor shall utilize a computerized maintenance management system (MAXIMO, or equal, asset management system) to plan, manage, track, record, and report maintenance activities, and to maintain accurate records on facility assets.
      1) System shall be a database driven system, containing records for every tagged device, instrument, hanger, valve, piece of equipment, line, circuit, etc. included in the facility.

2) System shall include an activity description, reason for the activity, lubricants, consumables, spare parts, outside services, internal resources, and schedule for each planned and unplanned maintenance activity.
3) Significant repairs and major maintenance conditions shall be documented with photographs depicting as-found, and as-left conditions, along with reports from internal or outside service organization. Results of root-cause investigations shall also be included.
4) Inspections and tests, such as oil sampling, bearing temperature checks, vibration readings, instrument calibration, etc. shall be scheduled and results recorded in the system.
5) Contractor shall maintain database in a current and accurate state at all times.

c. Instruments, meters, and gages shall be calibrated biannually or more frequently if recommended by manufacturer or regulations, or if instrument, meter, or gage is used for custody transfer.

d. Specialized outside service organizations or manufacturer's service organization shall be contracted for any service requiring expertise, qualifications, or resources beyond those possessed by Contractor. Other outside services may be contracted by Contractor at Contractor's discretion.

e. Contractor shall maintain facility clean and free from trash and debris.
1) Employ sufficient and special personnel to clean work areas each working day to keep the entire site clean, including sweeping floors, collecting and disposing of trash, and other functions required to keep the site clean.
2) Store materials and supplies in designated locations in a controlled and organized manner.
3) Contractor is responsible for all wastes generated on site unless otherwise provided by law. Collect, sort, and dispose of trash, debris, and waste materials and remove from site in a safe and legal manner.
4) Remove accumulations of dust, scraps, waste, oil, grease, weld spatter, insulation, paint, and other foreign substances. Surfaces damaged by deposits of insulation, concrete, paint, weld metal, or other adhering materials shall be restored by Contractor at Contractor's sole cost.
5) Holes, ruts, settlements, and depressions resulting from the Contractor's Work or use of areas shall be filled and graded to match elevations of adjacent surfaces, and all areas disturbed by the Work shall be restored to a condition acceptable to the Owner, in its reasonable discretion.

1.07 SUBMITTALS

A. Contractor shall submit reports, drawings, and other documents which are needed to operate and maintain the facility, to report on facility operation and maintenance, and to demonstrate contract compliance as indicated in Table 1.

B. Format, content, and submittal schedule (normally monthly) of reports shall be subject to review and approval by Owner. Other submittals shall be resubmitted each time they are updated or revised by Contractor. Contractor shall issue all documents to Owner by transmittal. Contractor shall submit reports to permit authorities as required by permits.

PART 2 PRODUCTS

NOT USED

PART 3 EXECUTION

NOT USED

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Design, furnish, and install formwork with shoring, bracing and anchorage for cast-in-place concrete.

1.02 QUALITY ASSURANCE

A. Design, construct, and erect concrete forms in accordance with applicable provisions of ACI 117, 301, and 347 except as specified hereinafter. Permissive language in reference standards shall be considered as mandatory except where quality of work would be diminished.

B. Allowable tolerances: Construct and maintain forms to produce concrete dimensions not to exceed tolerances specified under ACI 117.

PART 2 PRODUCTS

2.01 DESIGN REQUIREMENTS

A. Form all concrete unless permitted otherwise.

B. Contractor, at its option, may use either wood or removable metal forms except as otherwise specified or shown.

2.02 WOOD FORMS

A. Unexposed surfaces: Standard grade or better.

B. Exposed surfaces: Douglas fir, exterior type, concrete form plywood, 5/8" (15 mm) thick minimum, conforming to DOC PS 1, Grade B-B, Class I or II.

2.03 REMOVABLE METAL FORMS

A. Surfaces equal to Douglas fir, exterior type, concrete form plywood.

2.04 FIBER TUBE FORMS

A. Type: 1-piece, cylindrical fiber reinforced forms.

2.05 PAN-FORM UNITS

A. Factory-fabricate units of approximate sections shown for 1-way or 2-way joist and slab construction. Provide closure units as required.

B. Units shall consist of steel or molded fiberglass concrete form pans.

2.06 FORM TIES

A. Type leaving no metal within 1" (25 mm) of finished surface after removal of forms.

B. Form ties left in walls of water tanks, basins or other containment systems shall have waterstop washers and shall be fitted with removable cone on each side of wall to form 1" (25 mm) diameter by 1" (25 mm) deep recess for patching mortar.

2.07 FORM COATING

A. Wood forms: Nonstaining mineral oil or commercially produced form-release agent that will not bond with, stain, or adversely affect concrete surfaces and curing, and will not impair bond or adhesion of subsequent treatment of concrete surfaces.

B. Metal forms: Treat surfaces as recommended by manufacturer before placing reinforcing.

C. Fiber tube forms and form liners: Treat surfaces as specified for wood forms or as recommended by manufacturer.

PART 3 EXECUTION

3.01 INSPECTION

A. Verify accurate conformance to required lines, levels, and measurements.

B. Ensure form ties, wales, bracing, and anchorages are properly placed and constructed.

C. Ensure proper bracing and reinforcement at points of application of construction loads, concrete dump points and temporary nonuniform load applications.

3.02 FORM CONSTRUCTION

A. Forms shall be strong, straight, adequately braced and securely fastened. Fit and secure to preceding work to assure completed surface free from irregularities and offsets.

B. Finish, other formed concrete surfaces: Class C.

C. Minimize form joints. Arrange exposed joints symmetrically and match architectural lines. Make joints tight to prevent mortar leakage.

D. Reuse form material only if clean and undamaged.

E. Forms for unexposed grade beams and foundations shall maintain minimum dimensions and ensure exclusion of foreign material from concrete. This formwork shall remain in-place when grade beam is placed below and monolithic with slab above.

F. Arrange and assemble formwork to permit dismantling, so that concrete is not damaged during its removal.

G. Arrange forms to allow stripping without removal of principal shores, where required to remain in-place.

H. Provide bracing to ensure stability of formwork. Strengthen formwork at points of application of construction loads.

I. Support form facing materials with structural members spaced sufficiently close to limit deflection to allowables.
   1. Fit forms placed in successive units for continuous surfaces to obtain accurate alignment, flush joints and within allowable tolerances.
   2. Provide camber in formwork as required for anticipated deflections due to weight and pressures of fresh concrete and construction loads for long span form members.

J. Corner treatment:
   1. Form exposed corners to produce smooth, solid, unbroken lines, except as otherwise shown.

2. Provide 1" (25 mm) chamfer at exposed external corners and edges; accurately form and surface to produce uniformly straight lines and tight edge joints. Extend terminal edges to required limit and miter chamfer strips at changes in direction.
3. Concealed corners may be formed square.

K. Provide openings and recesses required for Work under this contract. Provide openings and recesses required by others at no additional cost to Owner if so instructed before placing concrete.

L. Provide temporary ports in formwork to facilitate cleaning and inspection. Locate openings at bottom of forms to allow flushing water to drain. Close ports with tight fitting panels, flush with inside face of forms, neatly fitted so that joints will not be apparent in exposed concrete surfaces.

M. Retighten forms immediately before concrete placement as required to eliminate concrete paste leaks.

N. Set forms and screeds for floors and slabs to provide uniform slope to drains and positive drainage of exterior slabs and steps.

3.03 APPLICATION OF FORM COATING

A. Apply form coating on formwork in accordance with manufacturer's instructions. Apply prior to placing reinforcing steel, anchoring devices, and embedded items.

B. Do not apply form coating where concrete surfaces are scheduled to receive special finishes or applied coverings which may be affected by agent.

C. Forms to be left in-place may be soaked with clean water instead of coating immediately before placing of concrete, except that in cold weather with probable freezing temperatures, coating shall be mandatory.

D. Surplus coating on form surfaces and coating on reinforcing steel and construction joints shall be removed prior to placing concrete.

3.04 CLEANING

A. Clean forms to remove foreign matter as erection proceeds.

B. Ensure that water and debris drain to exterior through clean-out ports.

3.05 FORM REMOVAL

A. Minimum time before removal after placing concrete, unless permitted otherwise:
1. Footings: 24 hours.
2. Walls, piers, and column: 48 hours (24 hours for metal-lined forms).
3. Self-supported beams and slabs: 14 days.
4. Time specified above represents cumulative time during which temperature of concrete is maintained above 50°F (10°C) and for concrete without set-controlling admixtures.

B. In any event, do not remove supporting forms and shoring until concrete has acquired sufficient strength to safely support own weight plus construction loads. Concrete strength shall be demonstrated by job cured concrete specimens provided in addition to those required for concrete control. Remove specimen from molds within 24 hours and provide same cure as in-place concrete. Test one specimen for each 400 sq ft (37 sq m) of surface area prior to removal of forms for slabs.

C. Take care when removing forms that concrete is not marred or gouged and corners are true, sharp and unbroken. Cut back tie wires and nails in exposed concrete surfaces at least 1" (25 mm). Remove rod and cone ties and separators or similar devices and pull inward away from finished surfaces.

D. Reshoring and backshoring: Conform to requirements of Section 2, ACI 301.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Reinforcing steel for concrete and masonry.

B. Supports and ties for reinforcement.

1.02 INFORMATIONAL SUBMITTALS

A. Quality assurance data:
1. Tests or certificates of compliance for each 25 tons (23000 kg) of each bar size of reinforcing steel supplied under each material specified.
2. Mill test reports on reinforcing requiring welding.

1.03 QUALITY ASSURANCE

A. Regulatory requirements:
1. Perform concrete reinforcement work in accordance with CRSI Manual of Standard Practice, and CRSI Placing Reinforcing Bars.
2. Conform to ACI 117, 301 and 315.

PART 2 PRODUCTS

2.01 MATERIALS

A. Bars: ASTM A615/A615M, Grade 60 (420) deformed bars, except use ASTM A706 deformed bars where required by ACI.

B. Epoxy-coated bars: ASTM A775/A775M or ASTM A934/A934M, Grade 60, deformed epoxy-coated bars. Use where deemed necessary by Contractor.

C. Welded wire fabric: ASTM A185 plain wire in flat sheets.

D. Smooth dowel bars: ASTM A615/A615M Grade 60 (420) plain bars, ASTM A675 Grade 60 (415) or ASTM A499 Grade 60 (415).

E. Mechanical splices: Conform to ACI 318; develop strength of reinforcement without damaging concrete.

2.02 ACCESSORY MATERIALS

A. Tie wire: Minimum 16-gage (1.5 mm) annealed type or acceptable patented system. Use epoxy- or plastic-coated tie wire or nylon-coated tie wire for tying epoxy-coated bars.

B. Metal chairs, standees, bolsters, bar supports, spacers and braces: Sized and shaped for strength and support of reinforcement and construction loads during installation and placement of concrete. Provide load bearing pad on bottom to prevent vapor barrier puncture.

C. Locations where space between top and bottom layers of reinforcing steel exceeds 4' (1.2 m) and other locations where workers could enter below top reinforcing layer: Metal chairs, standees, bar supports and braces that support and laterally brace top layer of reinforcing steel shall be design by professional engineer retained by Contractor.

D. Metal chairs, bolsters, bar supports, spacers for concrete surfaces exposed to weather: Plastic-protected or stainless steel-protected type; sized and shaped for strength and support of reinforcement during installation and placement of concrete.

E. Metal chairs, bolsters, bar supports, spacers for epoxy-coated bars: Epoxy-, vinyl-, or plastic-protected type; sized and shaped for strength and support of reinforcement during installation and placement of concrete.

2.03 FABRICATION

A. Fabricate in accordance with ACI 117, 301, and 315, providing concrete cover specified in Section 03 30 00.

B. Locate reinforcing splices, not shown, at points of minimum stress. Indicate location of splices on Shop Drawings.

C. Weld reinforcing bars in accordance with AWS D1.4.

D. Mechanical splices where used shall be staggered at least 40 bar diameters with not more than 50% of splices in 1 plane.
   1. Mechanical splice may be used instead of lap splice and shall develop at least 125% of yield strength of bar in tension and shall develop ultimate strength of bar in compression.
   2. Mechanical splices shall not be introduced at bottoms of walls, corners of walls, top bars over supports of beams, bottom bars midway between supports of beams or other locations of high stress in bar. Where splice locations are desired where not shown, Contractor shall specifically request Engineer's review of splice type and location prior to fabrication of reinforcement.

PART 3 EXECUTION

3.01 INSTALLATION

A. Remove scale, loose flaky rust, dirt, grease, curing compound, and other coatings which would impair bond. Remove any salts or other contaminates that may cause corrosion of the steel.

B. Install slab reinforcing bars in correct position by use of preformed bolsters and spacers, except concrete blocks may be used to position bars in concrete placed on grade. Concrete blocks shall have compressive strength equal to that of surrounding concrete.

C. Space bars properly and tie securely in position before placing concrete. Wire tie ends shall face away from forms. Tack welding to keep reinforcing in place is not permitted.

D. Do not tack weld anchor bolts or other embeds to reinforcing bars.

E. Place safety caps on exposed ends of vertical bars that pose danger to life safety.

F. Lap welded wire fabric not less than 8" (200 mm).

G. Install dowels in slab-on-grade at locations shown and at right angles to joint being doweled. Accurately position and align dowels parallel to finished concrete surface and rigidly support during concrete placement.

H. Welding of reinforcing bars: Conform to AWS D1.4.

I. Do not displace or damage vapor barrier.

J. Exercise extreme care in storing, handling, transporting, and placing epoxy-coated bars to minimize damage to coating. Repair damaged coating with patching material conforming to ASTM A775 ASTM A934 and in accordance with material manufacturer's recommendations. If epoxy-coated bars are cut in field, coat bar ends with same patching material.

K. Exercise extreme caution in storing, handling, transporting, and placing epoxy-coated welded wire fabric to minimize damage to coating. Repair damaged coating with patching material conforming to ASTM A884 and in accordance with material manufacturer's recommendations.

3.02 TOLERANCES

A. Spacing between adjacent bars and distance between layers of bars shall not vary from position by more than tolerances specified in ACI 117.

B. Concrete cover shall comply with ACI. Allowable variation for minimum cover shall be as specified in ACI 117.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Cast-in-place concrete and miscellaneous materials for concrete structures and foundations, except not including marine concrete work.

1.02 INFORMATIONAL SUBMITTALS

A. Design drawings for reinforced concrete structures and foundations.

B. Product Data: List of admixtures, curing agents, surface finish materials, grout and other manufactured materials furnished. Furnish manufacturer's literature and written recommendations for products furnished as equal to that specified or to meet performance requirements.

C. Quality assurance data:
1. Proposed concrete design mixes with supporting data and test results, for each concrete class specified:
   a. Concrete design mix proportions.
   b. Supporting data and tests results:
      1) Compressive strength (individual and average test results, standard deviation, and required average strength).
      2) Slump range.
      3) Air content range.
      4) Water/cement ratio.
      5) Density.
      6) Fine and coarse aggregates.
2. Manufacturer's certificates of compliance with specified standards:
   a. Cement: From each car from which cement will be used.
   b. Fly ash: From each separate shipment from which fly ash is being used.
3. Testing laboratory reports:
   a. Submit reports immediately after conducting tests.
   b. Test reports shall contain following information:
      1) Testing agency.
      2) Project identification.
      3) Material tested and date of test.
      4) Material source or placement description, as applicable.
      5) Tests performed and referenced standard.
      6) Test results and referenced standard or specification criteria.
      7) Laboratory shall stamp each report or certificate stating whether or not test results indicate materials comply with specifications.
   c. Bind reports in one volume at end of Project and resubmit
4. Mass concrete thermal control plan: Submit plan minimum of 1 month before placing mass concrete. Plan shall be prepared, sealed, signed, and dated by a registered professional engineer retained by Contractor. Plan shall contain following information:
   a. Concrete mix design including information on thermal properties.
   b. Cooling requirements during concrete batching and placement.
   c. Location of placements.
   d. Placement temperatures.
   e. Thermal modeling with detailed description of methods used to calculate temperature differences.
   f. Methods for limiting maximum temperature.
   g. Methods of limiting maximum temperature difference between internal and surface areas.
   h. Temperature monitoring plan including type and location of temperature monitors.
   i. Corrective measures if temperatures, temperature differences or cracking occurs.

D. Submit product data and quality assurance data to Owner.

E. Concrete batch delivery tickets: Provide signed copy of ticket to Owner for each concrete load delivered and placed into Work. Delivery tickets shall include information required by ASTM C94. Submit following supplemental information with first delivery of day for of each class of concrete placed:
   1. Type and amount of admixtures (per CY).
   2. Maximum permissible amount of water that truck driver can add and comply with specified water/cement requirements (per CY).

1.03 ACTION SUBMITTALS

A. Samples of concrete aggregates for testing by Owner's testing laboratory. Contractor shall coordinate with testing laboratory to ensure sufficient quantities of material are provided for testing. Coordinate with testing laboratory to allow sufficient time for testing and submittal of test results prior to initial concrete placement.

1.04 QUALITY ASSURANCE

A. Perform Work in accordance with ACI 117 and 301.

B. Maintain copy of ACI 117, 301 and SP-15 in field office at all times.

C. Contractor shall retain services of qualified independent testing laboratory to perform following:
   1. Establish proposed concrete design mixture proportions on basis of either field experience (previously used and tested concrete mixture) and/or trial mixtures in accordance with ACI 318, Chapter 5, except specific requirements shall conform to requirement of these specifications.
   2. Prepare trial mixture batches (if applicable) and perform tests
   3. Determine and submit supporting data, standard deviation, trial batch tests, required average strength, proportions, air content, and slump range for each mixture.
   4. Provide reports to Owner giving information on materials, concrete design mixes and testing performed.

D. Owner will retain services of qualified independent testing laboratory to perform following tests:
   1. Obtaining, making and transporting field samples of aggregate, concrete, and grout for testing.
   2. Conducting tests on following materials as specified.
      a. Concrete strength tests.
      b. Concrete aggregate tests.
      c. Concrete slump tests.
      d. Concrete air content tests.
      e. Temperature tests.
      f. Grout strength tests.
      g. Sample concrete panel tests.
   3. Tests on in-place concrete or concrete cores to verify concrete strength where tests on concrete strength tests indicate insufficient strength. Costs for these tests shall be borne by Contractor.
   4. Furnishing and installing test equipment and monitoring and recording concrete temperature for mass concrete. Test reports shall show location of temperature sensors
   5. Providing test reports.

E. Concrete strength tests:
   1. Comply with ASTM C39/C39M for testing and ASTM C31 or C192/C192M for preparation of cylinders. Cylinders shall be 6" (150 mm) diameter x 12" (300 mm) length.
   2. Field strength tests: Sample in accordance with ASTM C172 on basis of not less than:
      a. One sample from each day's placement for each class of concrete,
      b. One sample from each 150 cu yd (120 cu m), or
      c. One sample for each 5,000 sq ft (460 sq m) of surface area for slabs or walls,
      d. For a given class of concrete, if frequency of testing specified above would provide less than 5 samples, sample at least 5 randomly selected batches or each batch if 5 batches or fewer are required.
   3. For each sample taken, make and test 3 laboratory cured cylinders.
   4. Test 1 laboratory cured cylinder at 7 days and other 2 at 28 days for average strength.

5. If tests indicate deficient strength as defined by ACI 318, Contractor shall immediately adjust mix to increase average of subsequent test results and, when directed, perform drilled core testing, ASTM C42/C42M, and/or load tests required to establish that load-carrying capacity of structure is not jeopardized. If concrete fails to meet structural design requirements, promptly remove and replace or reinforce as required to satisfy design requirements. Testing and remedial work shall be at no additional cost to Owner.

F. Aggregate tests:
1. Comply with ASTM C33 for grading, deleterious substances, abrasion and soundness.
2. Test for each size aggregate prior to commencing concrete placement and as follows:
a. Gradation: Each 200 tons (181 metric tons).
b. Deleterious substances, abrasion and soundness: Each change in source from which aggregate is taken.
c. Change in strata will be considered a change in source.

G. Slump tests:
1. Sample on basis specified above for field strength tests; Test each batch as delivered; comply with ASTM C172 and C143/C143M.
2. If slump does not meet Specifications, promptly remove batch from Work and dispose of off-site at location selected by Contractor. On-site disposal shall be in location and in manner agreeable to Owner. Do not add water in excess of maximum specified water-cement ratio to batch to achieve desired slump.

H. Air content tests:
1. Sample on basis specified above for field strength tests.
2. Obtain samples from concrete at point of discharge from chute or pumper hose.
3. Determine air content by pressure method; comply with ASTM C231.
4. If air content does not meet Specifications, remove deficient concrete from Work.

I. Temperature tests:
1. Sample on basis specified above for field strength tests.
2. Comply with ASTM C1064/C1064M.
3. If temperature does not meet Specifications, remove deficient concrete from Work.

J. Grout strength tests:
1. Comply with ASTM C39/C39M and C192/C142M for preparation of 2" (50 mm) round specimens.
2. Sample (2 cylinders from each sample) and test on basis of:
a. One sample taken and tested prior to placement for each type and strength of grout. (Not required for prepackaged grouts from manufacturer's plant continuously engaged in packaging grout mixtures.)
b. One sample for each day's placement for each type and strength or for each 3 cu ft (0.085 cu m) of grout placed whichever provides most number of samples.
3. Cylinders shall be laboratory cured.
4. Test 1 cylinder at 4 days and one cylinder at 14 days.

1.05 DELIVERY, STORAGE, AND HANDLING

A. Cement: Keep clean, dry, and free from weather damage.

B. Aggregates: Stockpile each gradation separately on clean, noncontaminating surface.

PART 2 PRODUCTS

2.01 CEMENT

A. Portland cement: ASTM C150, Type I, II or V.

B. Cement for mass concrete:

1. Concrete sections more than 3'-0 (900 mm) in least dimension are termed mass concrete and shall conform to special requirements specified herein.
2. Cement:
   a. Use ASTM C150, Type I, II or V.
   b. Do not use ASTM C150, Type III in any mass concrete.

C. Use cement types suitable for exposure category and class per ACI 318-08 Chapter 4 durability requirements.

2.02 AGGREGATE

A. Regular aggregate: Strong, durable, well-graded minerals conforming to ASTM C33 requirements for grading, deleterious substances, abrasion, and soundness.

B. Aggregates not conforming exactly to above specifications may be used provided:
1. Special tests or actual service establish that such aggregates will produce concrete of quality specified.
2. An Addendum to Specifications is issued prior to receipt of Bids; no deviations will be permitted after receipt of Bids.

C. Coarse aggregate nominal size:
1. 1-1/2" to No. 4 (38 mm to 4.75 mm): Use for all concrete unless specified otherwise.
2. 3/4" to No. 4 (19 mm to 4.75 mm): Use for slabs and thin sections and areas where clear spacing between reinforcing bars is less than 3" (75 mm).
3. 3/8" to No. 8 (9.5 mm to 4.75 mm): Use for wearing course.
4. 2" to No. 4 (50 mm to 4.75 mm): Use for mass concrete.

D. Coarse aggregate for mass concrete: Gravel, crushed gravel or crushed stone produced from limestone or granite rock.

2.03 WATER

A. Clean, fresh, free from injurious amounts of oil, alkali, acid, salts, organic materials, or other substances that may be deleterious to concrete or steel. Mix water shall comply with ASTM C1602.

2.04 ADMIXTURES

A. Water-reducing and set-controlling admixture, ASTM C494/C494M, type as required. Use for all concrete.

B. Air entraining agent: ASTM C260. Use in accordance with manufacturer's recommendations.

C. Fly ash:
1. Conform to ASTM C618
2. Fly ash for total Project shall be obtained from single source.
3. Design concrete mixes to include fly ash in amount of approximately 15% to 20% of cement by weight.
4. At Contractor's option, concrete mixes may be designed to include fly ash in amount of approximately 15% to 20% of cement by weight unless specified otherwise.
5. Design mass concrete mixes to include fly ash in amount of approximately 30% to 50% of cement by weight.

D. Calcium chloride or admixtures containing chloride other than from impurities in admixture ingredients shall not be used.

E. Admixture products selected by Contractor shall be compatible, and shall result in no adverse effects on concrete.

2.05 CONCRETE DESIGN AND USE

A. Each concrete design mix shall be established in strict accordance with ACI 318 by proportioning on basis of either field experience (previously used and tested concrete mixture) and/or trial mixtures. Comply with ACI 318 durability requirements.

B. Strength classifications:

Class	Specified Compressive Strength, f'c	Required Average Compressive Strength, f'cr
A	4,000 psi	5,200 psi
B	2,500 psi	3,500 psi
C	3,000 psi	3,900 psi

Class	Specified Compressive Strength, f'c	Required Average Compressive Strength, f'cr
A	28 Mpa	36.4 Mpa
B	17.5 Mpa	24.5 Mpa
C	20.7 MPa	26.9 Mpa

C. Required average compressive strengths:
1. Produce concrete of average strengths noted above unless test results substantiate lower permissible average strength based on standard deviation criteria set forth in ACI 318.
2. For mass concrete, use value specified under "Mass Concrete".
3. Strengths listed above are 7-day strengths for concrete using high-early-strength cement and 28-day strengths for concrete using other type of cements except mass concrete. Use 90 day strength for mass concrete.

D. Concrete use:
1. Class A: Use for all concrete, unless specified otherwise.
2. Class B: use for fill concrete and thrust blocks.
3. Class C: Use for mass concrete.

E. Minimum cement content for floor slabs: 5.5 sacks of cement per cubic yard (307 kg of cement per cubic meter) of concrete.

F. Maximum water-cement ratio: 0.48 for Class A and C; 0.48 for Class B; by weight. Where pozzolan fly ash is used, water-cement plus pozzolan ratio shall not exceed specified ratio.

G. Air entrainment: Air entrained concrete shall contain entrained air within following limits.

Nominal Maximum Aggregate Size, in.	Total Air Content, Percent By Volume	
	Exposure Class F1	Exposure Classes F2 and F3
3/8	6	7.5
1/2	5.5	7
3/4	5	6
1	4.5	6
1-1/2	4.5	5.5
2	4	5
3	3.5	4.5

Nominal Maximum Aggregate Size, mm	Total Air Content, Percent By Volume	
	Exposure Class F1	Exposure Classes F2 and F3
9.5	6	7.5
13	5.5	7
19	5	6

25	4.5	6
38	4.5	5.5
51	4	5
76	3.5	4.5

H. Workability:
1. Proportions of concrete shall produce a mixture, suited to placement methods, which will work readily into corners and angles of forms and around reinforcement and embedded items. Segregation of materials or presence of free water will not be permitted.
2. Slump of concrete: Use minimum practical; vary within limits given to suit placement conditions; in no case is slump to be increased by addition of water in excess of design mix quantity:

Type of Construction	Slump, in.	
	Minimum	Maximum
All concrete unless noted otherwise	2	5
Building columns	3	5
Mass concrete	1	3

Type of Construction	Slump, mm	
	Minimum	Maximum
All concrete unless noted otherwise	50	127
Building columns	75	127
Mass concrete	25	75

3. Maximum slumps listed are without a high range water-reducing agent. Maximum slump with high-range, water-reducing agent shall not exceed 8" (200 mm).
4. Use of high-range, water-reducing agent for other concrete is at Contractor's option.

I. Water-soluble chloride ion content, maximum: Exposure Categories C0, C1, and C2 shall comply with requirements of Chapter 4 of ACI 318.

J. Concrete subject to Exposure Class F3: Comply with requirements for maximum percent of total cementitious materials by weight as provided in Chapter 4 of ACI 318.

2.06 MASS CONCRETE

A. Concrete sections more than 3'-0" in (900 mm) least dimension are termed mass concrete and shall conform to special requirements specified herein.

B. Admixtures:
1. Use fly ash and water-reducing and set-controlling material as specified in this Section.
2. Do not use accelerators.

C. Proportioning: Use least amount of cement that will produce average strength 1.30 times standard deviation above specified compressive strength. Use standard deviation of 600 psi (4.2 Mpa) until sufficient tests are run to adjust mix to actual standard deviation. (average strength = specified compressive strength + (1.30 x 600) (1.3 x 4.2 MPa).)

D. Concrete batch temperature:
1. Concrete batch temperature at time of placement shall not exceed 90°F (21°C). Concrete with batch temperature higher than this value will be rejected.
2. Use crushed ice, chilled water, cooling of ingredients or other means as necessary to not exceed applicable maximum concrete batch temperature.

2.07 MEASURING

A. Ingredients:
   1. Cement: By weight or bag.
   2. Aggregate: By weight.
   3. Water: By weight or volume.

B. Equipment: Must provide easy, accurate control, and easy checking.

2.08 MIXING

A. Mixer: Mechanical batch type; minimum capacity, 1/2 cu yd (0.4 cu m).

B. Minimum time: One minute after ingredients are in mixer for mixer up to 1 cu yd (0.8 cu m) capacity; increase 15 seconds for each additional 1/2 cu yd (0.4 cu m) capacity. Mix until mass is homogeneous and uniform in color.

C. Mixing equipment shall be clean before using.

2.09 READY-MIX CONCRETE

A. May be used if concrete provided meets requirements of concrete specified and if concrete is furnished by an established, approved plant. Ready-mix plant equipment and facilities shall be certified in accordance with NRMCA QC 3.

B. Equipment and methods: ASTM C94/C94M.

2.10 VAPOR BARRIER

A. Type: Polyethylene film, clear: In accordance with ASTM E1745.

B. Thickness: Minimum 10 mils (0.25 mm).

C. Use for beneath slabs on grade with floor covering.

2.11 EXPANSION AND ISOLATION JOINT MATERIALS

A. Expansion joint filler: Preformed nonextruding and resilient nonbituminous type, ASTM D1752, Type I.

2.12 JOINT SEALANTS

A. Vertical expansion joints: ASTM C920, Type M, Grade NS, Class 25.

B. Horizontal expansion and isolation joints: ASTM C920, Type M, Grade P, Class 25.
   1. Provide bond breaker polyethylene tape between sealant and filler where backing rod is not used.
   2. Provide primer as recommended by manufacturer.
   3. Use for expansion joints and other locations shown.

2.13 WATERSTOPS

A. Material:
   1. Waterstops not exposed to chemicals: Polyvinyl chloride: Conform to COE Spec. CRD-C-572.
   2. Waterstops exposed to chemicals: Suitable for exposure conditions, and highly resistant to anticipated chemical exposure.

B. Shop-fabricate intersection and change-of-direction waterstops.

2.14 BENTONITE WATERSEALS

A. Size: 1" x 3/4" (25 mm x 19 mm).

B. Use: Where head of water is less than 10'. Waterseals not permitted as substitute for PVC waterstops specified and shown.

C. Material: not less than 75% sodium bentonite.

D. Curing and sealing compound:
1. Initial curing and sealing application: ASTM C309, Type 1, Class A or B.
2. Intermediate and final sealing application: ASTM C309, Type 1, Class A.

2.15 CURING MATERIALS

A. Liquid membrane-forming compound:
1. ASTM C309, Type 1, VOC compliant with local and state regulations with fugitive dye, except Type 2 with white pigment for surfaces exposed to direct rays of sun.
2. Do not use compounds containing wax, oil, resin, varnish, or other bases that will prevent bonding of finishes such as floor coverings, tile, chemical hardeners, paint, and similar applied finishes.
3. Use for curing at Contractor's option except where other products are specified for particular application.
4. Not permitted on concrete surfaces receiving additional concrete or separate wearing course.

B. Plastic film:
1. Polyethylene plastic film, white, nonstaining, conforming to ASTM D2103.
2. Minimum 4-mil (0.10 mm) thickness.
3. Use for curing at Contractor's option except where other products are specified for particular application.

C. Absorptive mat:
1. Cotton fabric, burlap fabric, or burlap-polyethylene material woven or bonded to prevent separation.
2. Material shall be clean and nondetrimental to concrete or finish.
3. Use for curing at Contractor's option except where other products are specified for particular application.

2.16 GROUT

A. Type: Nonshrink.

B. Flowable nonmetallic, and free of chloride, gypsum or corrosive-type materials: ASTM C1107, Grade C; formulation suitable for application.

C. Minimum strength: 6,000 psi at 28 days.

D. Use for grouting beneath baseplates, bearing plates, equipment bases, and where shown.

2.17 ADHESIVE ANCHORED REINFORCING STEEL

A. Material:
1. Reinforcing steel: ASTM A615, Grade 60, deformed bars.
2. Adhesive system: ASTM C881, Type IV.

B. Use: For anchoring reinforcing bars into existing concrete.

2.18 BONDING AGENTS

A. Type: Latex. ASTM C1059.
   1. Type I (redispersable), except Type 1 is not permitted in exterior and underground applications where subject to submersion, or frequent or occasional wetting.
   2. Type II (nonredispersable).

B. Use to bond freshly mixed concrete to hardened concrete, coat concrete construction joints.

PART 3 EXECUTION

3.01 INSPECTION

A. Verify reinforcement, anchorages, plates, edge materials, inserts, waterstops, and other items to be cast in concrete are properly placed and secured.

B. Verify openings, recesses, and similar variations to concrete shape are formed and secured.

C. Verify concrete may be placed without resulting in voids and honeycomb areas. Make provisions for release of trapped air.

D. Verify forms are securely braced and tied.

E. Verify elevations and dimensions are accurate.

3.02 PREPARATION

A. Install vapor barrier under ground floor slabs where required to prevent vapor transmission. Lap and tape seams per manufacturer's recommendations.

B. Remove laitance from previously placed or existing concrete. Thoroughly clean surface and apply bonding agent before placing additional concrete.

C. Clean reinforcing steel and other embedded items.

D. Provide for transport and placement of materials.

E. Provide for adequate means and equipment to consolidate concrete. Standby vibrators or other consolidation equipment shall be on-site in case of equipment malfunction.

F. Dampen subgrades and forms.

G. Thaw subgrade, forms, and embedded items.

3.03 PLACING CONCRETE

A. Clean transporting equipment, reinforcing, and embedded items before placing concrete. Remove water and debris from places to be occupied by concrete.

B. Place no concrete until forms, reinforcing, and embedded items have been verified as adequately supported and accurately placed and reinforcing steel placement has been checked by Contractor and reviewed by Owner's Representative. Place no concrete over water-covered, muddy, or frozen soil.

C. Immediately prior to placing concrete for walls where water tightness is essential, place minimum 2" (50 mm) depth of cement-sand paste in bottom of wall forms. 28-day compressive strength of paste shall equal that of wall concrete.

D. Where conditions make placement or consolidation difficult or where reinforcement is congested, batches of mortar containing same proportions of cement, sand, and water as used in concrete shall be deposited in forms around congestion immediately prior to concrete placement to avoid segregation-induced "honeycomb."

E. Immediately remove concrete where water, soils, or other deleterious substances are permitted to mix with concrete; form or embedded item movement occurs; or inadequate consolidation is obtained.

F. Hot weather concreting:
   1. Applies to concrete when:
      a. Combination of concrete temperature, air temperature, direct sunlight, humidity, and wind velocity indicate a rate of evaporation of 0.2 lb/sq ft/hr (1.0 kg/m ^{2}/hr) or greater. Provide equipment at site for measuring evaporation rate.
      b. Concrete temperature requires an increase in water demand beyond maximum water/cementitious materials ratio to provide workability throughout placement and finishing process.
   2. Conform to ACI 305R recommendations and requirements in addition to requirements of Contract Documents.
   3. Control concrete temperature at time of placing by cooling of ingredients and/or use of crushed ice.
   4. Keep subgrade continuously wet for 24 hours prior to concrete placement.
   5. Cool concrete handling equipment, forms and embedded items to below 90°F (32°C) using fog spray and shading as required.
   6. Provide wind breaks to protect from moisture evaporation, when necessary.
   7. Schedule placements during cooler part of day or after dark for slabs or other locations having large exposed surfaces.

G. Employ best industry practices to prevent segregation during placing. Do not drop concrete more than 5' (1500 mm). Use elephant trunk, tremied, or pumped concrete to provide proper placement. Place in layers approximately 18" (450 mm) deep.

H. Place concrete continuously in each section until completed. Permit not more than 30 minutes between depositing adjacent layers of concrete within each section, unless an acceptable set retarder is used in concrete mix.

I. Thoroughly compact, puddle, and vibrate concrete into corners and around reinforcing and embedded items. Use internal vibration where size of section permits.

J. Maintain concrete placing temperature between 50°F (11°C) and 90°F (32°C) except as specified for hot weather concreting and mass concrete.

K. Place sections of concrete in sequence which eliminates shrinkage effects to greatest extent practicable.

L. If concrete is to be placed by pumping, submit details of placement for review.

M. Immediately following both placement and form removal, thoroughly clean up concrete spatter, leakage, and spills.

N. Paint steel surfaces where existing coatings are damaged by placement or cleanup operations.

O. Saw joints immediately after concrete has set sufficiently to allow sawing, foot and equipment traffic without damaging concrete surface. Perform work during nonregular working hours, if required, to comply with above specified timing.

P. Allow initial shrinkage of concrete to take place (ideally 90-120 days) before applying sealant to control joints.

Q. Protect concrete from injury due to sun, cold weather, running water, construction operations, and other causes until properly cured.

3.04 MASS CONCRETE

A. Conform to requirements of ACI 207R.

B. Use minimum slump practicable within limits specified.

C. Concrete temperature control: To dissipate heat from mass concrete at a controlled rate:
1. Insulate exposed surfaces of mass concrete as necessary to prevent differential between maximum temperature of interior of concrete and surface temperature of concrete from exceeding 35°F (19°C).
2. R-value and type of insulating material at Contractor's option.
3. Interior concrete temperature shall be determined from embedded thermocouples installed by testing laboratory. Concrete surface temperature shall be determined by surface-mounted thermometers. Devices shall be continuously electronically monitored and recorded. . Interior concrete temperature shall be determined from embedded temperature sensors installed by testing laboratory. Minimum of 2 interior sensors shall be installed in location of maximum anticipated concrete temperatures. Concrete surface temperature shall be determined by surface-mounted sensors except where forms are present, embedded sensors shall be used and installed at inside face of forms. Minimum of 2 surface mounted sensors shall be installed directly above or beside interior sensors. Temperature sensors shall be continuously electronically monitored and recorded. Testing laboratory shall be responsible for operation and recording of data and location of temperature devices
4. If it appears that measured temperature difference may exceeded specified temperature difference limit, an additional layer of surface insulation shall be installed.

D. When Weather Service projected maximum ambient temperature exceeds 90°F (32°C), schedule placement of after 5:00 p.m.

E. Curing:
1. Type: Plastic film or liquid membrane-forming compound. Water curing not permitted.
2. Minimum curing period 7 days.
3. At conclusion of curing period, rate of temperature drop at surface of concrete shall not exceed 20°F (11°C) in 24 hours.

3.05 PUMPED CONCRETE

A. Conform to ACI 304R and 304.2R recommendations and requirements.

B. Aluminum materials shall not be used in contact with fresh concrete.

C. Provide design mix specifically suited to pumping.

D. Provide backup for each component of system.

E. Provide special mix or mortar to lubricate transport line at beginning of each placement.

F. Provide for transport line cooling when ambient temperature exceeds 85°F (29°C) and heating when ambient temperature is less than 32°F (0°C).

3.06 CONSTRUCTION JOINTS

A. Install where required by ACI.

B. Provide keyway 1-1/2" (38 mm) deep covering approximately 1/3 area of construction joint, unless shown otherwise.

C. Install waterstop where shown or specified.

D. Location where not shown:
   1. Locate joints using following guide for Owner's review.
   2. Near center of self-supported slabs, beams, and girders unless beam intersects girder at this point, in which case joints in girders shall be offset a distance equal to twice beam width.
   3. Underside of deepest beam at walls and piers.
   4. At other places least likely to impair strength and appearance.
   5. Provide additional shear reinforcement where requested by Owner.

E. A delay, until concrete is no longer plastic, shall occur after placing concrete for columns or walls before placing concrete for slabs, beams, or girders supported thereon.

F. Place beams, girders, brackets, column capitals, and haunches monolithically with floor system.

G. Slabs-on-grade: Place concrete in continuous side-by-side strips with at least 48 hours curing time before placing concrete in adjoining units. Small slab areas less than 35' (11 m) in greatest dimension may be placed in a checkerboard pattern.

3.07 EXPANSION JOINTS

A. Formed joints: Make exposed edge of concrete slightly rounded with edger at joints to contain joint sealant.

B. Covered joints: Install cover anchorage in form prior to placing concrete, protect joint, and after construction activity which would damage cover are complete, clean out joint and install cover.

C. Install materials in accordance with manufacturers' instructions. Set preformed material securely in place before placing concrete.

D. Install joint filler at correct depth below concrete surface to allow space for backing rod, if required, and sealant at exposed surface, if required. Fill remainder of joint with joint sealant.

3.08 EMBEDDED ITEMS

A. Install items required under this contract to be embedded in concrete. Install items required by others for embedding in concrete, if so instructed before placing concrete.

B. Fasten embedded items securely in proper position before placing concrete.

C. Pipe through walls: Keyed blockout permitted instead of placing pipe or fitting in pour. Grout pipe or fitting in place with nonshrink grout.

D. Pipe through walls: Keyed blockout not permitted instead of placing pipe or fitting in pour.

E. Before placing concrete, pipe sleeves around anchor bolts shall be free of water and temporarily plugged by welding metal cap over top of pipe sleeve. Calk junction of metal cap and anchor bolt with sealant. Temporary cap shall be completely airtight. Remove metal cap after danger of water entering sleeve and freezing is past or immediately prior to installation of material utilizing anchor bolt.

F. Turbine-generator unit and diesel-generator unit anchor bolts and sleeves: use rigid steel templates to hold tops of bolts and sleeves; weld lower portion of bolts to auxiliary steel bars, tying system of bolts to each other and to framework.

G. Conduit or pipe embedded in slabs or walls:
   1. Material: Uncoated or galvanized steel or iron clean and free from rust; minimum thickness equal to standard weight pipe unless specified otherwise.
   2. Size: 1/3 wall or slab thickness maximum outside diameter.

3. Locate in center of slab or wall and space not closer than 3 diameters on center; locate to avoid impairing strength of concrete.
4. Coordinate placing of reinforcing with conduit or pipe location. Do not cut reinforcing to clear conduit or pipe.

H. Aluminum pipe shall not be embedded in concrete. Where aluminum projects into or rests against surface of concrete, coat surfaces of aluminum to prevent direct contact with concrete.

3.09 WATERSTOPS

A. Hold securely in proper position by tying with wire, clamping between members, or other method to prevent waterstop from being moved out of position or bent over due to placement of concrete.

B. Join ends by heat-sealing in accordance with manufacturer's recommendations.

3.10 BENTONITE WATERSEALS

A. Clean joint surfaces to remove dirt, oil, grease, wax, and loose concrete and laitance.

B. Grout irregular surfaces to fill honeycomb or spalled areas.

C. Remove water and allow concrete to become surface dry.

D. Apply waterseal directly to joint using primer or cut nails as required to securely adhere material to concrete surface.

E. Butt ends together at ends of coils and at intersections to keep continuous. Do not overlap material.

F. Waterseal contacted by water prior to placing concrete shall be removed and replaced with new waterseal if there is any evidence of swelling of material.

3.11 GROUTING

A. Prior to placement of equipment or steel to be grouted, roughen concrete surfaces by light chipping to remove laitance to approximately 1/4" (6 mm). Do not expose reinforcing steel.

B. Remove foreign materials and prepare surfaces in strict conformance to manufacturer's instructions. Ensure grout pockets and keyways are free from foreign substances and water.

C. Soak concrete contact areas with water for 24 hours.

D. To facilitate cleanup, mask adjacent surfaces of equipment and concrete with masking tape or paste wax.

E. Flowable grout:
1. Provide formwork for all grout.
   a. Formwork and area within formwork shall be liquid tight.
   b. Adequate space shall be provided between formwork and edge of base on all sides to permit pouring and observation of grout.
   c. Top of formwork shall be located to allow placement of grout to a level of at least 1/4" (6 mm) above bottom of base,
   d. Provide minimum 3/4" (19 mm) chamfer at corners of grout permanently exposed to view or tool edge of grout providing sloped surface from edge of base to top of concrete, either as recommended by grout manufacturer.
2. Mix, place, and cure grout in strict accordance to manufacturer's instructions and as specified for concrete for cementitious grouts. Space below base shall be completely filled with grout. Air and water pockets shall be eliminated to create solid grout mass without voids.
3. Minimum thickness: 2" (50 mm) unless specified otherwise.

4. Install epoxy grout when ambient temperature is within limits recommended by manufacturer and provide shade from summer sunlight.
5. Remove shims after grout is placed. Fill shim voids with grout.

F. Dry pack grout:
1. Soak contact areas with water for 24 hours prior to grouting.
2. Thoroughly mix grout with sufficient water to keep mixture below bleed point.
3. Hand place and thoroughly compact by hand ramming and tamping into entire void and beneath bearing plates.

3.12 ADHESIVE ANCHORED REINFORCING STEEL

A. Install in strict accordance with manufacturer's directions.

B. Perform work using manufacturer's standard equipment including adhesive cartridges, dispensing guns, mixer tubes and extensions, brush, and air nozzle for compressed air cleaning of holes. Contractor shall have all equipment at site prior to start of installation and workers shall demonstrate knowledge of procedure for epoxy grouting reinforcing steel prior to installation.

C. Where holes are within 6" (150 mm) of edge of concrete, core-drill holes.

D. Inspect concrete at location of installation of reinforcing steel for soundness. Immediately report to Owner's Representative cracked concrete conditions or evidence of deteriorated or weak concrete detected from drilling operation or from inspection. If detected, obtain directive from Contractor's engineer and perform required repairs or replacement.

3.13 FINISHING

A. Flatwork:
1. Tamp concrete to force coarse aggregate down from surface.
2. Screed with straightedge, eliminate high and low places, bring surface to required finish elevations; slope uniformly to drains.
3. Dusting of surface with dry cement or sand during finishing processes not permitted.
4. Apply hardeners, curing and sealing compounds, nonslip surfacing, and similar materials in accordance with manufacturer's instructions during or after finishing.
5. Finish surfaces within following tolerances in accordance with ACI 117:
   a. Plant and office floor slabs: Flat: 3/16" in 10'.
   b. Sidewalks and warehouse floor slabs: Straightedged: 5/16" in 10'.
   c. Top surfaces of structures other than slabs: In accordance with ACI 117.
6. Trowel finish:
   a. Float surface to true, even plane.
   b. Steel trowel to smooth, uniform finish, free of defects; steel trowel second time to final burnish finish; use edger on exposed edges.
   c. Use on floor slabs.
7. Float finish:
   a. Float surface to true, even plane.
   b. Float second time to uniform finish with wood or cork float; use edger on exposed edges.
   c. Use on equipment foundations and tops of structure foundations.
8. Roughened finish:
   a. Float surface to true, even plane.
   b. Roughen surface with rake or stiff broom to minimum depth of 1/4" (6 mm).
   c. Use on construction joints.
9. Broomed or belted finish:
   a. Float surface to true, even plane.
   b. Steel trowel to smooth, uniform surface.
   c. Broom with fiber brush or drag burlap belt across surface in direction transverse to traffic flow.
   d. Use on sidewalks, paving, and exterior slabs at door entrances.

B. Formed surfaces:
   1. Remove fins, projections, and loose material.
   2. Clean surfaces of form oil.
   3. Patch honeycomb, aggregate pockets, voids, and holes as follows:
      a. Chip out until sound concrete is exposed to minimum depth of 1" (25 mm).
      b. Prepare patching mortar with approximately 2 parts normal portland cement, one part white cement, 9 parts fine aggregate; vary proportions of cement as necessary to match color of adjacent concrete.
      c. Saturate surfaces with water and fill cavities with patching mortar.
   4. Fill holes left by form ties with patching mortar.
   5. Cure patches as specified for concrete.
   6. Grout-cleaned finish:
      a. Apply to surface within 180 hours after placing concrete.
      b. Prepare grout of 2 parts normal portland cement, 1 part white cement, 4-1/2 parts fine aggregate mixed with water to consistency of thick paint.
      c. Wet surfaces and rub grout on surfaces using rubber or cork float so that small voids and imperfections are filled.
      d. Allow surfaces to dry for approximately 1 hour, scrape off excess grout with trowel; rub surfaces with burlap sacks.
      e. Keep surfaces continuously damp for 24 hours.
      f. Use on exposed concrete surfaces at office and plant entrance areas.

3.14 CURING

A. Cure concrete; begin curing as soon as possible after placement of concrete.

B. Use of liquid membrane-forming curing compound permitted for all concrete except where product would impair bond of other applied materials to surface, .

C. Plastic film curing:
   1. Dampen surface of concrete and lay plastic film with minimum 6" (150 mm) side laps and free of wrinkles; tape side laps.
   2. Hold film in place with lumber or use similar provisions to prevent exposure of concrete for 7 days after placing.
   3. Immediately repair tears in film.

D. Water curing:
   1. Keep concrete continuously wet for 7 days after placing.
   2. Use on concrete surfaces to receive separate wearing course, and on other concrete surfaces not receiving compound or plastic film curing.
   3. Clean, nonstaining absorptive mat may be used with water curing.
   4. Do not use for curing cold weather concrete.

E. Cure grout, wearing courses, and miscellaneous cementitious placements by one of specified methods.

3.15 CURING AND SEALING COMPOUND

A. Initial curing and sealing application shall be applied immediately after concrete has sufficiently set to allow application without damaging surface.

B. Second application shall be applied 28 days after slab is cast.

C. Final application shall be applied immediately before turning slab area over to Owner.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Design, furnish and install cast-in-place marine concrete work for pier structures and foundations, and concrete structures and foundations in tidal and splash zones, including but not limited to:
   1. Cast in place concrete as required to complete work.
   2. Shoring and temporary bracing for concrete work.
   3. Provide sleeves, dowels, bolts, bearing plates, anchor bolts, inserts, anchors, dovetail anchor slots, waterstops, fillers, joint materials and similar items as required.
   4. Provide supports for utilities.
   5. Cooperation with inspection agency for all required tests and inspections.

1.02 PRE-CONSTRUCTION CONFERENCE

A. At least 14 days prior to start of concrete construction, Contractor shall hold a meeting to review detailed requirements of concrete design mixes and to determine procedures for producing proper concrete construction.

B. Contractor shall require responsible representatives of every party who is concerned with concrete work to attend conference, including but not limited to following:
   1. Contractor's superintendent
   2. Laboratory responsible for concrete design mix
   3. Laboratory responsible for field quality control
   4. Concrete subcontractor
   5. Ready-mix concrete producers
   6. Admixture manufacturers
   7. Concrete pumping contractor
   8. Representative of other contracts
   9. Owner's Representative.

C. Minutes of meeting shall be recorded, typed, and printed by Contractor and distributed by him to all parties concerned within five days of meeting.

D. The minutes shall include a statement by admixture manufacturers indicating that proposed mix design and placing techniques can produce concrete quality required by this Specification.

E. Owner's Representative will be present at conference. The Contractor shall notify Owner's Representative or its representative at least two days prior to scheduled date of conference.

1.03 ACTION SUBMITTALS

A. Provide submittals in accordance with Section 01 83 10.

B. Details shall be carried out in accordance with Standard ACI rules, and as shown on Contract Drawings.

C. Shop Drawings:
   1. Submit shop drawings, showing reinforcement and all reinforcement bending diagrams and reinforcing steel lists including but not limited to all concrete pile caps, pile cap beams at sheet piling, fill/plugs for steel pipe piles, high level platform composite topping, and approach slabs.
   2. Dimensions, bar schedules and bending details shall be shown. Details shall be in accordance with ACI rules. Reinforcing for flat slabs shall have top steel and bottom steel on separate Drawings.
   3. Owner's Representative acceptance stamp on shop drawings shall not relieve Contractor of responsibility for any error or for furnishing material of proper size, quantity, or quality.

D. Concrete mix design: 40 days minimum prior to concrete placement, submit a mix design for each strength and type of concrete. Include a complete list of materials including type, brand, source and amount of cement, pozzolan, and admixtures; and applicable reference specifications.

E. Contractor shall submit mill test certificates for cement and for steel reinforcement.

F. Concrete aggregate samples.

G. Cement mill test certificates.

H. Product Data: Catalog sheets, specifications, and installation instructions for each manufactured product specified.

I. Location of conduit runs, pipes and any other inserts or openings in concrete elements.

J. Deviations: Should Contractor desire a deviation from Drawings or Specifications, or both, he shall call specific deviation to Owner's Representative attention in writing prior to submittal of shop drawings showing subject deviation. Requests for deviations shall be submitted on Contractor's letterhead. Deviations not identified, or identified only in letters of transmittal or in shop drawings or both, without required written description on Contractor's letterhead, may not be accepted and shall be sufficient cause for Owner's Representative to return each shop drawing including such deviations, rejected without further action. Acceptance of shop drawings including deviations not detected by Owner's Representative during shop drawing review shall not relieve Contractor from responsibility to conform strictly to Contract Documents. Deviations will be allowed only where permitted by Owner's Representative in writing.

1.04 QUALITY ASSURANCE

A. Regulatory requirements: Work shall be performed in accordance with all applicable codes and regulations having jurisdiction. Unless specifically specified otherwise herein, all work shall be performed in accordance with following codes, standards, and specifications, and such requirements shall be binding as if specified directly herein. Unless noted otherwise, only latest editions (at bid date) of following codes, standards, and specifications shall form part of this Specification to extent indicated by reference thereto:
   1. American Concrete Institute (ACI):
      a. ACI - 211.1 "Recommended Practice for Selecting Proportions for Normal, Heavyweight, and Mass Concrete."
      b. ACI - 214 "Evaluation of Results of Tests Used to Determine Strength of Concrete."
      c. ACI - 301 "Specifications for Structural Concrete for Buildings."
      d. ACI - 304 "Recommended Practice for Measuring, Mixing and Placing Concrete."
      e. ACI - 305 "Hot Weather Concreting."
      f. ACI - 309 "Consolidation of Concrete."
      g. ACI - 311 "Recommended Practice for Concrete Inspection."
      h. ACI - 315 "Details and Detailing Reinforced Concrete Construction."
      i. ACI - 318 "Building Code Requirements for Reinforced Concrete."
      j. ACI - 347 "Recommended Practice for Concrete Formwork."
      k. ACI – 357 "Guide for Design and Construction of Fixed Offshore Concrete Structures."
   2. Concrete Reinforcing Steel Institute (CRSI):
      a. CRSI - 63 "Recommended Practice for Placing Reinforcing Bars."
      b. CRSI - 65 "Recommended Practice for Placing Bar Supports, Specifications and Nomenclature."
   3. National Ready Mix Concrete Association (NRMCA) "Concrete Plant Standards" and "Truck Mixer and Agitator Standards."
   4. American Welding Society (AWS) D12.1 Recommended Practice for Welding Reinforcing Steel, Metal Inserts and Connections in Reinforced Concrete Construction."
   5. Wire Reinforcement Institute (WRI) "Manual of Standard Practice."
   6. American Society for Testing and Materials (ASTM):
      a. ASTM A185 "Standard Specification for Welded Steel Wire Fabric for Concrete Reinforcement."

b. ASTM A615 Standard Specification for Deformed and Plain Billet-Steel Bars for Concrete Reinforcement."
c. ASTM A706 Standard Specification for Low-Alloy Steel Deformed and Plain Bars for Concrete Reinforcement.
d. ASTM C31 "Standard Method of Making and Curing Concrete Test Specimens in Field."
e. ASTM C33 "Standard specification for Concrete Aggregate."
f. ASTM C39 "Standard Test Method for Compressive Strength of Cylindrical Concrete Specimens."
g. ASTM C42 "Standard Method of Obtaining and Testing Drilled Cores and Sawed Beams of Concrete."
h. ASTM C94 "Standard Specification for Ready-Mix Concrete."
i. ASTM C138 "Test for Unit Weight, Yield and Air Content (Gravimetric of Concrete."
j. ASTM C150 "Standard Specification for Portland Cement."
k. ASTM C172 "Standard Method of Sampling Fresh Concrete."
l. ASTM C192 "Standard Method of Making and Curing Concrete Test Specimens in Laboratory."
m. ASTM C231 "Test Method for Air Content of Freshly Mixed Concrete by Pressure Method."
n. ASTM C 309 Standard Specification for Liquid Membrane Forming Compounds for Curing Concrete
o. ASTM C330 "Standard Specification for Lightweight Aggregates for Structural Concrete."
p. ASTM C494 "Specification for Chemical Admixtures for Concrete."
q. ASTM C1218 "Standard Test Method for Water-Soluble Chloride in Mortar and Concrete".

B. Conflicts: Contractor shall conform to requirements of above standards unless specified otherwise herein below. In case of apparent conflict between standards or between standards and Specifications herein below, more restrictive requirement, shall apply.

C. Special corrosion inhibitor requirements:
1. Admixture company shall have a minimum of 5 years' experience utilizing their calcium nitrite corrosion inhibitor.
2. Minimum of 5 projects of similar size.
3. Contractor shall submit written certification prior to or with submission of concrete mix that "active corrosion shall be inhibited to 9.9 pounds of chlorides at reinforcement, per cubic yard of concrete".

PART 2 PRODUCTS

2.01 CONCRETE

A. ACI 318 and ACI 357for Contractor-furnished mix design.

B. The minimum compressive strength of concrete at 28 days shall be 5,000 psi, unless otherwise indicated.

C. Add air-entraining admixtures at mixer to produce between 5-1/2% and 7-1/2% air by volume.

D. Last admixture shall be calcium nitrite corrosion inhibitor added at mixer at rate of 3 gallons per cubic yard of concrete.

E. Maximum slump shall be determined during testing of proposed mix, based upon providing a maximum water/cement ratio of 0.4.

F. Aggregate shall be tested for moisture content prior to mixing each day's batch of concrete, and moisture content of aggregate shall be accounted for in determining water-cement ratio of concrete.

G. Slump may be increased to 7" when superplasticizers are used.

2.02 MATERIALS

A. Cement:
1. ASTM C 150, Type II, or ASTM C 595, Type IP(MS) or IS(<70 MS) blended cement, except as modified herein. The blended cement shall consist of a mixture of ASTM C 150 cement and one of following materials: ASTM C 618 pozzolan or fly ash, or ASTM C 989 ground iron blast furnace slag. The pozzolan or fly ash content shall not exceed 25% by weight of total cementitious material. The ground iron blast-furnace slag shall not exceed 50% by weight of total cementitious material. Use one manufacturer for cement, ground slag, fly ash, and pozzolan.
2. Fly ash and pozzolan: ASTM C 618, Type N, F, or C, except that maximum allowable loss on ignition shall be 6% for Type N and F. Add with cement.
3. Ground iron blast-furnace slag: ASTM C 989, Grade 120.
4. Cement in a container in which part of cement has become caked or has otherwise deteriorated, shall be entirely removed from site.
5. Cement shall be stored in waterproof sheds.
6. Owner's Representative reserves right to take samples for testing from any or every lot of cement delivered upon work. The tests shall be made as determined by Owner's Representative. The expense incurred in making tests shall be borne by Contractor when cement fails to meet Specification requirements, but shall be chargeable to cost of work when cement does meet Specification requirements.

B. Admixtures
1. Air entraining agent shall be in accordance with ASTM C260. The air entrainment may be checked as in accordance with ASTM C-260. Acceptable documentary evidence must be submitted with additives showing this material increases durability of concrete, and that such material has been in use for not less than 5 years. Air entrained cement is not permitted. All concrete shall have air entraining agent specified above.
2. Water reducing admixture: ASTM C 494, Type A.
3. Water reducing, retarding admixture: ASTM C 494, Type D.
4. High range water-reducing admixture (superplasticizer): ASTM C 494, Type F or G.
5. Noncorrosive, nonchloride accelerator: ASTM C 494, Type C or E. Admixture manufacturer shall have long-term noncorrosive test data from an independent testing laboratory (of at least a year's duration) using an acceptable accelerated corrosion test method such as that using electrical potential measures.
6. Corrosion inhibiting admixture shall contain 30 +/- 2% of calcium nitrite, ASTM C494, Type C.
7. Prohibited admixtures: Calcium chloride, thiocyanates or admixtures containing more than 0.05% chloride ions are not permitted.
8. Calcium chloride or admixtures containing chloride other than from impurities in admixture ingredients shall not be used.
9. Admixture products selected by Contractor shall be compatible, and shall result in no adverse effects on concrete.
10. Certification: Written conformance to above mentioned requirements and chloride ion content of admixture will be required from admixture manufacturer prior to mix design review by Owner's Representative.

C. Fine aggregate:
1. Fine aggregate shall consist of sand, stone screening, or other inert materials with similar characteristics, or a combination thereof, having clean, hard, strong, durable uncoated grains, and free from injurious amounts of dusts, lumps, soft or flaky particles, shale, alkali, organic matter, loam or other deleterious substances.
2. Sand shall meet following requirements:
   a. ASTM C33, except where specified more stringent below.
   b. Colorimetric test in accordance with ASTM Designation C40, current edition, color not darker than Figure 1.
   c. Sediment test for excess loam (5% limit).
   d. Sieve analysis:

Sieve No.	% Retained
4	0 to 5
8	10 to 20
16	20 to 40
30	40 to 70
50	70 to 88
100	92 to 98

e. Fineness modulus shall be from 2.30 to 2.90
f. No mica, pyrites, or other deleterious materials.
g. Mortar made with this sand must produce tensile strength at least equal to 80% of Ottawa Sand Mortar Briquettes, of proportion is of one part of cement to three parts of sand.

D. Coarse aggregate:
1. ASTM C33, except where specified more stringent below.
2. Coarse aggregate shall consist of crushed stone or gravel, having clean, hard, strong, durable, uncoated particles free from injurious amounts of soft, friable, thin elongated or laminated pieces, alkali, organic or other deleterious matter.
3. Particles shall be well graded between upper and lower limit in order that voids may be reduced to a minimum for mass concrete (not reinforced). The stone or gravel shall pass a 1.5" mesh ring and be retained on 0.25" ring. Stone or gravel shall be graded as follows:

Sieve Size	% Retained
1"	0
0.75"	0 - 10
0.375"	45 - 80
No. 4	95 – 100

4. Maximum size limit may be raised at option of Owner's Representative, whenever design permits good workmanship with a coarser aggregate.
5. Aggregate shall be stored on platforms or otherwise, as to avoid inclusion of foreign materials.

E. Water: Clean, fresh, free from injurious amounts of oil, alkali, acid, salts, organic materials, or other substances that may be deleterious to concrete or steel. Mix water shall comply with ASTM C1602.

F. Reinforcing steel: See Section 03 20 00.

G. Forms: See Section 03 10 00

2.03 MISCELLANEOUS MATERIALS

A. Clear curing and sealing compound (VOC compliant): 30% solids content minimum, and will not yellow under ultraviolet light after 500 hours of test in accordance with ASTM D4887. Material shall be compatible with concrete fill or surface finish as applicable.

B. Nonshrink grout: CRD-C-621-83, "Corps of Engineers Specification for Non-Shrink Grout," having a minimum compressive strength of 10,000 psi.

2.04 CORROSION PROTECTION AND DURABILITY

A. Maximum water soluble chloride ion concentration in hardened concrete at ages 28 to 42 days contributed from ingredients including water, aggregates, cementitious materials and admixtures shall not exceed 0.10% by weight of cement. Tests performed to determine water soluble chloride ion content shall conform to and ASTM C1218.

B. Concrete shall have a water-to-cementitious material ratio not exceeding 0.40.

C. Concrete shall have an air content of between 4-1/2% and 7-1/2%.

PART 3 EXECUTION

3.01 SITE CONDITIONS

A. Contractor shall keep himself constantly informed as to progress of work in field, and have its materials and men ready to start work immediately when conditions or work are available or ready, wholly or in part so as not to delay progress of work or to interfere with progress of other work, and in any event he shall proceed with such work as directed to maintain uninterrupted progress of work.

B. Contractor, before commencing work, shall examine all adjoining work on which this work is in any way dependent for proper installation and perfect workmanship according to extent of this Specification, and shall report to Owner's Representative any conditions which prevent Contractor from performing first-class work. No "waiver of responsibility" for defective adjoining work will be considered unless notice has been filed by Contractor and acceded to in writing by Owner's Representative before Contractor begins any part of this work.

C. Contractor shall retain a surveyor licensed in Dominican Republic to establish all lines and levels necessary to proper locating, laying out, and erecting its work.

3.02 MIXING

A. ASTM C 94. Mixing operations shall produce batch-to-batch uniformity of strength, consistency, and appearance. The calcium nitrite based corrosion inhibitor admixture shall be added at batch plant immediately after all other concrete admixtures have been incorporated into concrete mixture. The Contractor shall ensure compatibility of all admixtures used in concrete mix. The Contractor shall strictly adhere to manufacturers' recommendations regarding use of admixtures, including storage, transportation, and method of mixing.

B. Concrete shall be machine mixed.

C. Provide water gage to deliver exact predetermined quantity of water for each batch.

D. Employ reliable system to ensure that not less than pre-determined quantity of cement goes into each batch.

E. Time of mixing shall be not less than one minute with peripheral speed of drum of about 200 fpm for batches of 1 cubic yard. For larger batches, mixing shall be in accordance with ASTM requirements.

F. Re-tempering of partly set concrete not permitted.

3.03 TRANSIT MIX CONCRETE

A. Transit mix concrete may be used provided it conforms to Specifications and tests herein described, and ASTM C94, current edition, and further provided that central plant producing concrete and equipment transporting it are in opinion of Owner's Representative suitable for production and transportation of concrete.

B. Maximum elapsed time between time of introduction of water and placing shall be one hour.

C. Minimum time of mixing shall be one minute per cubic yard after all material, including water, has been placed in drum, and drum shall be reversed for an additional two minutes.

D. Mixing water shall be added only in presence of Owner's Representative.

E. Trucks shall not be overloaded in excess of rated capacity, as recommended by manufacturer.

3.04 PLACING OF CONCRETE

A. Forms must be absolutely clean before starting concreting.

B. Place concrete as soon as possible after mixing, and thoroughly spaded and rammed in place. All possible care is to be exercised to prevent honeycombing and segregation. Placing of a rich mix adjacent to forms will not be permitted.

C. Concrete shall be placed in one operation up to temporary bulkheads that will be located in general at points of minimum shear with approval of Owner's Representative. Locations of construction joints shall be approved by Owner's Representative. Where new concrete is to be bonded to existing concrete, surfaces of existing concrete shall be swept with a stiff brush or scraped to remove laitance and roughened. The bonding surface after removal of all loose particles shall be kept wet for an hour, and horizontal surfaces shall be covered with a thin layer of grout just before placing new concrete.

D. Concrete shall be placed with aid of a mechanical vibrator. Provide at least two operating vibrators at site prior to start of placing operation. The vibrators shall be of a type and design approved and shall be capable of transmitting to concrete not less than 8,000 vibrations per minute. The vibration shall be sufficiently intense to visibly affect concrete over a definite radius of at least two feet around point of application, but no applied long enough to segregate ingredients. Enough vibrators shall be used to cause all concrete to flow or settle readily into place. The vibrators shall be of internal type, applied directly to concrete and not through forms, except sections too thin to permit insertion of internal type in which case form vibrators may be employed at discretion of Owner's Representative.

E. Use and type of vibrators shall conform to ACI 309 "Recommended Practice for Consolidation of Concrete."

F. Concrete if placed in hot weather shall be wet twice daily for first week after placing. Maximum placing temperature is to be 90 degrees F.

G. No concrete shall be deposited in water or water softened ground.

3.05 PLACING CONCRETE UNDERWATER

A. Concrete deposited under water shall be carefully placed in a compacted mass in final position by means of a tremie or other approved means, and shall not be disturbed after being deposited. Special care must be exercised to maintain still water at point of deposit. Concrete shall not be poured in running water. Underwater formwork shall be watertight. The consistency of concrete shall be carefully regulated, and special care shall be exercised to prevent segregation of materials. The method of depositing concrete shall be regulated to produce approximately horizontal surfaces.

B. When a tremie is used, it shall consist of a tube having a diameter of not less than 10 in. and constructed in sections having flanged couplings fitted with gaskets. The tremie shall be supported to permit free movement of discharge and over entire top surface of work and shall permit rapid lowering when necessary to choke off or retard flow. The discharge end shall be entirely sealed at all times and tremie tube kept full to bottom of hopper. When a batch is dumped into hopper, tremie shall be slightly raised, but not out of concrete at bottom, until batch discharges to bottom of hopper. The flow shall then be stopped by lowering tremie. The flow shall be continuous until pour has been completed.

3.01 FORMS, CENTERING AND FORMWORK AFFECTING WORKMANSHIP

C. Forms shall be constructed to conform to shape, form, line and grade required, and shall be maintained sufficiently rigid to prevent deformation under load. Studs shall be spaced sufficiently close to prevent deflection of form, material, and consequent waviness in surface of concrete.

D. Wood forms for exposed concrete work shall not be reused more than five times, unless in opinion of Owner's Representative they may be in good condition to be reused more than this number of times. During progress of Work, Owner's Representative shall inspect exposed concrete work and direct Contractor as may be necessary as to quality, color, texture, pattern and general workmanship and reuse of formwork.

E. Joints shall be sufficiently tight to prevent leakage during placing, and shall be arranged vertically or horizontally to conform to pattern of design for exposed locations. Forms placed on successive units for continuous surfaces shall be fitted to accurate alignment to assure a smooth completed surface free from irregularities. In long spans, where intermediate supports are not possible, anticipated deflection in forms due to weight of fresh concrete shall be computed accurately and taken into account in design of forms so that finished concrete members will have true surfaces conforming accurately to design lines, planes and elevations. Temporary openings shall be arranged in forms as required to facilitate cleaning and inspection. Lumber once used in forms shall have nails withdrawn and surfaced exposed to concrete carefully cleaned before reuse. Forms shall be readily removable without hammering or prying against concrete.

F. Form ties shall be of suitable design and adequate strength for purpose. Bolts and rods that are to be withdrawn completely shall be coated with grease. In walls exposed to view, grout smooth all form tie holes.

G. Proper shoring shall be provided under forms for concrete work to support all construction loads. Do not strip pile cap forms sooner than seven days after they have been poured.

H. If any material is used to coat form work to facilitate removal, this material shall be of such a nature as not to stain or injure concrete or cause injury to painted finish to be applied on exposed surfaces of concrete.

I. Forms shall be thoroughly cleaned before reusing.

J. Wood form work shall be removed.

K. External and internal corners of slabs and other exposed external corners shall be beveled and chamfered by moldings in forms, unless Drawings specifically state that chamfering is to be omitted.

L. Sleeves for all pipe in concrete work, shall be provided and installed. Sleeves shall be of size and spacing required to receive standards and shall be set true, and properly stayed to prevent displacement during pouring of concrete. Where sleeves are not set true in proper locations, or are out of alignment, they shall be removed and properly replaced.

M. Place all embedded pipes and conduit in accordance with chapter 6 of ACI 318.

3.06 REDESIGN OF CONCRETE STRUCTURES

A. Should field conditions necessitate redesign of concrete work, Contractor shall not proceed until he has revised Drawings from Contractor's Engineer.

3.07 JOINTS AND EMBEDDED ITEMS

A. Locate construction joints and isolation joints as detailed at approved locations. Make construction joints with straight stops and continuous keys. Reinforcement shall be continuous through construction joints unless otherwise indicated.

B. Provide expansion and isolation joints as recommended by ACI.

C. Install embedded items accurately in position conforming to approved shop drawings.

3.08 GROUTING

A. Perform grouting operations using material as specified in Part 2 of this Section in strict accordance with manufacturer's recommendations.

3.09 SLAB SURFACE FINISH

A. Platform deck topping shall receive a broomed finish. Concrete coping top surface shall receive a wood float finish subject to approval of Owner's Representative.

3.10 CLEANING

A. All lumber, forms, metal work etc., shall be removed immediately after completing local areas. The Contractor shall be responsible for removal of all debris from site.

B. Immediately remove misapplied sealant and droppings from metal surfaces with solvents and wiping cloths. On other materials, remove misapplied sealant and droppings by methods and materials recommended in writing by manufacturer of sealant material.

3.11 CURING

A. Careful attention shall be given to curing of all concrete. A curing procedure plan shall be submitted and approved by Owner's Representative prior to placing any fresh concrete. Curing shall be performed in accordance with ACI 308 and requirements herein. Curing procedures shall commence immediately after fresh concrete has been placed.

B. Wet curing:
   1. Perform for all deck slabs and approach slabs.
   2. Immediately after finishing concrete, apply wet burlap, which has been presoaked for a minimum of 24 hours in potable water, such that no marring of surface occurs. The burlap shall be kept continuously moist, 24 hours per day, through use of fog spraying system or soaker hoses arranged at high points of concrete pour. Burlap shall consist of two or more layers, overlapped a minimum of 1', and have a length at least 1' greater than necessary to cover entire width and edge of newly cast concrete. Adequately weigh down burlap to prevent displacement.
   3. Wet curing procedures may only be stopped when placing concrete for slabs directly adjacent to fog spraying system or soaker hoses. Under these conditions, which allow wet curing procedures to stop, Contractor shall allow sufficient time to apply a liquid membrane forming curing compound, as described below. All standing water shall be removed in areas to receive fresh concrete prior to placement. Occasionally spray a fine mist of water over wet curing areas. Do not puddle water on surface of fresh concrete. When fresh concrete is finished and covered with burlap, reassemble continuous fog spraying system or soaker hoses and continue wet curing immediately.
   4. Provisions shall be made to contain water within area of work.
   5. Wet curing shall continue for 7 days, or until concrete attains 80% of specified design compressive strength, whichever period is less. The effectiveness of curing shall be determined from strength tests performed on sample cylinders cast in field and cured in same manner as concrete.
   6. Immediately after wet curing procedures are completed, apply a liquid membrane forming curing compound, as described below.

C. Liquid membrane forming curing compounds and sheet materials for curing:
   1. Immediately after placing or finishing, commence curing process of concrete not covered by forms from loss of moisture.
   2. Choice of curing method shall be approved by Owner's Representative. Curing compound shall conform to ASTM C 309, Type 2 Class B and shall be pigmented.
   3. Polyethylene film or burlap polyethylene sheet, if used, shall be lapped at edges and ends at least 1 foot and shall have all ends and edges taped to adjacent sheets or surfaces to completely seal

areas to be cured. Secure in a sufficient manner that will not allow film, sheets, or securing mechanism to be removed by wind forces, resulting in fresh concrete exposure without protection.

4. Before reusing any sheet material, it shall be inspected. All holes or tears shall be repaired with cemented patches and approved by Owner's Representative prior to any reuse.
5. Liquid membrane forming curing compound, if used, shall be applied by approved pressure spraying or distributing equipment in two uniform full applications, perpendicular to each other, as recommended by manufacturer. Allow first coat to become tacky before applying second coat. Each application shall be full quantity recommended by manufacturer.
   a. Recoat areas subject to heavy rainfall within 3 hours of such occurrence.
   b. Manufacturer's recommendations for agitation during application shall be followed. Liquid membrane forming curing compound shall not be used where surface being cured is to receive additional concrete.
   c. The Owner's Representative shall check for uniformity through random sampling and testing. Testing may include determination of membrane infrared spectrum, pH, specific gravity, and solids content.

3.12 TESTING OF CONCRETE MATERIALS

A. Sand shall be tested for requirements hereinafter specified.

B. Colorimetric (chloride ion) tests, sieve analysis, soundness, organic content, sediment tests, and comparative tensile tests shall be made at start of job. Additional tests may be required by Owner's Representative if concrete compression tests specified fall below required strength, or if source of material is changed. These additional tests (if required) shall be at Contractor's expense.

C. Coarse aggregate shall be tested for requirements herein specified. If, after approval, character of material changes, it shall be subject to further tests for approval or rejection.

D. If, after trial, it is found that partly developed quarries, ledges, pit banks or other sources of supply do not furnish a uniform product, or if for any reason product from any source, at any time, proves to be unsatisfactory to Owner's Representative, Contractor shall furnish acceptable material from other sources of supply, at no additional cost to Owner. Samples and tests shall be taken and made on each 200 tons of fine aggregate to be used in work, all in accordance with ASTM Standards herein specified, and before each allotment is used in work.

E. Owner will employ and pay for services of independent testing laboratory to perform specified testing.

F. Contractor shall furnish and deliver to Owner's testing laboratory adequate quantities of representational samples of materials proposed to be used and which require testing.

G. Concrete tests:
   1. Owner's Representative shall have right to order making of load tests, compression tests on specimens taken from concrete in place, and any other tests of concrete or any part thereof at any time during course of construction. If tests show that concrete tested is not in accordance with these Specifications, Owner's Representative may condemn such concrete and order replacement of same with new concrete to its satisfaction.
   2. Contractor shall be responsible for additional engineering fees on any additional work required when original field tests have failed. Contractor shall patch holes where specimens were extracted.

H. Inspection of concrete - test and supervision:
   1. Preliminary tests for purpose of determining concrete mixes, in accordance with ACI 318, and tests of cement and other concrete materials, shall be made at Contractor's independent laboratory accepted by Owner's Representative. Owner's testing agency inspector shall be present when preliminary tests are made. It shall be responsibility of Contractor to satisfy himself that concrete mixes, based on results of preliminary tests, will produce concrete strengths as required by Contract.
   2. Cement and other concrete materials will be given preliminary tests. Cement samples shall be of same brand, type, and source, and aggregate samples shall be of same source, grading, and

mineral composition as materials to be used in actual construction. Approval of concrete materials will be conditional on acceptable results of preliminary tests and approval of preliminary test results by approved laboratory.

3. From results of preliminary tests, a smooth curve shall be drawn through average positions of points plotted, using 28 day strengths of test cylinders as ordinates and corresponding water-cement ratios as abscissas. The maximum ratio of water to cement shall include at least four different water cement ratios and at least four specimens for each water-cement ratio. The water-cement ratio to be used shall correspond to a point on curve established by these tests representing a concrete strength 25% higher than minimum ultimate strengths. However, if producer demonstrates to satisfaction of Owner's Representative, on basis of job performance records of coefficient of variation, that quality of control exercised in producer's plant warrants a change in 25% factor, change may be permitted. In no case, however, shall concrete used in work be produced using a water-cement ratio in excess of, or a cement factor less than that corresponding to a point in strength vs. water-cement ratio curve representing a strength. The design slump shall be as determined during preliminary trial testing, and concrete shall be placed at a slump equal to or less than this slump. The weight of aggregate shall be such that quality and consistency of concrete shall be suitable for proper placing and required finishes. The concrete proportions used by Contractor shall be such that daily field cylinder tests made will show that all concrete used meets strength requirements of Contract.
4. The consistency of concrete shall be such that it can be placed without segregation of materials. Slumps of over 5 inches will not be permitted, unless accepted by Owner's Representative. Whenever it is indicated by inspection or tests that segregation has occurred to an extent that quality or strength of concrete has been impaired, mix shall be revised by decreasing water content or increasing cement content or both. Water reducing admixtures may be used.
5. A sieve analysis of each shipment of aggregate shall be made by laboratory on working day prior to its use. In lieu thereof, and subject to approval of Owner's Representative, each shipment shall be accompanied by sieve analysis data that will be subject to a check by Owner's Representative.
6. In event that grading of aggregate is sufficiently different from that used in preliminary tests to indicate that water must be added to design mix, to obtain proper plasticity, testing laboratory will determine from established water-cement ratio amount of cement required to be added, subject to approval of Owner's Representative.
7. Source of supply of aggregate shall not be changed during course of job without previous notice to Owner's Representative, and material from any new source shall be subject to acceptance or rejection by Owner's Representative based on tests to be made by Testing Laboratory at Contractor's expense.
8. Should more than one concrete mixing plant be used at same time for concrete inspection, Contractor will bear cost of additional plant inspection.
9. All tests shall be made in accordance with applicable provisions of Standard Specifications of American Society of Testing Materials. Costs of this inspection and tests will be borne by Contractor, unless otherwise stated herein. Plastic concrete, as delivered to site, shall be sampled and tested as indicated below and in paragraph titled "Evaluation and Acceptance of Concrete" of ACI 318. A minimum of four cylinders shall be made during each concreting cycle of same mix for every 50 CY of concrete or less per day, to verify 28-day strength. Statistical evaluation of compressive test results shall be in accordance with ACI 214.
   a. Slump: In accordance with ASTM C143. Shall be monitored at least once for every 50 CY of concrete, or more often if variations are observed. Slump shall be taken prior to addition of admixtures.
   b. Air Content: Tests shall be made at same time that specimens for compression tests are made. Tests shall be made in accordance with ASTM C173 or ASTM C231.
   c. Calcium Nitrite: Shall be monitored by utilizing Michigan Test Method, MTM 607-86 "Test Method for Quantity of Calcium Nitrite Corrosion Inhibitor in Plastic Concrete", at least once for every 50 CY of concrete, or more often if variations are observed. In addition, one half of compression test specimens shall be tested to verify quantity of calcium nitrite in hardened concrete utilizing North Carolina Test Method, #C-20.0 "Determination of Nitrite in Concrete."
10. If measured slump, calcium nitrate, or air content falls outside limits specified, a check test shall be made on same batch of concrete. In event of a second failure, load of concrete represented shall be rejected. The replacement of concrete rejected shall be at expense of Contractor.
11. Contractor shall engage services of a testing laboratory acceptable to Owner to provide following services in accordance with applicable provisions of ACI 318:
    a. Preliminary tests required for proposed concrete mix designs.

b. Inspect and test concrete materials during batching.
c. Inspect and test concrete delivered to site.
d. Submitting reports. File and obtain all necessary approvals of all other agencies having jurisdiction.

12. Owner's testing agency will perform following services:
    a. Field sampling and testing of concrete specimens.
    b. Testing of concrete aggregates.
    c. Plant inspection.
    d. Field inspection of concrete work.
    e. Submitting reports.
13. Testing laboratory shall make, transport, and test standard 6" diameter by 12" in height specimens. Four test specimens shall be made for each 50 cubic yards of concrete placed but not less than 3 cylinders for each day's pour.
    a. Test cylinders shall be clearly marked, and system of marking shall have definite sequence. In addition, one set of three cylinders per 150 cubic yards of concrete placed shall be taken directly from bucket or hopper and clearly identified. The test specimens shall be carefully stored and transported so as not to damage them in any way.
    b. Records shall be kept identifying each cylinder with locations of concrete from which test cylinders were taken. The method of making, storing and testing specimens shall be in accordance with procedures set forth in applicable provisions of Standard Specifications of American Society for Testing of Materials.
14. Grout shall be tested for compressive strength using 2" test cubes in accordance with ASTM C 108. Grout shall also be tested in accordance with ASTM C 1090 for shrinkage or expansion properties to comply with ASTM C 1107. Six cubes shall be tested for strength for each day of grouting. Four samples shall be tested for shrinkage properties on first and last day of grouting. Records shall be taken of location of grout with each day's grouted samples.
15. Contractor's testing laboratory shall provide a full time qualified Inspector at place of batching who will inspect concrete and materials for concrete. Testing Laboratory shall provide adequate equipment for determination of moisture content and gradation of fine and coarse aggregate. Adjustment shall be made in batch weights to compensate for variation in moisture content. The Inspector shall verify batch weights.
16. Contractor's testing laboratory shall provide a qualified Inspector at site to see that concrete is thoroughly mixed and properly placed. It shall be responsibility of Inspector to control consistency of mix in order that there will be no segregation due to excessive water. The Inspector shall also supervise for proper spading and vibration of concrete.
17. Testing laboratory shall submit reports to Owner's Representative. Five copies of all reports shall be submitted as tests are completed, and a weekly report of amount of concrete poured each day shall be submitted. The reports shall also include air temperatures.
18. Testing laboratory shall prepare concrete inspection reports listing cylinder test results as required by ACI 318. These records shall be sent to Owner's Representative for filing.
19. Testing laboratory shall immediately call to attention of Owner's Representative any discrepancies found in work.
20. Contractor shall furnish all materials to be tested and shall cooperate and provide every assistance to facilitate work of inspection and testing.
21. If results of these tests and inspections indicate that concrete does not meet requirements as set forth on Drawings or in these Specifications, or is otherwise unsatisfactory, Contractor shall proceed as directed by Owner's Representative. All additional costs resulting from re-testing, load testing, replacement of concrete and/or damage to work of other trades shall be borne by Contractor.
22. If, during progress of work, it is found that concrete of required workability and strength cannot be attained with materials furnished by Contractor, Owner's Representative may order such changes in proportions or materials, or both, as may be necessary to secure desired results or requires removal of unsatisfactory area(s).

23. Any changes so ordered will be at Contractor's expense, and no extra compensation will be allowed by reason of such change.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Design, furnish and install precast structural concrete units for pier.

B. At Contractor's option, certain concrete elements may be constructed of precast concrete or cast-in-place concrete as approved by Owner's Representative.

1.02 SUBMITTALS

A. Refer to and comply with Section 01 83 10.

B. Shop Drawings: Submit shop drawings for precast structural members including details of member geometry and details of reinforcing and embedments. Include complete information for fabrication, handling, and erection of precast concrete members. Design calculations and drawings of precast concrete members (including connections) shall be prepared and sealed by Contractor's registered professional Engineer, and submitted for approval prior to fabrication. The shop drawings shall indicate, as a minimum, following information:
1. Indicate different precast unit types.
2. Marking of members for erection.
3. Connections for work of other trades.
4. Connections between members, and connections between members and other construction.
5. Location and size of openings which cut prestressing strands, or require relocation of prestressing strands to be cast in member.
6. Location and size of drainage holes and other holes or slots in fabricated units.
7. Joints between members, and joints between members and other construction.
8. Reinforcing, including prestressing steel details.
9. Schedule and sequence of tensioning and detensioning prestressing strands.
10. Material properties of steel and concrete used.
11. Lifting and erection inserts.
12. Dimensions and surface finishes of each member.
13. Estimated camber, if any.
14. Erection sequence and handling requirements.
15. Handling loads used in design.
16. Bracing/shoring required.
17. Areas to receive toppings, topping thickness.

C. Quality control submittals:
1. Conform to requirements specified in Section 03 30 10 in addition to requirements of this Section.
2. Design data:
   a. Precast concrete member design calculations: Design calculations and drawings of precast members (including connections) shall be prepared and sealed by a Contractor's registered professional Engineer, and submitted to Owner. Submit calculations for volume change as part of design calculations.
   b. Concrete mix design data:
      1) Submit a mix design for each strength and type of concrete. Include a complete list of materials including type; brand; source and amount of cement, pozzolan, and admixtures; and applicable reference specifications.
      2) Submit copies of test reports showing that mix has been successfully tested to produce concrete with properties specified and will be suitable for job conditions. Obtain approval before concrete placement.
3. Test reports:
   a. Pozzolan test reports: Submit results of pozzolan tests performed within 6 months of submittal date.
   b. Concrete mix test reports as per Section 03 30 10.

D. Product Data and source quality control data:
   1. Submit concrete materials and ingredients related to products used in concrete mix design(s) and submittal requirements for test reports specified herein.
   2. Quality control procedures and other data as required in Section 03 30 10. Include submittal of quality control procedures established in accordance with PCI MNL-116.
   3. Submit concrete batch ticket information. Conform to ASTM C 94. Submit mandatory batch ticket information for each load of ready-mixed concrete.

1.03 QUALITY ASSURANCE

A. Precast concrete units shall be product of a manufacturer specializing in plant production of precast concrete structural and non-structural members of types indicated for project.

B. PCI quality certifications: ACI 318/318M and PCI MNL-120. Design precast concrete members for handling without cracking in accordance with PCI MNL-120.

C. Product quality control: PCI MNL-116 for PCI enrolled plants. Where panels are manufactured by specialists in plants not currently enrolled in PCI "Quality Control Program," provide a product quality control system in accordance with PCI MNL-116 and perform concrete and aggregate quality control testing using an approved, independent commercial testing laboratory. Submit test results to Owner.

D. Fabrication, sampling, and testing: PCI MNL-116, Section 03 30 10, and requirements specified herein, whichever has more stringent requirement for each respective test.

E. Regulatory requirements:
   1. American Concrete Institute International (ACI). In ACI publications, advisory provisions shall be considered to be mandatory, as though word "shall" has been substituted for "should" wherever it appears; reference to "Building Official," "Structural Engineer" and "Engineer" shall be interpreted to mean Engineer.
      a. ACI 304R: Measuring, Mixing, Transporting, and Placing Concrete
      b. ACI 305R: Hot Weather Concreting
      c. ACI 309R: Consolidation of Concrete
      d. ACI 318/318M: Building Code Requirements for Structural Concrete
      e. ACI 357: Fixed Offshore Concrete Structures.
   2. American Society for Testing and Materials (ASTM)
      a. ASTM A 82: Steel Wire, Plain, for Concrete Reinforcement
      b. ASTM A 185: Steel Welded Wire Fabric, Plain, for Concrete Reinforcement
      c. ASTM A 497: Steel Welded Wire Fabric, Deformed, for Concrete Reinforcement
      d. ASTM C 94: Ready-Mixed Concrete
      e. ASTM C 1107: Packaged Dry, Hydraulic-Cement Grout (Nonshrink)
   3. Precast/Prestressed Concrete Institute (PCI)
      a. PCI MNL-116: Quality Control for Plants and Production of Precast Prestressed Concrete Products
      b. PCI MNL-120: Design Handbook - Precast and Prestressed Concrete

1.04 DELIVERY, STORAGE, AND HANDLING

A. Lift and support precast concrete members at lifting and supporting points indicated on detail shop drawings.

B. Store precast concrete members off ground.

C. Separate stacked members by battens across full width of each bearing point.

D. Protect from weather, marring, damage, and overload.

PART 2 PRODUCTS

2.01 DESIGN AND PERFORMANCE REQUIREMENTS

A. Concrete mixture design: Prior to precasting of concrete units, submit concrete mix design(s) and proportions for a concrete mixture for each strength and type of concrete to be used in precast concrete work, as specified in Section 03 30 10 "Cast-In-Place Marine Concrete" in addition to requirements of this Section.

B. Design in accordance with ACI 318, ACI 357, UFC 4-152-01 and other standards referenced herein, whichever is more stringent.

2.02 CONCRETE

A. ACI 318 for Contractor-furnished mix design.

B. Minimum compressive strength of concrete at 28 days: 6,000 psi, unless otherwise indicated.

C. Maximum water/cement ratio shall be 0.4.

D. Add air-entraining admixtures at mixer to produce between 5% and 7% air by volume.

2.03 MATERIALS

A. Cement: Conform to requirements of Section 03 30 10.
   1. Fly ash and pozzolan: Conform to requirements of Section 03 30 10.
   2. Ground iron blast-furnace slag: Conform to requirements of Section 03 30 10.

B. Water: Conform to requirements of Section 03 30 10.

C. Aggregates: Conform to requirements of Section 03 30 10.

D. Maximum water soluble chloride ion concentration in hardened concrete at ages 28 to 42 days contributed from ingredients including water, aggregates, cementitious materials and admixtures shall not exceed 0.06% by weight of cement. Tests performed to determine water soluble chloride ion content shall conform to and ASTM C1218.

E. Setting bed grout:
   1. Cementitious grout consisting of a mixture of portland cement, sand, and water.
   2. Proportion one-part cement to approximately 2.5 parts sand, with amount of water based on placement method.
   3. Provide air entrainment.

F. Admixtures: Conform to requirements of Section 03 30 10.

G. Reinforcing bars: Conform to requirements of Section 03 20 00.

2.04 FABRICATION

A. Conform to PCI MNL-116, unless specified otherwise.

B. Forms: Brace forms to prevent deformation. Forms shall produce a smooth, dense surface. Chamfer exposed edges of columns and beams 3/4", unless otherwise indicated.

C. Reinforcement placement: Conform to ACI 318/318M for placement and splicing. Reinforcement may be preassembled before placement in forms. Provide exposed connecting bars, or other approved connection methods, between precast concrete and cast-in-place concrete or other construction. Remove any excess mortar that adheres to exposed connections.

D. Concrete:
   1. Concrete mixing: ASTM C 94. Mixing operations shall produce batch-to-batch uniformity of strength, consistency, and appearance.
   2. Concrete placing: ACI 304R, ACI 305R for hot weather concreting, and ACI 309R, unless otherwise specified.
   3. Concrete curing: Commence curing immediately following initial set and completion of surface finishing. Provide curing procedures to keep temperature of concrete between 50ºF and 190ºF. When accelerated curing is used, apply heat at controlled rate and uniformly along casting beds. Monitor temperatures at various points in a product line in different casts.

E. Surface finish: Repairs to honeycombed sections located in a bearing area shall be approved by Engineer prior to repairs. Members containing hairline cracks which are visible and are less than 0.02" in width may be accepted. However, members which contain cracks greater than 0.02" in width shall be repaired. Any member that is structurally impaired will be rejected.
   1. Unformed surfaces: Provide rake finish with a 1/4" amplitude for surfaces to receive cast-on-place concrete. Provide a steel troweled finish for surfaces to remain exposed in finished work.
   2. Formed surfaces: PCI MNL-116 (Appendix A - Commentary), Chapter 3, for grades of surface finishes.
      a. Unexposed surfaces: Standard grade surface finish.
      b. Exposed surfaces: Grade B surface finish.

2.05 STEEL RING PLATES

A. Exposed surfaces of ring plates shall be coated.

PART 3 EXECUTION

3.01 SURFACE REPAIR

A. Prior to erection, and again after installation, check members for damage, such as cracking, spalling, and honeycombing.

B. As directed by Engineer, members that do not meet "Surface Finish" requirements specified in Article "Fabrication" shall be repaired, or removed and replaced with new members.

3.02 ERECTION

A. Erect members after concrete has attained specified compressive strength, unless otherwise approved by member manufacturer.
   1. Erect in accordance with approved detailed shop drawings. Conform to PCI MNL-116 and PCI MNL-120 (Chapter 8) shall apply for tolerances. Provide a 1:500 tolerance, if no tolerance is specified.
   2. Brace members unless design calculations submitted with detail drawings indicate bracing is not required. Follow manufacturer's recommendations for maximum construction loads.
   3. Place members level, plumb, and square within tolerances. Align member ends.

3.03 BEARING SURFACES

A. Bearing surfaces shall be flat, free of irregularities, and properly sized. Size bearing surfaces to provide for indicated clearances between precast units and adjacent members or adjoining field placed surfaces.
   1. Correct bearing surface irregularities with nonshrink grout.
   2. Provide bearing pads where indicated or required.

3.04 WELDING

A. Do not weld reinforcing or prestressing strands. Protect concrete, reinforcing and prestressing strands from heat during welding of any adjacent structural steel components.

3.05 OPENINGS

A. Where openings in members are required, openings shall be formed into members before casting and reinforcing steel shall be detailed to avoid interference with opening.

B. Holes or cuts requiring reinforcing steel to be cut, which are not indicated on approved detail drawing, shall only be made with approval of member manufacturer.

C. Where approved, drill holes less than 12" in diameter with a diamond tipped core drill.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Structural materials.

B. Structural design requirements.

C. Structural fabrication and erection.

D. Shop painting.

E. Inspection and testing.

1.02 ACTION SUBMITTALS

A. Engineering (design) drawings and Shop Drawings for structural materials:
1. Engineering (design) drawings showing general arrangement framing plans and elevations of steel designed by Contractor: Submit for review prior to development of detailed Shop Drawings. Each engineering drawing prepared by engineer retained by Contractor shall be sealed, signed, and dated by that engineer with following certification statement:
   a. "I hereby certify that this engineering document was prepared by me or under my direct personal supervision and that I am a duly registered Professional Engineer in accordance with Dominican Republic laws and I accept responsibility for the adequacy of this document to meet criteria stipulated in the Contract Documents.
2. Shop Drawings for structural material including erection plans and connection details. Each Shop Drawing showing connection details designed by engineer retained by Contractor shall be sealed, signed, and dated by that engineer with following certification statement:

   "I hereby certify that the connection design shown on this document was prepared by me or under my direct personal supervision and that I am a duly registered Professional Engineer in accordance with Dominican Republic laws, and I accept responsibility for the adequacy of the connections shown on this document to meet criteria stipulated in the Contract Documents.

3. Revised engineering drawings and Shop Drawings shall be labeled with revision number and revision date with all changes clearly identified by "clouding," and signed and dated by engineer retained by Contractor certifying drawing revision.
4. Shop Drawings submitted without seal, signature, date, certification statement of engineer retained by Contractor and not identifying revisions will be returned to Contractor without review.
5. Details of the proposed typical beam connections shall be submitted prior to development of corresponding detail drawings.
6. Erection drawings shall be submitted prior to or with the submittal of the referenced detail drawings.

1.03 QUALITY ASSURANCE

A. Fabricator shall have not less than 5 years' experience in fabrication of structural steel.

B. Owner will retain services of qualified, independent special inspectors to inspect fabricating shop and test fastener assemblies, installation and tightening of bolts; and to perform inspection and testing of welds.

C. Where tests or inspections indicate noncompliance with Contract Documents, repair or replace defective materials at Contractor's expense. Costs for retesting shall be borne by Contractor.

PART 2 PRODUCTS

2.01 DESIGN REQUIREMENTS

A. Design in accordance with AISC "Specification for Structural Steel Buildings AISC 360-05 and AISC 341-05 Seismic Provisions for Structural Steel" and these specifications.

B. Design shall be performed by a professional structural engineer registered in accordance with Dominican Republic laws, retained by Contractor.

2.02 MATERIALS

A. Structural steel:
1. W and WT shapes: ASTM A992/A992M, Grade 50.
2. C, MC and S shapes: ASTM A36/A36M or ASTM A572/A572M, Grade 50.
3. L shapes: ASTM A36/A36M or ASTM A572/A572M, Grade 50.
4. Plates: ASTM A36/A36M or ASTM A572/A572M, Grade 50.

B. Structural square and rectangular tubing: ASTM A500, Grade B.

C. Structural pipes: ASTM A53/A53M, Grade B.

D. Round HSS: ASTM A500, Grade B.

E. Steel fasteners, plain finish:
1. High-strength bolts: ASTM A325/A325M, Types 1 or 3 ASTM A490/A490M, Types 1 or 3, cold-forged.
2. Nuts: ASTM A563/A563M DH.
3. Washers: ASTM F436/F436M; hardness of 38 to 45 H.C.
4. Direct tension indicators: ASTM F959/F959M.
5. Twist off tension control bolts conforming to ASTM F1852 may be substituted for A325 bolts. Twist off tension control bolts conforming to ASTM F2280 may be substituted for A490 bolts. Heads shall be heavy hex or round type.

F. Steel fasteners, galvanized:
1. High-strength bolts: ASTM A325/A325M, Type 1 only.
2. Nuts: ASTM A563/A563M DH.
3. Washers: ASTM F436/F436M; hardness of 38 to 45 HRC.
4. Direct tension indicators: ASTM F959/F959M.
5. Bolt, nut, and washer galvanizing: ASTM B695, Class 50 or ASTM F2329
6. Direct tension indicator galvanizing: ASTM B695, Class 50 only.
7. Twist off tension control bolts conforming to ASTM F1852 may be substituted for A325 bolts. Heads shall be heavy hex or round type.

G. Standard bolts: ASTM A307.

H. Aluminum fasteners:
1. Bolts: Anodized Alloy 2024-T4.
2. Washers: Alclad 2024-T4.
3. Nuts: 6061-T6 or 6262-T9.

I. Stainless steel: ASTM A240/A240M, Type 304 or 316, as appropriate for service conditions.

J. Galvanizing: ASTM A123/A123M.

2.03 STEEL FABRICATION

A. Conform to AISC "Specification for Structural Steel Buildings AISC 360-05" and "Specification for Structural Joints using High Strength Bolts (2009)," AISC 341-05 "Seismic Provisions for Structural Steel Buildings" and "Code of Standard Practice for Steel Buildings and Bridges AISC 303-05,".

B. Welding:
   1. AWS D1.1 and AWS D1.6 for stainless steel.
   2. Other connections not specified as slip-critical may be bearing-type connections, designed assuming threads in shear plane. Clearly identify connections as being slip-critical or bearing-type connections on Shop Drawings.

C. Bolts for slip-critical connections and bolts subject to tension shall be tightened to develop minimum tension specified by AISC using direct-tension indicator tightening method. Use direct-tension indicator washers under nonturning part of bolt assembly.

D. Shop connections: Either weld or use high-strength bolts.

E. Field connections: Provide bolts for field connections, except provide welds where deemed necessary by Contractor.
   1. Use high-strength bolts. Use galvanized high-strength bolts when bolting galvanized steel.
   2. Use of high-strength bolts: Conform to "Specification for Structural Joints Using ASTM A325 or A490 Bolts," as approved by Research Council on Structural Connections of the Engineering Foundation, and published by AISC.
   3. Use standard bolts for members at temporary or removable locations, unless noted otherwise. Standard bolts may be used for channel-girt connections.

F. Detail single angle cross bracing to require light drifting to draw holes together resulting in small amount of initial tension in diagonals.

G. Wall girts:
   1. Extend past column; miter ends and connect girts at corners unless shown otherwise.
   2. Detail connections to allow faces of girts receiving enclosure siding shall be field-aligned in true vertical planes within ±1/8" (3 mm) tolerance. Connection holes shall be slotted to allow adjustment between girts and their supports. Use slip-critical bolts.

H. Close ends of pipe and tubular members with minimum 10-gage (4 mm) plate, seal welded to member.

I. Column splices:
   1. Detail splices to meet requirements of AISC "Structural Steel Detailing," unless indicated otherwise.
   2. Minimum thickness of splice plate: 1/2" (13 mm).

2.04 FACTORY FINISHING

A. Surface preparation: As specified in Section 09 90 00.

B. Omit paint from contact surfaces of slip-critical connections unless paint has been qualified by test in accordance with "Test Method to Determine the Slip Coefficient for Coatings Used in Bolted Joints" as adopted by the AISC Research Council on Structural Connections. Manufacturer's certification shall include certified copy of test report.

C. Omit shop prime coat:
   1. Sufficient distance from surfaces subject to field welding to prevent prime coat damage from welding process, but not less than 3" (75 mm).
   2. From surfaces to be embedded in concrete.
   3. From galvanized surfaces, stainless steel, aluminum and from surfaces which are to receive gunite.

D. Leave unpainted steel clean and free from rust.

E. Shop primer: As specified in Section 09 90 00.

PART 3 EXECUTION

3.01 ERECTION

A. Erect plumb and level; introduce temporary bracing required to support erection loads.

B. Erect temporary horizontal bracing at concrete slab floor levels; temporary bracing shall remain in place until 7 days after slab has been installed.

C. Plumb columns within a tolerance of AISC Code of Standard Practice for Steel Buildings and Bridges (AISC 303-05).

D. Use light drifting necessary to draw holes together. Drifting to match unfair holes is not allowed. Use of twist drills to enlarge holes to make connections is only permitted for slip-critical connections where permitted by design engineer. If diameter of enlarged hole exceeds original bolt diameter by 1/4" (6.4 mm) or more, provide a larger bolt so final hole does not exceed bolt diameter by more than 3/16" (4.8 mm).

E. Provide washers, install, and tighten high-strength bolts in accordance with "Specification for Structural Joints Using ASTM A325 or A490 Bolts," as approved by Research Council on Structural Connections of the Engineering Foundation, and published by AISC. Tighten bolts used in slip-critical connections or bolts subject to tension by "Direct Tension Indicator Tightening" method.

F. Welding: AWS D1.1. Provide Owner with proof of qualification of welders, and shop inspection and test records. Proof of qualification not required for tack welds or welds not carrying stress.

G. Shore existing members when unbolting of common connections is required. Use new bolts for rebolting connections.

H. Grouting:
1. Roughen concrete surfaces by light chipping to remove laitance to approximately 1/4" (6 mm). Do not expose reinforcing steel.
2. Remove foreign materials; prepare surfaces in strict conformance to manufacturer's instructions.
3. Soak concrete contact areas with water for 24 hours. Ensure grout pockets and keyways are free from foreign substances and water.
4. To facilitate cleanup, mask adjacent surfaces of equipment and concrete with masking tape or paste wax.
5. Provide formwork for all grout.
   a. Formwork and area within formwork shall be liquidtight.
   b. Provide 3/4" (19 mm) chamfer at corners of grout permanently exposed to view.
6. Mix, place, and cure grout in strict accordance to manufacturer's instructions.
7. Grout under baseplates to provide full bearing area after steel has been plumbed and aligned. Grout shall be placed in manner to prevent forming air pockets.
8. Grout thickness: 1 1/2" (38 mm), unless required otherwise by equipment manufacturer.
9. Remove shims after grout is placed. Fill shim voids with grout under baseplates to provide full bearing area after steel has been plumbed and aligned. Place and cure as recommended by manufacturer.

I. Design, install, and maintain guardrails and kickplates as required by OSHA.

3.02 INSPECTION AND TESTING OF BOLTED CONNECTIONS

A. Inspection and testing:
1. Performed by Special Inspector retained by Owner.

2. In accordance with Section 9 of "Specification for Structural Joints Using ASTM A325 or A490 Bolts," Direct Tension Indicator (DTI) manufacturer's installation and inspection instructions, and these specifications.

B. Inspection and testing shall also include following:
1. Verify that bolt, nut, washer, and DTI types conform to materials specified.
2. Verify bolts, nuts, washers and DTI are properly marked in accordance with appropriate ASTM specifications including manufacturer symbol.
3. Verify appropriate test certificates have been furnished by manufacturer for bolts, nuts, washers and DTI washers according to ASTM specification requirements.
4. Verify certificate lot numbers coincide with lot numbers on containers at job site.
5. Perform DTI calibration test and bolt assembly load test using Skidmore Wilhelm bolt tension calibrator. Minimum of 3 assemblies for each diameter and grade of bolt, nut, hardened washer and DTI shall be tested for each shipment.
6. Verify bolting crews are installing bolts in accordance with references specified.
7. Verify slip-critical connection bolts and bolts subject to tension have been properly pretensioned using feeler gage and visual inspection in accordance with DTI manufacturer's written instructions.
8. Verify bearing-type connection bolts are snug tight bringing all plies into contact.

3.03 INSPECTION AND TESTING OF WELDS

A. Inspection:
1. Performed by Special Inspector retained by Owner. Special inspector shall be certified in accordance with AWS D1.1.
2. In accordance IBC Chapter 17. Visually inspect all shop and field welds

B. Nondestructive testing:
1. Performed by testing laboratory retained by Owner.
2. Shop and field full penetration welds of structural shapes: Test full length of welds.
3. Other field welds:
   a. Test minimum of 10% of field welds. Perform 2 additional tests for each test that fails.
   b. Each 4" (100 mm) of weld length shall be considered one test.
   c. Locations: Determined by Special Inspector.
4. Welded connections for seismic-force-resisting and base metal: IBC Section 1703.
5. Nondestructive testing: Ultrasonic or magnetic particle method conforming to AWS D1.1.
6. Repair welds shown by inspections or testing to have discontinuities that would reduce weld strength in accordance with AWS D1.1. Cost of reworking welds and follow-up inspections and tests shall be borne by Contractor.

3.04 FIELD PAINTING

A. After erection, apply one field coat of primer to cleaned surfaces of bolts, new welds, abrasions to shop coat, and all metal surfaces not shop prime painted except do not paint aluminum, stainless steel, or galvanized steel work.

B. After erection, repair hot-dip galvanized coatings in accordance with ASTM A780. This includes surfaces where shop-applied galvanized coatings have been damaged, removed, or omitted.

C. Field finish painting: As specified in Section 09 90 00.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Slip bearing pads materials, fabrication, and erection.

PART 2 PRODUCTS

2.01 MATERIALS

A. Structural steel: ASTM A36/A36M.

B. 3/32 (2.4 mm) minimum thick reinforced "Teflon" pad bonded to 10-gage (3.4 mm)minimum thick carbon or stainless steel plate (as suitable for exposure conditions) which is to be fully field welded to framing member.

C. Provide bearing area to allow of total movement and as required to support reactions.

D. Fabricate slip bearing pads in accordance with manufacturer's recommendations.

PART 3 EXECUTION

3.01 ERECTION

A. Install at expansion joint connections.

B. Install in accordance with manufacturer's recommendations.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Waterproofing for underground concrete vaults and concrete foundation walls including drainage board.

1.02 QUALITY ASSURANCE

A. Installer: Firm which has at least 3 years' of experience in work of type required by this Section.

B. Materials: For each type of material required for work of this Section, provide primary materials which are products of one manufacturer.

C. Manufacturer's representative: Make arrangements necessary to have trained employee of manufacturer on Site periodically during membrane waterproofing work to review installation procedures.

1.03 DELIVERY, STORAGE, AND HANDLING

A. Deliver materials to Site in manufacturer's original, sealed containers bearing original labels.

B. Store materials as recommended by manufacturer in enclosed area free from contact with soil and weather. Maintain materials at not less than 50°F (10°C) for at least 24 hours before use.

C. Handle materials in a manner to prevent damage. Remove damaged materials from Site and replace with new specified materials.

1.04 WARRANTY

A. Sheet membrane waterproofing: Provide written 5 year material warranty issued by membrane manufacturer upon completion of Work.

PART 2 PRODUCTS

2.01 MATERIALS

A. Membrane: Fluid applied waterproofing membrane per ASTM C836

B. Primer: As recommended by the fluid-applied membrane manufacturer

C. Prefabricated drainage composite: Design to promote positive drainage while serving as protection course for the waterproofing as recommended by the waterproofing manufacturer.

D. Miscellaneous materials: Primer, mastic, liquid membrane, tape and accessories specified or acceptable to manufacturer of waterproofing.

PART 3 EXECUTION

3.01 EXAMINATION

A. Installer shall examine conditions of substrates and other conditions under which Work shall be performed and notify Contractor, in writing, of circumstances detrimental to proper completion of Work. Do not proceed with Work until unsatisfactory conditions are corrected.

3.02 PREPARATION OF SUBSTRATES

A. Refer to manufacturer's literature for requirements for preparation of substrates.

B. Surfaces shall be structurally sound and free of voids, spalled areas, loose aggregate and sharp protrusions.

C. Remove contaminates such as grease, oil, and wax from exposed surfaces.

D. Remove dust, dirt, loose stone, and debris.

E. Use repair materials and methods which are acceptable to manufacturer of waterproofing.

F. Cast-in-place concentrate substrates:
1. Do not proceed with installation until concrete has properly cured and dried; minimum 7 days for normal structural concrete.
2. Fill form tie rod holes with concrete and finish flush with surrounding surface.
3. Repair bug holes over 1/2" (13 mm) in length and 1/4" (6 mm) deep and finish flush with surrounding surface.
4. Remove scaling to sound, unaffected concrete and repair exposed area.
5. Grind irregular construction joints to suitable flush surface.

G. Related materials: Treat joints and install flashing as recommended by waterproofing manufacturer.

3.03 INSTALLATION

A. Refer to manufacturer's recommendations on installation, including but not limited to, following:
1. Apply primer at rate recommended by manufacturer. Recoat areas not waterproofed if contaminated by dust. Mask and protect adjoining exposed finish surfaces to protect surfaced from excessive application of primer.
2. Apply waterproofing to provide continuous membrane. Thickness and number of coats shall comply with manufacturer's recommendations for exposure conditions.
3. Delay application of membrane until primer is completely dry. Dry time will vary with weather conditions.
4. Seal daily terminations with troweled bead of mastic.
5. Apply protection board and related materials in accordance with manufacturer's recommendations.

3.04 CLEANING AND PROTECTION

A. Remove any masking materials after installation. Clean any stains on materials which would be exposed in completed work.

B. Protect completed waterproofing from subsequent construction activities as recommended by manufacturer.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Interior and exterior paints and coatings.

1.02 DEFINITIONS AND ABBREVIATIONS

A. Qualification testing: Qualification testing is performance of all test requirements listed in product specification. Testing is accomplished by Master Painting Institute (MPI) to qualify each product for MPI Approved Product List, and may also be accomplished by Contractor's third party testing lab if alternative to Batch Quality Conformance Testing by MPI is desired.

B. Batch quality conformance testing: Batch quality conformance testing determines that product provided is same as product qualified to appropriate product specification. Testing shall only be accomplished by MPI testing lab.

C. Coating: Film or thin layer applied to base material called a substrate. Coating may be metal, alloy, paint, or solid/liquid suspensions on various substrates (metals, plastics, wood, paper, leather, cloth, etc.). They may be applied by electrolysis, vapor deposition, vacuum, or mechanical means such as brushing, spraying, calendaring, and roller coating. Coating may be applied for aesthetic or protective purposes or both. Term "coating" as used herein includes emulsions, enamels, stains, varnishes, sealers, epoxies, and other coatings, whether used as primer, intermediate, or finish coat. Terms paint and coating are used interchangeably.

D. DFT or dft: Dry film thickness, film thickness of fully cured, dry paint or coating.

E. DSD: Degree of Surface Degradation, MPI system of defining degree of surface degradation. Five (5) levels are generically defined under the Assessment sections in the MPI Maintenance Repainting Manual.

F. EPP: Environmentally Preferred Products, a standard for determining environmental preferability in support of Executive Order 13101.

G. EXT: MPI short term designation for exterior coating system.

H. INT: MPI short term designation for interior coating system.

I. micron / microns: Metric measurement for 0.001 mm or one/one-thousandth of a millimeter.

J. mil / mils: English measurement for 0.001 in or one/one-thousandth of an inch, equal to 25.4 microns or 0.0254 mm.

K. mm: Metric measurement for millimeter, 0.001 meter or one/one-thousandth of a meter.

L. MPI gloss levels:
1. MPI system of defining gloss. Seven (7) gloss levels (G1 to G7) are generically defined under the Evaluation sections of the MPI Manuals. Traditionally, Flat refers to G1/G2, Eggshell refers to G3, Semigloss refers to G5, and Gloss refers to G6.
2. Gloss levels are defined by MPI as follows:

Gloss Level	Description	Units at 60 degrees	Units at 85 degrees
G1	Matte or Flat	0 to 5	10max
G2	Velvet	0 to 10	10 to 35
G3	Eggshell	10 to 25	10 to 35
G4	Satin	20 to 35	35 min
G5	Semi-Gloss	35 to70	

Gloss Level	Description	Units at 60 degrees	Units at 85 degrees
G6	Gloss	70 to 85	
G7	High Gloss		

a. Gloss is tested in accordance with ASTM D523.
3. MPI System Number: MPI coating system number in each Division found in either MPI Architectural Painting Specification Manual or Maintenance Repainting Manual and defined as an exterior (EXT/REX) or interior system (INT/RIN). Division number follows CSI Master Format.
4. Paint: See Coating definition.
5. REX: MPI short term designation for exterior coating system used in repainting projects or over existing coating systems.
6. RIN: MPI short term designation for interior coating system used in repainting projects or over existing coating systems.

1.03 SUBMITTALS

A. Product Data: Coating. Manufacturer's Technical Data Sheets.

B. Samples: Submit manufacturer's samples of paint colors.

1.04 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: Preprinted cleaning and maintenance instructions for all coating systems shall be provided.

1.05 APPLICATOR'S QUALIFICATIONS

A. SSPC QP 1 certification:
1. Contractors and subcontractors that perform surface preparation or coating application shall be certified by the Society for Protective Coatings (formerly Steel Structures Painting Council) (SSPC) to the requirements of SSPC QP 1 prior to contract award, and shall remain certified while accomplishing any surface preparation or coating application.
2. Notify Owner of any change in contractor certification status.

1.06 QUALITY ASSURANCE

A. Field samples and tests:
1. Owner may choose up to two coatings that have been delivered to site to be tested at no cost to the Owner. Take samples of each chosen product as specified in the paragraph "Sampling Procedures." Test each chosen product as specified in paragraph "Testing Procedure." Products which do not conform, shall be removed from job site and replaced with new products that conform to referenced specification.
2. Use Batch Quality Conformance Testing to prove conformance of manufacturer's paint to specified MPI standard. This testing is accomplished before materials are delivered to job site. Provide testing for paint products. Test paint products as specified in paragraph "Testing Procedure".
   a. Sampling Procedure: Owner will select paint at random from products that have been delivered to job site for sample testing. Contractor shall provide one quart samples of selected paint materials. Samples shall be taken in presence of Owner, and labeled, identifying each sample. Provide labels in accordance with paragraph "Packaging, Labeling, and Storage" of this specification.
3. Testing Procedure:
   a. Provide Batch Quality Conformance Testing for specified products, as defined by and performed by MPI. As alternative to Batch Quality Conformance Testing, Contractor may provide Qualification Testing for specified products above to appropriate MPI product specification, using third-party laboratory approved under paragraph "Qualification Testing" laboratory for coatings. Qualification testing lab report shall include backup data and summary of test results. Summary shall list all reference specification requirements and

result of each test. Summary shall clearly indicate whether tested paint meets each test requirement. Qualification Testing may take 4 to 6 weeks to perform, due to extent of testing required.

1.07 REGULATORY REQUIREMENTS

A. Publications listed below form a part of this specification to extent referenced. Publications are referred to within the text by the basic designation only.
   1. ACGIH 0100 - Documentation of the Threshold Limit Values and Biological Exposure Indices
   2. ASME A13.1 - Scheme for the Identification of Piping Systems
   3. ASTM D235 - Mineral Spirits (Petroleum Spirits) (Hydrocarbon Dry Cleaning Solvent)
   4. ASTM D4263 - Indicating Moisture in Concrete by the Plastic Sheet Method
   5. ASTM D4444 - Use and Calibration of Hand-Held Moisture Meters
   6. ASTM D523 - Standard Test Method for Specular Gloss
   7. ASTM D6386 - Standard Practice for Preparation of Zinc (Hot-Dip Galvanized) Coated Iron and Steel Product and Hardware Surfaces for Painting
   8. ASTM F1869 - Measuring Moisture Vapor Emission Rate of Concrete Subfloor Using Anhydrous Calcium Chloride
   9. MPI 101 - Epoxy Anti-Corrosive Metal Primer
   10. MPI 107 - Rust Inhibitive Primer (Water-Based)
   11. MPI 108 - High Build Epoxy Coating, Low Gloss
   12. MPI 113 - Exterior Pigmented Elastomeric Coating (Water Based)
   13. MPI 116 - Epoxy Block Filler
   14. MPI 141 - Interior High Performance Latex MPI Gloss Level 5
   15. MPI 145 - Institutional Low Odor / VOC Interior Latex, MPI Gloss Level 3
   16. MPI 164 - Exterior W.B. Light Industrial Coating, Gloss, MPI Gloss Level 6
   17. MPI 19 - Inorganic Zinc Rich Primer
   18. MPI 2 - Aluminum Heat Resistant Enamel (up to 427 C and 800 F
   19. MPI 21 - Heat Resistant Enamel, Gloss (up to 205 degrees C and 400 degrees F), MPI Gloss Level 6
   20. MPI 22 - Aluminum Paint, High Heat (up to 590 degrees C and 1100 degrees F.
   21. MPI 39 - Interior Latex-Based Wood Primer
   22. MPI 4 - Interior/Exterior Latex Block Filler
   23. MPI 42 - Latex Stucco and Masonry Textured Coating
   24. MPI 45 - Interior Alkyd Primer Sealer
   25. MPI 47 - Interior Alkyd, Semi-Gloss, MPI Gloss Level 5
   26. MPI 48 - Interior Alkyd, Gloss, MPI Gloss Level 6
   27. MPI 50 - Interior Latex Primer Sealer
   28. MPI 57 - Interior Oil Modified Urethane Clear Satin
   29. MPI 77 - Epoxy Gloss
   30. MPI 79 - Alkyd Anti-Corrosive Metal Primer
   31. MPI 9 - Exterior Alkyd, Gloss, MPI Gloss Level 6
   32. MPI 90 - Interior Wood Stain, Semi-Transparent
   33. MPI 95 - Quick Drying Primer for Aluminum
   34. SSPC PA 1 - Shop, Field, and Maintenance Painting of Steel
   35. SSPC PA Guide 3 - A Guide to Safety in Paint Application
   36. SSPC Paint 16 - Coal Tar Epoxy-Polyamide Black (or Dark Red) Paint
   37. SSPC-QP1 - Standard Procedure for Evaluating Painting Contractors (Field Application to Complex Industrial Structures)
   38. SSPC-SP1 - Solvent Cleaning
   39. SSPC-SP10/NACE No. 2 - Near-White Blast Cleaning

B. Environmental Protection: In addition to requirements specified elsewhere for environmental protection, provide coating materials that conform to restrictions of local Air Pollution Control District and regional jurisdiction. Notify Owner of any paint specified herein which fails to conform.

C. Lead content: Do not use coatings having lead content over 0.06% by weight of nonvolatile content.

D. Chromate content: Do not use coatings containing zinc-chromate or strontium-chromate.

E. Asbestos content: Materials shall not contain asbestos.

F. Mercury content: Materials shall not contain mercury or mercury compounds.

G. Silica: Abrasive blast media shall not contain free crystalline silica.

H. Human carcinogens: Materials shall not contain ACGIH 0100 confirmed human carcinogens (A1) or suspected human carcinogens (A2).

1.08 PACKAGING, LABELING, AND STORAGE

A. Paints shall be in sealed containers that legibly show contract specification number, designation name, formula or specification number, batch number, color, quantity, date of manufacture, manufacturer's formulation number, manufacturer's directions including any warnings and special precautions, and name and address of manufacturer.

B. Pigmented paints shall be furnished in containers not larger than 5 gallons.

C. Paints and thinners shall be stored in accordance with manufacturer's written directions, and as a minimum, stored off ground, under cover, with sufficient ventilation to prevent buildup of flammable vapors, and at temperatures between 40 to 95°F.

D. Do not store paint, polyurethane, varnish, or wood stain products with materials with high capacity to absorb VOC emissions. Do not store paint, polyurethane, varnish, or wood stain products in occupied spaces.

1.09 SAFETY AND HEALTH

A. Apply coating materials using safety methods and equipment in accordance with following:
   1. Work shall comply with applicable codes and standards and local laws and regulations.
   2. Safety Methods Used During Coating Application: Comply with the requirements of SSPC PA Guide 3.
   3. Toxic Materials: To protect personnel from overexposure to toxic materials, conform to most stringent guidance of applicable manufacturer's Material Safety Data Sheets (MSDS) or local regulation.

1.10 ENVIRONMENTAL CONDITIONS

A. Comply, at minimum, with manufacturer recommendations for space ventilation during and after installation. Isolate area of application from rest of building when applying high-emission paints or coatings.

B. Coatings: Do not apply coating when air or substrate conditions are:
   1. Less than 5°F above dew point;
   2. Below 50°F or over 95°F, unless specifically pre-approved by Owner and product manufacturer. Under no circumstances shall application conditions exceed manufacturer recommendations.

C. Post-Application: Vacate space for as long as possible after application. Wait minimum of 48 hours before occupying freshly painted rooms. Maintain one of following ventilation conditions during curing period, or for 72 hours after application:
   1. Supply 100 percent outside air 24 hours a day.
   2. Supply airflow at rate of 6 air changes per hour, when outside temperatures are between 55°F and 85°F and humidity is between 30 percent and 60 percent.
   3. Supply airflow at rate of 1.5 air changes per hour, when outside air conditions are not within range stipulated above.

1.11 SCHEDULING

A. Allow paint, polyurethane, varnish, and wood stain installations to cure prior to installation of materials that adsorb VOCs.

1.12 COLOR SELECTION

A. Colors will be selected by Owner.

1.13 LOCATION AND SURFACE TYPE TO BE PAINTED

A. Where space or surface will be painted, include following unless indicated otherwise.
   1. Surfaces behind portable objects and surface mounted articles readily detachable by removal of fasteners, such as screws and bolts.
   2. New factory finished surfaces that require identification or color coding and factory finished surfaces that are damaged during performance of the work.
   3. Existing coated surfaces that are damaged during performance of the work.

B. Exterior painting: Includes new surfaces of buildings and appurtenances.

C. Interior painting: Includes new surfaces of buildings and appurtenances. Where a space or surface will be painted, include following items, unless indicated otherwise.
   1. Exposed columns, girders, beams, joists, and metal deck; and
   2. Other contiguous surfaces.

D. Painting excluded: Do not paint following unless indicated otherwise.
   1. Surfaces concealed and made inaccessible by panelboards, fixed ductwork, machinery, and equipment fixed in place.
   2. Surfaces in concealed spaces. Concealed spaces are defined as enclosed spaces above suspended ceilings, furred spaces, attic spaces, crawl spaces, elevator shafts and chases.
   3. Steel to be embedded in concrete.
   4. Copper, stainless steel, aluminum, brass, and lead except existing coated surfaces.
   5. Hardware, fittings, and other factory finished items.

E. Mechanical and electrical painting: Includes field coating of interior and exterior new surfaces.
   1. Where space or surface will be painted, include following items unless indicated otherwise.
      a. Exposed piping, conduit, and ductwork;
      b. Supports, hangers, air grilles, and registers;
      c. Miscellaneous metalwork and insulation coverings.
   2. Do not paint following, unless indicated otherwise:
      a. New zinc-coated, aluminum, and copper surfaces under insulation
      b. New aluminum jacket on piping.
      c. New interior ferrous piping under insulation.
      d. Fire extinguishing sprinkler systems.

F. Clean, pretreat, prime, and paint new fire extinguishing sprinkler systems including valves, piping, conduit, hangers, supports, miscellaneous metalwork, and accessories. Apply coatings to clean, dry surfaces, using clean brushes. Clean surfaces to remove dust, dirt, rust, and loose mill scale. Immediately after cleaning, provide metal surfaces with one coat primer per schedules. Shield sprinkler heads with protective covering while painting is in progress. Upon completion of painting, remove protective covering from sprinkler heads. Remove sprinkler heads which have been painted and replace with new sprinkler heads. Provide primed surfaces with following:
   1. Piping in Unfinished Areas: Provide primed surfaces with one coat of red alkyd gloss enamel applied to minimum dry film thickness of 1.0 mil in attic spaces, spaces above suspended ceilings, crawl spaces, pipe chases, mechanical equipment room, and spaces where walls or ceiling are not painted or not constructed of prefinished material. In lieu of red enamel finish coat, provide piping with 2" (50 mm) wide red enamel bands or self-adhering red plastic bands spaced at maximum of 20' (6 m) intervals.

2. Piping in Finished Areas: Provide primed surfaces with two coats of paint to match adjacent surfaces, except provide valves and operating accessories with one coat of red alkyd gloss enamel applied to minimum dry film thickness of 1.0 mil. Provide piping with 2" (50 mm) wide red enamel bands or self-adhering red plastic bands spaced at maximum of 20' (6 m) intervals throughout piping systems.

PART 2 PRODUCTS

2.01 MATERIALS

A. Conform to coating specifications and standards referenced in PART 3 of this Section. Submit manufacturer's technical data sheets for specified coatings and solvents. Comply with applicable regulations regarding toxic and hazardous materials.

PART 3 EXECUTION

3.01 PROTECTION OF AREAS AND SPACES NOT TO BE PAINTED

A. Prior to surface preparation and coating applications, remove, mask, or otherwise protect, hardware, hardware accessories, machined surfaces, radiator covers, plates, lighting fixtures, public and private property, and other such items not to be coated that are in contact with surfaces to be coated. Following completion of painting, workmen skilled in the trades involved shall reinstall removed items. Restore surfaces contaminated by coating materials, to original condition and repair damaged items.

3.02 SURFACE PREPARATION

A. Remove dirt, splinters, loose particles, grease, oil, and other foreign matter and substances deleterious to coating performance as specified for each substrate before application of paint or surface treatments. Oil and grease shall be removed prior to mechanical cleaning. Cleaning shall be programmed so that dust and other contaminants will not fall on wet, newly painted surfaces. Exposed ferrous metals such as nail heads on or in contact with surfaces to be painted with water-thinned paints, shall be spot-primed with a suitable corrosion-inhibitive primer capable of preventing flash rusting and compatible with the coating specified for the adjacent areas.

3.03 PREPARATION OF METAL SURFACES

A. Ferrous surfaces:

Ferrous Surface Preparation		
SSPC Blasting/Cleaning Levels - Primer Types/Exposures		
	Exposure	
	Interior	Exterior
Primer Type	alkyd/oil	epoxy
	latex	silicone
	oleoresinous	inorganic
	phenolic	zinc-rich
Surface Condition		
Uncoated		
Oil, grease, dirt	SSPC-SP1	SSPC-SP10
Shop coated		
Oil, grease, dirt	SSPC-SP1	SSPC-SP10
Localized damage to be spot repaired	SSPC-SP2, SP3, or SP7, SP12 WJ-4	SSPC-SP10

B. Galvanized surfaces:
1. Clean with solvent, steam, or non-alkaline detergent solution in accordance with SSPC-SP1.
2. If the galvanized metal has been passivated or stabilized, coating shall be completely removed by brush-off abrasive blast.

3. Galvanized steel to be coated shall not be "passivated" or "stabilized" If absence of hexavalent stain inhibitors is not documented, test as described in ASTM D6386, Appendix X2, and remove by one of methods described therein.

C. Nonferrous Metallic Surfaces:
1. Aluminum and aluminum-alloy, lead, copper, and other nonferrous metal surfaces.
2. Surface Cleaning: Solvent clean in accordance with SSPC-SP1 and wash with mild non-alkaline detergent to remove dirt and water soluble contaminants.

D. Terne-Coated Metal Surfaces: Solvent clean surfaces with mineral spirits, ASTM D235. Wipe dry with clean, dry cloths.

3.04 PREPARATION OF CONCRETE AND CEMENTITIOUS SURFACE

A. Concrete and masonry:
1. Curing: Concrete, stucco and masonry surfaces shall be allowed to cure minimum 30 days before painting, except concrete slab on grade, which shall be allowed to cure 90 days before painting.
2. Surface Cleaning: Remove following deleterious substances.
a. Dirt, Grease, and Oil: Wash new surfaces with solution composed of 1/2 cup trisodium phosphate, 1/4 cup household detergent, and 4 quarts of warm water. Then rinse thoroughly with fresh water. For large areas, water blasting may be used.
b. Fungus and Mold: Wash new surfaces with solution composed of 1/2 cup trisodium phosphate, 1/4 cup household detergent, 1 quart 5 percent sodium hypochlorite solution and 3 quarts of warm water. Rinse thoroughly with fresh water.
c. Paint and loose particles: Remove by wire brushing.
d. Efflorescence: Remove by scraping or wire brushing followed by washing with a 5% to 10% by weight aqueous solution of hydrochloric (muriatic) acid. Do not allow acid to remain on surface for more than five minutes before rinsing with fresh water. Do not acid clean more than 4 sq ft of surface, per workman, at one time.
3. Cosmetic repair of minor defects: Repair or fill mortar joints and minor defects, including but not limited to spalls, in accordance with manufacturer's recommendations and prior to coating application.
4. Allowable moisture content: Latex coatings may be applied to damp surfaces, but not to surfaces with droplets of water. Do not apply epoxies to damp vertical surfaces as determined by ASTM D4263 or horizontal surfaces that exceed 3 lb of moisture per 1000 sq ft in 24 hours as determined by ASTM F1869. In all cases follow manufacturer's recommendations. Allow surfaces to cure minimum of 30 days before painting.

B. Gypsum board, plaster, and stucco:
1. Surface cleaning: Plaster and stucco shall be clean and free from loose matter; gypsum board shall be dry. Remove loose dirt and dust by brushing with soft brush, rubbing with dry cloth, or vacuum-cleaning prior to application of first coat material. Damp cloth or sponge may be used if paint will be water-based.
2. Repair of minor defects: Prior to painting, repair joints, cracks, holes, surface irregularities, and other minor defects with patching plaster or spackling compound and sand smooth.
3. Allowable moisture content: Latex coatings may be applied to damp surfaces, but not surfaces with droplets of water. Do not apply epoxies to damp surfaces as determined by ASTM D4263. New plaster to be coated shall have maximum moisture content of 8 percent, when measured in accordance with ASTM D4444, Method A, unless otherwise authorized. In addition to moisture content requirements, allow new plaster to age minimum of 30 days before preparation for painting.

3.05 PREPARATION OF WOOD AND PLYWOOD SURFACES

A. Plywood and wood surfaces, except floors:
1. Wood surfaces shall be cleaned of foreign matter.
2. Surface cleaning: Surfaces shall be free from dust and other deleterious substances to receiving paint or other finish. Do not use water to clean uncoated wood.

3. Moisture content of wood shall not exceed 12 percent as measured by moisture meter in accordance with ASTM D4444, Method A, unless otherwise authorized.
4. Wood surfaces adjacent to surfaces to receive water-thinned paints shall be primed and/or touched up before applying water-thinned paints.
5. Cracks and nail heads: Set and putty stop nail heads and putty cracks after prime coat has dried.
6. Cosmetic repair of minor defects:
   a. Knots and resinous wood: Prior to application of coating, cover knots and stains with 2 or more coats of 3-pound-cut shellac varnish, plasticized with 5 oz of castor oil per gallon. Scrape away existing coatings from knotty areas, and sand before treating. Prime before applying putty over shellacked area.
   b. Open joints and other openings: Fill with whiting putty, linseed oil putty. Sand smooth after putty has dried.
   c. Checking: Where checking of wood is present, sand surface, wipe and apply coat of pigmented orange shellac. Allow to dry before paint is applied.
7. Prime coat for exterior surfaces: Prime coat wood doors, windows, frames, and trim before wood becomes dirty, or warped.

B. Interior wood surfaces, stain finish: Interior wood surfaces to receive stain shall be sanded. Oak and other open-grain wood to receive stain shall be given coat of wood filler not less than 8 hours before the application of stain; excess filler shall be removed and surface sanded smooth.

3.06 APPLICATION

A. Coating application:
1. Painting practices shall comply with applicable local (MIMARENA) and international (EPA) laws enacted to ensure compliance with Clean Air Standards. Apply coating materials in accordance with SSPC-PA1. SSPC-PA1 methods are applicable to all substrates, except as modified herein.
2. At time of application, paint shall show no signs of deterioration. Uniform suspension of pigments shall be maintained during application.
3. Unless otherwise specified or recommended by paint manufacturer, paint may be applied by brush, roller, or spray. Use trigger operated spray nozzles for water hoses. Rollers for applying paints and enamels shall be of a type designed for coating to be applied and surface to be coated. Wear protective clothing and respirators when applying oil-based paints or using spray equipment with any paints.
4. Paints, except water-thinned types, shall be applied only to surfaces that are completely free of moisture as determined by sight or touch.
5. Thoroughly work coating materials into joints, crevices, and open spaces. Special attention shall be given to insure that edges, corners, crevices, welds, and rivets receive a film thickness equal to that of adjacent painted surfaces.
6. Each coat of paint shall be applied so dry film is uniform thickness and free from runs, drops, ridges, waves, pinholes or other voids, laps, brush marks, and variations in color, texture, and finish. Hiding shall be complete.
7. Touch up damaged coatings before applying subsequent coats. Interior areas shall be broom clean and dust free before and during the application of coating material.
8. Apply paint to new fire extinguishing sprinkler systems including valves, piping, conduit, hangers, supports, miscellaneous metal work, and accessories. Shield sprinkler heads with protective coverings while painting is in progress. Remove sprinkler heads which have been painted and replace with new sprinkler heads. For piping in unfinished spaces, provide primed surfaces with one coat of red alkyd gloss enamel to a minimum dry film thickness of 1.0 mil. Unfinished spaces include attic spaces, spaces above suspended ceilings, crawl spaces, pipe chases, mechanical equipment room, and space where walls or ceiling are not painted or not constructed of prefinished material. For piping in finished areas, provide prime surfaces with two coats of paint to match adjacent surfaces, except provide valves and operating accessories with one coat of red alkyd gloss enamel. Upon completion of painting, remove protective covering from sprinkler heads.
   a. Drying time: Allow time between coats, as recommended by coating manufacturer, to permit thorough drying, but not to present topcoat adhesion problems. Provide each coat in specified condition to receive next coat.

b. Primers and intermediate coats: Do not allow primers or intermediate coats to dry more than 30 days, or longer than recommended by manufacturer, before applying subsequent coats. Follow manufacturer's recommendations for surface preparation if primers or intermediate coats are allowed to dry longer than recommended by manufacturers of subsequent coatings. Each coat shall cover surface of preceding coat or surface completely, and there shall be visually perceptible difference in shades of successive coats.
c. Finished surfaces: Provide finished surfaces free from runs, drops, ridges, waves, laps, brush marks, and variations in colors.
d. Thermosetting paints: Topcoats over thermosetting paints (epoxies and urethanes) should be applied within overcoating window recommended by manufacturer.
e. Floors: For nonslip surfacing on ramps, provide MPI 77 with non-skid additive, applied by roller in accordance with manufacturer's instructions.

B. Mixing and thinning of paints:
1. Reduce paints to proper consistency by adding fresh paint, except when thinning is mandatory to suit surface, temperature, weather conditions, application methods, or for type of paint being used.
2. When thinning is allowed, paints shall be thinned immediately prior to application with not more than 1 pint (0.125 L) of suitable thinner per gallon (liter). Use of thinner shall not relieve Contractor from obtaining complete hiding, full film thickness, or required gloss. Thinning shall not cause paint to exceed limits on volatile organic compounds. Paints of different manufacturers shall not be mixed.

C. Two-component systems: Mix in accordance with manufacturer's instructions. Any thinning of first coat to ensure proper penetration and sealing shall be as recommended by manufacturer for each type of substrate.

D. Coating systems:
1. Systems by substrates: Apply coatings that conform to respective specifications listed in following Tables.
a. Exterior paint tables:
1) Division 1. Concrete Masonry Units Paint Table
2) Division 2. Metal, Ferrous and Non-Ferrous Paint Table
3) Division 3. Wood; Dressed Lumber, Paneling, Decking, Shingles Paint Table
4) Division 4: Stucco Paint Table
5) Division 5: Hydraulic Structures
b. Interior paint tables:
1) Division 1. Concrete Paint Table
2) Division 2. Concrete Masonry Units Paint Table
3) Division 3. Metal, Ferrous and Non-Ferrous Paint Table
4) Division 4. Wood Paint Table
5) Division 5: Plaster, Gypsum Board, Textured Surfaces Paint Table
2. Minimum dry film thickness (DFT): Apply paints, primers, varnishes, enamels, undercoats, and other coatings to minimum dry film thickness of 1.5 mil each coat unless specified otherwise in tables. Coating thickness where specified, refers to minimum dry film thickness.
3. Coatings for surfaces not specified otherwise: Coat surfaces which have not been specified, same as surfaces having similar conditions of exposure.

3.07 COATING SYSTEMS FOR METAL

A. Apply coatings of Tables in Division 2 for Exterior and Division 3 Interior.
1. Apply specified ferrous metal primer on same day that surface is cleaned, to surfaces that meet specified surface preparation requirements at time of application.
2. Inaccessible Surfaces: Prior to erection, use one coat of specified primer on metal surfaces that will be inaccessible after erection.
3. Shop-primed Surfaces: Touch up exposed substrates and damaged coatings to protect from rusting prior to applying field primer.

4. Pipes and Tubing: Semitransparent film applied to some pipes and tubing at mill is not considered a shop coat, and shall be overcoated with specified ferrous-metal primer prior to application of finish coats.
5. Exposed Nails, Screws, Fasteners, and Miscellaneous Ferrous Surfaces. On surfaces to be coated with water thinned coatings, spot prime exposed nails and other ferrous metal with latex primer MPI 107.

3.08 COATING SYSTEMS FOR CONCRETE AND CEMENTITIOUS SUBSTRATES

A. Apply coatings of Tables in Divisions 1 and 2 for Exterior and Interior.

3.09 COATING SYSTEMS FOR WOOD AND PLYWOOD

A. Apply coatings of Tables in Division 4 for Interior.

B. Prior to erection, apply two coats of specified primer to treat and prime wood and plywood surfaces which will be inaccessible after erection.

C. Apply stains in accordance with manufacturer's printed instructions.

3.10 PIPING IDENTIFICATION

A. Piping identification, including surfaces in concealed spaces: Provide in accordance with ASME A13.1. Place stenciling in clearly visible locations. On piping not covered by ASME A13.1, stencil approved names or code letters, in letters a minimum of 1/2" (13 mm) high for piping and a minimum of 2" (50 mm) high elsewhere. Stencil arrow-shaped markings on piping to indicate direction of flow using black stencil paint.

3.11 INSPECTION AND ACCEPTANCE

A. In addition to meeting previously specified requirements, demonstrate mobility of moving components, including swinging and sliding doors, cabinets, and windows with operable sash, for inspection by Owner. Perform this demonstration after appropriate curing and drying times of coatings have elapsed and prior to invoicing for final payment.

3.12 PAINT TABLES

A. All DFT's are minimum values.

EXTERIOR PAINT TABLES			
DIVISION 1 - EXTERIOR CONCRETE MASONRY UNITS PAINT TABLE			
Concrete masonry on uncoated surface:			
	Elastomeric; MPI EXT 4.2D		
	Primer	Intermediate	Topcoat
	Per Manufacturer	MPI 113	MPI 113
System DFT	16 mils		
Primer	As recommended by manufacturer		
Topcoat	Coating to match adjacent surfaces. Surface preparation and number of coats in accordance with manufacturer's instructions		
	Apply sufficient coats of MPI 113 to achieve a minimum dry film thickness of 16 mils		
DIVISION 2 - EXTERIOR METAL, FERROUS AND NON-FERROUS PAINT TABLE			
Steel/Ferrous Surfaces:			
Steel blast cleaned to SSPC-SP10/NACE No. 2	Epoxy; MPI EXT 5.1R-G6 (Gloss)		

EXTERIOR PAINT TABLES			
	Primer	Intermediate	Topcoat
	MPI 20 (3 mil)	MPI 108 (5 mil)	MPI 164 (2 mil)
System DFT	10 mils		
Galvanized Surfaces	Epoxy; MPI EXT 5.3K-G6 (Gloss)		
	Primer	Intermediate	Topcoat
	MPI 20	MPI 164	MPI 164
System DFT	8 mils		
Aluminum, Aluminum Alloy and Other Miscellaneous Non-Ferrous Metal Items not otherwise specified except hot metal surfaces, roof surfaces, and new prefinished equipment. Match surrounding finish:	Alkyd; MPI EXT 5.4F-G6 (Gloss)		
	Primer	Intermediate	Topcoat
	MPI 95	MPI 9	MPI 9
System DFT	8 mils		
Surfaces adjacent to painted surfaces; Mechanical, Electrical, Fire extinguishing sprinkler systems including valves, conduit, hangers, supports, exposed copper piping, and miscellaneous metal items not otherwise specified except floors, hot metal surfaces, and new prefinished equipment. Match surrounding finish:	Alkyd; MPI EXT 5.1D-G6(Gloss)		
	Primer	Intermediate	Topcoat
	MPI 79	MPI 9	MPI 9
System DFT	8 mils		
Hot metal surfaces including smokestacks subject to temperatures up to 400°F:	Heat-Resistant Enamel; MPI EXT 5.2A		
	Primer	Intermediate	Topcoat
	MPI 21	Surface preparation and number of coats per manufacturer's instructions.	
System DFT	Per Manufacturer		
Ferrous metal subject to high temperature, up to 750°F:	Inorganic Zinc Rich Coating; MPI EXT 5.2C		
	Primer	Intermediate	Topcoat
	MPI 19	Surface preparation and number of coats per manufacturer's instructions.	
System DFT	Per Manufacturer		
Surfaces made bare cleaning to SSPC-SP10/NACE No. 2 subject to temperatures up to 1100°F:	Heat Resistant Coating; MPI EXT 5.2D		
	Primer	Intermediate	Topcoat
	MPI 22	Surface preparation and number of coats per manufacturer's instructions.	
System DFT	Per Manufacturer		

EXTERIOR PAINT TABLES			
DIVISION 3 - EXTERIOR STUCCO PAINT TABLE			
	Elastomeric; MPI EXT 9.1C		
	Primer	Intermediate	Topcoat
	N/A	MPI 113	MPI 113
System DFT	16 mils		
Primer	As recommended by manufacturer		
Topcoat	Coating to match adjacent surfaces. Surface preparation and number of coats in accordance with manufacturer's instructions		
	Apply sufficient coats of MPI 113 to achieve a minimum dry film thickness of 16 mils		
DIVISION 4 - HYDRAULIC STRUCTURES PAINT TABLE			
Formula C-200a. Coal Tar-epoxy (Black) Paint:	Paint shall conform to SSPC Paint 16 manufactured with Type 1 pitch.		

INTERIOR PAINT TABLES			
DIVISION 1 - INTERIOR CONCRETE PAINT TABLE			
Vertical surfaces, not specified otherwise:			
	High Performance Architectural Latex; MPI INT 3.1C-G5 (Semigloss)		
	Primer	Intermediate	Topcoat
	MPI 50	MPI 141	MPI 141
System DFT	4 mils		
Concrete ceilings, uncoated:			
	Latex Aggregate; MPI INT 3.1N		
	Primer	Intermediate	Topcoat
	N/A	N/A	MPI 42
System DFT	Per Manufacturer		
Topcoat	Coating to match adjacent surfaces		
Texture - Medium	Surface preparation, number of coats, and primer in accordance with manufacturer's instructions.		
Concrete Floors:			
	Epoxy; MPI INT 3.2C-G6 (Gloss)		
	Primer	Intermediate	Topcoat
	MPI 77	MPI 77	MPI 77
System DFT	5 mils		
Primer may be reduced for penetration per manufacturer's instructions.			
DIVISION 2 - INTERIOR CONCRETE MASONRY UNITS PAINT TABLE			
Concrete Masonry	High Performance Architectural Latex; MPI INT 4.2D-G5 (Semigloss)		
Filler	MPI 4		
	Primer	Intermediate	Topcoat
	N/A	MPI 141	MPI 141
System DFT	11 mils		
Fill all holes in masonry surface			
Concrete masonry units in areas requiring a high degree of sanitation, and other high humidity areas unless otherwise specified:	Epoxy; MPI INT 4.2G-G6 (Gloss)		

INTERIOR PAINT TABLES			
Filler	MPI 116		
	Primer	Intermediate	Topcoat
	N/A	MPI 77	MPI 77
System DFT	10 mils		
Fill all holes in masonry surface			
DIVISION 3 - INTERIOR METAL, FERROUS AND NONFERROUS PAINT TABLE			
Interior Steel / Ferrous Surfaces			
Metal, Mechanical, Electrical, Fire extinguishing sprinkler systems including valves, conduit, hangers, supports, surfaces adjacent to painted surfaces (Match surrounding finish), exposed copper piping, and miscellaneous metal items not otherwise specified except floors, hot metal surfaces, and new prefinished equipment:	Alkyd; MPI INT 5.1E-G6 (Gloss)		
	Primer	Intermediate	Topcoat
	MPI 79	MPI 48	MPI 48
System DFT	5.25 mils		
Metal floors (non-shop-primed surfaces or non-slip deck surfaces) with non-skid additive (NSA), load at manufacturer's recommendations:	Epoxy; MPI INT 5.1L-G6 (Gloss)		
	Primer	Intermediate	Topcoat
	MPI 101	MPI 77	MPI 77 (plus NSA)
System DFT	5.25 mils		
Metal in areas requiring a high degree of sanitation, and other high-humidity areas not otherwise specified except floors, hot metal surfaces, and new prefinished equipment:	Alkyd; MPI INT 5.1E-G6 (Gloss)		
	Primer	Intermediate	Topcoat
	MPI 79	MPI 48	MPI 48
System DFT	5.25 mils		
Ferrous metal in concealed damp spaces or in exposed areas having unpainted adjacent surfaces:	Aluminum Paint; MPI INT 5.1M		
	Primer	Intermediate	Topcoat
	MPI 79	MPI 1	MPI 1
System DFT	4.25 mils		
Miscellaneous nonferrous metal items not otherwise specified, except floors, hot metal surfaces, and new prefinished equipment. Match existing surrounding finish:	Alkyd; MPI INT 5.4J-G6 (Gloss)		
	Primer	Intermediate	Topcoat
	MPI 95	MPI 48	MPI 48
System DFT	5 mils		

INTERIOR PAINT TABLES			
Hot metal surfaces including smokestacks subject to temperatures up to 400°F:	Heat Resistant Enamel; MPI INT 5.2A		
	Primer	Intermediate	Topcoat
	MPI 21	Surface preparation and number of coats per manufacturer's instructions	
System DFT	Per Manufacturer		
Ferrous metal subject to high temperature, up to 750°F:	Inorganic Zinc Rich Coating; MPI INT 5.2C		
	Primer	Intermediate	Topcoat
	MPI 19	Surface preparation and number of coats per manufacturer's instructions	
System DFT	Per Manufacturer		
Surfaces made bare cleaning to SSPC-SP10/NACE No. 2 subject to temperatures up to 593°C (1100°F):	High Heat Resistant Coating; MPI INT 5.2D		
	Primer	Intermediate	Topcoat
	MPI 22	Surface preparation and number of coats per manufacturer's instructions	
System DFT	Per Manufacturer		
DIVISION 4 - INTERIOR WOOD PAINT TABLE			
Wood and plywood not otherwise specified			
	High Performance Architectural Latex; MPI INT 6.4S-G5 (Semigloss)		
	Primer	Intermediate	Topcoat
	MPI 39	MPI 141	MPI 141
System DFT	4.5 mils		
Wood and Plywood, except floors; natural finish or stained:			
	Stained, oil-modified polyurethane; MPI INT 6.4E-G4		
Stain	MPI 90		
	Primer	Intermediate	Topcoat
	MPI 57	MPI 57	MPI 57
System DFT	4 mils		
Wood surfaces in areas requiring a high degree of sanitation, and other high humidity areas not otherwise specified:			
	Alkyd; MPI INT 6.3B-G6 (Gloss)		
	Primer	Intermediate	Topcoat
	MPI 45	MPI 48	MPI 48
System DFT	4.5 mils		
Wood Doors; Natural Finish or Stained:			
	Stained, oil-modified polyurethane; MPI INT 6.3E-G4		
Stain	MPI 90		
	Primer	Intermediate	Topcoat
	MPI 57	MPI 57	MPI 57
System DFT	4 mils		
Sand between all coats per manufacturer's recommendations.			

INTERIOR PAINT TABLES			
DIVISION 5 - INTERIOR PLASTER, GYPSUM BOARD, TEXTURED SURFACES PAINT TABLE			
Plaster and Wallboard not otherwise specified:			
High Traffic Areas	High Performance Architectural Latex; MPI INT 9.2B-G5 (Semigloss)		
	Primer	Intermediate	Topcoat
	MPI 50	MPI 141	MPI 141
System DFT	4 mils		
Offices	Institutional Low Odor / Low VOC Latex; MPI INT 9.2M-G3 (Eggshell)		
	Primer	Intermediate	Topcoat
	MPI 50	MPI 145	MPI 145
System DFT	4 mils		
Plaster and wallboard in areas requiring a high degree of sanitation, and other high humidity areas not otherwise specified.			
	Alkyd; MPI INT 9.2C-G5 (Semigloss)		
	Primer	Intermediate	Topcoat
	MPI 50	MPI 47	MPI 47
System DFT	4 mils		

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Control room furnishings.

1.02 ACTION SUBMITTALS

A. Shop Drawings and Product Data with material samples, showing furnishing layouts, dimensions, model numbers, hardware, trim, and accessories.

B. Color samples upon award of Contract.

1.03 QUALITY ASSURANCE

A. Manufacturer: Company specializing in manufacture and installation of control room furnishings with minimum of 5 years experience.

B. Manufacturer's product test data, performed and certified by independent testing agency, showing that product meets specified manufacturer's product.

C. Furnishings shall be suitable for use in control room environment manned 24 hours per day on continuous basis.

PART 2 PRODUCTS

2.01 CONTROL CONSOLES

A. Provide control consoles for Unit 1 and Unit 2.

B. Features: Provide dual pole mounts for operator displays for up to 18 operator displays per unit.

C. Arrange control consoles in horseshoe arrangement.

2.02 ENGINEERING WORKSTATION CONSOLE

A. Quantity: 1 per Unit.

B. Features: Provide working surface for up to 4 computer workstations.

2.03 PRINTER STATION

A. Quantity: 1 per Unit.

B. Features: Provide working surface for up to 3 printers.

2.04 TASK CHAIRS

A. Quantity: 4 per Unit.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install furnishings only after painting has been completed.

B. Install in accordance with manufacturer's instructions.

C. Damaged material shall be replaced.

D. Furnishings shall be protected until accepted by Owner.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Design, furnish, and install pre-engineered shop-fabricated metal building frame; insulated metal wall and sloped roof system including soffits, gutters and downspouts, roof-mounted equipment curbs, and exterior doors, windows, overhead doors, louvers, and foundations with trim and accessories.

1.02 SUBMITTALS

A. Shop Drawings and Product Data:
1. Shop painting, finishing, colors, profiles, sizes, spacing, and locations of primary and secondary structural framing members, connections, attachments, gutters, downspouts, overhangs, service and man doors, windows, roof ventilators, insulation, and openings.
2. Foundation sizes, locations, and details.
3. Welded connections using standard AWS welding symbols. Indicate net weld lengths.
4. Location, magnitude and direction of column loads. Dead load, live load, and wind and seismic load shall be listed separately and direction of applied force to foundation clearly indicated for each loading. Indicate designed stress and deflection analysis. Submit prior to start of preparation of foundation detailed shop drawings.
5. Framing anchor bolt settings, sizes, and locations from datum. Indicate wall and roof system dimensions, panel layout, general construction details, anchorages and methods of anchorage, and methods of installation.

B. Submit Contractor's and manufacturer's warrantees as outlined below.

C. Prepare Shop Drawings and calculations with a written certification and seal of a professional structural engineer registered in accordance with Dominican Republic laws. Certification shall verify building system design and metal roof system design (including panels, clips, and support system components) meet indicated loading requirements and codes of authorities having jurisdiction. Certification shall reference specific dead loads, live loads, snow loads, wind loads/speeds, tributary area load reductions (if applicable), concentrated loads, collateral loads, seismic loads, end use categories, governing code bodies including year, and load applications.

D. In addition to mill certifications of structural steel, manufacturer shall provide, upon request, evidence of compliance with specifications through testing independent of manufacturer's suppliers. Quality assurance testing shall include structural bolts, nuts, screw fasteners, mastics, and metal coatings (primers, metallic coated products, and painted coil products).

1.03 QUALITY ASSURANCE

A. Perform work in accordance with AISC 360-05, AISC 341-05, and MBMA Low Rise Building Systems Manual.

1.04 QUALIFICATIONS

A. Manufacturer: Company specializing in manufacturing products specified in this section with minimum 5 years' documented experience.

B. Erector: Company specializing in performing Work of this section with minimum 5 years documented experience. Approved by manufacturer.

C. Design structural components, develop Shop Drawings, and perform shop and Site work under direct supervision of Professional Engineer experienced in design of this Work and licensed in accordance with Dominican Republic laws.

1.05 WARRANTY

A. Furnish manufacturer's 20-year weathertight written warranty. Warranty shall be signed by metal roofing system manufacturer and metal roofing system contractor.

B. Furnish manufacturer's 20-year film and color life written warranty for factory-finished metal coating systems against cracking, crazing, chipping, peeling, chalking, or fading. Warranty shall be signed by building system or roof manufacturer and state coating contains polyvinylidene fluorine (PVDF).

C. Contractor shall furnish signed 1-year material and workmanship written warranty.

PART 2 PRODUCTS

2.01 DESIGN CRITERIA

A. Basic design criteria, rationally applied to structure and its components specified herein, shall conform to applicable sections relating to design requirements and allowable stresses of following publications:
1. AISC "Specification for the Design, Fabrication, and Erection of Structural Steel for Buildings."
2. AISI "Specification for the Design of Cold-Formed Steel Structural Members."
3. AWS "Structural Welding Code."
4. MBMA "Low Rise Building Systems Manual."

B. Material standards:
1. Structural steel members: ASTM A36/A36M A529/A529M A572/A572M, Grade 50 or as recommended by manufacturer of pre-engineered building.
2. Structural tubing: ASTM A500, Grade B.
3. Bolts, nuts, and washers: ASTM A325/A325M, galvanized to ASTM A153/A153M.
4. Plate or bar stock: ASTM A529/A529M.
5. Galvanizing: ASTM A123/A123M.
6. Anchor bolts: A36/A36M, galvanized to ASTM A153/A153M or as recommended by manufacturer of pre-engineered building.
7. Welding materials: AWS D1.1; type required for materials being welded.

C. Design loads shall include live load, collateral load, wind load, seismic load, and dead load of structure and accessories:
1. Dead load: Weight of structural frame and all other materials of building system.
2. Collateral loads shall be applied to entire structure to account for weight of additional permanent materials other than building system, such as sprinklers, mechanical systems, electrical systems, hung partitions, and ceilings. Allowance does not include weight of hung equipment weighing 50 lb (22 kg) or more.
3. Mechanical loads: Equipment loads of 50 lb (22 kg) or more shall be investigated and structure (frame, purlins, girts) shall be strengthened as required. Contractor responsible for providing building manufacturer magnitude and approximate location of concentrated loads greater than 50 lb (22 kg). Provide 6" (150 mm) minimum wide structural member to support mechanical equipment.
4. Roof live loads: 20 psf (1 kPa) applied in accordance with MBMA-01 and International Building Codes.
5. Wind loads.
6. Auxiliary (dynamic live) loads such as superimposed loads resulting from building machinery, hoists and cranes.
7. Seismic loads: Primary and secondary members and covering shall be designed for all applicable loads and combinations of these loads as set forth in MBMA "Low Rise Building Systems Manual."
8. Design building to withstand anticipated construction loads.
9. Elevated floor framing loads.
10. Vertical live loads: Roof covering shall be designed for either 50 psf (2.5 kPa) uniformly distributed or a 200 lb (90 kg) concentrated (point load over a 1' x 1' (300 mm x 300 mm) area) located at center of maximum roofing (panel) span. Most severe conditions shall govern.

11. Cranes:
    a. Support cranes with capacity greater than 10 tons (9 metric tons) by structural system which is separate from building frames.
    b. Obtain crane loads from crane manufacturer and apply in accordance with MBMA-01 for design of crane runways and supports.
    c. Cranes, girders, rails, end trucks, stops, and bumpers shall be provided by crane manufacturer.
    d. For buildings in which overhead bridge crane is supported by crane columns, crane columns shall not be tied to building frame by rigid bracing, but shall have their own independent method of supporting crane longitudinal forces. Connections carrying crane lateral forces into building frames shall be designed and constructed to allow for difference in required erection tolerances between building frame and crane support members.

D. Roof construction shall carry UL construction (uplift) rating of not less than Class 90.

E. Locate end wall columns and girts to clear door, window, and louver openings.

F. Complete design calculations shall be made available to Owner.

G. Building shall be provided with additional steel framing around roof and wall openings, and roof curbs adequate for design loads.

2.02 DEFLECTION CRITERIA

A. Lateral drift of building rigid frames shall not exceed height/200 under wind loads using a 50-year mean recurrence interval wind velocity.

B. Lateral deflections of rigid building frames shall be compatible with siding and roofing systems furnished and concrete block walls.

C. Design masonry support systems to withstand all imposed loads with a maximum vertical deflection of span/600.

D. Design metal panel support systems to withstand all imposed loads with a maximum vertical deflection of span/180.

E. Building columns, girts and purlins providing lateral support for metal panels shall have maximum lateral deflections under wind loads no greater than span/180 using a 50-year mean recurrence interval wind velocity.

F. Building columns, girts and purlins providing lateral support for masonry walls shall have maximum lateral deflections under wind loads no greater than span/400 using a 50 year mean recurrence interval wind velocity.

G. Elevated floors shall be designed in accordance with AISC Steel Design Guide Series Volume 11, "Floor Vibrations Due to Human Activity". Design shall satisfy acceptance criteria for human comfort for office occupancy.

H. Elevated floors shall be designed for a maximum live load deflection of span/240.

2.03 FOUNDATION DESIGN

A. Basic design criteria, rationally applied to foundation and anchor bolts shall conform to applicable sections relating to design requirements and allowable stresses of the following publications:
    1. IBC "International Building Code" (2009).
    2. ACI 318 "Building Code Requirements for Reinforced Concrete."

B. Footing parameters:
    1. Footings: Proportion to withstand building loads as specified.

2. Design foundations to achieve a factor of safety of 1.5 for uplift and overturning.

C. Maximum net allowable soil bearing pressure shall be in accordance with geotechnical report.

2.04 COMPONENTS

A. Building arrangement and size: See Section 01 30 00.

B. Primary framing:
1. Type: Rigid frame design, with solid-web frame consisting of tapered or uniform depth beams rigidly connected to vertical pin-based columns with "Z" shaped purlins.
2. Secondary floor beams, braced end frame, end wall wind columns, and wall diagonal bracing.

C. Secondary framing: Purlins, girts, eave struts, flange bracing, wind bracing, head, jamb, roof opening framing, sill supports, clips, and other items.

D. Wall and roof system: Preformed metal panels of vertical profile, with subgirt framing/anchorage assembly, accessory components, and reinforced draped roof insulation. Liner panel to eave strut.

E. Roof pitch and slope: 0.25:12 minimum to 4:12 maximum for rigid frame and continuous beam design.

F. Anchor bolts, structural steel, girts, bracing, purlins, and miscellaneous framing required for roof and wall openings.

G. Flashings, fastenings, closure strips, girt trim, and base trim.

H. Gutters and downspouts.

I. Flashing vent stack through roof and other required roof penetrations.

J. Prefabricated roof curbs.

K. Doors and frames.

L. Windows and frames.

M. Louvers.

2.05 ANCHOR BOLTS

A. Provide anchor bolt assemblies for building columns to suit column loads.

B. Provide washers and heavy hexagon heads and nuts on anchor bolts unless specified otherwise.

C. Do not prime paint surfaces which are to be embedded in concrete.

D. Anchor bolts shall be installed in accordance with manufacturer's recommendations.

2.06 EXTERIOR COVERING MATERIAL

A. Wall and fascia panels: Wall system insulated sandwich panel with concealed fasteners, 22-gage steel (0.75 mm) flat, 36" (900 mm) wide panels with 2" (50 mm) minimum thick poured-in-place non CFC, blister-free polyurethane, 92% minimum density, 2.0 lbs/cu ft (32.1 kg/sq m).

B. Roof panels: Standing seam roof system, 16" (400 mm) minimum wide, 24-gage (0.6 mm) minimum thick panel.

C. Material:
   1. Wall panels: Aluminum zinc coating, minimum Grade 33 conforming to ASTM A792. .
   2. Roof panels: Aluminum zinc coating, minimum Grade 33 conforming to ASTM A792.

D. Finish:
   1. Wall panels: Fluoropolymer containing 70% PVDF resin.
   2. Roof panels: VSR standing seam roof system: Butler-Cote 500, fluoropolymer containing 70% PVDF resin.

E. Roof openings:
   1. Openings 12" (300 mm) or smaller: May be flashed and sealed to roof panel, providing complete structural support and weathertightness is maintained.
   2. Openings larger than 12" (300 mm) round or square:
      a. Frame with welded metal base, fabricate from 0.07" (2 mm) minimum thick aluminum.
      b. Support base and its appurtenances by roof purlins and/or header framing, if required.
      c. Base shall have minimum projection of 6" (150 mm) above weather surface of roof and configuration of flanges shall match roof panel.
      d. Seal flange-to-panel joint with nonhardening sealant and fastened in such manner to provide complete support and weathertightness.

F. Covering panels: Full height of walls as shown.

G. Exposed exterior bolts and fasteners: Stainless steel; use neoprene washers for fastenings for covering sheets.

H. Provide base zee flashing, eave trim, eave trim supports, cap flashing, closures, gutters, fascia, downspouts, and other exposed trim. Same finish as wall and roof panels.

2.07 INSULATION

A. Provide for exterior walls and roof.

B. Roof insulation:
   1. Vinyl scrim, foil faced, glass fiber.
   2. Thickness: As required.
   3. Flame spread rating: Not more than 25.
   4. Smoke development: 50.
   5. Fuel contribution: 50.

C. Wall insulation: Installed in sandwich wall cavity between ribs of exterior wall panel.

D. Install tightly draped over roof purlins and within exterior panels with foil facing interior. Join sheet edges by either stapling through rolled flaps or taping.

2.08 ACCESSORIES

A. Trim: Provide trim, flashings, closures, and framing materials as required for finishing walls, roof, and openings. Finish shall match wall and roof panels.

B. Prefabricated curbs:
   1. Fabricate from 14-gage (2.0 mm) minimum galvanized sheet steel, welded construction, with extended flange for mounting and constructed to keep top of curb level. Chemically clean galvanized surfaces and paint curb 1 coat of rust-inhibitive primer.
   2. Insulation: Rigid-type, 1-1/2" (38 mm) thick installed with protective metal cover.
   3. Type and size: To suit mechanical requirements.
   4. Finish shall match roof panels.
   5. Curb flashing.

C. Gutters and downspouts:
   1. Manufacturer's standard roof gutters drop box outlet, downspout straps, and downspouts complete with supports and fastenings.
   2. Finish: Match building panels.
   3. Size system to adequately carry rainwater in accordance with local codes regarding anticipated maximum rainfall.

D. Pipe flashing:
   1. Construct of ethylene propylene diene monomer (EPDM) rubber.
   2. Bond ductile aluminum reinforcing ring to rubber flange on base of flashing unit.
   3. Design flashing to allow for movement where required.

E. Exterior swing doors:
   1. Sizes: 3'-0" minimum.
   2. Type: Manufacturer's standard hollow metal, insulation filled, 20-gage (0.9 mm) galvanized face sheets shop primed for field painting.
   3. Provide doors complete with door frames, wall framing, and hardware, including ball bearing hinges, locksets, closers, thresholds, and weatherstripping.
   4. Hinges: 4-1/2" x 4-1/2" (115 mm x 115 mm) full mortise, template-type, loose pin, ball bearing, painted steel.
   5. Locksets: Heavy-duty cylinder lock and guarded latch bolt; match Owner's existing standards.

F. Windows:
   1. Provide building manufacturer's standard slider aluminum windows.
   2. Main frame and sash member shall have nominal wall thickness of not less than 0.062" (1.6 mm).
   3. Provide completely assembled windows with factory glaze or open for field glazing. Factory glass shall be 1/8" (3.2 mm) or 3/16" (4.8 mm) double strength or 5/8" (16 mm) or 1" (25 mm) insulating glass.
   4. Finish: Paint exposed surfaces with silicone polyester enamel, mineral brown color in accordance with AMMA 603.8.
   5. Screens: Frames shall be extruded aluminum, mineral brown color with 16/18 metal gray screen cloth.

G. Provide drip lips at door heads of swing doors.

H. Louvers:
   1. Manufacturer's standard louver.
   2. Provide framing required to support louver.
   3. Provide insect screen for each louver.
   4. Finish: To match building panels.

I. Provide weatherproof roof curbs and metal flashings at all roof penetrations.

2.09 PAINTING

A. See Section 09 90 00.

2.10 COLORS

A. Exterior wall and roof panel color: Selected from manufacturer's full range of standard colors after award of Contract.

PART 3 EXECUTION

3.01 INSTALLATION

A. Verify foundations are installed correctly.

B. Verify anchor bolts are installed as indicated on anchor bolt Shop Drawings.

C. Erect pre-engineered building in accordance with manufacturer's instructions, Drawings, and other erection documents.

D. Provide temporary bracing, shoring, blocking, bridging, and securing of components as required during erection process.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. General electrical requirements for equipment and services including, but not limited to:
1. Factory wiring.
2. Low voltage field wiring.
3. Low voltage splices and terminations.
4. Low voltage cabinets and electrical enclosures.
5. Equipment safety grounding.
6. Low voltage fuses and fuse blocks.
7. Electrical meters.
8. Control relays and switches.
9. Pushbuttons.
10. Indicating lights.
11. Alarm and trip contacts.
12. Low voltage starters.
13. Low voltage circuit breakers and disconnect switches.
14. Auxiliary power transformers.
15. Power factor correction capacitors.
16. Outlet, pull, and junction boxes.
17. Plates and covers.
18. Wiring devices,
19. Welding receptacles.
20. Panelboards.
21. Welding.
22. Shop finish.
23. Rust-inhibiting compounds.
24. Galvanizing.
25. Packaging, identification, and tagging.
26. Nameplates.
27. Trip setting coordination.
28. Grounding and bonding.
29. Fireproofing and fire ratings.
30. Testing and demonstration.

1.02 CLOSEOUT SUBMITTALS

A. Operation and maintenance manuals. Provide at minimum:
1. Itemized equipment list.
2. General description and technical data.
3. Receiving, storage, installation, and testing instructions.
4. Operating and maintenance procedures.
5. Complete set of final drawings requiring no further action.
6. Complete documentation of inspections and tests performed, including logs, curves, and certificates. Documentation shall note any replacement of equipment or components that failed during testing.
7. Spare parts list.
8. Lubrication recommendations.
9. Warranty information.

1.03 MAINTENANCE MATERIALS

A. Extra materials: Provide touchup paint in same type and color to repair at least 25% of finish-painted equipment surface. Paint shall be sufficient to perform touch-up painting in accordance with shop-applied material instructions for repair painting.

B. Each piece of equipment shall be furnished with special tools as required for installation, maintenance, and dismantling of equipment.
   1. Furnish in quantities as necessary to complete work on schedule.
   2. Tools shall be new and shall become property of Owner.
   3. Tools and intended use shall be identified in assembly instructions. Tools shall only be used for their intended purpose.

1.04 QUALITY ASSURANCE

A. Manufacturer qualifications:
   1. Manufacturer of equipment specified shall be recognized in industry for normally supplying this type of equipment.
   2. Manufacturer shall be ISO certified.
   3. When requested by OWNER, provide list of similar equipment installations that have employed identical equipment from manufacturer.

B. Installer qualifications:
   1. Installer shall be skilled in trade and shall have thorough knowledge of products and equipment specified.
   2. Cutting, drilling, trenching, or channeling necessary to properly install equipment shall be performed by competent skilled crafts people in safe, professional manner.

C. Regulatory requirements: Perform electrical construction in accordance with NEC and local codes as applicable to job site.

D. Materials and equipment furnished for permanent installation shall be new, unused, and undamaged.

E. Asbestos not allowed.

F. Parts shall be manufactured to industry standard sizes and gages to facilitate maintenance and interchangeability. Metric sized components not allowed unless specifically requested and approved.

1.05 DELIVERY, STORAGE, AND HANDLING

A. Pack, ship, handle, and store in accordance with manufacturer's requirements.

B. Ship equipment completely factory assembled unless physical size, arrangement, configuration, or shipping and handling limitations make this impracticable. Shipping splits and required field assembly shall be identified with equipment submittals.

C. Costs associated with sections, accessories, or appurtenances requiring field assembly shall be Contractor's responsibility.

D. Separately packaged parts and accessories shall be consolidated and shipped together with equipment. Mark each container clearly to identify contents and as belonging with main equipment.
   1. Provide individual weatherproof itemized packing slips attached to outside of each container for contents included. Provide duplicate inside each container.
   2. Attach master packing list, covering accessory items for equipment, to main piece of equipment.
   3. Mark each container with project identification number for equipment and container number followed by total number of containers.

E. Equipment shall be suitably protected during shipment, handling, and storage. Damage incurred during shipment shall be repaired at no cost to Owner.

F. Protect coated surfaces against impact, abrasion, and discoloration.

G. Electrical equipment and insulation systems shall be protected against ingress of moisture. Use space heaters if necessary to protect against moisture.

H. Exposed threads shall be greased and protected.

I. Pipe, tube, and conduit connections shall be closed with rough usage plugs. Seal and tape open ends of piping, tubing, and conduit.

J. Equipment openings shall have covers, and taped to seal equipment.

K. Store materials in clean, dry place. Protect from weather, dirt, water, construction debris, and physical damage in accordance with manufacturer's instructions.

1.06 SCHEDULING

A. Coordinate with Owner early and late shipping and delivery schedules for items requiring storage and handling at Site.

1.07 WARRANTY

A. Electrical equipment shall be provided with manufacturer's standard warranty, but not less than 1 year.

PART 2 PRODUCTS

2.01 DESIGN CRITERIA

A. Service conditions: Provide equipment and material suitable for intended service and installation at location indicated.

B. Low-voltage auxiliary and control power.
   1. Electrical power for ac control and instrumentation equipment:
      a. Provide devices necessary for proper operation and protection of equipment during electrical power supply and ambient temperature fluctuations specified.
      b. Design for continuous operation at any voltage from 85% to 110% of nominal voltage. Dropout voltage shall be 60% of nominal for relays and 75% for contactors and starters.
   2. Electrical power for dc devices:
      a. Design for continuous operation on ungrounded station battery system, capable of maintaining operation at any voltage from 80% to 112% of nominal voltage.
      b. Electrical devices served shall not impose ground connection on supply.

C. Auxiliary power: Design auxiliary equipment for low voltage service, with electrical power designed to operate from one of nominal electrical power sources as follows and as indicated on Drawings:

Volts	Phase	Frequency
480Y/277	3 or 1	60
208Y/120	3 or 1	60
120/240	1	60
125	1	Dc

2.02 FACTORY WIRING

A. Select cable for electrical and environmental conditions of installation, and suitable for unusual service conditions where encountered.
   1. Proper temperature application cable shall be used throughout, but shall be not less than 90ºC rated.
   2. Conductors routed over hinges shall use extra-flexible stranding.

3. Cable insulation shall be rated for maximum service voltage used, but not less than 600 volts.
4. Splices not allowed.

B. Panel, control cabinet, switchboard, motor control center, and switchgear wiring shall use flame retardant cross-linked polyethylene (XLP) or flame retardant ethylene-propylene rubber (EPR) insulation that meet or exceed requirements of UL 44 for Types SIS, and XHHW.
1. Minimum size: No. 14 AWG (1.5 mm^2).

C. Instrumentation, thermocouple, and thermocouple extension wire shall use twisted shielded pairs/triads having flame retardant cross-linked polyethylene (XLPE) insulation, and chlorinated polyethylene (CPE) jacket.
1. Minimum size: No. 16 AWG (1.0 mm^2).
2. Conductor type:
   a. Instrument: Annealed copper Class B stranding.
   b. Thermocouple: Solid alloy, ANSI MC 96.1.
3. Provide each pair/triad with shield.
4. Shielding shall consist of aluminum-polyester tape and flexible strand tin-coated No.18 AWG (0.75 mm^2) copper drain wire.
5. Drain wire for each instrument cable shall be insulated with spaghetti sleeve. One end of shield wire shall be terminated on grounded terminal.
6. Cables shall pass IEEE 1202 and ICEA 70,000 Btu/hr vertical tray flame test, and each conductor shall pass UL VW-1 flame test.

D. Terminations:
1. Conductor terminal connectors shall be insulated, ring tongue, compression type connectors properly sized for conductor and terminal.
   a. Connectors shall be constructed of copper and shall be tin-plated.
   b. Interior surface of connector wire barrel shall be serrated; exterior surface of connector wire barrel shall be furnished with crimp guides.
2. Uninsulated terminal connectors shall be used for conductors terminated on devices equipped with individual fitted covers, such as, but not limited to, control switches and lockout relays.
3. Connections requiring disconnect plug and receptacle type devices shall be provided with factory-terminated conductors on each plug and receptacle.
   a. Plugs and receptacles shall be factory wired into junction boxes containing terminal blocks for external connections.
   b. Conductors on disconnect portion of plug-receptacle assemblies shall be in common jacket.
4. Prior to shipment of equipment, remove temporary wiring installed in factory for equipment testing.
5. Current transformers shall terminate on shorting type terminal blocks. Ship with shorting jumpers installed.

E. Identification and labeling:
1. Provide conductor identification sleeve on each end of each internal conductor. Mark each sleeve with opposite end destination identification with nonsmudging, permanent black ink. Sleeves shall be UV-resistant self-adhesive type or PVC, not less than 1/2" long.
2. Permanently label each terminal block, terminal, conductor, relay, breaker, fuse block, and other auxiliary devices to coincide with identification indicated on manufacturer's drawings.

2.03 FIELD WIRING

A. Nationally or internationally recognized cable manufacturer shall produce cable provided.
1. Metal-clad cable, NEC Type MC, may not be substituted in place of cable and conduit unless specified otherwise, or unless approved in writing.
2. Comply with code and Project requirements directly associated with use of each cable type.

B. Cables specified are for voltages 600 volts and below.

C. Wiring shall be annealed, bare copper with not less than 98% conductivity, unless specified otherwise.

D. General-purpose building conductor used on interior lighting circuits and general-purpose branch circuits routed entirely in conduit shall be single conductor.
   1. Voltage rating: 600-volt.
   2. Conductor: Class B, solid or stranded, annealed, uncoated copper, minimum size No. 12 AWG ($4.0mm^2$).
   3. Insulation: Polyvinyl chloride (PVC) complying with NEC for type THHN or THWN.
   4. Jacket: Overall clear nylon jacket applied over conductor insulation, UL-listed as gasoline and oil resistant.
   5. Cables shall pass IEEE 383 70,000 Btu/hr, UL Standard 83 for Type THHN or THWN wire.
   6. Color coding:
      a. Provide conductor sizes No. 8 AWG and smaller in following colors:
         1) Source voltage of 208Y/120 volts:
            a) Phase A: Black.
            b) Phase B: Red.
            c) Phase C: Blue.
            d) Neutral: White.
         2) Source voltage of 120/240 volts:
            a) Phase A: Black.
            b) Phase B: Red.
            c) Neutral: White.
         3) Source voltage of 480Y/277 volts:
            a) Phase A: Brown.
            b) Phase B: Orange.
            c) Phase C: Yellow.
            d) Neutral: Gray.
      b. Sizes No. 6 AWG and larger shall be black and color-coded with field-applied tape.
   7. Installations in dry or damp locations shall utilize THHN and installations in wet locations shall utilize THWN.

E. Single-conductor, low-voltage power cable for motors, feeders, branch circuits, and dc circuits routed in conduit, duct bank, or cable tray:
   1. Voltage rating: 600-volt.
   2. Conductor: Annealed, bare copper, Class B, stranded, minimum size No. 12 AWG ($4.0mm^2$).
   3. Insulation: Cross-linked polyethylene (XLPE), complying with NEC Type XHHW-2. Insulation shall be sunlight resistant and cable tray (CT) rated.
   4. Jacket: None.
   5. Color coding: Black.
   6. Wire shall be identified by surface marking indicating manufacturer, conductor size, conductor material, voltage rating, UL symbol, and listed type.
   7. Cables shall pass IEEE 383 70,000 Btu/hr, ICEA T-29-520, 210,000 Btu/hr vertical tray flame tests, and UL 1581, VW-1 vertical flame test.
   8. Temperature rating: 90° C for normal operation in wet or dry locations.

F. Multiconductor, low-voltage power cables for motors, feeders, and branch circuits routed in cable tray, conduit or duct bank:
   1. Voltage rating: 600-volt.
   2. Conductors: Annealed, bare copper, Class B, stranded, minimum size No. 12 AWG ($4.0mm^2$).
   3. Insulation: Cross-linked polyethylene (XLPE) complying with NEC Type XHHW-2.
   4. Jacket: Flame-retardant, heat, moisture, and sunlight-resistant; polyvinyl chloride (PVC).
   5. Color coding: Insulated phase conductors shall be black and shall have printed numbers in accordance with ICEA Method 4. Each cable shall be identified by means of surface ink printing indicating manufacturer, number of conductors, size, metal, voltage rating, and UL listing as suitable for cable tray use.
   6. Phase conductors shall be cabled together with Class B stranded, bare copper grounding conductor and fillers. Ground wire size shall comply with requirements of UL 1277.
   7. Cover cable assembly with helically applied polyester binder tape with minimum 10% overlap.
   8. Cables shall pass IEEE 383 70,000 Btu/hr, and ICEA T-29-520, 210,000 Btu/hr vertical tray flame test.
   9. Temperature rating: 90° C for normal operation in wet or dry locations.

G. Multiconductor, low-voltage power cables for motors fed from adjustable speed drives, any installation.
   1. Voltage rating: 600-volt.
   2. Conductors: Annealed, bare copper, Class B, stranded, minimum size No. 10 AWG (4.0mm^2)
   3. Insulation: Flame-retardant, cross-linked polyethylene (XLPE) complying with physical and electrical requirements for NEC Type XHHW-2.
   4. Jacket: Flame-retardant, polyvinyl chloride (PVC).
   5. Armor/shield: Continuously welded and corrugated high conductivity aluminum.
   6. Ground conductors: 3 segmented Class B strand, annealed copper conductors sized to meet requirements of UL 1569.
   7. Marking: Insulated phase conductors shall be black and shall have printed numbers in accordance with ICEA Method 4. Each cable shall be identified by means of surface ink printing indicating manufacturer, number of conductors, size, metal, voltage rating, and UL listing.
   8. Cables shall pass IEEE 1202 70,000 Btu/hr, and ICEA T-29-520, 210,000 Btu/hr vertical tray flame tests, and individual conductors UL-approved and marked with FT-4 designation.
   9. Rated for Class 1, Division 1 hazardous locations.
   10. Temperature rating: 90°C maximum continuous operating temperature in wet or dry locations.

H. Multiconductor cable for control, interlocks, current transformers (CTs), voltage transformers (VTs), routed in cable tray and conduit:
   1. Voltage rating: 600-volt.
   2. Conductors: Annealed, bare copper, Class B, stranded, CT minimum size No. 10 AWG (6.0mm^2), VT minimum size No. 12 AWG (4.0mm^2).
   3. Insulation: Flame-retardant, cross-linked polyethylene (XLPE) or complying with NEC Type XHHW-2.
   4. Jacket: Flame-retardant, heat, moisture, and sunlight-resistant; polyvinyl chloride (PVC).
   5. Conductors shall be cabled together with nonhygroscopic fillers.
   6. Cover cable assembly with helically applied binding tape with minimum 10% overlap.
   7. Color coding: Insulated conductors shall have colored insulation meeting ICEA Method 1, Table E-2 color code (K2 color code).
   8. Each cable shall be identified by means of surface ink printing indicating manufacturer, number of conductors, size, voltage rating, and UL listing as rated for cable tray.
   9. Cables shall pass IEEE 383 70,000 Btu/hr, and ICEA T-29-520, 210,000 Btu/hr vertical tray flame tests.
   10. Temperature rating: 90° C for normal operation in wet or dry locations.

I. Instrumentation cable installed indoor or outdoor routed in cable tray, conduit, and ducts:
   1. Voltage rating: 300-volt.
   2. Conductors: Annealed, bare copper, Class B, stranded, minimum size No. 16 AWG (1.0 mm^2).
   3. Insulation: Flame-retardant polyvinyl chloride (PVC).
   4. Jacket: Flame-retardant, heat, moisture, and sunlight resistant; polyvinyl chloride (PVC).
   5. Pairs/triads: Each twisted with lay not exceeding 2" (50 mm).
   6. Color code: Insulated conductors shall have colored insulation meeting ICEA Method 1, Table E-2 color code (K2 color code): Pairs black/red; Triads black/red/blue.
   7. Assembly:
      a. Each pair or triad shall be cabled together with aluminum/polyester tape shield helically wrapped with minimum lap of 15% of tape width and isolation tape. Entire cable assembly shall have overall aluminum/polyester tape shield helically wrapped.
      b. Flexible strand tin-coated No.18 AWG (0.75 mm^2) copper drain wire shall be helically wound between twisted conductors and tape shield.
   8. Each instrumentation cable shall be identified by means of surface ink printing indicating manufacturer, conductor size, and quantity, UL listing.
   9. Cables shall pass UL 1581, 70,000 Btu/hr flame test.

J. Thermocouple extension cable circuited in cable tray or conduit:
   1. Voltage rating: 300-volt.
   2. Conductors:
      a. No. 16 AWG solid alloy (+Chromel / -Constantan); ANSI and ASA/ISA Type "EX".
      b. No. 16 AWG solid alloy (+Chromel / -Alumel); ANSI and ASA/ISA Type "KX".

c. No. 16 AWG solid alloy (+Iron / -Constantan); ANSI and ASA/ISA Type "JX".
3. Insulation: Flame-retardant polyvinyl chloride (PVC), color code:
   a. Type EX: Purple (+) and red (-).
   b. Type KX: Yellow (+) and red (-).
   c. Type JX: White (+) and red (-).
4. Jacket: Flame-retardant, heat, moisture, and sunlight-resistant; polyvinyl chloride (PVC); color code:
   a. Type EX: Purple.
   b. Type KX: Yellow.
   c. Type JX: Black.
5. Assemble insulated conductors with 1-1/2" to 2-1/2" (38 mm to 63.5 mm) twisted lay.
6. Assembly: Provide with helically applied, laminated aluminum/polyester tape shield, with minimum lap of 15% of tape width. Flexible strand tin-coated No.18 AWG (0.75 mm^2) copper drain wire shall be helically wound between twisted conductors and tape shield.
7. Cables shall pass UL 1581, 70,000 Btu/hr flame test.

K. Provide high-temperature wire around process equipment operating at temperatures exceeding standard cable ratings.
1. Voltage rating: 600-volt.
2. Temperature rating: Up to 1000°C.
3. Conductor: Stranded, "A" nickel.
4. Insulation: Layers of ceramic fiber braids.
5. Jacket: Overall metallic sheath.

L. Category 6 communication cable circuited in tray, conduit or used for field wiring internal to cabinets.
1. Conductor: Solid, bare copper minimum No. 23 AWG.
2. Insulation: Fluorinated ethylene propylene (FEP) insulated singles.
3. Insulated conductors: Unshielded, twisted 4 pairs enclosed with a spline fluorinated ethylene propylene filler material.
4. Cable assembly shall be covered with clear "Flamearrest" jacket, sequentially marked at 2' (600 mm) intervals. Ripcord shall be integrally installed to allow easy removal of jacket material.
5. Each communication cable shall be identified by means of surface ink printing indicating manufacturer, model, or catalog number. Cable shall meet TIA/EIA Draft 9A CAT6.
6. Cables shall be capable of passing UL flame test Type CMP.

M. Twin-axial communication cable installed indoors in cable tray and conduit:
1. Voltage rating: 600-volt.
2. Conductor: One pair, bare copper, No. 18 AWG with 7 x 26 stranding.
3. Insulation: Flame-retardant polyolefin.
4. Assembly: Aluminum foil-polyester tape shield with No. 20 AWG, 7 x 28 stranded tinned copper drain wire with 100% shield coverage, and tinned copper braid shield with minimum 55% coverage. Overall cable assembly shall be Type "PLTC."
5. Jacket: Polyvinyl chloride (PVC).
6. Cable shall be UL-listed 1581 for flame resistance.
7. Temperature rating: 75°C in dry maximum operating temperatures in dry locations.

N. Fiber cable systems: Reference specification section 40 95 33-23-13.

O. Uninsulated and Insulated grounding conductors:
1. Voltage rating: 600V, green XHHW-2, when insulated.
2. Conductors: Class B, stranded, bare copper.

2.04 SPLICES AND TERMINATIONS

A. Splices, except as in lighting and general purpose power circuits specified below, not allowed unless required for connection to equipment.

B. Temperature rating of splices and terminations: No less than 75°C.

C. Splices allowed in lighting and general-purpose power circuits.
   1. Provide wire and cable connectors of high-conductivity, corrosion-resistant material with contact area equal to at least current carrying capacity of wire or cable.
   2. General lighting and general-purpose building power circuits:
      a. Twist-type, insulated spring connectors for splices on solid or stranded conductors smaller than No. 6 AWG.
      b. Use indent, hex screw, or bolt clamp-type connectors, with or without tongue for splices on solid or stranded conductors No. 6 AWG and larger.
      c. Apply insulating 600-volt tape.

D. Insulating tapes and compounds for terminations and splices: UL-listed for intended use, location, and voltage by manufacturer.

E. Termination of conductors to equipment with bolted connections:
   1. Use compression type lugs:
   2. Compression lugs for cables 250 kcmil and larger shall have at least 2 clamping elements of compression indents, and provision for at least 2 bolts for joining to apparatus terminals.
   3. Crimping hand tools used for securing conductors in compression type connectors or terminal lugs shall be made for purpose and conductor sizes involved.
   4. Crimping tools shall be ratchet-type preventing tool from opening until crimp action is completed.
   5. Tools shall be product approved by connector manufacturer.

F. Terminals:
   1. Conductors No. 10 AWG and smaller: Marathon 1500 Series.
   2. Conductors larger than No. 4/0 AWG: Terminate to tinned copper bus bar drilled and tapped with standard NEMA sized and spaced holes.

G. Coordinate sizes and types of conductor terminals for 600-volt power cable terminations in equipment with furnished conductor and terminal connector data.

H. Provide 600-volt rated terminal blocks for instrumentation and control conductors for connection to circuits external to specified equipment, and for internal circuits crossing shipping splits.
   1. Use crimp-on terminals matching termination point terminations in manufacturer-furnished panels. Splices not allowed.
   2. Terminal blocks for thermocouple extension wire: Buchanan "Medium Duty" with thermocouple contacts or Marathon 200 Series with Omega Engineering, Inc. Type TL terminal lugs.
   3. Furnish with white marking strips.
   4. Where permitted by safety codes and standards, provide without covers. Neither step-type terminal blocks nor angle mounting of terminal blocks allowed.
   5. Fuses may be mounted on terminal blocks.
   6. Maximum 2 conductors in accordance with termination point.

I. Terminal blocks for external connections shall leave from centrally mounted location, not from individual devices in enclosure.
   1. Group-in instrument and control compartment for easy accessibility.
   2. Provide sufficient space on each side of each terminal block to allow orderly arrangement of leads to be terminated on block.
   3. Locate auxiliary equipment in compartments, enclosures, or junction boxes so service personnel will have direct access without interference from structural members and instruments without removal of barriers, cover plates, or wiring.
   4. Do not mount terminal blocks in compartments containing cables or buses operating at voltages above 600 volts.
   5. Size for wire sizes of incoming conductors as necessary.

J. Install shorting-type terminal blocks nearest current transformer in accessible location for each set of CTs supplied with equipment furnished, no other shorting-type terminal blocks allowed, unless specified otherwise.

K. Install din-rail mounted miniature circuit breakers (MCB) for protection of VT circuits on line and load side. Breakers shall have alarm contacts wired to terminal blocks.

L. Terminate each conductor in multiconductor control cable or as shown on Drawings. Provide 10% spare terminals for circuit modifications.

M. Each control switch and lockout relay shall have minimum of 4 spare normally open and 4 spare normally closed contacts wired out to terminal blocks.

N. Circuit identification number listed on either circuit schedule or panel schedule shall be used to identify circuit, positioned as near as possible to end of each conductor on multiple single wire circuits and on cable jacket for multiconductor cables.

O. Cable designations shall be visible after installation without requiring physical movement of cable.

2.05 ELECTRICAL ENCLOSURES

A. Size junction boxes, pull boxes, and enclosures in accordance with requirements of NEC.

B. Junction boxes and pull boxes 4" (100 mm) trade size or smaller in any dimension shall be galvanized malleable iron, or cast ferrous metal NEMA rated for installed location. Do not use concentric knockouts.

C. Junction boxes, pull boxes, and electrical enclosures larger than 4" (100 mm) trade size in any dimension shall be as follows, unless required otherwise.
   1. NEMA rating for electrical enclosures installed in nonhazardous locations:
      a. Indoor:
         1) Dry environmentally controlled area: NEMA 12.
         2) Noncorrosive wet or hose-down area: NEMA 4.
         3) Corrosive wet or hose-down area: NEMA 4X
      b. Outdoor: NEMA 4X.
   2. Construct noncast-metal electrical enclosures from reinforced steel plate capable of supporting devices mounted on or within enclosure without deflection. Steel plate thickness shall conform to UL requirements.
   3. Enclosures shall be of adequate strength to support mounted components during shipment and installation.
   4. Conduit entrances: Field drilled.
   5. Electrical equipment enclosures located in outdoor, wet, or hose down areas shall be provided with space heaters. Provide space heaters completely wired within enclosure. Provide following:
      a. Space heater.
      b. Adjustable thermostat with set point temperature indicator.
      c. One miniature circuit breaker protective device.
      d. Space heaters, thermostat, and protection shall not interfere with cable into or out of enclosure, or with maintenance or replacement of devices within enclosure.
      e. Use of space heaters shall not change or discolor any painted surface.
      f. Space heater capacity shall maintain enclosure internal temperature above dew point under specified service conditions.
      g. Space heaters: Rate for 240 volts ac minimum, and size for operation on applied voltage of 120 volts ac.

D. Outdoor electrical enclosures with ventilating openings:
   1. Louver on outdoor electrical equipment and protect in accordance with NEMA type.
   2. Equip openings on outdoor electrical equipment with fine mesh filters and stainless steel bug screens.

2.06 OUTLET BOXES

A. Outlet boxes for concealed wiring systems: Sheet metal, galvanized or cadmium plated.

B. Minimum 4" (100 mm) square, 1-1/2" (38 mm) deep, sized to accommodate devices and number of conductors in accordance with NEC. Equip with plaster ring or cover as necessary for flush finish.

C. Exposed conduit systems shall have surface-mounted boxes unless specified otherwise. Boxes for exposed wiring in nonhazardous, noncorrosive, and nonweatherproof locations shall be malleable iron, cadmium finish or cast aluminum alloy, minimum 4" (100 mm) square, 1-1/2" (38 mm) deep.

D. Enclosures shall be as required for areas in which they are installed and as specified.
   1. Boxes: Install flush in masonry construction and design for intended use.
   2. Recessed boxes:
      a. Where fixture is mounted, boxes shall be minimum 4" (100 mm) and octagonal in shape or 4" (100 mm) square by 1-1/2" (38 mm) deep with round plaster ring.
      b. Where used as junction box, boxes shall be minimum 4" (100 mm) square by 2-1/8" (53 mm) deep.
   3. Outlet boxes for wall concealed telephone and signaling systems: 4" (100 mm) square by 1-1/2"(38 mm) deep, minimum. Furnish with plaster ring and cover plate.
   4. Floor boxes for floor outlets:
      a. Cast-metal with threaded conduit entrances, brass flange ring and brass duplex flap cover plate.
      b. Watertight with leveling and adjustment screws for adjusting cover plate to finished floor.
      c. Minimum 4" (100 mm) diameter and 3-1/2" (88 mm) deep with approved gasket or seal between adjusting ring and box.
   5. Floor outlets for combination signaling, data, and power outlets: Construct of steel base, PVC housing, and steel bracket to allow feed through wiring and activation load-bearing support. Box construction shall meet UL 514A requirements.
      a. Entire housing shall be removable for unrestricted access.
      b. Once assembled, PVC housing shall be capable of carrying 6,000 lb (2722 kg) load.
      c. Coordinate outlet requirements with communication system requirements.
   6. Floor boxes in 2-hour rated floors shall be secured in cored hole and shall be UL classified and listed for 2-hour rated floors.

2.07 PULL AND JUNCTION BOXES

A. Furnish junction boxes and pull boxes were shown on Drawings, and where necessary to facilitate pulling wires and cables without damage.

B. Above ground boxes shall be formed from sheet steel, with corners folded in and securely welded with inward flange on each of 4 edges.

C. Drill box for mounting and attachment of cover; galvanize after fabrication.

D. Cover: Construct of one-piece galvanized steel and provide with stainless steel round head machine screws.

E. Box and cover shall be made of code gage steel, or heavier if shown on Drawings.

F. Size: Minimum 4-1/2" (113 mm) deep and in accordance with NEC. Use next larger standard size when necessary in accordance with manufacturer standard sizes.

G. Furnish pull and junction boxes without knockouts for field drilling.

H. Enclosures shall be as required for areas in which installed and in accordance with requirements specified.

I. Underground boxes: Specifically design and construct for intended installed location, and be either pre-formed concrete or PVC. Covers shall be capable of withstanding, without failure, type of traffic in general area.

J. If pull and junction boxes are exposed in and around architecturally finished surfaces, paint box to match finish of nearby surfaces, unless indicated otherwise.

K. Bolt-on junction box covers 3'-0" (900 mm) square or larger, or heavier than 25 lb. (11 kg) shall have permanent rigid handles. Covers larger than 3'-0" x 4'-0" (900 mm x 1200 mm) shall be split.

2.08 EQUIPMENT SAFETY GROUNDING

A. Install exposed raceway electrically continuous. Conduit and tray shall not be considered to be only ground conductor.

B. Furnish equipment that is part of integral shipping unit or assembly with bare copper ground conductor extending to central ground connection lug. Lug shall be suitable for field connection to local ground. Electrical equipment shall be considered any device that is energized.

C. Single-point ground connections required for proper operation of electronic equipment shall be insulated from equipment safety ground. Such connections shall be extended, using insulated cable, to single insolated termination point suitable for field connection to appropriate ground system.

D. Conduits containing power circuits shall have ground conductor installed inside conduit. Ground conductor shall be bonded to equipment or tray or duct ground at both ends.

E. Provide ground bushing on each conduit containing power circuit. Connect ground bushings together inside enclosure and to enclosure ground lug or ground bus.
   1. Use No. 8 AWG conductor for ground bushings trade size 1-1/2" (38 mm) and smaller.
   2. Ground bushings larger than 1-1/2" (38 mm) shall be sized in accordance with requirements of NEC, but in no case shall bushings be smaller than No. 8 AWG.

F. Ground conductor: Uninsulated, Class B standard, round soft drawn uncoated copper as defined in ICEA S-19-81, unless specified otherwise.

G. Hardware: Clamps, bolts, washers, nuts, and other hardware used with grounding conductor shall be copper, copper alloy, high copper alloy, or silicon bronze.

2.09 PIN AND SOCKET CONNECTORS

A. Unless shown on Drawings, not allowed.

2.10 ELECTRICAL METERS

A. Meters for measuring electrical quantities shall be utility grade, multifunction, switchboard-type with accuracy of ±0.2% or better for volts and amperes, and 0.4% for power functions.

B. Readouts shall have true RMS capability with at least 1/2" (13 mm) high intensity LED displays and be capable of surge withstand exceeding IEEE C37.90.1.

C. Instruments checked in field and found to be inaccurate in excess of percent error shall be returned for replacement without cost to Owner.

D. Design meters for operation through 5-ampere current transformer secondary and 120-volt voltage transformer secondary.

E. Provide communications capability; coordinate with Owner.

2.11 CONTROL RELAYS

A. General service, industrial grade auxiliary relays rated 600-volt.

B. Contacts: Reversible from N.O. to N.C. in field.

C. Timing relays for critical service: Agastat Series 7000.

2.12 CONTROL SWITCHES

A. Multistage, rotary-type rated 120 volts ac or 125 volts dc, 3 amperes, as required.

B. Handles: Black, fixed, modern, pistol grip type. Provide engraved black plastic escutcheon plates with targets.

C. Provide with colored LED lamps and nameplates as required.

2.13 PUSHBUTTONS

A. Standard pushbuttons: Heavy, industrial-type rated 120 volts ac or 125 volts dc, 3 amperes, as required.

B. Provide with colored LED lamps and nameplates as required.

2.14 INDICATING LIGHTS

A. Status indicating lights: High-intensity, cluster, LED-type for panel mounting.

B. Coordinate indicating light colors with indicated conditions as follows. Indicating lights shall be energized when condition exists and shall be de-energized when condition does not exist:
1. Red: Equipment energized: such as motor running, valve open, or breaker closed.
2. Green: Equipment de-energized: such as motor stopped, valve closed, or breaker open.
3. Amber: Equipment abnormality: such as motor trip, breaker trip, or relay trip.
4. White: Monitoring of control power or trip coil: such as lockout relay trip coil monitor or breaker trip coil monitor. Light is on during normal circuit operation and off during loss of power or loss of coil.
5. Blue: Loss of control power.

2.15 ALARM AND TRIP CONTACTS

A. Alarm contacts for remote annunciation: Suitable for operation at 120 volts ac and 125 volts dc. Contacts shall be rated at least 0.5-ampere make and break, minimum.

B. Alarm contacts: Normally closed contacts that open to alarm condition.

C. Trip contacts for remote trip: Suitable for operation at 125 volts dc and rated 5 amperes make or break, minimum.

2.16 SEPARATELY MOUNTED COMBINATION MOTOR STARTERS

A. Enclosed, 3-phase, full-voltage, nonreversing, unless indicated otherwise.

B. Complete combination starter shall have minimum interrupting rating of 65 kA or greater if specified elsewhere or indicated on Drawings.

C. Starter enclosures shall have enclosure NEMA rating specified herein.

D. Provide combination starter with microprocessor-based contactor and integral electronic overload protection; minimum size shall be NEMA 1.

E. Each phase shall have microprocessor-monitored current sensor for motor running overload, phase loss and phase unbalance protection.

1. Provide Class II ground fault protection; set to 20% of maximum continuous ampere rating and have delay of 20 seconds and run delay of 1 second to prevent nuisance trip on start.
2. Single-speed starters shall be furnished with 3 current sensors. 2-speed starters shall be furnished with 6 current sensors.

F. Starters shall be furnished with motor circuit protectors (MCP) rated 600-volt.
1. Each breaker shall be manually operated with quick-make, quick-break, trip-free toggle mechanism.
2. Starters shall have external manual breaker-operating handle with provisions for up to 3 padlocks.
3. Access door shall be interlocked with motor circuit protector, so door cannot be opened while breaker is closed except by interlock override.
4. Starter contactor shall mechanically operate auxiliary contacts. Each starter shall include auxiliary contacts required for application, plus 2 spare NO and 1 spare NC contacts.
5. Provide membrane-style pushbutton control module and LED lights, if indicated on schematics, to control starter functions and indication. Pushbuttons and LEDs shall be clearly identified.
6. Verify and match control power transformers, overload protection, and sizes of starters to actual equipment furnished.
7. Size control power transformers (CPT) to supply control circuit and any additional loading simultaneously. Minimum CPT size shall be 100 volts-amperes for Size 1 starters and 150 volts-amperes for Size 2 and larger starters.
8. CPTs shall have primary leads protected, and one secondary lead protected and one secondary lead grounded. Provide DIN rail-mounted, miniature circuit breakers for protection. Fuses not allowed.
9. Starters for systems with system voltage of 120 volts or less shall not require CPT.
10. Two-speed starters and reversing starters shall be mechanically and electrically interlocked so only one set of contacts can be closed at any one time.

2.17 LOCAL SEPARATE MANUAL STARTERS

A. Separately enclosed manual starters, shall be provided with adjustable, bimetallic, Class 10 ambient-compensated, integral overload relay and fixed magnetic short-circuit trip mechanism designed to trip at 12 times maximum current rating.

B. Starters shall use high-conductivity copper for current carrying parts.

C. Size starters for motors served in accordance with NEC and manufacturer's recommendations.

D. Mount manual starters in enclosures with NEMA rating for area as specified herein.

E. If applicable, starters shall be UL-listed and CSA-certified for group installations.

F. Accessories shall be available for auxiliary contacts, trip alarm, under-voltage release, and shunt trip for field installation.

G. Starters shall be pad-lockable with 3 padlocks in "On" and "Off" position.

2.18 LOCAL SEPARATE CIRCUIT BREAKERS

A. Provide 3-pole, molded-case, separately enclosed circuit breakers of not less than interrupting rating of the fault current available to the system at the rated voltage.
1. Provide with thermal and instantaneous trip elements.
2. Breakers shall use high-conductivity copper for current carrying parts. Breaker enclosures shall have NEMA type enclosure as specified.

B. Each breaker shall be manually operated with quick-make, quick-break, and trip-free toggle mechanism. Thermal elements shall withstand sustained overloads and short-circuit currents without injury and without affecting calibration.

C. Circuit breakers shall have "On," "Off," and "Tripped" indication and shall be pad-lockable with 3 padlocks in "On" and "Off" position.
   1. Breakers rated over 70 amperes shall be rated 100% and have adjustable electronic trip units.
   2. Breakers shall be capable of adding alarm, lockout, shunt trip, and under-voltage as options.

2.19 LOCAL SEPARATE DISCONNECT SWITCHES

A. Three-pole, nonfusible, heavy-duty, rated 600-volt with continuous current rating as required by the load and overcurrent protection.
   1. Type: Either molded-case or blade.
   2. Switches shall use high-conductivity copper for current carrying parts.

B. Switches shall be positive, quick-make, and quick-break mechanisms.
   1. Switch assembly plus operating handle shall be integral part of enclosure base.
   2. Each switch shall have handle whose position is easily recognizable and which can be locked in "On" and "Off" position with 3 padlocks. "On" and "Off" positions shall be clearly marked.

C. Switches shall be UL-listed and horsepower rated. Where applicable, switches shall have defeatable door interlocks that prevent door from being opened while operating handle is in "On" position.

2.20 DC MOTOR STARTERS

A. Magnetic starters for dc service shall be suitable for starting 125 volts dc rated motors unless stated otherwise.

B. Starters shall have same features and capabilities, where applicable, as ac combination and manual starters.

C. Size starters for motor served. Coordinate system requirements with equipment manufacturer's requirements.

2.21 AUXILIARY POWER TRANSFORMERS

A. Provide separately mounted transformers as shown on Drawings.

B. Windings: Copper.

C. Transformers shall be self-air-cooled, dry-type, capable of wall- or floor-mounting, and enclosed for wiring connection by conduit. In areas where dust and dirt may be normally present, use encapsulated-type transformers.

D. NEMA enclosure type protection shall be as specified herein.

E. Provide at least 2 full kVA capacity voltage taps above and 2 full kVA capacity taps below nominal rating. Each tap shall be 2.5% step.

F. Transformer shall be capable of at least 150ºC rise above rated site maximum ambient without degrading transformer life.

G. Transformers shall be capable of continuous operation at rated kVA with normal life expectancy as defined in ANSI C57.

H. Sound level shall not exceed NEMA maximum average sound level.

I. Enclosure: Sheet steel with corrosion-resistant finish and manufacturer's standard color.

2.22 POWER FACTOR CORRECTION CAPACITORS

A. Where specified, capacitors shall be rated 3-phase, delta configuration, and rated for voltage of system to which capacitors will be connected. Capacitors shall not contain PCBs.

B. Enclosures shall be as required for areas in which they are installed and in accordance with requirements of this Specification.

C. kVA sizes indicated on Drawings are approximate. Actual rating shall be verified with manufacturer in order to improve power factor to 95% at full load.

D. Capacitors shall be complete with discharge resistors and fuses.

E. Mount as close as physically possible to motors, preferably in main termination enclosure.

2.23 PLATES AND COVERS

A. Provide finish plates and covers of appropriate type and size for wiring and control devices, signal, and communication outlets.

B. Mark each plate and cover to show circuit and panel designation. Unless indicated to be engraved plate, use self-sticking, clear membrane, UV-resistant labels with typed black letters. Handwritten labels not allowed.

C. Coordinate color with adjacent surfaces.

D. Raised cover galvanized steel plates shall be acceptable for use on surface-mounted outlet boxes in unfinished areas where weatherproof plates are not required.

E. For weatherproof installations, cover plates shall be gasketed and rated for NEMA Type 4 installation.

F. Device plate mounting hardware shall be countersunk and finished to match plate.

2.24 WIRING DEVICES

A. Where more than one flush device is indicated in same location, mount devices in gangs under common plate.

B. Switches for control of ac lighting panel load circuits, single-pole, 3-way, and 4-way, shall be premium, heavy-duty specification-grade, and meet FS W-S-896E. Switches shall be rated for use at 120 or 277 volts and 20 amperes minimum.

C. Device color, if not shown on Drawings, shall be coordinated to match adjacent finishes.

D. Wall switches requiring pilot light indication shall have red LED pilot light when toggled "On."

E. Pulse control of lighting contactors shall be 20 amperes, 120/277 volts, momentary, double-throw, and center "Off."

F. Standard convenience outlets: Premium, heavy-duty, specification-grade, duplex, 3-wire, grounding, 20-ampere, 125-volt for 120-volt circuits, and rated 250-volts for 240 or 208-volt circuits.

G. Ground fault circuit interrupter (GFI) receptacles: Duplex, 20-ampere, and 125 volts, feed-through type.

H. Isolated ground (IG) outlets: Duplex, 3-wire, with isolated grounding terminal, 20-ampere, and 125 volts. Outlets shall be orange in color, unless specified otherwise.

2.25 WELDING RECEPTACLES

A. Coordinate manufacturer and type with Owner's requirements.

B. Provide in appropriate amperage as shown on Drawings; 600-volt, 3-phase with grounding conductors connected through fourth pole.

C. Provide 1 matching plug with appropriate woven grip and plug cap for cable size.

D. Match receptacles to equipment.

2.26 PANELBOARDS

A. Dead-front, circuit breaker type, rated for voltage, phase, with main lugs or main breaker as indicated on panel schedules.

B. Enclosure shall be NEMA-rated for installation location and capable of flush or surface mounting.

C. Enclosure cover and access door shall be hinged with breaker operating handles accessible through latchable and lockable door.

D. Typed panel directory located inside door shall have panel and circuits function clearly identified. Handwritten panel schedules not allowed.

E. Provide main and neutral buses insulated from cabinet with separate ground bus. Bus material shall be copper. Ground bus shall be similar to neutral bus in size and number of conductor terminating positions.
   1. Bond ground bus to panelboard enclosure by copper ground strap or copper conductor of appropriate size. Bond neutral bus to ground bus in accordance with requirements of NEC.
   2. Grounding bus connection to enclosure by removable screws not allowed.
   3. Bus shall be capable of terminating clamp type lugs for neutral cable in each supply conduit, and connections for neutral cable in each load circuit.
   4. Neutral bus shall be fully rated, unless specified otherwise.
   5. Isolated ground panelboards: As specified above, except isolated ground bus shall be bonded, by insulated ground conductor, back to source of separately derived system. Do not bond isolated ground bus to panelboard enclosure unless this is first point of grounding for separately derived system.

2.27 CIRCUIT BREAKERS

A. Molded-case, thermal-magnetic, bolt-in, individually front replaceable, and shall visibly indicate "On," "Off," and "Tripped" position.

B. Branch circuit breakers used for lighting circuits shall be switch duty rated, "SWD."

C. Breakers having multiple poles shall be manufactured as common trip type.

D. Interrupting rating shall be not less than interrupting rating of panelboards, and not series rated to achieve required short circuit interrupting rating.

E. Provide handle clips for 10%, or minimum of 2 whichever is greater, for breakers to prevent casual operation. If no breakers are indicated for installation, then provide on breakers labeled as spare.

F. Breakers, and provisions for future breakers, shall be provided in quantities, poles, and ampere ratings shown on Drawings.

G. Molded-case circuit breakers used in ac and dc panelboards and ac load centers shall be bolt-on type, G-frame size.

2.28 FINISHES

A. Manufacturer's standard coating systems shall be factory-applied. Coating systems shall provide resistance to corrosion caused by weather and industrial environments.
   1. Surfaces inaccessible after factory or field assembly shall be protected for life of equipment.
   2. Painted surfaces shall be filled to provide smooth, uniform base for painting.
   3. Surfaces requiring field welds shall not be coated within 3" (75 mm) of field weld.

B. Coating material and application techniques shall conform to regulations of air quality management agency having jurisdiction.

C. Exterior surfaces of control and electrical equipment, including panels, cabinets, switchgear, transformers, and motors shall be manufacturer's standard colors unless specified otherwise.

D. Apply high-temperature coating systems to uninsulated equipment operating at temperatures at or above 200°F (93°C).

2.29 RUST-INHIBITOR COMPOUNDS

A. Uncoated machined and ferrous surfaces subject to corrosion shall be protected with rust-inhibitor compounds.

B. Rust-inhibitor compounds used to protect surfaces of equipment and piping exposed to feedwater or steam shall be completely water-soluble.

C. Surfaces to be field welded shall be coated with consumable rust-inhibitor compounds that will not affect quality of weld.

D. External gasket surfaces, flange faces, couplings, rotating equipment shafts and bearings shall be thoroughly cleaned and coated with rust-inhibitor compounds.

2.30 GALVANIZING

A. Galvanized structural steel members and steel assemblies shall be pickled after fabrication. Remove scale, rust, grease, and other impurities, then hot-dip galvanized in accordance with ASTM.

B. If galvanized member is to be bolted, structural bolts shall be galvanized in accordance with ASTM.

2.31 IDENTIFICATION AND TAGGING

A. Conduits inside manholes, hand holes, building entrance pull boxes, and junction boxes shall be provided with 19-gage (1 mm) stainless steel identification tags, with 1/2" (13 mm) stamped letters and numbers.
   1. Attach conduit Identification tags with stainless steel banding. Tag position shall be readily visible for inspection.
   2. Tags shall provide, as minimum:
      a. Circuit origination and destination.
      b. Voltage.
      c. Number of conductors in accordance with phase.
      d. Number of phase conductors.

B. Cables passing through or terminating in manholes, hand holes, and pull boxes shall have 19-gage (1 mm) stainless steel identification tags with stamped lettering that provides circuit identification information.

C. Provide power, control, and instrumentation cables with permanent type identification markers with typed cable numbers and from/to information at each point of termination. Cable numbers and from/to information will be provided for circuits not associated with low-voltage panelboards.

1. Position cable markers to be readily visible for inspection.
2. Cable numbers shall match those as shown on Drawings.
3. Provide wire tags at each termination point for each conductor. Tags shall be permanent, wrap around, heat-shrinkable type with typewritten information.

D. Color-code power conductors with electrical tape or provide with colored jacket.
1. Source voltage of 208Y/120 volts:
   a. Phase A: Black.
   b. Phase B: Red.
   c. Phase C: Blue.
   d. Neutral: White.
2. Source voltage of 120/240 volts:
   a. Phase A: Black.
   b. Phase B: Red.
   c. Neutral: White.
3. Source voltage of 480Y/277 volts:
   a. Phase A: Brown.
   b. Phase B: Orange.
   c. Phase C: Yellow.
   d. Neutral: Gray.
4. Source voltage of 240/120-volt delta: High-leg systems shall not be used.
5. Service entrance and equipment ground conductors shall be bare copper or green insulated conductor. Equipment bonding conductors shall be bare copper.
6. Isolated ground conductors shall be insulated; green in color with integral yellow stripe. No substitutions.

E. Signage:
1. Provide proper signage, plaque, directory and warning labels for electrical equipment and raceway in accordance with NEC requirements.
2. One-line diagram: Display unfolded and behind clear plastic so diagram is clearly visible.
3. Mount diagram to permanent structure or wall and located within sight of each feeder, branch-circuit disconnect, each service disconnect, and switchgear. Place permanent legible warning sign in conspicuous location with wording "Danger – High Voltage" required for following areas over 600 volts:
   a. A "DANGER – HIGH VOLTAGE" warning sign lettering shall be a minimum of 1" (25 mm) high and remaining lettering a minimum of 1/4" (6 mm) high.
   b. Locations:
      1) At entrances to electrical equipment vaults and electrical equipment rooms, areas, or enclosures, and manholes and hand holes, unless words are cast into access cover.
      2) At points of access to conductors on high-voltage conduit systems and cable systems.
      3) On cable trays and cable trench containing high-voltage conductors with maximum spacing of warning notices not to exceed 10' (3 m).
      4) On metal-clad and metal-enclosed switchgear panels or doors providing access to live parts over 600 volts [a], [Article 225.70].
      5) On isolated phase and nonsegregated phase bus duct, at access openings unless Owner has a differing standard.

2.32 EQUIPMENT NAMEPLATES

A. Laminated white-over-black plastic such that face is white with black letters, with 1/8" (3 mm) engraved letters securely fastened with minimum of 2 self-tapping, stainless steel screws.

B. Motor starters, either separately mounted or contained in motor control centers, shall have nameplates identifying related equipment. Where separate control and indicating lights are used, starters shall have engraved or etched legends ("Start", "Stop", etc.).Provide control stations with nameplates identifying related equipment. Control and indicating lights shall have engraved or etched legends.

C. Circuit breakers within main switchboards and distribution switchboards shall be provided with nameplates identifying related equipment being served.

D. Fused and nonfused switches shall have 2 front cover-mounted nameplates.
   1. Nameplate containing permanent record indicating switch type, manufacturer's name, catalog number, and appropriate rating for equipment served.
   2. Provide additional nameplate to identify associated equipment.

E. Panelboards shall have front cover-mounted nameplates identifying panelboard, matching information shown on Drawings and associated panel schedule. Nameplate shall have at least 4 lines of text consisting of:
   1. Line 1: Panel equipment identification number.
   2. Line 2: IEEE Voltage Designation.
   3. Line 3: Appropriate description from which power is derived, (i.e. fed from HP1 through XFMR-LP1).
   4. Line 4: Location of power source, (i.e. PP-1, NW wing).

F. Lighting and auxiliary power transformers shall have front cover-mounted nameplates identifying the transformer. Nameplate shall have at least 2 lines of text that consist of:
   1. Line 1: Transformer equipment identification number.
   2. Line 2: Location of derived power source (i.e. fed from MDB, Elec Rm Basement).

G. Nameplates shall meet requirements of NFPA 70E

2.33 HARDWARE

A. Provide hardware including, but not limited to, anchor bolts, nuts, washers, expansion anchors, wire nuts needed for installation.

B. Hardware smaller than 3/4" (19 mm) shall match NEMA standard size bolt holes on motors and electrical equipment.

2.34 LOGIC SYSTEMS FACTORY TESTING

A. Prior to shipment, test electrical equipment containing solid-state logic systems in accordance with manufacturer's standard tests for minimum of 120 hours under power.
   1. Components tested shall include electronic devices; power supplies, input-output devices, operator interface devices, and interconnecting cables provided with system.
   2. System shall be tested as complete assembly. Testing of individual components or modules not allowed as system tests.

B. System test shall include:
   1. Means of confirming logic or mathematical design response of system by simulating changes in system input.
   2. Test shall repeatedly cycle system through operations system will be expected to perform in service with loads on various components equivalent to those which will be experienced in actual service.
   3. Adjustment of power source voltages to high and low limits. Verify correct operation of system at both high and low power source voltage limits.

C. System shall be tested and verified capable of providing surge withstand capability in accordance with requirements of ANSI C37.90.1.

D. Perform tests with solid-state logic system exposed to ambient temperature appropriate to service for which associated electrical equipment is designed.

PART 3 EXECUTION

3.01 EXAMINATION OF SITE

A. Contractor shall be responsible for familiarity with Project Site conditions. Equipment furnished and installed shall be capable of withstanding most severe conditions that will be encountered.

3.02 PROTECTION OF WORK

A. Protect installed Work and provide temporary and removable protection for installed products. Control activity in immediate work area to prevent damage.

B. Damage occurring to building or equipment during installation shall be repaired or replaced to conditions existing prior to damage at no additional cost or delay to project or Owner.

3.03 INSTALLATION

A. Install equipment and materials in accordance with manufacturer's recommendations.

B. Details for equipment and systems installed in accordance with industry standard techniques will not be furnished.

C. Except as otherwise specified, equipment shall be installed plumb, square, and level.

D. Sheet metal junction boxes, equipment enclosures, sheet metal raceways, and similar items mounted on earth-bearing walls shall be separated from wall not less than 1/4" (6 mm) by corrosion-resistant spacers.

E. Substations, switchgear, motor control centers, and similar equipment located outdoors shall be permanently sealed at base. Openings into equipment shall be screened or sealed as to prevent entrance of birds, rodents, and insects the size of wasps and mud daubers.
   1. Sealing material at base shall be concrete grout.
   2. Small cracks and openings shall be sealed from inside with silicone sealant.
   3. Large openings shall use galvanized screen mesh.

3.04 TRIP SETTING COORDINATION

A. Motor overload protection shall be selected and set by Contractor based on final motor nameplate information. Size motor circuit protectors to coordinate with motor starting characteristics and overload protection. Submit summary of settings to Owner, list:
   1. Equipment project identification number.
   2. Nameplate information.
   3. Overload device trip range.
   4. Overload device setting.
   5. Trip device rating.
   6. Trip device setting if different from rated value.

B. Set trip devices and verify devices are operating within manufacturer's tolerances. Device settings will be furnished for following equipment:
   1. Medium-voltage system.
   2. Low-voltage switchgear.
   3. Secondary unit substations.

3.05 CABLE

A. Prior to installation of each cable or cable group into assigned raceway, verify that raceway has been correctly sized.

B. Replace cables pulled into wrong raceway or cut too short to rack and train.

C. Do not reinstall cables installed in wrong raceway and removed. Discard cables unless inspected and accepted by Owner's Representative in writing.

D. Carefully lay or pull circuits in cable tray so neither cables nor tray is damaged.

E. Protect cables from dirt, water, oil, damaging chemicals, and from physical injury prior to, and during installation.

F. Cables shall be cut sufficiently long to conform to contour of trays, with particular attention paid to vertical inside bends.

G. Remove excessive slack so cables lie parallel to sides of trays.

H. Multiple single-conductor power cables No. 1/0 AWG (50 mm^2) or larger installed in cable tray that constitute single power circuit shall be grouped together in triplexed or quadriplexed arrangement. Maintain cable spacing to be 2.15 x O.D. of largest conductor in group or adjacent group.

I. Multiconductor power cables No. 4/0 AWG (120 mm^2) or larger installed in cable tray shall be installed in single layer with maintained spacing of not less than 1 cable diameter of largest cable.

J. Fasten cables to cable tray with rated nylon ties to hold cables in place.

K. Perform fishing and pulling with flexible round metal tape, CO_2 propelled polyethylene cord, nylon rope, or manila rope.

L. Cable damage caused by improper pulling tension and excessive sidewall pressures shall be considered for any cable pulls that require use of mechanized cable pulling machine, whether installed underground or overhead.
   1. NEC requirements shall be used as guideline. Calculations shall be performed for duct bank runs over 300' (90 m), and for installations in conduit over 100' (30 m).
   2. Monitor pulling tension during installation of cable. Tension shall not exceed maximum recommended by cable manufacturer.
   3. To avoid damage from excessive sidewall pressure at bends, pulling tension shall not exceed cable manufacturer's recommendation.
   4. Pulling mechanisms, manual or power type, shall have rated capacity in tons legibly marked on mechanism.
   5. During installation, observer shall constantly watch dynamometer and record maximum tension achieved during pull.
      a. If excessive strain develops, stop pulling operation at once. Determine difficulty and correct.
      b. Inform Owner prior to cable pulls.
   6. Do not use woven wire cable grips. Use only pulling eyes for pulling cables.
   7. As soon as cable is pulled into place, remove pulling eyes and reseal cable.

M. Insert reliable nonfreezing type of swivel or swivel connection between pulling rope and eye to prevent twisting under strain.

N. Only use lubricants as recommended by cable manufacturer. Water-based lubricants not allowed.

O. Outside of each cable reel shall be carefully inspected. Remove protruding nails, fastenings, or other objects that might damage cable.
   1. Perform visual inspection for flaws, breaks, or abrasions in cable sheath as cable leaves reel. Pulling speed shall be slow enough to permit inspection.
   2. Damage to sheath or finish of cable shall be sufficient cause for rejecting cable.
   3. Cable damaged during installation shall be replaced at no expense to Owner.

P. Permanent radius of each bend after cable installation shall be in accordance with manufacturer's recommendations.

Q. Cable supports and securing devices shall have bearing surfaces located parallel to surfaces of cable sheath. Install to provide adequate support without deformation of cable jackets or insulation.

R. Provide adequate cable end lengths. Properly install in junction boxes and manholes to avoid longitudinal strains and distorting pressures on cable at conduit bushings and duct end bells.

S. Final inspection shall be made after cables are in place. Where supports, bushings, and end bells deform cable jacket, provide additional supports.

T. Splices, joints, and connections shall be made only in accessible junction boxes in accordance with methods specified and instructions of cable manufacturer.

U. Rough-in wiring terminated in junction boxes shall have at least 8" (200 mm) of free conductor coiled in box for connection to equipment and receptacles.

V. Circuit information for circuits originating from panelboards is indicated on panel schedules. Other circuits are identified on circuit schedule.
   1. Do not combine receptacle loads with lighting loads.
   2. Circuits fed from panelboards shall not be combined with circuits from circuit schedule.

W. Panelboard circuits are indicated as individual runs. Circuits may be combined into common conduits in accordance with rules of NEC. Perform work associated with combining of circuits at no additional cost to Owner.

3.06 WIRING DEVICES, BOXES, AND FITTINGS

A. Install galvanized or cadmium plated, threaded, malleable iron boxes and fittings in:
   1. Embedded in concrete walls, ceiling, and floors.
   2. Outdoor exposed faces of masonry walls.
   3. Locations where weatherproof cover is required by code or this specification.

B. Install galvanized or cadmium plated sheet steel boxes in:
   1. Indoor exposed faces of masonry walls.
   2. Interior partition walls.
   3. Joist supported ceilings.

C. Rigid PVC device boxes shall be installed in exposed nonmetallic conduit systems.

D. Telephone and communication conduit systems shall have separate junction boxes and pull fittings.

E. Install fire system wiring in dedicated conduit system.

F. Finish openings so standard sized cover plates can be used. Oversized plates not allowed.

G. Mount wall switches 3'-6" (1050 mm) above finished floor or grade unless specified otherwise. After circuits are energized, test wall switches for proper operation.

H. Outlets:
   1. Standard mounting height: 18" (450 mm) above finished floor, unless specified otherwise.
   2. Outlets outdoors, garages, basements, shops, storerooms, and other rooms where equipment may be hosed down: 4'-0" (1200 mm) above finished floor or grade.
   3. Surface-mount welding receptacles 4'-0" (1200 mm) above finished floor or grade.
   4. After circuits are energized, test each receptacle for correct polarity.
   5. Test GFCI receptacles for proper operation.

6. Mount wall thermostats 5'-6" (1650 mm) above finished floor unless noted otherwise. Thermostats mounted shall be suitably insulated from wall temperatures.

I. Communication outlets:
1. 18" (450 mm) above finished floor unless required otherwise.
2. Outlets outdoors, garages, basements, shops, storerooms, and rooms where equipment may be hosed down: 4'-0" (1200 mm) above floor.

J. Clock outlets: Locate 7'-0" (2.13 m) above finished floor or grade.

3.07 GROUNDING AND BONDING

A. Electrical system and equipment grounding shall be installed in accordance with NEC and shall conform to following, where applicable:
1. Ground conductors shall be bare or green-insulated in accordance with NEC.
2. Cable shall be soft-drawn copper or copper bar, sized in accordance with drawings and NEC, but not smaller than No. 12 AWG.
3. Ground cable splices and joints inaccessible upon completion of construction shall meet requirements of IEEE 837 and shall be exothermic weld or compression system type.
4. Ground cable through exterior building walls not in conduit shall enter within 3' (1 m) below finished grade and shall be provided with water stop. Installation of water stop shall include filling space between strands with solder and soldering 12" (300 mm) copper disc over cable.
5. Ground cable near base of structure shall be in undisturbed earth and as far from structure as excavation permits, but not closer than 6" (150 mm).
6. Copper ground conductor in addition to conduit connection shall ground each piece of electrical equipment.
7. Copper or high-conductivity copper alloy ground lugs or clamps shall make ground connections to equipment and ground buses. Connections to enclosures not provided with ground buses or ground terminals shall be made by clamp-type lugs added under permanent assembly bolts or under new bolts drilled and added through enclosures other than explosionproof, or by grounding locknuts or bushings. Ground cable connections to anchor bolts; against gaskets, paint, or varnish; or on bolts holding removable access covers not permitted.
8. Bond grounding system to water piping by connection to first flange inside building from main that will form good ground connection. Make connection with copper bar or strap by drilling and tapping flange and providing bolted connection.
9. Ground conductors on equipment shall be formed to contour of equipment and firmly supported.
10. Ground rods not described elsewhere shall be minimum 5/8" (16 mm) diameter by 10' (3.0 m) long, with copper jacket bonded to steel core.
11. Make connections to ground grid where shown on Drawings.
12. Verify connections by performing continuity checks.

3.08 POWER FACTOR CORRECTION CAPACITOR

A. Provide capacitors for motors where shown on Drawings.

B. Do not connect capacitors to load side of solid-state starters, reduced-voltage autotransformer starters with open transition, multispeed starters, or adjustable frequency drives.

C. Furnish galvanized angle-iron mounting stands to mount capacitors at least 4" (100 mm) above mounting surface and as close to motors as physically possible without interference for installation or maintenance.

3.09 FIREPROOFING AND FIRE RATINGS

A. Maintain fire-resistive integrity during construction.

B. Penetrations through fire-resistive structures shall be sealed with fire-resistive material compatible with construction penetration.

C. Where required by codes, local building officials, or fire marshal, furnish UL fire sealing systems and install in accordance with manufacturer's recommendations.

3.10 STARTUP AND TESTING

A. Clean equipment interiors and exteriors prior to start-up and testing.

B. Unless specified otherwise, tests performed shall be standard tests listed by ANSI/IEEE for intended equipment.

C. Equipment shall be checked and placed in service ready for operation.

D. Circuits shall be electrically tested after installation. Test power and motor circuits prior to final connection to equipment. Splices shall be complete prior to testing.
   1. Provide equipment and labor required for testing.
   2. Circuit failing to test satisfactorily shall be replaced or repaired, and retested at no additional cost to Owner.
   3. Check power and motor circuits, dc power, and control circuits for:
      a. Correct terminations.
      b. Continuity.
      c. Unintentional shorts and grounds.
   4. Check power conductors for correct phasing.
   5. Motor circuits shall be checked for proper rotation and motors "bumped" to verify correct machine rotation.
   6. Control, instrumentation, and thermocouple wire shall be checked for correct termination, continuity, freedom from shorts or grounds, and identification.
   7. Current transformer wiring shall be loop checked by injecting current at one end of loop and checking with clip-on ammeter at each field termination point to assure continuity and phase identification.
   8. Voltage transformer wiring shall be tested by applying voltage at one point and checking with voltmeter phase rotation meter and phase angle meter at each field termination point to assure continuity, identification and phase shift.

3.11 DEMONSTRATION

A. Final start-up and check out shall be completed prior to Owner acceptance of project.

B. Electrical installation shall be complete in every detail and capable of normal operation in presence of Owner or Owner's Representative to verify its readiness.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Low-voltage, single-phase, fractional horsepower electric motors rated less than 1/2 hp.

1.02 INFORMATIONAL SUBMITTALS

A. Submit with Bid: Motor list identifying equipment by name, quantity furnished for each type, horsepower or kW rating, voltage requirements, and number of phases.

B. Quality assurance data: Certified shop test reports.

1.03 ACTION SUBMITTALS

A. Shop Drawings:
1. Manufacturer's standard 8.5" x 11" motor description sheet, to include;
a. Frame size.
b. RPM at rated load.
c. Rated output.
d. Maximum driven Load capability.
e. Design type.
f. Locked rotor current.
g. Enclosure type.
h. Bearing life expectancy.
i. Enclosure type.
j. Starting method.
k. Number of speeds.
2. Interconnection wiring with terminal points clearly labeled.
3. Interface coordination details.

1.04 QUALITY ASSURANCE

A. Manufacturer's qualifications:
1. Manufacturer shall manufacture major components of motor and shall be ISO certified.
2. Manufacturer shall have produced similar equipment for minimum period of 5 years.

B. Regulatory requirements:
1. Motors shall be in accordance with applicable requirements of IEEE 841, NEMA MG-1, NFPA 70, IEEE 112, and UL 1004.

1.05 DELIVERY, STORAGE, AND HANDLING

A. During delivery and storage, handle equipment to prevent damage, denting, or scoring.

B. Store equipment and components in clean, dry place. Protect from weather, dirt, water, construction debris, and physical damage in accordance with manufacturer's instructions.

PART 2 PRODUCTS

2.01 SYSTEM DESCRIPTION

A. Motors shall be squirrel-cage, induction type conforming to standards specified.

B. Supply motors either separate or as integral component of equipment package.

C. Motors shall meet, as a minimum, the requirements of this specification.

D. Motors shall be rated to continuously supply power at rated load, and capable of supplying short-term overload condition calculated by multiplying rated horsepower of motor by service factor at rated voltage and frequency.

E. Motor shall not exceed temperature rise specified when supplying power at nameplate rated horsepower.

F. Motors installed outdoor or in corrosive environment shall conform to IEEE 841.

2.02 ENCLOSURE SYSTEM

A. Materials potentially exposed to process fluids shall be Type 316L stainless steel, or other materials not susceptible to corrosion.

B. Do not use copper or copper alloy for air coolers.

C. Coat copper conductor windings with varnish.

D. Provide drains and breathers for moisture removal.

E. Bolts and nuts exposed to environment shall be of Type 316L stainless steel.

2.03 VOLTAGE AND FREQUENCY

A. Nameplate voltage shall be 110 or 200 for operation on a 120 or 208 volt system.

B. Operating frequency shall be 60Hz.

C. Service factor:
1. Motors up to 1/8 Hp: 1.4
2. Motors 1/6 up to 1/3: 1.35

D. Motors shall run successfully at rated load and frequency with ±10% variation in supply voltage.

E. Motors shall run successfully at rated load and voltage with ±5% supply frequency variation.

F. Motors shall run successfully at rated load with combined variation of supply voltage and frequency that is not more than ±10% (sum of absolute values) of rated voltage and rated frequency provided 5% frequency variation is not exceeded.

G. Motors started directly across line shall accelerate to running speed with connected load, with maximum voltage dip of 20%, at starting.

2.04 CHARACTERISTICS

A. Motor shall be sufficient to start and operate connected loads at designated speeds in installed environment, and within operating sequence without exceeding nameplate ratings without use of service factor.

B. Torque characteristics shall conform to standard NEMA design letter designation and shall be appropriate for mechanical load served.

C. Motor in-rush current shall correspond to code letters specified in NFPA 70, Table 430.7(B).

D. Motor efficiency shall be determined in accordance with IEEE Std. 112, Method B. Efficiency at rated load shall meet or exceed the values required by the Energy Policy Act of 1992.

E. Motor shall be rated for continuous duty at rated load.

F. Sound level shall not exceed 90dBA at 3' (1 m).

G. Design for full voltage non-reversing starting or VFD control as required.

2.05 MOTOR FRAME

A. Machine sealing parts in high-accuracy to minimize breathing.

B. Where motor may be in contact with corrosive or harmful vapors, equip openings with charcoal air filters.

C. If specified for hazardous area application or required by the packaged equipment, motors shall be enclosed and UL-listed for class, division, and group designation in accordance with NEC Article 500.

D. Motor frame, end brackets, fan covers, drip shields, and bearing housing shall be corrosion-resistant. Motor supporting feet shall be an integral part of frame.

E. Provide motors with stainless steel replaceable automatic drainage fittings. Locate drain holes at low point of motor in final mounted position.

F. Drill and tap for ground lug connection. Locate bolt hole on motor frame, external to, and on same side as terminal box. Provide 1/4-20 unified inch coarse thread (UNC) hole.

G. For interchangeability, multiple motors provided as part of same system or on same piece of equipment shall have similar motor frame sizes to minimize number of different frame sizes and associated mounting dimensions.

2.06 STATOR AND STATOR ASSEMBLY

A. Maintain assembly in alignment and hold under compression by using through bolts and end rings. Provide high-grade material consistent with specified operating efficiency.

B. Insulation:
1. Multiple dips and bakes of insulating varnish.
2. Provide additional dips and bakes of insulating varnish and either use of special insulating materials or varnish treatment to prevent growth of fungus and ingress of moisture where required per site conditions.

C. Windings shall be copper.

2.07 ROTOR AND SHAFT ASSEMBLIES

A. Motor shaft shall be machined, carbon steel capable of transmitting torque produced by motor.

B. Rotor cage shall be fabricated aluminum, or integrally die-cast aluminum.

C. Dynamically balance motors by one of following means:
1. Drilling out parent metal in such a manner that structural strength of rotor is not weakened.
2. Use balance washers securely pinned in place.
3. Chiseling, sawing, or use of solder or similar deposit materials to achieve balance is not acceptable.

2.08 WINDING INSULATION AND TEMPERATURE RISE

A. Windings shall be random-wound coils with Class F insulation. Completely insulate windings and winding terminals for ungrounded system.

B. Temperature rise shall not exceed temperature for motors with Class B insulation at 40 °C ambient conditions and elevation up to 3,300 ft (1000 m) elevation.

C. Temperature rise shall not be exceeded when tested under fully rated nameplate values at site ambient conditions and elevation, but shall not exceed 80°C.

2.09 BEARINGS

A. Provide grease-lubricated ball bearings, vacuum-degassed steel, motor quality.

B. Construct and provide bearing and bearing housing with slingers and seals to prevent dirt or moisture from entering motor.

C. Provide interior bearing caps to prevent lubricant from entering motor.

D. Integrally case bearing supports as part of motor end bell. Rabbet end bell to stator assembly to ensure proper bearing alignment and air gap spacing.

E. Design bearings so damage does not occur by axial rotor movement during motor startup and shutdown.

F. Bearings shall be antifriction-type and shall have minimum rated life L10 with median life no less than 50% of L10 life, as defined by ABMA. Reliability of each bearing shall be greater than 90%.

2.10 LUBRICATION SYSTEM

A. System shall be capable of operating at least 8,000 hours without requiring addition of grease or complete change of grease.

B. Provide system with readily accessible grease inlet and outlet plugs in bearing housings to enable regreasing while motor is in service.

2.11 FANS

A. Fans shall be bidirectional, air-cooled, equipped with externally mounted, nonsparking fan and fan housing suitable for Class 1, Division 2. Fan housing shall be cast iron construction. Rotation shall be indicated by permanent, legible marker mounted on motor.

B. Fan material shall be nonsparking bronze alloy or conductive plastic. Aluminum, bronze, copper, or copper alloy not acceptable.

C. Provide stainless steel hardware.

D. Provide grounding lug inside motor lead terminal box to accommodate incoming earth conductor. Size in accordance with NEMA MG-1.

E. Motor leads shall have brass, stainless steel ferrules embossed with appropriate lead number, or leads imprint with lead number. Tagging of main leads shall be in accordance with MG-1 2.60 and shall allow determination of motor rotational direction.

F. Fit with neoprene gaskets.

G. Main terminal boxes shall be capable of rotation in 90° increments to permit connection on any one of four sides.

H. Provide motor lead seal and separator gasket between motor frame and terminal box.

I. Provide main terminal boxes with threaded conduit entrances or hubs for cable glands. Coordinate size with Engineer.

J. Motor leads shall have oil-resistant insulation.

K. Electrical connections shall be tinned.

2.12 IDENTIFICATION AND TAGGING

A. Securely attach embossed, stainless steel nameplates with stainless steel screws or pins.

B. Nameplate shall contain standard information in accordance with NEMA MG-1 40.1 and as follows:
1. Year of manufacture.
2. Type of bearing lubricant and specification number.
3. Arrow indicating direction of rotation for main lead connections.
4. Bearing type and manufacturer's part number.

C. If identification number cannot be included on motor nameplate, provide separate stainless steel equipment identification nameplate in accordance with equipment identification as provided by Owner.

D. Motor power and space heater circuits may be derived from different sources. Covers of motor terminal boxes containing space heater leads shall be provided with nameplate reading: "ISOLATE MOTOR AND HEATER CIRCUITS BEFORE REMOVING COVER".

2.13 SOURCE QUALITY CONTROL

A. Perform shop tests in accordance with NEMA MG-1 for each motor and provide documentation as specified.

B. Where standard designs have been type tested, type test documentation may be furnished for each of tests instead of performing physical tests.

PART 3 EXECUTION

A. Install per manufacturer recommendations.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Low-voltage, 3-phase, fractional and integral horsepower squirrel cage induction electric motors 1/2 to 200 hp.

1.02 CLOSEOUT SUBMITTALS

A. Manufacturer's operation and maintenance manuals. Provide, at minimum:
1. Final reviewed set of drawings listed above.
2. Operating and maintenance procedures.
3. Warranty information.

1.03 QUALITY ASSURANCE

A. Manufacturer's qualifications:
1. Manufacturer shall manufacture major components of motor and shall be ISO certified.
2. Manufacturer shall have produced similar equipment for minimum period of 5 years.

B. Regulatory requirements:
1. Motors shall be in accordance with applicable requirements of IEEE 841, NEMA MG-1, NFPA 70, IEEE 112, and UL 1004.

1.04 DELIVERY, AND HANDLING

A. During delivery and handle equipment to prevent damage, denting, or scoring.

B. Ship equipment to job Site for installation.

PART 2 PRODUCTS

2.01 SYSTEM DESCRIPTION

A. Furnish motors either separately or as integral part of mechanical system. Motor horsepower and torque characteristics shall be coordinated with driven piece of equipment by manufacturer.

B. Motor rated power shall exceed driven equipment maximum load by 15% unless otherwise agreed by Owner. Service factor shall not be considered in this calculation.

C. Motors installed in an environmentally controlled indoor, non-corrosive environment shall conform to NEMA MG-1.

D. Motors installed outdoor or in corrosive environment shall conform to IEEE 841.

2.02 ENCLOSURE SYSTEM

A. Provide weather enclosure and cooling class type suitable for application and environment. Furnish motors with frames 182T and above with lifting eyes arranged so lifting slings do not become entangled in accessories mounted on motor.

B. Treat materials potentially exposed to process fluids with rust preventing compounds such as Cosmoline, Rust-Veto, or equal.

C. Do not use copper or copper alloy for air coolers.

D. Bolts and nuts exposed to environment shall be of galvanized steel.

2.03 VOLTAGE AND FREQUENCY

A. Motors shall be capable of operating within design characteristics for system source voltage as required.

B. Design motors for full-voltage, across-the-line starting unless specified otherwise.

2.04 CHARACTERISTICS

A. Torque characteristics shall conform to standard NEMA design letter designation and shall be appropriate for mechanical load served. Motor speed and rotation shall be that required by the driven equipment. Motors shall have torque characteristics adequate to "break away" driven load and to accelerate load to rated speed in length of time that is at least 2 seconds less than the hot locked rotor thermal damage time of motor.

B. Motor locked-rotor current shall not exceed 650% of full load current.

C. Efficiency at rated load shall meet or exceed NEMA Premium efficiency levels.

2.05 MOTOR FRAME

A. Type: Heavy-duty, using cast iron or welded steel construction.

B. Machine sealing parts to high-accuracy to minimize breathing.

C. If specified for hazardous areas, motors shall be enclosed and UL-listed for class, division, and group designation in accordance with NEC Article 500.

D. Motor frame, end brackets, fan covers, drip shields, and bearing housing shall be corrosion-resistant. Motor supporting feet shall be an integral part of frame.

E. Provide motors with stainless steel replaceable automatic drainage fittings. Locate drain holes at low point of motor in final mounted position.

F. Drill and tap for ground lug connection. Locate bolt holes on motor frame, external to, and on same side as terminal box. Provide hole size as follows:
   1. Motors up to 50 hp: 1/4-20 unified inch coarse thread (UNC).
   2. Motors over 50 hp and up to 200 hp: 3/8-16 UNC.
   3. Motors over 200 hp: 1/2-13 UNC.

G. For interchangeability, multiple motors provided as part of same system or on same piece of equipment shall have similar motor frame sizes to minimize number of different frame sizes and associated mounting dimensions.

H. Mount motor on equipment skid and provide provisions for alignment adjustments and belt tightening. Motor shall be factory mounted and aligned to equipment prior to shipment.

2.06 STATOR AND STATOR ASSEMBLY

A. Insulation:
   1. Multiple dips and bakes of insulating varnish.
   2. Provide varnish treatment to prevent growth of fungus and ingress of moisture.

B. Windings: Copper.

C. Windings shall be random-wound coils with class of insulation H.

2.07 ROTOR AND SHAFT ASSEMBLIES

A. Motor shaft shall be machined, carbon steel capable of transmitting torque produced by motor.

B. Rotor cage shall be fabricated aluminum, or integrally die-cast aluminum.

C. Rotor shall be epoxy-coated.

D. Dynamically balance motors by one of following means:
1. Drilling out parent metal in such a manner that structural strength of rotor is not weakened.
2. Use balance washers securely pinned in place.
3. Chiseling, sawing, or use of solder or similar deposit materials to achieve balance is not acceptable.

2.08 BEARINGS

A. Anti-friction type bearings shall be grease lubricated and have minimum rated life L10 with a median life no less than 50% of L10 life, as defined by ABMA. Reliability of each bearing shall be greater than 90%.

B. Ball bearings shall be vacuum-degassed steel, motor quality.

C. Construct and provide bearing and bearing housing seals to prevent dirt or moisture from entering motor.

D. Provide interior bearing caps or other suitable means to prevent lubricant from entering motor.

E. Integrally cast bearing supports as part of motor end bell. Rabbet end bell to stator assembly to ensure proper bearing alignment and air gap spacing.

F. Design bearings so damage does not occur by axial rotor movement during motor startup and shutdown.

G. Shaft and bearings for belt-connected motor shall withstand normal belt pull of equipment furnished and momentary and continuous overloads due to acceleration caused by incorrect belt tension.

H. Bearings for motors driving vertical pumps, including in-line pumps, shall be designed to carry 200% of maximum thrust, up and down, that pump develops during starting and stopping, and while operating at any capacity on rated performance curve.
1. Minimum momentary up-thrust capacity shall be equal to 30% of down-thrust at rated capacity.
2. Thrust bearings for in-line pump motors shall be the motor non-drive end bearing.

I. Motors rated 100 hp and above for non-VFD applications shall have non-drive end bearing insulated to prevent against circulating shaft current.

J. Motors shall have metallic bearing isolators on each bearing.

K. Furnish vertical motors coupled to vertical pumps with non-reversing ratchets and bolted couplings with case drip shields.

L. For variable frequency application, provide drive shaft grounding.

2.09 LUBRICATION SYSTEM

A. System shall be capable of operating at least 8,000 hours without requiring addition of grease or complete change of grease.

B. Provide system with readily accessible grease inlet and outlet plugs in bearing housings to enable regreasing while motor is in service.

2.10 FANS

A. Fan material shall be nonsparking bronze alloy or conductive plastic. Aluminum, bronze, copper, or copper alloy not acceptable.

2.11 SPACE HEATERS

A. Provide low surface-temperature space heaters for motors rated 75 hp or larger installed outdoor. Mount on inside of motor frame or winding end turns.

B. Sheath temperature at 110% of rated voltage, when operating at ambient temperature, shall not exceed 200°C or cause motor insulation temperature to exceed 130 °C, whichever is more restrictive.

C. Space heaters shall be suitable for installation in hazardous areas as defined by NFPA, if motor is specified to be installed in a hazardous area.

D. Route space heater power leads to dedicated terminal box for control and space heater leads.

2.12 MOTOR TERMINAL BOXES

A. Equip each motor with terminal boxes.

B. Size motor lead terminal box to allow for bending radius and stiffness of motor supply cables, and for terminating grounding conductor.
   1. Frame size 445T and below: terminal box shall be at least twice usable volume specified in NEMA MG-1, and not less than 24 in^3 (393.3 cm^3).
   2. Frame size exceeding 445T: Cast iron, cast steel, or steel plate terminal box sized according to NEMA MG-1, Figure 20-3.

C. Motor leads shall have brass or stainless steel ferrules embossed with appropriate lead number, or leads imprint with lead number. Tagging of main leads shall be in accordance with MG-1, Part 2.

D. Fit motor terminal box with neoprene gaskets.

E. Main terminal boxes shall be capable of rotation in 90° increments to permit connection on any one of four sides.

F. Provide motor lead seal and separator gasket between motor frame and terminal box.

G. Provide main terminal boxes with threaded conduit entrances.

H. Motor leads shall have oil-resistant insulation.

I. Terminate main lead electrical connections with tinned lugs.

2.13 IDENTIFICATION AND TAGGING

A. Securely attach embossed or stamped, stainless steel nameplates with stainless steel screws or pins.

B. Nameplate shall contain standard information in accordance with NEMA MG-1 40.1 and as follows:
   1. Year of manufacture.
   2. Type of bearing lubricant and specification number.
   3. Arrow indicating direction of rotation for main lead connections.
   4. Bearing type and manufacturer's part number.

C. If identification number cannot be included on motor nameplate, provide separate stainless steel equipment identification nameplate in accordance with equipment identification as provided by Owner.

D. Motor power and space heater circuits may be derived from different sources. Covers of motor terminal boxes containing space heater leads shall be provided with nameplate reading: "ISOLATE MOTOR AND HEATER CIRCUITS BEFORE REMOVING COVER".

2.14 VARIABLE SPEED MACHINES

A. Motors for variable speed application shall be inverter duty rated and operated over the speed range required by process application.

B. Provided motors with external cooling fans to force cool the machine if the operational speed range reduces integral fan performance below required levels to maintain maximum temperature rise.

C. Electrically insulate both drive end and non-drive end bearings.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install in accordance with manufacturer's recommendations.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. General electrical requirements for equipment and services including, but not limited to:
1. Auxiliary power.
2. Factory wiring.
3. Electrical enclosures.
4. Equipment safety grounding.
5. Low voltage fuses and fuse blocks.
6. Electrical meters.
7. Control relays and switches.
8. Pushbuttons.
9. Indicating lights.
10. Alarm and trip contacts.
11. Starters.
12. Circuit breakers and disconnect switches.
13. Auxiliary power transformers.
14. Power factor correction capacitors.
15. Nameplates.

1.02 WORK BY OTHERS

A. Equipment foundations and supports.

B. Receiving, unloading and storing.

C. Final placement and assembly.

D. External power, control and grounding connections.

E. Field testing and commissioning.

1.03 INFORMATIONAL SUBMITTALS

A. Product Data:
1. Equipment performance curves.
2. List of recommended spare parts required for equipment start-up, commissioning and operation.
3. List of special maintenance tools required for installation and operation of equipment.

1.04 CLOSEOUT SUBMITTALS

A. Operation and maintenance manuals. Provide at minimum:
1. Complete set of final drawings submitted for review and comment.
2. Product data.
3. Itemized equipment list.
4. General description and technical data.
5. Receiving, storage, installation, and testing instructions.
6. Operating and maintenance procedures.
7. Complete documentation of inspections and tests performed, including logs, curves, and certificates. Documentation shall note any replacement of equipment or components that failed during testing.
8. Lubrication recommendations.
9. Warranty information.

1.05 MAINTENANCE MATERIALS

A. Each piece of equipment shall be furnished with special tools as required for installation, maintenance, and dismantling of equipment.
   1. Furnish in quantities as necessary to complete work on schedule.
   2. Tools shall be new and shall become property of Owner.
   3. Tools and intended use shall be identified in assembly instructions. Tools shall only be used for their intended purpose.

1.06 QUALITY ASSURANCE

A. Manufacturer of equipment specified shall be recognized in industry for normally supplying this type of equipment and shall be ISO certified.

B. Materials and equipment furnished for permanent installation shall be new, unused, and undamaged.

C. Asbestos not allowed.

D. Parts shall be manufactured to American industry standard sizes and gages to facilitate maintenance and interchangeability. Metric sized components not allowed unless specifically requested and approved.

1.07 DELIVERY, STORAGE, AND HANDLING

A. Pack, ship, handle, and store in accordance with manufacturer's requirements.

B. Ship equipment completely factory assembled unless physical size, arrangement, configuration, or shipping and handling limitations make this impracticable.

C. Costs associated with sections, accessories, or appurtenances requiring field assembly shall be Contractor's responsibility.

D. Separately packaged parts and accessories shall be consolidated and shipped together with equipment. Mark each container clearly to identify contents and as belonging with main equipment.
   1. Provide individual weatherproof itemized packing slips attached to outside of each container for contents included. Provide duplicate inside each container.
   2. Attach master packing list, covering accessory items for equipment, to main piece of equipment.
   3. Mark each container with project identification number for equipment and container number followed by total number of containers.

E. Equipment shall be suitably protected during shipment, handling, and storage. Damage incurred during shipment shall be repaired at not cost to Owner.

F. Protect coated surfaces against impact, abrasion, and discoloration.

G. Electrical equipment and insulation systems shall be protected against ingress of moisture. Use space heaters if necessary to protect against moisture.

H. Exposed threads shall be greased and protected.

I. Pipe, tube, and conduit connections shall be closed with rough usage plugs. Seal and tape open ends of piping, tubing, and conduit.

J. Equipment openings shall have covers, and taped to seal equipment.

K. Store materials in clean, dry place. Protect from weather, dirt, water, construction debris, and physical damage in accordance with manufacture's instructions.

PART 2 PRODUCTS

2.01 DESIGN REQUIREMENTS

A. Equipment and material furnished shall be suitable for intended service and installation location at project site.

B. If equipment will be installed in or required for hazardous locations, equipment shall be carry appropriate UL-listing and have labeling for class, division, and group designation in accordance with NEC Article 500.

2.02 AUXILIARY POWER

A. Design auxiliary equipment for low voltage service, with electrical power designed to operate from one of nominal electrical power sources as follows and as indicated on Drawings:

Volts	Phase	Frequency
480Y/277	3 or 1	60
208Y/120	3 or 1	60
120/240	1	60
125	1	dc

B. Equipment package shall have a single point service connection for ac power and when required, a single point service connection for dc power.
   1. Multiple electrical loads on skid shall be served from control panel supplied with equipment package.
   2. Control panel shall include transformers required to develop voltage levels that differ for single source supply.

C. Electrical power for ac control and instrumentation equipment:
   1. Provide devices required for proper operation and protection of equipment during electrical power supply and ambient temperature fluctuations specified.
   2. Design for continuous operation at any voltage from 85% to 110% of nominal voltage. Dropout voltage shall be 60% of nominal for relays and 75% for contactors and starters.

D. Electrical power for dc devices:
   1. Design for continuous operation on ungrounded dc system, capable of maintaining operation at any voltage from 80% to 112% of nominal voltage.
   2. Electrical devices served shall not impose ground connection on supply.

2.03 FACTORY WIRING

A. Select cable for electrical and environmental conditions of installation, and suitable for unusual service conditions where encountered.
   1. Proper temperature application cable shall be used throughout, but shall be not less than 90ºC rated.
   2. Conductors routed over hinges shall use extra-flexible stranding.
   3. Cable insulation shall be rated for maximum service voltage used, but not less than 600 volts.
   4. Splices not allowed.
   5. Mineral insulation (NEC Type MI), and polyvinyl chloride (PVC) insulation and jacketing (NEC Types AWM, MTW, TA, TBS, THHN, THHW, THWN, TW, or THW) shall not be utilized.

B. Control panel cabinet and power wiring shall utilize flame retardant cross-linked polyethylene or flame retardant ethylene-propylene rubber insulation meeting requirements of UL 44 for Types SIS, and XHHW. Power wiring shall meet or exceed requirements of UL 44 for Types SIS, and XHHW.
   1. Minimum size: No. 14 AWG (1.5 mm^2).
   2. Conductors: Annealed bare copper Class B stranding passing IEEE 1202 and UL VW-1 flame test.
      a. Single conductor cables shall have moisture resistant, flame retardant ethylene-propylene rubber insulation with Hypalon jacket.
      b. Multi-conductor cables shall have moisture resistant, flame retardant cross-linked polyethylene conductor insulation (XHHW or RHW) and an overall Hypalon jacket

c. For extreme ambient conditions (in excess of 70C) use one of following:
   1) NEC Type SF-2 silicone rubber insulated cable with braided glass jacket.
   2) NEC Type FEP fluorinated ethylene-propylene insulated cable.

C. Instrumentation, thermocouple, and thermocouple extension wire shall use twisted shielded pairs/triads having flame retardant cross-linked polyethylene (XLPE) insulation, and chlorinated polyethylene (CPE) jacket.
   1. Minimum size: No. 16 AWG (1.0 mm^2).
   2. Conductor type:
      a. Instrument: Annealed copper Class B stranding.
      b. Thermocouple: Solid alloy, ANSI MC 96.1.
   3. Provide each pair/triad with shield.
   4. Shielding shall consist of aluminum-polyester tape and flexible strand tin-coated No.18 AWG (0.75 mm^2) copper drain wire.
   5. Drain wire for each instrument cable shall be insulated with spaghetti sleeve. One end of shield wire shall be terminated on grounded terminal.
   6. Cables shall pass IEEE 1202 and ICEA 70,000 Btu/Hr vertical tray flame test, and each conductor shall pass UL VW-1 flame test.

D. Terminations:
   1. Conductor terminal connectors shall be insulated, ring tongue, compression type connectors properly sized for conductor and terminal.
      a. Connectors shall be constructed of copper and shall be tin-plated.
      b. Interior surface of connector wire barrel shall be serrated; exterior surface of connector wire barrel shall be furnished with crimp guides.
   2. Uninsulated terminal connectors shall be used for conductors terminated on devices equipped with individual fitted covers, such as, but not limited to, control switches and lockout relays.
   3. Connections requiring disconnect plug and receptacle type devices shall be provided with factory-terminated conductors on each plug and receptacle.
      a. Plugs and receptacles shall be factory wired into junction boxes containing terminal blocks for external connections.
      b. Conductors on disconnect portion of plug-receptacle assemblies shall be in common jacket.
   4. Prior to shipment of equipment, remove temporary wiring installed in factory for equipment testing.
   5. Current transformers shall terminate on shorting type terminal blocks. Ship with shorting jumpers installed.

E. Identification and labeling.
   1. Provide conductor identification sleeve on each end of each internal conductor. Mark each sleeve with opposite end destination identification with nonsmudging, permanent black ink. Sleeves shall be UV-resistant self-adhesive type or PVC, not less than 1/2" (13 mm) long.
   2. Permanently label each terminal block, terminal, conductor, relay, breaker, fuse block, and other auxiliary devices to coincide with identification indicated on manufacturer's drawings.

2.04 ELECTRICAL ENCLOSURES

A. Size junction boxes, pull boxes, and enclosures in accordance with requirements of NEC.

B. Junction boxes and pull boxes 4" (100 mm) trade size or smaller in any dimension shall be galvanized malleable iron, or cast ferrous metal NEMA rated for installed location. Do not use concentric knockouts.

C. Junction boxes, pull boxes, and electrical enclosures 4" (100 mm) trade size and larger in any dimension shall be as follows, unless required otherwise.
   1. NEMA rating for electrical enclosures installed in nonhazardous locations:
      a. Indoor:
         1) Dry environmentally controlled area: NEMA 12.
         2) Noncorrosive wet or hose-down area: NEMA 4.
         3) Corrosive wet or hose-down area: NEMA 4X
      b. Outdoor:

1) Corrosive area: NEMA 4X.
2) Noncorrosive area hose-down or spray area: NEMA 4.
3) Noncorrosive area nonhose-down area NEMA 3R.

2. Construct noncast-metal electrical enclosures from reinforced steel plate capable of supporting devices mounted on or within enclosure without deflection. Steel plate thickness shall conform to UL requirements.
3. Enclosures shall be of adequate strength to support mounted components during shipment and installation.
4. Conduit entrances shall be field drilled.
5. Electrical enclosures located in outdoor, wet, or hose down areas shall be provided with space heaters. Provide space heaters completely wired within enclosure. Provide following:
   a. Space heater.
   b. Adjustable thermostat with set point temperature indicator.
   c. One miniature circuit breaker protective device.
   d. Space heaters, thermostat, and protection shall not interfere with cable into or out of enclosure, or with maintenance or replacement of devices within enclosure.
   e. Use of space heaters shall not change or discolor any painted surface.
   f. Space heater capacity shall maintain enclosure internal temperature above dew point under specified service conditions.
   g. Space heaters shall be rated for 240 volts ac minimum, and shall be sized for operation on applied voltage of 120 volts ac.

D. Outdoor electrical enclosures with ventilating openings:
   1. Louver on outdoor electrical equipment and protect in accordance with NEMA type.
   2. Equip openings on outdoor electrical equipment with fine mesh filters and stainless steel bug screens.

2.05 EQUIPMENT SAFETY GROUNDING

A. Furnish equipment that is part of integral shipping unit or assembly with bare copper ground conductor extending to central ground connection lug. Lug shall be suitable for field connection to local ground. Electrical equipment shall be considered any device that is energized.

B. Single-point ground connections required for proper operation of electronic equipment shall be insulated from equipment safety ground. Such connections shall be extended, using insulated cable, to single insolated termination point suitable for field connection to appropriate ground system.

C. Conduits that contain power circuits shall have ground conductor installed inside conduit. Ground conductor shall be bonded to equipment or tray or duct ground at both ends.

D. Provide ground bushing on each conduit containing power circuit. Connect ground bushings together inside enclosure and to enclosure ground lug or ground bus.
   1. Use No. 8 AWG conductor for ground bushings trade size 1-1/2" (38 mm) and smaller.
   2. Ground bushings larger than 1-1/2" (38 mm) shall be sized in accordance with requirements of NEC, but in no case shall they be smaller than No. 8 AWG.

E. Ground conductor: Uninsulated, Class B standard, round soft drawn uncoated copper as defined in ICEA S-19-81, unless specified otherwise.

F. Hardware: Clamps, bolts, washers, nuts, and other hardware used with grounding conductor shall be copper, copper ally, high copper alloy, or silicon bronze.

2.06 ELECTRICAL METERS

A. Meters for measuring electrical quantities shall be utility grade, multifunction, switchboard-type with accuracy of ±0.2% or better for volts and amperes, and 0.4% for power functions.

B. Readouts shall have true RMS capability with at least 1/2" (13 mm) high intensity LED displays and be capable of surge withstand exceeding IEEE C37.90.1.

C. Instruments checked in field and found to be inaccurate in excess of percent error shall be returned for replacement without cost to Owner.

D. Design meters for operation through 5-ampere current transformer secondary and 120-volt voltage transformer secondary.

E. Provide communications capability; coordinate with Owner.

2.07 CONTROL RELAYS

A. General service, industrial grade auxiliary relays rated 600-volt.

B. Contacts shall be reversible from N.O. to N.C. in field.

C. Timing relays for critical service: Agastat Series 7000.

2.08 CONTROL SWITCHES

A. Multistage, rotary-type rated 120 volts ac or 125 volts dc, 3 amperes, as required.

B. Handles shall be black, fixed, modern, pistol grip type. Provide engraved black plastic escutcheon plates with targets.

C. Provide with colored LED lamps and nameplates as required.

2.09 PUSHBUTTONS

A. Standard pushbuttons shall be heavy, industrial-type rated 120 volts ac or 125 volts dc, 3 amperes, as required.

B. Provide with colored LED lamps and nameplates as required.

2.10 INDICATING LIGHTS

A. Status indicating lights shall be high-intensity, cluster, LED-type for panel mounting.

B. Coordinate indicating light colors with indicated conditions as follows. Indicating lights shall be energized when condition exists and shall be de-energized when condition does not exist:
1. Red: Equipment energized: such as motor running, valve open, or breaker closed.
2. Green: Equipment de-energized: such as motor stopped, valve closed, or breaker open.
3. Amber: Equipment abnormality: such as motor trip, breaker trip, or relay trip.
4. White: Monitoring of control power or trip coil: such as lockout relay trip coil monitor or breaker trip coil monitor. Light is on during normal circuit operation and off during loss of power or loss of coil.
5. Blue: Loss of control power.

2.11 ALARM AND TRIP CONTACTS

A. Alarm contacts for remote annunciation shall be suitable for operation at 120 volts ac and 125 volts dc. Contacts shall be rated at least 0.5-ampere make and break, minimum.

B. Alarm contacts shall be normally closed contacts that open to alarm condition.

C. Trip contacts for remote trip shall be suitable for operation at 125 volts dc and shall be rated 5 amperes make or break, minimum.

D. Alarm and Trip contacts shall be protected from installation location site conditions by providing enclosure.

2.12 FACTORY PREWIRED ELECTRONIC CABINETS AND ENCLOSURES

A. Wiring internal to factory pre-wired electronic system cabinets shall be installed according to manufacturer's recommended standards for wire size, insulation, and method of termination on internal equipment.

B. Individual conductors of interconnecting cables shall meet flame resisting test requirements of ICEA S-19-81, Paragraph 6.19.6.

C. Identify conductors by color-coding. Insulation to match drawings and wiring lists.

2.13 COMBINATION MOTOR STARTERS

A. Enclosed, 3-phase, full-voltage, nonreversing, unless indicated otherwise.

B. Complete combination starter shall have minimum interrupting rating of 65 kA or greater if specified elsewhere or indicated on Drawings.

C. Starter enclosures shall have enclosure NEMA rating specified herein.

D. Provide combination starter with microprocessor-based contactor and integral electronic overload protection; minimum size shall be NEMA 1.

E. Each phase shall have microprocessor-monitored current sensor for motor running overload, phase loss and phase unbalance protection.
   1. Provide Class II ground fault protection; set to 20% of maximum continuous ampere rating and have delay of 20 seconds and run delay of 1 second to prevent nuisance trip on start.
   2. Single-speed starters shall be furnished with 3 current sensors. 2-speed starters shall be furnished with 6 current sensors.

F. Starters shall be furnished with motor circuit protectors (MCP) rated 600-volt.
   1. Each breaker shall be manually operated with quick-make, quick-break, trip-free toggle mechanism.
   2. Starters shall have external manual breaker-operating handle with provisions for up to 3 padlocks.
   3. Access door shall be interlocked with motor circuit protector, so door cannot be opened while breaker is closed except by interlock override.
   4. Starter contactor shall mechanically operate auxiliary contacts. Each starter shall include auxiliary contacts required for application, plus 2 spare NO and 1 spare NC contacts.
   5. Provide membrane-style pushbutton control module and LED lights, if indicated on schematics, to control starter functions and indication. Pushbuttons and LEDs shall be clearly identified.
   6. Verify and match control power transformers, overload protection, and sizes of starters to actual equipment furnished.
   7. Size control power transformers (CPT) to supply control circuit and any additional loading simultaneously. Minimum CPT size shall be 100 volts-amperes for Size 1 starters and 150 volts-amperes for Size 2 and larger starters.
   8. CPTs shall have primary leads protected, and one secondary lead protected and one secondary lead grounded. Provide DIN rail-mounted, miniature circuit breakers for protection. Fuses not allowed.
   9. Starters for systems with system voltage of 120 volts or less shall not require CPT.
   10. Two-speed starters and reversing starters shall be mechanically and electrically interlocked so only one set of contacts can be closed at any one time.

2.14 CIRCUIT BREAKERS

A. Provide molded-case separately enclosed circuit breakers with an interrupting rating not less than available at system at point of connection, at rated voltage.
   1. Provide with thermal and instantaneous trip elements.
   2. Breakers shall use high-conductivity copper for current carrying parts. Breaker enclosures shall have NEMA type enclosure as specified.

B. Each breaker shall be manually operated with quick-make, quick-break, and trip-free toggle mechanism. Thermal elements shall withstand sustained overloads and short-circuit currents without injury and without affecting calibration.

C. Circuit breakers shall have "On," "Off," and "Tripped" indication and shall be pad-lockable with 3 padlocks in "On" and "Off" position.
   1. Breakers rated over 70 amperes shall be rated 100% and have adjustable electronic trip units.
   2. Breakers shall be capable of adding alarm, lockout, shunt trip, and under-voltage as options.

2.15 DISCONNECT SWITCHES

A. Three-pole, nonfusible, heavy-duty, rated 600-volt with continuous current rating as shown on Drawings and as required by load.
   1. Type: Either molded-case or blade.
   2. Switches shall use high-conductivity copper for current carrying parts.

B. Switches shall be positive, quick-make, and quick-break mechanisms.
   1. Switch assembly plus operating handle shall be integral part of enclosure base.
   2. Each switch shall have handle whose position is easily recognizable and which can be locked in "On" and "Off" position with 3 padlocks. "On" and "Off" positions shall be clearly marked.

C. Switches shall be UL-listed and horsepower rated. Where applicable, switches shall have defeatable door interlocks that prevent door from being opened while operating handle is in "On" position.

2.16 DC MOTOR STARTERS

A. Magnetic starters for dc service shall be suitable for starting 125 volts dc rated motors unless stated otherwise.

B. Starters shall have same features and capabilities, where applicable, as ac combination and manual starters.

C. Size starters for motor served. Coordinate system requirements with equipment manufacturer's requirements.

2.17 AUXILIARY POWER TRANSFORMERS

A. Provide separately mounted transformers as shown on Drawings.

B. Windings: Copper.

C. Transformers shall be self-air-cooled, dry-type, capable of wall- or floor-mounting, and enclosed for wiring connection by conduit. In areas where dust and dirt may be normally present, use encapsulated-type transformers.

D. NEMA enclosure type protection shall be as specified herein.

E. Provide at least 2 full KVA capacity voltage taps above and 2 full KVA capacity taps below nominal rating. Each tap shall be 2.5% step.

F. Transformer shall be capable of at least 150ºC rise above rated site maximum ambient without degrading transformer life.

G. Transformers shall be capable of continuous operation at rated kVA with normal life expectancy as defined in ANSI C57.

H. Sound level shall not exceed NEMA maximum average sound level.

I. Enclosure shall be sheet steel with corrosion-resistant finish and manufacturer's standard color.

2.18 WIRING DEVICES

A. Standard convenience outlets: Premium, heavy-duty, specification-grade, duplex, 3-wire, grounding, 20-ampere, 125-volt for 120-volt circuits, and rated 250-volts for 240 or 208-volt circuits.

B. Ground fault circuit interrupter (GFI) receptacles: Duplex, 20-ampere, and 125 volts, feed-through type.

C. Isolated ground (IG) outlets: Duplex, 3-wire, with isolated grounding terminal, 20-ampere, and 125 volts. Outlets shall be orange in color, unless specified otherwise.

2.19 INSTRUMENT IDENTIFICATION

A. Provide stainless steel identification tag on instruments, gages, valves and temperature wells shown on instrument index.

B. Rack-mounted instrumentation shall have tag screwed above or below device with stainless steel hardware. Other instrumentation, control valves, valve actuators, gages and temperature wells shall have tags wired on using stainless steel wire.

C. Following information shall be stamped into each identification tag. Numbers/letters shall be minimum of 3/16" (5mm) high.
1. Purchase order number.
2. Instrument span or range.
3. Instrument identification number.

2.20 NAMEPLATES

A. Laminated white-over-black plastic such that face is white with black letters, with 1/8" (3 mm) engraved letters securely fastened with minimum of 2 self-tapping, stainless steel screws.

B. Nameplates for hazardous conditions shall be red plastic laminate engraving stock with white core.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install equipment and materials in accordance with manufacturer's recommendations.

B. Installation of equipment shall be in accordance with NEC.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Medium-voltage, 3-phase, induction, squirrel cage electric motors rated 250 hp and larger.

B. Soleplates, motor anchor bolts, and leveling screws.

1.02 CLOSEOUT SUBMITTALS

A. Operation and maintenance manuals. Provide at a minimum:
1. General description and technical data.
2. List of instruments and accessories supplied, listing manufacturer, model number, operating ranges, and equipment tag numbers.
3. Receiving, storage, installation, and testing instructions.
4. Operating and maintenance procedures.
5. Complete set of reviewed drawings that require no further action.
6. Complete documentation of inspections and tests performed, including logs, curves, and certificates. Documentation shall note any replacement of equipment or components that failed during testing.
7. Recommended spare parts list that includes bearings.
8. Lubrication recommendations.
9. Bearing temperature limits.
10. Winding temperature limits.
11. Current transformer excitation and ratio correction factor curves as applicable to specific application.

1.03 QUALITY ASSURANCE

A. Manufacturer's qualifications:
1. Manufacturer shall manufacture motor and major motor components and shall be ISO certified.
2. Manufacturer shall have produced similar equipment for minimum period of 5 years.
3. When requested by Owner, provide acceptable list of similar equipment installations complying with requirements of this Section.

B. Regulatory requirements:
1. Motors shall be in accordance with applicable requirements of ANSI C50.41, NEMA MG-1, IEEE 85, NFPA 70, and UL 1004.
2. Testing shall be performed in accordance with IEEE 112.

1.04 MAINTENANCE MATERIALS

A. Provide complete set of special tools as necessary for installation and maintenance for each piece of equipment supplied.

B. Tools and intended use shall be identified in assembly instructions.

PART 2 PRODUCTS

2.01 SYSTEM DESCRIPTION

A. Furnish motors either separately or as integral part of mechanical system. Motor horsepower and torque characteristics shall be coordinated with driven piece of equipment by manufacturer.

B. Motor rated power shall exceed driven equipment maximum load by 15% unless otherwise agreed by Owner. Service factor shall not be considered in this calculation.

2.02 ENCLOSURE

A. Provide weather enclosure and cooling class type suitable for the environmental conditions.

B. Furnish motors with lifting eyes so lifting slings do not become entangled in any apparatus mounted on motor.

C. Materials potentially exposed to process fluids or corrosive atmospheres shall be Type 316L stainless steel or other corrosion-resistant material specifically selected for expected environment.

D. Do not use copper or copper alloy for air coolers.

E. Bolts and nuts exposed to environment shall be galvanized carbon steel.

2.03 VOLTAGE AND FREQUENCY

A. Design motors for use on power system with fixed frequency or operated on variable frequency drives.

B. Design motors for full-voltage, across-the-line starting unless specified otherwise.

C. Motor locked rotor current shall be limited to 650% when started full voltage.

D. If indicated, motors shall be braced for full-voltage bus transfer from one source of power to another. Bus transfer time may take as long as 6 cycles as defined by ANSI C50.41, section 14.3.

2.04 CHARACTERISTICS

A. Motors rated up to 500hp and less than 5000V shall meet or exceed NEMA Premium efficiency levels.

B. Ratings shall include allowance for altitude and maximum temperatures as required by site conditions.

2.05 MOTOR FRAME

A. Motor frames shall be fabricated of heavy-duty cast steel or plate steel weldments. Provide access covers for inspection of windings without removal of bearings or removal of motor base from foundation.

B. Locate air inlet points above centerline of horizontal motors.

C. Machine sealing parts in high-accuracy to minimize breathing.

D. Equip air intakes with reusable stainless filters. Filters shall be surface mounted over openings and capable of replacement with machine in operation.

E. Provide differential pressure switches on each set of filters. Switches shall be Ashcroft or equal.

F. If specified for hazardous areas, motors shall be enclosed and UL-listed for class, division, and group designation in accordance with NEC Article 500.

G. Motor frame, end brackets, fan covers, drip shields, and bearing housing shall be corrosion-resistant, with motor supporting feet case as integral part of frame.

H. Provide motors with stainless steel drains and plugs. Locate drain holes at low point of motor in mounted position.

I. Drill and tap two 3/8" (10 mm), 16-pitch bolt holes in a NEMA two-hole configuration for use as ground connections.

1. Horizontal frames: Right rear motor foot and left front motor foot as viewed from drive end.
2. Vertical frames: Junction box side and opposite of junction box side.

J. Motor base shall be heavy steel construction provided with 4 vertical leveling screws to facilitate field alignment of motors and driven load.

K. Provide motor sole plates and motor anchor bolts which attach motor frame and sole plates.

2.06 STATOR ASSEMBLY

A. Windings shall be form wound copper.

B. Insulation:
1. Vacuum pressure impregnation (VPI). Windings shall undergo minimum of 2 VPI and bake cycles.
2. Provide varnish treatment to prevent growth of fungus and ingress of moisture.

C. Resistance temperature detectors (RTD) shall be 3-wire, platinum, rated 100 ohms at 0°C.
1. Provide 2 per phase in stator windings.
2. RTD leads: Insulated, stranded, copper wire extended and terminated on terminal blocks in separate instrumentation junction box.

D. Provide differential protection:
1. Both stator-phase and neutral winding leads shall be brought out to main terminal box.
2. Each set of neutral and line leads shall be run through one core-balance current transformer.
3. Rigidly mount current transformers within motor terminal housing.
4. Wire 6 current transformer leads to control terminal box, terminate on shorting type terminal blocks. Provide jumpers between Current Transformer X2 terminals and ground.

E. Motor stator slot wedges shall be non-magnetic type.

2.07 ROTOR AND SHAFT ASSEMBLIES

A. Machine motor shaft from corrosion-resistant forged steel or cold-rolled steel bar stock; capable of transmitting torque produced by motor.

B. Rotor bars and end rings shall be of copper or copper alloy. Rotor bars shall be brazed to end rings.

C. Rotor: Epoxy-coated.

D. Motor rotating components: Dynamically balanced (at rated speed) after mounting on shaft.

E. Dynamically balance motors by one of following means:
1. Drilling out parent metal in such a manner that structural strength of rotor is not weakened.
2. Use of balance washers securely pinned in place.
3. Chiseling, sawing, or use of solder or similar deposit materials to achieve balance not acceptable.

F. Rotor assembly removal:
1. Horizontal motors: Removable through either bell end of motor without requiring removal of stator assembly.
2. Vertical motors: Removable from top of motor without requiring removal of motor.

2.08 BEARINGS

A. Horizontal machines:
1. Design bearings so as not to be damaged by axial rotor movement during motor startup or shutdown.

2. Construct and provide bearing and bearing housing with slingers and seals to prevent dirt or moisture from entering motor. Provide interior bearing caps to prevent lubricant from entering motor.
3. Bearing supports: Integral to case as part of motor end bell. Rabbet end bell to stator assembly to ensure proper bearing alignment and air gap spacing.
4. Single shaft extension motors: Insulated non-drive end bearing and ground drive end shaft with shaft brushes.
5. Double shaft extension motors: Insulate non-drive end bearing and drive end shall be grounded by use of shaft grounding brushes.

B. Vertical machines:
1. Design spherical roller thrust bearings to carry 200% of maximum thrust, up and down, which pump may develop during starting or stopping or while operating at any capacity on rated performance curve.
2. Equip with spark-resistant, non-reversing ratchets, and bolted couplings.
3. Provide water cooling of thrust bearing to maintain bearing temperature below 50C when operated with driven equipment.
4. Extend guide bearing grease zerk outside of motor and pump base.
5. Provide electrically insulated thrust bearing.

C. All machines:
1. Anti-friction type bearings: Grease-lubricated; minimum rated life L10 with a median life no less than 50% of L10 life, as defined by ABMA. Reliability of each bearing shall be greater than 90%.
2. Provide bearings sized to carry imposed loads with minimum design safety factor of 2.0. Provide bearings and housings that can be removed for examination or replacement without removing rotating element.
3. Bearings shall be vacuum-degassed steel, motor quality.
4. Equip each bearing with three wire platinum RTDs rated 100 ohms at 0°C in quantities specified. Evenly space multiple RTDs around bearing. Wire and terminate RTD leads on terminal blocks in a common externally mounted instrument junction box.
5. Each bearing shall be tapped for two vibration probes mounted in an X-Y configuration, 90º apart for measuring radial vibration. If vibration probes are specified, factory wire probes to instrumentation junction box.
6. Drill and tap holes for provisions for vibration probes on bearings.
7. Shaft grounding brushes provided shall be 2" (50 mm) wide braided, silver coated, copper shaft grounding brush with copper grounding conductor routed from brush to motor grounding pad.

2.09 LUBRICATION SYSTEM

A. Bearing housing shall have extra-large oil reservoirs to serve as settling chambers.

B. Fit each sleeve bearing housing with constant-level, sight-feed oiler marked with proper oil level. Oiler shall be located at extent of motor frame, supported, and piped to bearing housing.

C. Oil system shall have sufficient surge capacity to absorb, without overflowing, oil returned from bearings when motor is stopped.

D. Fit bearing housings with fill and drain openings, slingers, equalizers, vents, and other devices to prevent loss of lubricant.

E. Inlet lines shall be not less than 1/2" (13 mm) diameter.

F. Lubricant for motors requiring forced-feed lubrication shall be supplied from same system as driven equipment.

G. Provide motors with forced lube oil supplied from driven equipment system with oil rings for startup and emergency operation and with dial thermometers to indicate oil temperature.

H. Provide motor with forced lubrication as required by site ambient conditions. Lube oil system shall heat and cool oil to maintain temperature within machine bearing limits.

I. Lube oil tank and piping, if supplied, shall be welded stainless steel construction.

J. Provide system for anti-friction bearings with readily accessible grease inlet and outlet plugs in bearing housings to enable regreasing while motor is in service.

2.10 MOTOR FANS

A. Equip totally enclosed fan cooled motors with externally mounted, nonsparking fan and fan housing. Key fan to motor shaft.

B. Equip weather-protected I, II, and open-dripproof motors with internal shaft mounted fan.

C. Fan material: Bronze alloy, fiberglass or some other nonsparking material. Aluminum, bronze, copper, or copper alloy not acceptable.

2.11 SPACE HEATERS

A. Mount low surface-temperature space heaters on inside of motor frame.

B. When operating at 110% of rated voltage and ambient temperature, sheath temperature shall not exceed 200°C.

C. Space heaters shall be rated and designed to operate at 120 voltages.

D. Space heaters shall automatically maintain temperature inside motor at 5°C above dew point.

E. Route space heater power leads to dedicated control terminal box near main terminal box.

2.12 MOTOR TERMINAL BOXES

A. Equip each motor with corrosion-resistant terminal boxes.
   1. Provide main terminal box for motor power lead terminations, house surge arrestors and capacitors as required.
   2. Provide separate control terminal box for termination of space heaters leads, current transformer terminations, filter differential pressure switch etc.
   3. Provide separate low-voltage instrument terminal box from main and control boxes. Instrument terminal box shall house terminations for RTDs, thermocouples, vibration probes, etc. Mount instrument terminal box near control terminal box.

B. Size motor main terminal box to allow for bending radius and stiffness of motor supply cables, and for terminating grounding conductor. At a minimum, size main terminal box at least one size larger than listed in NEMA MG-1.

C. Motor leads shall have brass or stainless steel ferrules embossed with appropriate lead number, or leads imprinted with lead number.

D. Motor lead connections shall be tinned.

E. Main terminal boxes shall have required bushings, standoff insulators, insulation barriers, and hardware for completing line connections.

F. Terminal boxes shall be weatherproof and dusttight, and fitted with neoprene gaskets.

G. Provide motor lead seal and separator gasket between motor frame and terminal box.

H. Provide terminal boxes with removable and gasketed bottom plate for field drilling. Knockouts not acceptable.

I. Motor lead insulation shall be oil-resistant.

J. If specified by manufacturer, current transformers, surge arrestors, and surge capacitors shall be provided and mounted in main terminal box. Main terminal box shall be increased in size accordingly.

K. Provide NEMA MG-1 Type II motor terminal housing for motors provided with current transformers, surge arrestors, capacitors, and for any machine larger than 1,000 hp.

2.13 NOISE AND VIBRATION

A. Equipment shall not exceed sound pressure levels of 85dBA at 3' (1 m) from equipment surface in accordance with NEMA MG-1.

B. Magnitude of vibration values for running speed and 120 Hz vibrations shall not exceed NEMA-MG1 requirements.

C. Provide vibration monitoring. Design to keep torsional, rotational, and reed natural frequencies of vibration at least 25% above or below motor rated speed ranges to avoid resonant vibration over operating speed range of motor and driven equipment.

D. When vibration monitoring is required, provide following equipment for each motor:
1. X and Y probes, installed: 2.
2. Thrust probes: 2.
3. Key phaser probe: 1.
4. Manufacturer: Bentley-Nevada, or equal.

2.14 SURGE ARRESTERS AND PROTECTIVE CAPACITORS

A. Provide protective capacitors and/or MOV-type arresters in motor terminal box. Bus arresters and capacitors to motor terminals.

B. Surge capacitors shall be sealed, nonflammable, and shall not contain polychlorinated biphenyl (PCB) dielectric.

C. Ratings shall correspond to system grounding type.

2.15 VARIABLE SPEED MACHINES

A. Motors for variable speed application shall be inverter duty rated and operated over speed range required by process system design.

B. Provided motors with external cooling fans to force cool machine if operational speed rangereduces integral fan performance below required levels to maintain maximum temperature rise.

C. Provide 2" (50 mm) wide braided, silver coated, copper shaft grounding brush with copper grounding conductor routed from brush to motor grounding pad.

D. Electrically insulate both drive end and non-drive end bearings.

2.16 IDENTIFICATION AND TAGGING

A. Provide motor with stainless steel nameplates attached with stainless steel screws or pins in locations clearly visible and readable without requiring unsafe condition.

B. Nameplate shall contain standard information in accordance with NEMA MG-1 and following additional information:

1. Serial number and year of manufacture.
2. Type of bearing lubricant and specification number.
3. Arrow indicating direction of rotation for main lead connections.
4. Bearing type and manufacturer's part number.
5. Current transformer ratings and polarity, if applicable.

C. Motor power and space heater circuits may be derived from different sources. Covers of motor terminal boxes containing space heater leads shall be provided with nameplate reading: "DEENERGIZE AND ISOLATE MOTOR AND HEATER CIRCUITS BEFORE REMOVING COVER."

2.17 SOURCE QUALITY CONTROL

A. Perform following routine and typical tests complying with NEMA MG-1 and manufacturer standard tests:
1. Full load current, locked rotor current, and power measurements.
2. Vibration test in accordance with NEMA MG 1.
3. Locked-rotor current measurement.
4. Full load heat run.
5. Power factor at full load, 3/4 load, 1/2 load, and under locked rotor conditions.
6. Percent slip at rated load.
7. Vibration measurements.
8. Machine noise level test in accordance with IEEE 85.
9. Breakdown torque calculation, and pullout and starting torque measurements.
10. Efficiency and power factor measurements for 1/2, 3/4, and full-rated loads in accordance with IEEE 112, Test Method B.
11. Current balance measurement.
12. Winding resistance measurement, before and after heat run.

B. Test results shall be tabulated, submitted, and accepted by Owner's Engineer prior to shipment.

C. Heat run and temperature rise testing and results shall utilize imbedded temperature detectors in accordance with NEMA MG-1 Section 20.8.

D. Defects and defective equipment revealed or noted during testing will be corrected prior to shipment.

E. Heat run test shall be performed using actual loading or dual frequency methods as defined by IEEE 112. Forward stall method is not acceptable.

F. Equipment damaged during testing shall be considered permanently damaged and shall be replaced at suppliers cost with new equipment.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install in accordance with manufacturer's recommendations.

B. Motors furnished with space heaters shall have heaters connected to temporary source of power capable of being monitored during storage.

C. Maintain temporary power until motors are installed in final position and normal power source is permanently energized.

D. Store motors and components in clean, dry place. Protect from weather, dirt, water, construction debris, and physical damage in accordance with manufacturer's instructions.

E. Perform mega-ohm meter test on all three motor leads to ground once a month. Use 10 kV mega-ohm meter for testing. Tabulate results and submit to Owner after commissioning.

F. After machine is installed into final location but before startup, maintain motor space heaters electrical supply.

G. Bump motor for proper rotation and run motor uncoupled from mechanical load for a minimum of 4 hours prior to coupling to load. Provide temporary vibration monitoring equipment during run in and submit results to Owner.

H. Flush lube oil system, if supplied, to cleanliness level required by equipment manufacturer.

I. Verify bearing oil level and adjust flow orifice from external lube oil systems to supply lube oil flow rates as specified by manufacturer.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Above grade conduit, wireway, boxes, and associated accessories for support, securing, and protection of electrical wiring.

1.02 QUALITY ASSURANCE

A. Manufacturer's qualifications.

B. Regulatory requirements: Equipment shall be designed and manufactured in accordance with applicable requirements of following: NFPA 70; ANSI C80.1, C80.3, C80.4, C80.5; UL 1, UL 6, UL 360, UL 651, UL 797, UL 870, UL 1242; and NEMA TC2, TC3, TC6, TC9, and RN1.

PART 2 PRODUCTS

2.01 SYSTEM DESCRIPTION

A. Raceway systems and accessories shall include, but not be limited to:
1. Exposed and concealed conduit.
2. Elbows, fittings, and accessories.
3. Hardware for support, securing, and protection.
4. Wireways.

2.02 RIGID METAL CONDUIT, STEEL (RGS)

A. Material: Mild steel tube with continuous welded seam in accordance with ANSI C80.1, and UL 6.

B. Exterior and Interior protective coating: Metallic zinc applied by hot-dip galvanizing or electro-galvanizing. Apply final coat of transparent zinc chromate to exterior. Exterior and interior coatings applied to conduit shall afford sufficient flexibility to permit field bending without cracking or flaking.

C. Thread pitch shall conform to ANSI/ASME B1.20.1. Taper shall be 3/4"/ft (62.5 mm/m).

D. Each length of conduit shall have UL listing label.

E. Couplings, unions, and fittings: Threaded-type, galvanized steel.

F. Conduit bodies: Threaded or threadless type, cast metal or malleable iron type with zinc or cadmium coating. Covers shall have solid gaskets and captive screw fasteners.

G. Running thread not acceptable.

2.03 RIGID METAL CONDUIT, STEEL, POLYVINYL CHLORIDE COATED (PVC-RGS)

A. Requirements of article "Rigid Metal Conduit - Steel (RGS)" shall apply.

B. Coating: Apply minimum 40-mil, gray polyvinyl chloride (PVC) coating over exterior and apply urethane coating uniform and consistent to interior of conduit. Internal coating shall be nominal 2 mil thickness. Conduit having areas with thin or no coating, not acceptable. Protect conduit threads by urethane coating. PVC coating shall have been investigated by UL as providing primary corrosion protection for rigid metal conduit.

C. Fittings, and conduit bodies: Threaded type, PVC-coated. PVC coating on outside of conduit couplings shall have series of longitudinal ribs, 40 mils in thickness, to protect coating from tool damage during installation. Manufacturer of couplings, fittings, and conduit bodies shall be same as

conduit manufacturer. Hazardous location fittings shall be manufactured prior to application of plastic coating, and shall be UL-listed.

D. PVC exterior and urethane interior coatings applied to conduit shall afford sufficient flexibility to permit field bending without cracking or flaking at temperatures above 30°F (-1°C).

2.04 INTERMEDIATE METAL CONDUIT (IMC)

A. Material: High-grade sheet steel with continuous welded seam.

B. External protective coating: Metallic zinc applied by hot-dip galvanizing or electro-galvanizing. Coating shall not flake or crack when conduit is bent. Internal coating of enamel or similar material resulting in smooth surface.

C. Fittings: Threaded or threadless type, galvanized steel or malleable iron.

D. Conduit bodies: Threaded-type, cast metal, or malleable-iron type, with zinc or cadmium coating. Covers shall have solid gaskets and captive screw fasteners

E. Running thread not acceptable.

2.05 RIGID METAL CONDUIT, ALUMINUM (RAC)

A. Material: Aluminum alloy No. 6063-T1 in accordance with ANSI C80.5, and UL 6A.

B. Fittings: Threaded type, aluminum alloy containing not more than 0.40% copper.

C. Conduit bodies: Threaded or threadless type, fabricated from aluminum alloy or cadmium-plated malleable iron. Covers shall have solid gaskets and captive screw fasteners.

D. Running thread not acceptable.

2.06 LIQUIDTIGHT FLEXIBLE METAL CONDUIT (LFMC)

A. Material: Mild steel, galvanized.

B. Construction: One continuous length steel strip of uniform weight and thickness and shaped in interlocking convolutions; fabrication shall result in smooth interior surface.

C. External coating: Provide outer jacket of tough extruded polyvinyl. Jacket shall be positively locked to steel core and be sunlight resistant and listed as oil resistant.

D. Continuous integral grounding strip: Required in sizes 1-1/4" (31 mm) and smaller. Ground wire shall be required for larger sizes.

E. Fittings: Cadmium or zinc-plated steel or malleable iron. Compression type with tapered hub and synthetic rubber gasket and ground ferrule for making positive ground contact with steel core, designed to prevent outer jacket from pulling away from steel core. Connectors shall have insulated insert in throat. Suitable for grounding through 1-1/4" (31 mm) trade size, provide ground wire lug for sizes 1-1/2" (38 mm) and larger.

2.07 REINFORCED THERMOSETTING RESIN CONDUIT (RTRC)

A. Material: Epoxy-based resin system using anhydride-curing agent. Conduit shall be UL 1684 listed.

B. Conduit shall consist of continuous E-glass roving. Additives for increasing flame spread and lowering smoke density shall be halogen free.

C. Carbon black shall be used as ultraviolet inhibitor to protect conduit and fittings.

D. Dielectric strength shall exceed 400 volts/mil when tested in accordance with ASTM D149.

E. Fittings, elbows, and accessories shall be from same manufacturer, and be manufactured from same process, using same methods and chemicals as pipe. Plastic duct plug may be PVC.

F. Conduit bodies shall be manufactured using compression molding process using vinylester resin with reinforcement glass. Bodies shall be fire resistant in accordance with UL 1684 and be halogen free.

G. Provide in standard trade sizes, minimum 3/4" (19 mm).

H. Rated for cables operating up to 90°C installed within.

I. Joining system: As recommended by manufacturer to maintain UL listing of components and system. Method shall comply with requirements of installed location.

J. Consult with manufacturer for acceptability of use for particular application.

2.08 PULLBOXES AND JUNCTION BOXES

A. General use areas, protected or indoor: Galvanized sheet steel with a metal thickness meeting UL 50. Provide removable covers attached with round head silicon bronze machine screws.

B. Process or wet locations, indoor or outdoor: Galvanized steel or aluminum with gasketed covers attached with stainless steel hardware using raintight hubs.

C. Temperate marine environment, indoor or outdoor: Aluminum with gasketed covers attached with stainless steel hardware using raintight hubs.

D. Hazardous areas: UL-approved for area classification.

E. Where required for elbows, fittings, and accessories to be furnished by same manufacturer as conduit, boxes shall also be furnished by conduit manufacturer or by supplier approved by manufacturer.

2.09 WIREWAY

A. Metal gage thickness shall conform to NEC.

B. NEMA 1: Minimum 16-gage steel with baked enamel finish, hinged or removable covers with captive stainless steel screws.

C. NEMA 3R: Minimum 16-gage galvanized steel with baked enamel finish, gasketed drip-shield cover, with stainless steel screws, weatherproof.

D. NEMA 4X: Minimum 14-gage Type 304 stainless steel with neoprene gasket, hinged cover, stainless steel external screw clamps, and external mounting tabs.

E. NEMA 12: Minimum 16-gage steel with baked enamel finish with gasketed, hinged cover with stainless steel screws, dust-tight.

F. Screws shall be guarded to prevent damage to wire installation.

G. Provide fittings, supports, end plates, and accessories as required.

PART 3 EXECUTION

3.01 INSTALLATION - GENERAL

A. Areas designated for, but not limited to; access, maintenance, hatchway, tube removal, and expansion shall be kept clear of field-routed raceway.

B. Exposed raceway runs shall be installed parallel or perpendicular to dominant surfaces with right-angle turns made with symmetrical bends or fittings.

C. Install exposed raceway minimum of 6" (150 mm) from outside surface of insulation and lagging on hot water pipes, steam pipes, and other heat sources. Install minimum of 12" (300 mm) from uninsulated heat sources. Avoid long runs parallel to heat sources.

D. Use expansion fittings where necessary. When expansion or deflection will be greater than 6" (152 mm) or greater than fitting is designed to accommodate, provide junction boxes solidly mounted on each side of expansion joint and connect with flexible, liquidtight conduit, or adjust conduit sections to limit expansion to less than 6" (152 mm).

E. Support raceway independently from equipment, and temporary or movable structures.

F. At minimum, identify raceways at both ends with raceway numbers provided by Engineer. Markers shall be adhesive, UV-resistance type with 1" (25 mm) high lettering.

3.02 USES AND LIMITATIONS

A. RGS shall general be used indoor throughout the plant and process areas. Refer to NEC for guidelines regarding use, and limitation of each type of conduit.

B. PVC-RGS: Acceptable for corrosive areas. Install conduit system in accordance with manufacturer's installation manual. Installer shall be certified by manufacturer to install coated conduit.

C. RAC: shall general be used outdoor throughout the plant and process areas, piers, facilities near costal areas or temperate marine environments.

D. IMC: Use only for circuits rated 600 volts or less. Do not use in plant process areas, in outdoor areas or areas deemed corrosive.

E. LFMC: 1/2" (13 mm) minimum size; 5' (1.5 m) maximum length.

F. RTRC: Use in such installations as, but not limited to, petrochemical, wastewater, chemical, pulp and paper, bridges, tunnels, docks, piers, and cooling tower and vicinity. May be used in other locations with approval from Engineer.

3.03 RIGID CONDUIT

A. Minimum size conduits shall be in accordance with NEC.

B. Conceal conduit in finished areas.

C. Drainage: Avoid water pockets in conduit runs; provide suitable fittings at low spots in exposed conduit where pockets cannot be avoided. Weep holes not permitted in conduit.

D. Conduit ends:
   1. Cap spare conduits with fittings designed for intended use.
   2. Conduit terminating in panels or enclosures where exposed to entrance of foreign material shall be plugged with commercial duct-sealing compound around conductors.
   3. Cap conduit ends during construction to prevent entrance of foreign material.

E. Where practicable, provide 3" (75 mm) stubbed up conduit for conduit entering into bottom of freestanding equipment. Coordinate locations with equipment. Terminate with grounding bushings.

F. Clean and swab inside of conduit by mechanical means to remove foreign materials and moisture before wires or cables are installed. Cleaning method shall not damage interior surface of conduit.

G. Bushings: Provide at termination of conduit not terminated in hubs and couplings. Insulating bushings with 150°C rated insulating inserts in metal housings shall be provided on conduit 1-1/4" (31 mm) and larger. Insulating bushings shall be grounding type. Standard bushings shall be galvanized.

H. Apply coat of zinc chromate to zinc-coated conduits where protective coating is damaged.

I. Couplings and unions:
   1. Threaded conduit couplings shall join metal conduit with conduit ends butted. Where standard threaded couplings cannot physically be used, join metal conduit using conduit unions or split couplings.
   2. Use ground-seat type, watertight unions where union may be submerged.
   3. Install coupling nut in upper-most union to prevent entrance of water into union when used in vertical or inclined conduit runs.

J. Bends: Run of conduit shall not contain more than equivalent of three 90° bends, including offsets at outlets or fittings. Use only manufacturer-approved conduit bending equipment. Do not use deformed or crushed conduits.

K. Threads: Cut ends of conduit with saw; do not use wheel cutter. Conduit end shall have same number of threads as present from factory. Apply coat of zinc chromate to steel conduit threads and apply anti-seize compound containing powdered zinc or lubricating graphite to aluminum conduit threads.

L. Use expansion joints as required such that no more than 6" (152 mm) allowance for expansion or contraction of conduit occurs.

3.04 FLEXIBLE CONDUIT

A. Connect equipment that moves due to vibration, normal operation of mechanism, or thermal expansion, in relation to supported conduit using flexible conduit. Install junction boxes as required. Provide green ground wire.

B. Flexible metal conduit 1-1/2" (38 mm) and larger shall be installed with external lugs and external grounding conductor.

3.05 SPECIAL FITTINGS

A. Hazardous areas: Rigid conduit shall be used in areas designated as Class 1 areas classified as hazardous locations in accordance with NEC.

B. Fittings installed outdoors or in damp locations shall be weathertight. Outdoor fittings shall be of heavy-duty construction.

3.06 CONDUIT SUPPORTS

A. Supports of structural steel or manufactured framing members shall be fabricated from lightweight channel approved by manufacturer for intended use, provide required rods, anchors, inserts, clamps, spacers, shims, bolts and accessories.

B. Clamps: Galvanized malleable iron 1-hole straps, beam clamps, or other device with necessary bolts and expansion shields.

C. Adjustable hangers: Use to support horizontal runs only. Use trapeze-type supports for parallel runs of conduit. Install U-bolts at end of each run and at each elbow. Install conduit clamps every third intermediate hanger for each conduit. Hanger rods shall be 3/8" (10 mm) minimum diameter threaded galvanized steel rods.

D. Conduits supports mounted on concrete surfaces: Fasten with self-drilling tubular expansion shell anchors with externally split expansion shells, single cone expanders, and annular break-off grooved chucking cones.

3.07 PENETRATIONS

A. Provide required penetrations in floors, walls, or roofs. Penetrations shall be kept to minimum, as small as possible, and installed in neat manner. Surrounding surfaces damaged during installation of penetrations shall be included as part of this work.

B. Seal penetrations in walls, floors, ceilings, and enclosures. Provide fire stops for electrical raceway penetrations. Maintain original fire rating that existed prior to commencement of work. Do not install fire seal for wire openings until interconnecting wiring of equipment is proven to operate properly.

C. Sleeves:
1. Provide for passage of conduits through walls, floors, or partitions. Set sleeves in masonry during construction; set sleeves through concrete before placement begins.
2. Material: Rigid conduit or pipe securely fastened in position.
3. Cut sleeve flush with floor where conduit enters equipment enclosure otherwise extend sleeve 3" (75 mm) above floor.
4. Sleeves through exterior building walls: Install conduit in center of sleeve. Pack interior and exterior annular space around conduit with plastic backer rod sized to fit annular space in compression as recommended by backing manufacturer. Seal interior and exterior of joint with acrylic polymer sealant.
5. Sleeves through waterproof construction shall be flanged type.

D. Penetrations required after walls, floors, or ceilings are constructed shall be provided and grouted or sealed. Openings shall be core-drilled, do not jackhammer.

E. Patch and finish openings made in existing walls and floors to match original material in composition and appearance.

F. Cut or punch penetrations in wall panels. External penetration shall be flashed and calked to provide weather tight seal.

G. Limit penetrations in roofs to applications where required for connection to specific piece of equipment. When required, flash and apply seal material after installation of conduit to provide weathertight bond and seal. Materials shall be compatible with roofing system.

3.08 WIREWAY AND BOXES

A. Installed in accordance with manufacturer's recommendations.

B. Connections shall be made such that they maintain NEMA rating of enclosure and system.

C. To access interior, locate to permit full removal of covers, or such that doors can be opened more than 100°. Mount at height as indicated, or as required by NEC, whichever is more restrictive.

D. Support wireways and boxes independently of conduits by means of bolts, screws, rod hangers, and other suitable means.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Cable tray system including, but is not limited to, tray sections, fittings, covers, connection hardware, end plates, supports, and necessary hardware.

1.02 QUALITY ASSURANCE

A. Manufacturer's qualifications:
   1. Manufacturer shall be manufacturer of major components within assembly and shall be ISO certified.
   2. Manufacturer shall have produced similar equipment for a minimum period of 5 years.

B. Regulatory requirements: Equipment shall be designed and manufactured in accordance with applicable requirements of NFPA 70; ANSI C80.1, C80.3, C80.4, C80.5; UL 1, UL 6, UL 360, UL 651, UL 797, UL 870, UL 1242; and NEMA TC2, TC3, TC6, TC9, and RN1.

PART 2 PRODUCTS

2.01 SYSTEM DESCRIPTION

A. Cable tray system shall be capable of supporting low-voltage control cables and instrumentation cables, low-voltage power cable rated 600 volts and below and medium-voltage power cable rated 601 volts to 26 kV.

B. Cable tray system and support shall be designed for environmental and seismic conditions in accordance with Section 01 30 00.

2.02 CABLE TRAY AND FITTINGS

A. Provide complete and coordinated cable tray system of size, type and arrangement as required.

B. Construction:
   1. Material: Roll-form structural steel in accordance with ASTM A570 or ASTM A611; hot-dip galvanized after fabrication in accordance with ASTM A123.
   2. Alternate material: Extruded from AA aluminum alloy 6063. Fabricated parts shall be manufactured from AA aluminum alloy 5052.
   3. Alternate material: Fiberglass trough-type with ventilated bottom and solid longitudinal side rails.

C. Cable tray widths: Manufacturer's standard 9" (230 mm), 12"(300 mm), 18" (460 mm), 24" (600 mm), 30" (750 mm), and 36" (900 mm) as indicated on drawings.

D. Tray and fittings depth: 4" (100 mm) minimum loading depth.

E. Minimum internal bending radius: 12" (300 mm). Adjust radius to meet bending radius requirements of cable.

F. Rungs shall have flat top surface with rounded edges to prevent cable damage.

G. Installation indoors: Provide for minimum working load classification of 75 lb/lin ft (112 kg/lin m), 12' (3.5 m) support span, 1.5 safety factor., with supports a maximum of 12'-0" (3.5 m) spacing.

H. Installation outdoors: Provide for minimum working load classification of 75 lb/lin ft(112 kg/lin m), 20' (6 m) support span, 1.5 safety factor, with supports a maximum of 20'-0" (6 m) spacing.

I. In addition to above working loads, tray and supports shall be capable of withstanding 200 lb concentrated static load applied at mid-span between supports without damage.

J. Ladder tray shall have minimum 9" (225 mm) rung spacing with side rail flanges on outside of tray.
   1. Aluminum tray and fittings shall be suitable as equipment-grounding conductor meeting requirements of NEC for minimum 1,000-ampere rating, and minimum 0.60 sq in (39 mm^2) metallic cross section.
   2. Steel tray and fittings shall be suitable as equipment-grounding conductor meeting requirements of NEC for 400-ampere rating, and minimum 0.40 sq in (26 mm^2) metallic cross section.
   3. Aluminum and steel trays shall have rungs welded to side rails.
   4. Install fiberglass cable tray and fittings in corrosive areas. Fiberglass tray installed outdoors shall be UV sunlight-resistant by use of additive to material during manufacturing, and surface-applied protective veil. Repair scratches with veil material prior to completion of work. Furnish minimum of 2 cans of spare touch-up veil material for maintenance personnel.

K. Finish:
   1. Natural finish of aluminum material.
   2. Hot-dip galvanized or zinc-coated after welding and fabrication for steel.

2.03 HARDWARE

A. Connecting hardware for aluminum and steel tray, fittings, and accessories shall be zinc-plated and shall maintain solid electrical connection for grounding path.

B. Fiberglass tray shall use Type 316 stainless steel bolts, nuts, and washers.

2.04 SPLICE PLATES

A. Splice plates for connecting tray sections to each other and to fittings shall match cable tray systems. Furnish in pairs.

B. Provide expansion plates for horizontal or vertical straight run tray lengths exceeding 60 lin ft (18 lin m) for aluminum tray and 120 lin ft (36 lin m) for steel tray. Expansion plates shall allow minimum of 1" (25 mm) expansion.

C. If required, provide adjustable hinged connector plates for minor horizontal or vertical offsets.

D. Prior to assembly, coat contact surfaces of aluminum connections to be coated with antioxidant compound.

E. Expansion connectors and hinged adjustable connectors shall have bonding jumpers minimum No. 1/0 AWG copper or prefabricated aluminum or copper braid.

2.05 TRAY COVERS

A. Fully ventilated, solid flanged covers matching tray material for protection of cables.

B. Material:
   1. Aluminum covers: Flanged type with 1/2" (13 mm) side flanges, minimum 0.040" (1 mm) thick, sized to fit tray width and fittings styles; aluminum joint strips between cover sections.
   2. Steel covers: Minimum 20-gage (0.9 mm) steel, pregalvanized with 1/2" (13 mm) side flanges, sized to fit tray width and fitting styles; galvanized steel joint strips between cover sections.

C. Peak exterior tray covers minimum 1/2" (13 mm) rise for water shedding.

2.06 TRAY COVER CLAMPS

A. Provide hold-down clamps for covers installed indoors. Provide standoffs for bolting covers to tray outdoors.

B. Material: Aluminum, galvanized steel with zinc-plated hardware, or fiberglass to match tray material.

C. Clamps at expansion joints shall be guide-type to allow slide movement of tray at support.

D. Provide cover clips and standoffs in quantities as recommended by manufacturer.

2.07 CONDUIT-TO-TRAY CLAMPS

A. Clamps designed for conduit takeoffs from cable tray shall be UL-listed as acceptable grounding means.

B. Conduits not directly attached to trays that receive cables from tray shall have grounding bushings with stranded copper-bonding jumper from bushing to tray.

2.08 BOX CONNECTORS

A. Aluminum, galvanized steel, or fiberglass, as required, size for tray loading depth.

2.09 TRAY SUPPORTS

A. Provide tray supports in accordance with manufacturer's recommendations unless indicated otherwise. Strictest requirement shall apply.

B. Trapeze support rods: 1/2" (13 mm) all-thread; 13 threads per inch, zinc-plated with minimum working load of 1,130 lb (512 kg) and safety factor of 5.

C. Preformed channel:
1. Minimum 12-gage (2.5 mm) carbon steel with pregalvanized zinc coating.
2. Nominal dimensions: 1.625" x 1.625" (41 mm x 41 mm) with 9/16" x 7/8" (14 mm x 22 mm) slots on 2" (50 mm) centers.

D. Preformed channel nuts, connector bolts, locknuts, nuts, and washers shall be zinc-plated.

E. Hanger rod beam clamps:
1. Unfinished iron or zinc-plated steel designed to clamp onto beam flanges up to 1" (25 mm) thick with case-hardened 5/8" x 11" (16 mm x 28 cm) steel set screw.
2. Clamp shall have 1/2" (13 mm) x 13-tapped hole for 1/2" (13 mm) rod.
3. Safe working load of clamp shall be minimum 900 lb (408 kg).

F. Trapeze support beams:
1. Preformed channel, minimum 12-gage (2.5 mm) carbon steel with pregalvanized zinc coating.
2. Dimensions: 3-1/4" deep x 1.625" wide (80 mm deep x 41.3 mm wide) with 9/16" x 7/8" (14 mm x 22 mm) slots on 2" (50 mm) centers.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install tray level and with sections properly aligned.

B. Do not permit workers to stand, walk, sit, or lay in tray.

C. Where tray galvanizing is drilled out, cut, or damaged during installation, coat damaged portion with rust-inhibitor and paint with one coat of zinc-enriched paint.

D. Edges, fittings, and hardware shall be finished free from burrs and sharp edges.

E. Trays installed outdoors shall be installed with cable tray covers on top tray for UV protection.

F. Trays installed indoors under walkways or platforms shall be installed with cable tray covers on top tray.

G. Tray covers shall be ventilated and shall be secured in accordance with manufacturer's recommendations.

3.02 ROUTING

A. Establish reference dimensions and coordinate routing, placement of supports, and hanger rods with other project activities and contractors to avoid piping, steel, and equipment interferences.

3.03 SUPPORTS

A. Provide supports for cable tray in accordance with manufacturer's recommendations and at maximum spacing of 12' (3.5 m) indoors and 20' (6 m) outdoors.

B. Maintain mechanically strong and rigid installation suitable for supporting wire carried and capable of maintaining electrical continuity.

C. Provide supplementary support steel as necessary to hang and support tray system.

3.04 DIRECTIONAL CHANGES AND SPACING

A. Change horizontal or vertical directions by stacking and bolting tray together at flange.

B. Provide bonding jumpers at directional changes to maintain grounding integrity.

C. Provide fittings as necessary.

D. Installation shall allow sufficient space around cable tray to permit easy installation of conductors and installation or removal of cover.

3.05 PENETRATIONS

A. Provide cable tray penetrations through floors, walls, ceilings, and roofs where necessary to meet project requirements.

B. Seal tray penetrations with fire-sealing material after cable and wires have been installed and tested. Fire sealant shall be approved for intended use and rated equal to or greater than rating of penetrated structure.

3.06 CIRCUIT SEGREGATION

A. Route medium-voltage circuits in dedicated tray.

B. Route low-voltage motor and power feeder circuits in dedicated tray.

C. Route low-voltage control circuits and dc circuits in control tray.

D. Route instrumentation circuits in dedicated tray.

3.07 GROUNDING AND BONDING

A. Ground cable tray system in accordance with NEC requirements, Drawings, and specifications.

B. Tray system shall be electrically continuous.

C. Tray-to-tray connections shall be bolted-type, meeting electrical continuity requirements of NEMA VE1.

D. Provide copper bonding jumper at discontinuities in tray system.

E. Ground each end of tray to building ground grid or to equipment with copper bonding jumper.

F. Ground long runs of tray every 100' (30 m) with copper bonding jumper.

G. For fiberglass trays and trays used for low-voltage and medium-voltage power cables, run separate ground length of tray. Separate ground shall be minimum 1/0 AWG bare copper cable bonded to every tray section and to ground every 100' (30 m) and to equipment at both ends.

3.08 EXPANSION JOINTS

A. Install expansion splice plate where cable tray spans building joints or 2 structures.

B. Cable tray straight run: Install expansion splice plates every 120' (36 m) for steel tray and 60' (18 m) for aluminum tray in areas with maximum 100ºF (38°C) differential.

C. Anchor cable tray at support closest to midpoint between expansion splice plates. Install expansion guides at supports between anchor and expansion splice plates.

3.09 BOX CONNECTORS

A. Install at locations where trays connect to equipment enclosures.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Below-grade conduit, boxes, and associated accessories for support, securing, and protection of electrical wiring.

1.02 QUALITY ASSURANCE

A. Manufacturer's qualifications:
1. Manufacturer shall be manufacturer of major components within assembly and shall be ISO certified.
2. Manufacturer shall have produced similar equipment for a minimum period of 5 years.

B. Regulatory requirements:
1. Equipment shall be designed and manufactured in accordance with applicable requirements of following; NFPA 70; ANSI C80.1, C80.3, C80.4, C80.5; UL 1, UL 6, UL 360, UL 651, UL 797, UL 870, UL 1242; and NEMA TC2, TC3, TC6, TC9, and RN1.

PART 2 PRODUCTS

2.01 SYSTEM DESCRIPTION

A. Raceway systems and accessories include, but shall not be limited to:
1. Direct buried ducts.
2. Concrete encased ducts.
3. Cable trench.
4. Elbows, fittings, and accessories.
5. Hardware for support, securing, and protection.
6. Manholes and handholes.
7. Trenching and backfilling.

2.02 RIGID METAL CONDUIT, STEEL (RGS)

A. Material: Mild steel tube with continuous welded seam in accordance with ANSI C80.1, and UL 6.

B. Exterior and Interior protective coating: Metallic zinc applied by hot-dip galvanizing or electro-galvanizing. Apply final coat of transparent zinc chromate to exterior. Exterior and interior coatings applied to conduit shall afford sufficient flexibility to permit field bending without cracking or flaking.

C. Conduits shall be available in standard trade sizes, 3/4" (21 mm) minimum.

D. Thread pitch shall conform to ANSI/ASME B1.20.1. Taper shall be 3/4"/ft (62.5 mm/m).

E. Each length of conduit shall have UL listing label.

F. In areas designated as corrosive, conduit shall meet NFPA 70.

G. Couplings, unions, and fittings: Threaded-type, galvanized steel.

H. Conduit bodies: Threaded-type, cast metal or malleable iron type with zinc or cadmium coating. Covers shall have solid gaskets and captive screw fasteners.

I. Running thread not acceptable.

2.03 RIGID METAL CONDUIT, STEEL, POLYVINYL CHLORIDE COATED (PVC-RGS)

A. Requirements of NEC article "Rigid Metal Conduit - Steel (RGS)" shall apply.

B. Coating: Apply minimum 40-mil, gray polyvinyl chloride (PVC) coating over exterior and apply urethane coating uniform and consistent to interior of conduit. Internal coating shall be nominal 2 mil thickness. Conduit having areas with thin or no coating, not acceptable. Protect conduit threads by urethane coating. PVC coating shall have been investigated by UL as providing primary corrosion protection for rigid metal conduit.

C. Fittings, and conduit bodies: Threaded type, PVC-coated. PVC coating on outside of conduit couplings shall have series of longitudinal ribs, 40 mils in thickness, to protect coating from tool damage during installation. Manufacturer of couplings, fittings, and conduit bodies shall be same as conduit manufacturer. Hazardous location fittings shall be manufactured prior to application of plastic coating, and shall be UL-listed.

D. Conduit shall meet NFPA 70 in areas designated as corrosive.

E. PVC exterior and urethane interior coatings applied to conduit shall afford sufficient flexibility to permit field bending without cracking or flaking at temperatures above 30°F (-1°C).

2.04 RIGID NONMETALLIC CONDUIT, POLYVINYL CHLORIDE (PVC)

A. Material: PVC Schedule 40, and Schedule 80. Schedule 40 shall be rated for underground installation; underground shall be either direct buried or encased in concrete. When encased in concrete, underground conduits shall be rated for cables operating up to 90ºC installed within.

B. Fittings, elbows, and accessories: Connect to conduit by solvent-type cement process. Material shall be same as conduit. Provide belled end fittings at each manhole and wall entrance.

C. Transition for connection of plastic conduit to rigid metal conduit shall be threadless solvent-type cement connection to PVC, with threaded connection to rigid metal conduit.

2.05 RIGID NONMETALLIC UNDERGROUND CONDUIT (EB)

A. Material: PVC, designed for concrete encased applications. Comply with NEMA TC-6 and TC-8, and ASTM F512 for utility duct, and ETL-listed.

B. No special cutting or tapering devices required.

C. Joints shall be made with solvent-type cement.

D. Provide duct end bells for termination into manholes.

E. Fittings, elbows, and accessories, shall be manufactured by conduit manufacturer, and be of same material.

2.06 PULLBOXES AND JUNCTION BOXES

A. Hazardous areas: UL-approved for area classification.

B. Where required for elbows, fittings, and accessories to be furnished by same manufacturer as conduit, boxes shall also be furnished by conduit manufacturer or by supplier approved by manufacturer.

2.07 MANHOLES

A. Manholes shall meet NEC requirements.

B. Hardware:
   1. Support cables on walls by means of heavy-duty, nonmetallic cable racks.
   2. Cable rack shall consist of stanchion attached to manhole wall in accordance with manhole manufacturer's recommendations with adjustable arms that lock into stanchion.
   3. Cable rack arm lengths shall be appropriate for manhole size and cable being installed. Install at least 2 spare arms at each stanchion.
   4. Provide holes or slots in arms for cable wire ties.
   5. Cable rack capabilities shall exceed load capacity requirements of cable installed.

C. Insulators not required.

D. Make provisions for sump pump.

2.08 HANDHOLES

A. Size to accommodate splices and equipment contained within handhole.

2.09 CABLE TRENCH

A. Material: Composed of cement mortar; reinforced by alkali-resistant fiber; and deformed, high-tensile welding wire.

B. Construction: Precast, standard 4' (1.2 m) sections with open bottom to allow conduit to enter and exit, and for drainage. Covers shall be flush with top of trench.

C. Trench, transition pieces, tees, ells, or crosses shall be by same manufacturer and designed as integrated system.

D. Trench shall be rated for 200 lb/sq ft (0.098 kg/cm^2) in pedestrian areas where traffic or equipment not physically possible. Use heavy traffic rated trench with 1/4" (6.35 mm) galvanized steel diamond plate covers at road crossings and in locations where heavy equipment may be present. Heavy traffic rated trench shall meet AASHTO H-20 for 32,000 lb (14,510 kg) axle load.

E. Provide lifting tools for covers. Tool shall become property of Owner upon completion of Project.

F. Provide either factory pre-drilled or cast-in-place inserts for connection of grounding wires on trench wall.

G. Provide partition boards where cable voltages require physical separation. Boards shall be by same manufacturer as trench. Design shall be such that boards do not require physical attachment to trench for support, and will not tip over.

H. Where cable tray shall be used in trench, supply embedded Unistrut, or equal, channel cast into trench. Provide quantity of supports as necessary to properly secure cable tray.

PART 3 EXECUTION

3.01 USES AND LIMITATIONS

A. Refer to NEC for guidelines regarding use, and limitation of each type of conduit.

B. RGS: Do not use underground except as stub-ups and apply corrosion protection. Do not mix aluminum fittings with steel conduit and vice versa.

C. PVC-RGS: May be used for conduits installed underground, direct buried, or for slab-on-grade construction. Acceptable for corrosive areas. Install conduit system in accordance with manufacturer's installation manual. Installer shall be certified by manufacturer to install coated conduit.

D. PVC and EB: Use Schedule 80 PVC conduit encased in concrete for installation under heavy traffic areas.

3.02 RIGID CONDUIT

A. Minimum conduit size shall be 3/4" (19 mm).

B. Conceal conduit in finished areas.

C. Drainage: Avoid water pockets in conduit runs; provide suitable fittings at low spots in exposed conduit where pockets cannot be avoided. Weep holes not permitted in conduit.

D. Conduit ends:
1. Cap spare conduits with fittings designed for intended use.
2. Conduit terminating in panels or enclosures where exposed to entrance of foreign material shall be plugged with commercial duct-sealing compound around conductors.
3. Cap conduit ends during construction to prevent entrance of foreign material.

E. Where practicable, provide 3" (75 mm) stubbed up conduit for conduit entering into bottom of freestanding equipment. Coordinate locations with equipment. Terminate with grounding bushings.

F. Clean and swab inside of conduit by mechanical means to remove foreign materials and moisture before wires or cables are installed. Cleaning method shall not damage interior surface of conduit.

G. Bushings: Provide at termination of conduit not terminated in hubs and couplings. Insulating bushings with 150°C rated insulating inserts in metal housings shall be provided on conduit 1-1/4" (31 mm) and larger. Insulating bushings shall be grounding type. Standard bushings shall be galvanized.

H. Apply coat of zinc chromate to zinc-coated conduits where protective coating is damaged.

I. Couplings and unions:
1. Threaded conduit couplings shall join metal conduit with conduit ends butted. Where standard threaded couplings cannot physically be used, join metal conduit using conduit unions or split couplings.
2. Use ground-seat type, watertight unions where union may be submerged.

J. Bends: Run of conduit shall not contain more than equivalent of three 90° bends, including offsets. Use only manufacturer-approved conduit bending equipment. Do not use deformed or crushed conduits.

K. Threads: Cut ends of conduit with saw; do not use wheel cutter. Conduit end shall have same number of threads as present from factory. Apply coat of zinc chromate to steel conduit threads and apply anti-seize compound containing powdered zinc or lubricating graphite to aluminum conduit threads.

L. Use expansion joints as required such that no more than 6" (152 mm) allowance for expansion or contraction of conduit occurs.

3.03 SPECIAL FITTINGS

A. Hazardous areas: Rigid conduit shall be used in areas designated as Class 1 areas classified as hazardous locations in accordance with NEC.

3.04 CONDUIT SUPPORTS

A. Supports of structural steel or manufactured framing members shall be fabricated from lightweight channel approved by manufacturer for intended use, provide required rods, anchors, inserts, clamps, spacers, shims, bolts and accessories.

B. Clamps: Galvanized malleable iron 1-hole straps, beam clamps, or other device with necessary bolts and expansion shields.

C. Adjustable hangers: Use to support horizontal runs only. Use trapeze-type supports for parallel runs of conduit. Install U-bolts at end of each run and at each elbow. Install conduit clamps every third intermediate hanger for each conduit. Hanger rods shall be 3/8" (10 mm) minimum diameter threaded galvanized steel rods.

D. Conduits supports mounted on concrete surfaces: Fasten with self-drilling tubular expansion shell anchors with externally split expansion shells, single cone expanders, and annular break-off grooved chucking cones.

3.05 PENETRATIONS

A. Provide required penetrations in floors and walls. Penetrations shall be kept to minimum, as small as possible, and installed in neat manner. Surrounding surfaces damaged during installation of penetrations shall be included as part of this work.

B. Seal penetrations in floors and enclosures. Provide fire stops for electrical raceway penetrations. Maintain original fire rating that existed prior to commencement of work. Do not install fire seal for wire openings until interconnecting wiring of equipment is proven to operate properly.

C. Sleeves:
1. Provide for passage of conduits through walls, floors, or partitions. Set sleeves in masonry during construction; set sleeves through concrete before placement begins.
2. Material: Rigid conduit or pipe securely fastened in position.
3. Cut sleeve flush with floor where conduit enters equipment enclosure otherwise extend sleeve 3" (75 mm) above floor.
4. Sleeves through exterior building walls: Install conduit in center of sleeve. Pack interior and exterior annular space around conduit with plastic backer rod sized to fit annular space in compression as recommended by backing manufacturer. Seal interior and exterior of joint with acrylic polymer sealant.
5. Sleeves through waterproof construction shall be flanged type.

D. Penetrations required after footings, walls, or floors are constructed shall be provided and grouted or sealed. Openings shall be core-drilled, do not jackhammer.

E. Patch and finish openings made in existing walls and floors to match original material in composition and appearance.

3.06 CONDUIT INSTALLED UNDERGROUND

A. Direct-buried conduit:
1. Direct-buried, underground or below slab conduit shall be rigid nonmetallic conduit unless indicated otherwise and installed to yield completely corrosion protected conduit system.
2. Slope conduits for drainage.
3. Depth: Minimum as required by NEC.

B. Plastic-coated, rigid steel conduit:
1. Use procedures recommended by manufacturer to prevent damage to PVC coating.
2. Use strap wrenches for tightening threaded joints.
3. If protective coating is damaged, repair by application of patching compound as recommended by manufacturer.

C. Concrete encased underground duct may be Type EB, unless noted otherwise. Verify by calculation that hydraulic force on bottom duct does not exceed theoretical collapse pressure of duct. Use thicker wall duct as required, unless a sequential pour technique is used.

D. Elbow that stubs up at end of a conduit run shall be RGS conduit and shall be bonded to grounding system. Provide required fittings and accessories for connection of RGS conduit to nonmetallic conduit.

E. Install duct runs and manholes at elevations consistent with project requirements. Top of duct banks shall be not less than 30" (750 mm) below finished grade elevation, unless indicated otherwise. Provide extension rings on manholes as required to bring opening flush with finished surface.

F. Utilize duct spacers, both vertically and horizontally, to support runs of concrete encased ducts. Install duct spacers 8' (2.4 m) maximum on center, unless specified otherwise. Brace duct runs during concrete placement to prevent floating. Wood spacers or braces in concrete encasement are not acceptable, and iron ties or straps shall not be used around single ducts, but may be used around whole duct run.

G. Crown duct runs between manholes at midpoint of run to allow drainage back into manholes. Slope shall be minimum of 1/32" per foot (0.8 mm per meter) of slope. Duct runs from stub-ups back to manholes shall maintain same slope. Provide end bell fittings at terminations of conduits into manholes.

H. Install ground cable and connect to ground system on both ends of duct bank. Place ground cable in concrete, and above direct buried conduits.

I. Concrete work:
   1. Duct bank concrete shall be poured without forming, provided trench walls do not cave; otherwise, use forms. Make trench no wider than necessary to provide nominal size concrete thickness.
   2. Tie down conduits to prevent floating during concrete pouring.
   3. Remove foreign substances from conduits before pouring concrete.
   4. Use splashboard to divert flow of concrete away from trench sides, and avoid dislodging soil and stones. Prevent loose excavated material from falling into trench during concrete pouring.
   5. Pour each section of duct bank complete in one operation; if this is not feasible, provide construction joint using rigid steel conduit 5' (1.5 m) on each side of joint.
   6. Begin concrete pouring at 1 end of duct bank, working toward other end, to allow free end to move. Do not pour concrete from each end toward center.
   7. Do not use mechanical vibrators.
   8. Provide red coloring in concrete.

J. Adjust duct footage at each tie-in to account for expansion and contraction due to variations in temperature anticipated during installation. Backfill terminated duct runs from tie-in point toward other end. If trench must be left open, do not terminate run. Consult with manufacturer for coefficient of thermal expansion properties.

K. Use expansion joints as required such that no more than 6" (150 mm) allowance for expansion or contraction of conduit occurs.

L. After construction of duct bank is complete, pull mandrel through each duct. Mandrel shall be 1/4" (6 mm) smaller in diameter than duct. If obstruction is encountered, or if there is evidence of water pocket, that section of duct bank shall be located, removed, and rebuilt with no schedule delay and additional cost to Owner.

M. Underground utility marking tape for below grade raceway systems:
   1. Provide solid aluminum foil core tapes for protection, location, and identification of underground utility installations.
   2. Meet or exceed industry standards for APWA color code.
   3. Resist degradation from acids and alkalis found in soil.
   4. Contain environmentally safe lead-free pigments and organic lead-free ink identifying type of utility line it protects.
   5. Provide width of tape appropriate for detection of conduit at required depth of installation.

N. Support wireways and boxes independently of conduits by means of bolts, screws, rod hangers, and other suitable means.

3.07 MANHOLES AND HANDHOLES

A. Install in accordance with manufacturer's instructions.

B. Remove material as required for proper alignment and elevation of work. Backfill and grade area to match final grade elevations.

C. Provide extension rings as required to meet final finished elevations.

3.08 PRECAST CABLE TRENCH

A. Install in accordance with manufacturer's instructions. Note requirements for sealing of joints and provisions for drainage and incorporate into installation.

B. Install No. 4/0 AWG ground cable in trench system over entire length.

C. Excavate to minimum 4" (100 mm) below bottom of framing members.

D. Provide 4" (100 mm) minimum layer of washed pea gravel below framing members and in bottom of trench; smooth and compact.

E. Set framing members on compacted gravel or earth such that top of bracket (and sidewall) will be at final grade specified.

F. After setting frames and sides in place, place backfill along sides and place minimum 4" (100 mm) bedding of sand in trench to form a level bottom, just covering framing members.

G. Construct to grades as necessary for topside walls to be at elevation approximately 1" (25 mm) above elevation of finished rock surfacing or other finished grade material. Provide required excavation and backfill.

H. During construction, maintain trenches free of trash and debris. Clean trenches such that clean backfill remains uncontaminated.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Medium-voltage, arc-resistant, metal-clad switchgear and accessories, rated 27 kV and below.

1.02 CLOSEOUT SUBMITTALS

A. Operation and maintenance manuals. Provide at a minimum:
1. General description and technical data, including actual weights and dimensions.
2. List of instruments and accessories supplied, listing manufacturer, model number, operating ranges, and equipment tag numbers.
3. Receiving, storage, installation, handling, and testing instructions.
4. Operating and maintenance procedures.
5. Complete set of reviewed drawings that require no further action.
6. Complete documentation of inspections and tests performed, including logs, curves, and certificates. Documentation shall note any replacement of equipment or components that failed during testing.
7. Recommended spare parts list, including circuit breakers.
8. Bill of Materials including nameplate information and shop order numbers for each item of equipment furnished.
9. Material Safety Data Sheets.
10. Instruction manuals including detailed erection sequence and procedures.

1.03 MAINTENANCE MATERIALS

A. Provide complete set of special tools required for installation of equipment.

B. Tools and their intended use shall be detailed in manufacturer's assembly instructions.

1.04 QUALITY ASSURANCE

A. Qualifications: Manufacturer shall have produced similar equipment for minimum period of 10 years.

B. Regulatory requirements:
1. Metal-clad switchgear and related components shall be designed, manufactured, and tested in accordance with latest applicable standards of NEMA SG-4, NEMA SG-5, ANSI/IEEE C37.09, ANSI/IEEE C37.12 and ANSI/IEEE C37.20.2.
2. For arc-resistant switchgear, standard ANSI/IEEE C37.20.7 applies in addition to above.
3. Equipment manufactured and tested to other standards shall not be used without written approval from Owner.

1.05 TEMPORARY POWER

A. Space heaters shall be connected to temporary source of power; capable of being monitored.

B. Maintain temporary power until switchgear is installed and normal power source is permanently energized.

PART 2 PRODUCTS

2.01 SYSTEM DESCRIPTION

A. Switchgear shall be a complete, coordinated factory assembly ready for installation, connection, and designed for operation at site ambient temperatures and elevations. Switchgear shall include instruments and equipment per design requirements.

B. When one-line drawings, control schematics and layout drawings are furnished with specifications, drawings are preliminary and intended as an aid in understanding scope of equipment to be provided, unless specifically noted otherwise.

C. If arc-resistant gear is specified, manufacturer will provide complete and coordinated arc chute plenum design including supports and vents. This shall include routing of arc chute to vent location as coordinated with Owner.

2.02 ENCLOSURE

A. Switchgear assembly shall consist of individual free-standing vertical sections to form a rigid, metal-clad switchgear assembly.

B. Vertical sections shall have metal side sheets of minimum 12-gage steel.

C. Solid removable metal barriers shall isolate major primary sections.

D. Provide safety shutter between bus compartment and breaker cubicle, which will close automatically when circuit breaker is disconnected from bus and removed from connected position.

E. Metal work shall be free from burrs and sharp edges.

F. Expandability:
1. Switchgear shall be capable of future expansion without modification to existing switchgear structural members or bus work.
2. Documentation shall provide adequate information for design of future extensions.

G. Operating height for unit disconnects and other operable controls shall not be more than 6'-6" (2 m) above finished floor.

H. Gaskets shall be provided to seal doors, and filters shall be provided on all louvers to impede entrance of dust, and falling dirt. Filters shall be easily removable for maintenance.

I. Cable entrances:
1. Depth of finished equipment shall be sufficient to allow for entrance, bending, and termination of cables.
2. Provide sufficient clearance between terminal pads and cable entrance.

J. Design switchgear to accommodate entrance of cables and/or bus duct.

K. Provide minimum distance of 36" (0.9 m) for termination of cables between cable termination point and window-type current transformer, or cable termination point and cable entrance location if window-type current transformers are not used.

2.03 DOORS

A. Switchgear doors shall open minimum of 110° to allow for breaker removal with door-mounted relays.

B. Doorstops and brackets with detents shall hold doors in fully open position.

C. Front doors shall not open so far as to allow damage to devices mounted on adjacent doors.

D. Front and rear doors shall be made from 12-gage heavy-duty formed steel with hand-operated triple door latches, and triple-hinges with provisions for padlocking.
1. Front doors for switchgear with 2-high construction shall have separate doors for each compartment.
2. Rear doors of vertical sections for single-high and 2-high construction shall have single, full-height removable door.

2.04 CUBICLE SPACE HEATERS

A. Each cubicle of switchgear shall be furnished with space heater to prevent condensation of moisture.

B. Locate heater in interior of cubicle.

C. Thermally insulate from metal enclosure so no painted surface will be damaged or discolored.

D. Space heaters shall maintain compartment internal temperature at no less then 5° above dew point connected through an adjustable humidistat, factory set.

E. Wire individual heaters to accessible common terminal blocks for connection to single external power source.

F. Protect heater circuits with fuses.

2.05 MOTOR SPACE HEATER POWER SUPPLY

A. Where motor space heaters are required, provide set of common, internally wired motor space heater bus and terminal blocks for connection to Contractor-furnished multiphase external power source.
   1. Provide main circuit breaker or fusing for external power source.
   2. Coordinate external power source requirements.
   3. Incorporate requirements on manufacturer-furnished drawings.
   4. Manufacturer shall balance current loading on multiphase space heater buses.

B. Each individual motor space heater circuit shall include:
   1. Switchgear breaker 'b' auxiliary contact (52) control wiring.
   2. Connections to terminal blocks for field external connections.
   3. Internally wired fuses.

C. Wire such that motor space heater operates only when breaker is in open and connected position and disconnected when breaker is closed, drawn-out, or test positions.

D. When auxiliary power transformer is required:
   1. Size transformer to accommodate motor space heater power requirements.
   2. External power source not required.

E. When required, a 3-pole 480 volt interposing relay shall be provided and wired to power circuit breaker a contact to close when breaker is opened.

2.06 AUXILIARY COMPARTMENTS

A. Bus voltage and current transformer mounted devices shall be wired to terminal blocks located in compartment. Overall switchgear-indicating instruments shall be mounted on door of compartment.

B. Provide wiring required to termination points for outgoing supervisory connections.

2.07 CIRCUIT BREAKER COMPARTMENTS

A. Each compartment shall have screw-type racking mechanism capable of manual operation by field-engaged crank. Each breaker shall have 3 defined stop positions in enclosure: "Connected," "Test," and "Withdrawn."
   1. Racking mechanism shall have mechanical interlocks to prevent insertion, or withdrawal, of circuit breaker with contacts closed.
   2. Provide interlocks to prevent breaker from closing between connected and test positions.
   3. If breaker contacts are closed, contacts shall be opened automatically and stored energy mechanism discharged prior to either inserting or removing breaker from connected position.
   4. Provisions shall be made for padlocking breaker in withdrawn position.
   5. Provisions shall be made to allow breaker-racking operation with compartment door closed.

6. Each cubicle door shall be capable of being fully closed with breaker in withdrawn position.
7. Breaker frame shall maintain ground connection in any position.

B. Secondary control circuit contacts shall be stationary mounted within breaker compartment to mate with control circuit contacts on circuit breaker. Contacts shall remain engaged when breaker is racked into test position.

C. Provide remote racking device(s).

2.08 CIRCUIT BREAKERS

A. Circuit breakers shall be vacuum interrupting horizontal draw-out type capable of being withdrawn. Ratings shall be based on design requirements. Breakers shall not be forced cooled in order to achieve maximum rating. Comply with latest version of ANSI C37.04 and C37.06. MVA rated breakers not acceptable.

B. Operating mechanism:
1. Operating voltage per design requirements.
2. Mechanically and electrically trip free.
3. Mechanical operations counter: Visible at front of breaker assembly.
4. Mechanism shall be capable of manual charging by use of handle.

C. Mechanical indicator shall show breaker position and condition of stored-energy mechanism.

D. Each breaker shall contain 3 vacuum interrupters, separately mounted in self-contained and self-aligning unit, which can easily be removed. Breaker shall be hermetically sealed in high-vacuum and be maintenance free.
1. Mount unit on either glass polyester or epoxy supports.
2. Provide contact wear gap indicator for each vacuum interrupter requiring no tools to indicate available contact life. Indicator shall be easily visible.

E. Contacts:
1. Contact surfaces shall be silver-to-silver, designed and fabricated to be self-aligning and to resist burning and deterioration.
2. Breaker main contacts shall not touch or arc across into faulted circuit when breaker close signal is received while trip signal is being applied.
3. Closing speed of moving contacts shall be independent of both control voltage and operator.
4. Contacts shall have low current chopping characteristics.
5. Primary disconnect contacts shall be "fingers" engaging cubicle stationary contacts when breaker is moved into operating position.
6. Secondary control circuit contacts on breaker shall engage stationary control circuit contacts when breaker is moved into connected position.

F. Breaker units of same type and ampere capacity shall be wired alike and shall be mechanically and electrically interchangeable.

G. Grounding:
1. Provide breaker frame grounding facility for grounding in connected and test positions.
2. Power circuit breaker ground connection shall be capable of carrying short-circuit rating of circuit breaker for minimum of 2 seconds and also be capable of withstanding peak current value or 2.7 times rated short circuit current of circuit breaker.

H. Provisions on breaker shall be made for operating mechanism-operated auxiliary switch contacts (MOC) (Device 52) and stationary truck-operated cell switch contacts (TOC) (Device 33).

I. Testing:
   1. Provide testing station to permit checking of breaker controls and operation with breakers high-voltage side de-energized and isolated from switchgear bus.
   2. Testing shall be done in fully withdrawn position. Control station shall be wall-mounted.

2.09 AUXILIARY CONTACTS

A. Each breaker shall be furnished with circuit breaker auxiliary contacts, MOCs, and TOCs as required to provide interlocking or control of auxiliary devices.
   1. All spare contacts shall be wired to terminal blocks for ease of maintenance and access to external connection.
   2. Furnish no less than 2 Type "a" and 2 Type "b" spare electrically separate auxiliary contacts mounted on breaker for remote interlocking service.

B. Auxiliary contacts shall be electrically separate. Each contact shall have 125VDC, 20-ampere minimum continuous current rating.

C. MOC contacts shall be activated by circuit breaker mechanism when circuit breaker is in "connected" position only. A minimum of 4 Type "a" and 4 Type "b" spare MOC contacts shall be provided. TOC contacts shall be activated by circuit breaker mechanism when circuit breaker is in "connected," "test," or "disconnected" position. A minimum of 4 Type "a" and 4 Type "b" spare TOC contacts shall be provided.

2.10 BREAKER CONTROL

A. Location:
   1. A separate breaker control cubicle section shall be provided with all breaker control switches for that switchgear lineup; otherwise, provide breaker control switch on breaker cubicle.
   2. For arc-resistant switchgear, breaker control switches, CT and VT test switches shall be mounted on instrument compartment associated with that breaker cubicle.
   3. When provided as part of this specification control shall be in accordance with typical schematic diagrams in regards to local trip, close, alarms, remote/local control switches etc.

B. Breaker control switches:
   1. Provide each breaker with local control switch and breaker truck position switches arranged to provide following control of breaker operation.

	Remote		Local	
Breaker Position	Close	Trip	Close	Trip
Connected	Yes	Yes	No	Yes
Test	Yes	Yes	Yes	Yes

   2. Each circuit breaker local control switch shall have trip-close escutcheon, center normal position, and spring return to normal from close and trip. Furnish with red and green indication lights. Circuit breaker control switches shall have pistol-grip handles.

C. Trip and close circuits:
   1. Provide terminal pairs wired in trip and close circuits of each breaker for Owner furnished remote trip and close contacts.
   2. Terminals shall be grouped adjacent to each other.
   3. Unless specified otherwise, quantities shall be:
      a. Trip circuit: 2 pairs.
      b. Close circuit: 2 pairs.

2.11 CONTROL POWER

A. Furnish internal switchgear wiring to distribute single source of control power to each switchgear unit.

B. Control power voltage: per design requirements.

C. For ac control power:
1. Provide as required, control power transformer integral to switchgear line-up capable of providing required power.
2. Provide each breaker with capacitive trip device that stores a minimum of two breaker operations in event of loss of ac control power.
3. Each breaker shall be furnished with 1- or 2-pole, as required, DIN rail-mounted, miniature circuit breakers (MCB) as control power disconnecting and protective device.
4. Provide one for closing circuit and one for tripping circuit.
5. MCBs shall have contacts wired to I/O blocks for common external alarm indication of tripped MCB.

D. For dc control power:
1. Each breaker shall be furnished with 1- or 2-pole, as required, DIN rail-mounted, miniature circuit breakers (MCB) as control power disconnecting and protective device. Provide one set for closing circuit and one set for tripping circuit.
2. MCBs shall have contacts wired to I/O blocks for common external alarm indication of tripped MCB.

E. Provide loss of voltage relay for breaker closing control voltage.
1. Form C contact shall be wired to terminal blocks.
2. Contact shall be used for remote indication.

F. If required, provide self-contained dc control power system within line-up:
1. Batteries:
   a. Use sealed-type, maintenance-free, lead-acid, gel cell type batteries.
   b. Batteries furnished with minimum 10-year, pro-rated warranty.
2. Battery charger: Size to fully recharge batteries within 8 hours with batteries fully discharged, while simultaneously providing rated power for dc loads.
3. Provide separate, full-height switchgear section for dc control power system.
4. Dc distribution panel with required number of dc rated breakers.
5. Provide required interface between breaker circuitry and relaying for compatibility with dc voltage supply.
6. Provide ventilation or air conditioning for batteries in accordance with code requirements and to meet battery manufacturer's recommendations.
7. Alarms:
   a. Provide Form C contact for remote indication common alarm.
   b. Common alarm shall, at a minimum, include charger malfunction, overload on battery, low-battery voltage, and loss of dc power output.

2.12 MAIN BUS

A. Switchgear main bus shall be copper bar, designed to continuously carry designed current carrying capacity without exceeding temperature rise requirements

B. Bus shall meet requirements of latest version of ANSI C37.04, C37.06, and C37.09.

C. Install with rigid, nontracking, fire-resistant, and nonhygroscopic insulating supports capable of withstanding mechanical forces imposed by short-circuit currents greater than or equal to momentary current rating of switchgear.

D. Furnish expansion joints where necessary to prevent destructive mechanical strains in bus supports and connections throughout full ambient temperature range.

E. Current-carrying connections shall be flat bar and completed by bolting together.

F. Joints shall have silver-to-silver contact surfaces with minimum contact resistance.

G. Design instrument transformer connections to permit removal and replacement of transformers without damage to connections.

H. Insulation:
   1. Except at bolted terminations and connection points, coat bus with fluidized bed epoxy-type insulating material molded around and bonded to bus.
   2. Voltage rating of insulation shall be greater than or equal to highest voltage rating of switchgear.
   3. Bolted joints, expansion joints, external bus connections, terminals for external power cable connectors, and instrument transformer connections shall be insulated with removable boots.
   4. Design removable boots to overlap permanent bus or cable insulation minimum of 1" (25 mm) upon each conductor in connection insulated by boot.
   5. Furnish materials required to complete field connections, insulation of switchgear bus, and terminals.

I. Orientation of bus when viewed from front of switchgear shall be A-B-C top-to-bottom, front-to-back, and left-to-right.

J. Provide molded epoxy inserts for bus passing through barriers.

2.13 GROUND BUS

A. Provide uninsulated copper ground bus with momentary rating at least equal to momentary rating of Switchgear.

B. Connect switchgear equipment grounds to ground bus.

C. Provide 2 ground cable connectors for attachment of stranded copper cable to each end of ground bus for external connection to grounding system in copper cable size as required.

D. Each switchgear unit containing terminals for connection of metal-enclosed bus duct shall have provision for connecting bus duct ground bus to switchgear ground bus.

2.14 FACTORY WIRING

A. Low-voltage control and instrument wiring shall be installed and tested at factory.

B. Provide manufactured wiring harnesses to complete interconnection of switchgear groups in field for wiring across shipping splits.

C. Furnish and install, at own expense, missing wires or termination points, wiring not matching interconnection diagrams, or other deficiencies.

D. Cable shall be selected for electrical and environmental conditions of installation, and suitable for unusual service conditions where encountered.
   1. Proper temperature application cable shall be used throughout, but shall not be less than 90ºC rated.
   2. Conductors routed over hinges shall utilize extra flexible stranding.
   3. Cable insulation shall be rated for maximum service voltage utilized, but not less than 600 volts.
   4. Splices not acceptable.

E. Panel, control cabinet, switchboard, motor control center, and switchgear wiring shall use flame-retardant, cross-linked polyethylene (XLP) or flame-retardant ethylene-propylene rubber (EPR) insulation meeting or exceeding requirements of UL 44 for Types SIS, and XHHW.
   1. Minimum size: No. 14 AWG.

2. Conductors: Annealed bare copper Class B stranding passing IEEE 1202 and UL VW-1 flame test.

F. Instrumentation wire shall use twisted shielded pairs/triads having flame-retardant, cross-linked polyethylene (XLPE) insulation, and chlorinated polyethylene (CPE) jacket.
   1. Minimum size: No. 16 AWG
   2. Conductor type: Annealed copper Class B stranding.
   3. Provide each pair/triad with shield.
   4. Shielding shall consist of aluminum-polyester tape and a flexible strand tin-coated No.18 AWG copper drain wire.
   5. Drain wire for each instrument cable shall be insulated with spaghetti sleeve. Terminate one end of shield wire on grounded terminal.
   6. Cables shall pass IEEE 1202 and ICEA 70,000 Btu/hr vertical tray flame test. Each conductor shall pass UL VW-1 flame test.

G. Terminations:
   1. Conductor terminal connectors: Insulated, ring tongue, compression type connectors properly sized for conductor and terminal.
      a. Construct connectors of copper and tin-plate.
      b. Interior surface of connector wire barrel shall be serrated; exterior surface of connector wire barrel shall be furnished with crimp guides.
   2. Use noninsulated terminal connectors for conductors terminated on devices equipped with individual fitted covers, such as, but not limited to, control switches and lockout relays.
   3. Provide connections requiring disconnect plug and receptacle type devices with factory-terminated conductors on each plug and receptacle.
      a. Plugs and receptacles shall be factory-wired into junction boxes containing terminal blocks for external connections.
      b. Conductors on disconnect portion of plug-receptacle assemblies shall be in common jacket.
   4. Temporary wiring installed in factory for equipment testing shall be removed prior to shipment of equipment.
   5. Current transformers shall terminate on shorting type terminal blocks and shall be shipped with shorting jumpers installed.
   6. Spare auxiliary contacts, meter outputs, multifunction relay outputs and inputs, and spare control switch contacts shall be connected to terminal points to facilitate external connection.

H. Identification and labeling.
   1. Provide preprinted conductor identification sleeve on each end of each internal conductor.
   2. Mark each sleeve with opposite end destination identification.
   3. Conductor identification sleeves shall be UV-resistant, self-adhesive type or PVC, not less than 1/2" long.
   4. Conductor identification shall be computer printed on sleeve with nonsmudging, permanent black ink. Hand written identification is not acceptable.
   5. Each terminal block, terminal, conductor, relay, breaker, fuse block, and other auxiliary devices shall be permanently labeled to coincide with identification indicated on manufacturer's drawings.

2.15 CURRENT TRANSFORMERS (CT)

A. In accordance with requirements of ANSI C57.13.

B. CT mechanical and thermal limits shall withstand without damage momentary and short time ratings of circuit breakers with which used.

C. Multi-ratio type, unless specified otherwise.

D. Wire secondary leads out to shorting terminal blocks including leads from spare CTs and unused multiratio CT leads.

E. Ground in accordance with C57.13.3.

F. CT secondary circuits identified for metering or relaying devices not located in switchgear shall be grounded in switchgear using easily removable secondary ground straps.

G. Manufacturer's drawings shall specifically state ground straps that should be removed if circuit will be grounded remotely.

H. Unless indicated otherwise, CT polarity markings shall be toward circuit breaker.

I. Separate CTs shall provide metering and protection functions, unless specified otherwise.

J. Provide current transformer (CT) of type, ratio, and accuracy class appropriate for the protection relay applications for reliable and correct operation. Minimum accuracy requirements for current transformers shall be as follows:

Primary Current Rating, amperes	Minimum Protective Accuracy Class for CT with 5 A Secondary Currents
50 through 75	C20
100 through 300	C50
400 through 800	C100
1200 through 4000	C200

2.16 VOLTAGE TRANSFORMERS (VT)

A. In accordance with requirements of ANSI C57.13.

B. Each set shall be draw-out type and removable with 4-stage cell interlock switch.

C. Where physical size restrictions do not allow VTs to be mounted as draw-out assembly, VTs may be stationary mounted with primary fuses mounted as draw-out unit.

D. Provide appropriate interlocks in accordance with ANSI standards for operator safety.
   1. Provide continuously maintained ground for transformer primary windings and fuses that is clearly visible when assembly is moved to "withdrawn" position.
   2. Disconnect and ground secondary circuit in "draw-out" position.

E. Protect each transformer primary and secondary.
   1. Primary circuit:
      a. Current-limiting fuses mounted on draw-out type removable carriage unit designed to isolate and ground potential circuits when unit is in fully withdrawn position.
      b. Fuses shall meet requirements of NEMA SG2.
   2. Secondary circuit:
      a. Relays and meters shall be kept on separate circuits, unless specified otherwise.
      b. Each secondary circuit shall be protected by use of separate DIN rail-mounted miniature circuit breaker (MCB).
      c. Each MCB shall be furnished with dry contact that changes state when breaker is tripped.
      d. Contacts shall be wired to terminal blocks for use as alarm signal.
      e. Wire contacts in parallel at terminal blocks to allow single external connection for common alarm condition.

F. Ground in accordance with C57.13.3.

G. The minimum voltage transformer metering accuracy ratings for each standard indicated shall be in accordance with the following values and burdens:

Metering Accuracy Class	Limits of Transformer Correction Factor VT at 110% of Rated Voltage

	Minimum	Maximum
0.3	0.997	1.003
0.6	0.994	1.006
1.2	0.988	1.012

H. Provide dedicated metering class CTs and VTs for the input to revenue meters: CT Class C800; VT metering accuracy 0.3.

2.17 LOCKOUT RELAYS

A. Mount lockout relays on breaker or breaker auxiliary compartment door.

B. Wire to trip breaker and simultaneously block closing of breaker.

C. Rated operating trip voltage shall be capable of allowing coil operation at 75% of rated voltage.

D. Furnish with required number of contacts to perform functions and with additional spare contacts for customer use.

E. Wire normal and spare contacts to terminal blocks.

F. Provide all used and spare contacts with test switches wired in series to facilitate relay testing.

G. Provide with local tripped indication and pistol-grip handle.

H. Lockout relays shall be manually reset.

2.18 PROTECTIVE RELAYS

A. Relays shall be solid-state microprocessor-type; flush panel mounted self-contained units; operable from designated control power source.

B. Programming of relay shall be from face of unit without requiring additional equipment. Programming of relay shall also be possible from lap top computer.

C. Provide all software required for relay settings, communications, and oscillography as a Corporate perpetual license.

D. Operation, troubleshooting, and trip indication information shall be displayed on unit face.

E. Relays shall have built-in self-test functions with Form C relay failure alarm contact for remote indication. Separate Form C trip alarm contact shall also be furnished for remote trip indication.

F. Provide relays in draw-out type or connectorized type cases, whenever available.

G. Auxiliary relays shall be surface-mounted inside same switchgear cubicle in which it is used. Provide with following ratings:
   1. Relay: 300-volt minimum.
   2. Coil: 115-volt.
   3. Continuous duty.
   4. Number of poles as required or as indicated on Drawings.

H. Contacts shall be universal or convertible type for connection as either normally open or normally closed, rated NEMA B150, minimum.

2.19 METERS

A. Meters shall be microprocessor-based, multifunction type.

B. Metering unit shall provide local indication and be capable of remote communication for all functions.

C. Programming of meters shall be from face of unit without requiring additional equipment.

D. Provide all software required for meter settings or setup, communications, and oscillography as a Corporate perpetual license.

E. Revenue quality meters shall have accuracy guaranteed by testing traceable to NBS. Revenue power meters shall meet requirements of ANSI C12.20.

2.20 INDICATING LIGHTS

A. Provide LED-colored indicating lights as manufactured by Data Display Products, or equal. Clear LEDs with colored caps are not acceptable.

B. Provide each breaker with at least following LEDs:
   1. Red LED: Illuminated when breaker is closed. Wire red light to monitor trip coil such that light will be out if trip coil continuity is lost.
   2. Green LED: Illuminated when breaker is open.

C. Provide each lockout relay with an amber monitoring light.
   1. LEDs may be optionally integrated into LOR faceplate.
   2. Wire as follows:
      a. Continuity light shall be illuminated to indicate LOR is ready to respond and coil continuity is intact. If coil fails, light shall go out and contact shall close to initiate alarm.
      b. Trip indicator light shall illuminate when LOR has tripped, and shall stay lit until relay is reset regardless of whether trip signal is maintained or not.

2.21 TEST SWITCHES

A. Provide test switches for all relay and meter VT, CT, and trip circuits.

B. Relay and meter switches shall be industrial grade, manually operated, knife-blade type, 10-pole with voltage and current elements with screw-on cover for personnel protection. Switches shall be ABB FT-1, or equal.

C. Identify each voltage and current switch by group and phase. Orientation shall be Phase A-B-C, left-to-right when looking at test switch from front. Extend voltage and current wiring for each relay and meter for incorporation into single test block.

D. Lockout relay test switches shall be 10 single-pole voltage elements wired in series with coils and normally open contacts of relays. Provide screw-on cover for protection when not in use.

E. Back-wire, unless installed in location requiring front-wired type.

2.22 SURGE ARRESTERS

A. Provide station class, metal oxide surge arresters in quantities, and ratings as required.

2.23 SWITCHGEAR ACCESSORY SET

A. Provide accessories for test, inspection, maintenance, and operation.

B. Minimum one hand-crank or racking handle per switchgear line-up for moving breakers into "Connected," "Test," or "Disconnected" position.

C. Provide wall-mounted test cabinet for testing electrically operated breakers complete with connecting cables and secondary couplers.

D. Tool for manually charging breaker closing spring and manually opening shutter.

E. Test jumper for electrically operating breaker while out of compartment.

F. One breaker maintenance closing device per switchgear line-up.

G. One test plug for draw-out relays per switchgear line-up.

H. Provide dolly for circuit breaker transport for switchgear. Dolly shall be combination cart and lifting device capable of removing and inserting breakers in both single- and 2-high switchgear. Dolly shall be suitable for transporting vacuum contactors or switchgear circuit breakers; portable, floor-supported with roller base.

2.24 BREAKER BUS TEST TERMINALS

A. Provide means for connecting test equipment directly to bus, located on load side of each breaker. Terminal shall be accessible without having to remove conductor insulation material.

B. Protect connection point with removable insulating boot material rated same voltage class as switchgear main bus.

C. Provide same connection point on ground bus so phase conductors may be grounded for protection of personnel during maintenance.

2.25 MIMIC DIAGRAMS

A. Provide mimic diagrams on front of each switchgear door that depicts interconnection of switchgear and associated equipment.

B. Mimic diagrams shall be acceptable to Owner prior to fabrication.

2.26 NAMEPLATES

A. Laminated black letters on white background, with 1/8" (3 mm) engraved letters securely fastened with minimum of 2 self-tapping, stainless steel screws.

B. Provide nameplates to identify:
   1. Each externally visible devices including, but not limited to, protective relays, lockout relays, meters, switches, instruments, and indicating lights shall have nameplate on outside of switchgear and on inside of switchgear.
   2. Each externally invisible device shall have nameplate identifying device.
   3. Each vertical section shall have nameplate located on front and rear of switchgear. Nameplates shall include equipment description and identification number of equipment being served.
   4. Each switchgear line-up shall have main nameplate located on front and rear of switchgear with switchgear name and identification number.

C. Caution nameplates: Yellow with black letters.

D. Warning nameplates: Red with white letters.

E. Provide nameplates for terminal blocks. Mark in accordance with manufacturer's instructions.

F. Each internal device or component shall have identification marking in accordance with manufacturer's instructions.

G. Nameplates and placards including warning signs and safety placards shall meet NFPA 70E requirements.

2.27 SOURCE QUALITY CONTROL

A. Manufacturer shall submit proposed testing plan for complete switchgear and accessories for review and approval prior to performing testing.

B. Switchgear shall be electrically and mechanically assembled into single line-up, inspected, and tested as single unit with actual project breakers installed in switchgear at factory prior to shipment. Notify Owner at least 30 days prior to final testing so arrangements can be made for Owner to witness tests.

C. Perform following tests on equipment specified in accordance with latest edition of ANSI standards.
1. Manufacturer's standard production inspections and testing on switchgear assemblies.
2. Complete wiring check including function operation.
3. Polarity verification of phase-sensitive circuits including VT and CT circuitry.
4. Test communications of devices including control devices, relays and meters.
5. High-potential insulation check of main bus.
6. Control wiring insulation check.

D. Test breakers in accordance with ANSI C37.09.

E. Arc-resistant design testing shall be performed in accordance with IEEE C37.20.7 using maximum short circuit current available for system or device rating as perspective current available at incoming bus terminals of test sample.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install in accordance with manufacturer's requirements.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Medium-voltage variable frequency drive (VFD) including input transformer or input reactor for drive.

1.02 CLOSEOUT SUBMITTALS

A. Operation and maintenance manuals.
   1. General description and technical data.
   2. Receiving, storage, installation, and testing instructions.
   3. Operating and maintenance procedures.
   4. Complete set of final drawings.
   5. Complete documentation of inspections and tests performed, including logs, curves, and certificates. Documentation shall note replacement of equipment or components that failed during testing.
   6. Spare parts lists.
   7. Installation field reports.

1.03 QUALITY ASSURANCE

A. Manufacturer's qualifications:
   1. Minimum 10 years experience manufacturing medium-voltage VFDs of size specified.
   2. ISO 9000 certified.

B. Design and manufacture VFD and related equipment in accordance with applicable standards of NEC, NEMA, UL, NFPA, OSHA, IEEE and ANSI.

C. Printed circuit boards shall be completely tested and burned-in in accordance with UL 347A before being assembled into completed VFD. Test completed drive for at least 3 hours with an induction motor connected.

D. Design drive to provide 50,000 hours mean time between failures (MTBF) when specified preventative maintenance is performed.

E. Prototype designs: Equipment shall be dependable and reliable, offering best performance available from currently proven technology. Equipment furnished shall have documentation showing proof of actual commercial "in-the-field" operation for a minimum of 1 year. New design topologies that have less than 1 year of actual operating experience will not be acceptable unless approved by Buyer. Obsolete components or components scheduled for immediate discontinuation shall not be used.

PART 2 PRODUCTS

2.01 SYSTEM DESCRIPTION

A. If necessary, equip VFD with input and output filters to limit harmonic distortion to specified levels.

B. VFD shall convert incoming fixed frequency power input and convert to variable frequency power output to drive motor at variable speed operation.

C. Motor voltage shall be varied with frequency to maintain desired motor magnetization current suitable for eliminating need for motor derating.

D. VFD shall be installed in a climate controlled building.

E. VFD shall be capable of operating any standard ac squirrel cage induction motor (noninverter duty) without need for upgraded turn-to-turn winding insulation. Special motor insulation, or motor service factor of greater than 1.0 shall not be required.

2.02 DESIGN REQUIREMENTS

A. Harmonic requirements:
   1. Maximum harmonic current distortion at point of common coupling (PCC) shall not exceed limits listed in Table 10.3 of IEEE Standard 519.
   2. PCC is defined as point between nonlinear loads and other loads. For ID Fans PCC shall be defined at point of termination of power cable at 6,900-volt switchgear Bus.
   3. VFD (individual or simultaneous operation) shall not add more than 3% individual frequency voltage harmonic distortion while operating from utility source as listed on Table 10.1 of IEEE Standard 519.
   4. VFD shall not exceed 5% (calculated and measured) of total harmonic current distortion at point of common coupling and in accordance with voltage distortion limits shown in Table 11-1 of IEEE Standard 519.
   5. Total harmonic distortion (THD) at each PCC shall not exceed 5% THD limit recommended for general systems as listed in Table 10.2 of IEEE Standard 519.
   6. VFD converter section shall be an 18-pulse, 24-pulse, or an active front end system to eliminate need for harmonic filters.
   7. Harmonic compliance shall be verified by manufacturer with field measurements of harmonic distortion differences at point of common coupling with and without VFD operating.
   8. Inverter section shall be PWM or active front end type with output current distortion less than 5.0% to reduce harmonics that contribute to increased motor heating.
   9. Use of harmonic filters external to VFD to control harmonic frequencies is undesirable due to necessity to modify filters to avoid resonance problems and to correct for tuning whenever other inductive/capacitive loads are placed on system or when power system changes.

B. VFD input isolation transformer installed outdoors shall be oil filled suitable for mounting on a concrete pad. Transformer shall be suitable for operation in ambient conditions specified for site. VFD input isolation transformer or reactors installed indoors shall be dry-type and integral to VFD.

C. Equipment shall be complete, operable and installed at specified location. Equipment shall include required accessories. All like equipment shall be interchangeable.

D. Manufacture, assemble, test, and provide with UL label.

E. Designs using output transformer or reactor not acceptable.

F. Design shall demonstrate average repair time of less than 15 minutes for power switching devices and printed circuit boards.

G. Provide redundancy for critical components such that failure of anyone component will not shutdown drive.

H. VFD systems shall be capable of continuous operation at specified ambient conditions without derating. System shall also be simultaneously suitable for continuous operation in humidity between 5% and 95% noncondensing.

2.03 EQUIPMENT

A. Ratings:
   1. VFD shall be rated to operate from multi-phase power as supplied from drive isolation transformer or reactor specified.
   2. VFD converter section: 18-pulse, 24-pulse, or active front end system to eliminate need for harmonic filters.
      a. 18-pulse diode rectifier shall minimize input line harmonic distortion and operate at input power displacement of 0.97 at all speeds and loads.
      b. 24-pulse rectifier shall be used if 18-pulse rectifier is not sufficient to ensure compliance with IEEE 519 in specific installation conditions of station.
   3. Efficiency:

a. Guaranteed minimum total VFD system efficiency shall be a minimum 96.5 at 100% speed and 100% load and minimum 95% at 80% speed & 50% load.
b. Efficiency evaluation shall include input transformer, reactor, harmonic filter and power factor correction (if applicable), VFD converter, and output filter, as indicated below.
c. Auxiliary controls, such as internal VFD control boards, cooling fans or pumps, shall be included in all loss calculations.
d. Perform factory test at manufacturer's facility certifying that system efficiencies have been met.
e. VFDs which have output current harmonic distortions greater than 3% shall decrease Overall Efficiency rating by 0.5% at each point to account for additional losses which will occur at motor.

4. Output voltage and current ratings shall meet adjustable frequency operating requirements for the driven motor.
5. Overload current capacity: 110% of rated current for 1 minute every 10 minutes.
6. Maximum output frequency shall be a parameter adjustable between 0 and 60 Hz.
7. PWM switching pattern shall be continually adjusted to provide optimum motor flux.

B. Motor compatibility:
1. VFD system shall provide an output waveform that will allow utilization of standard induction motors, without need of any special insulation or derating. Motor life expectancy should not be compromised by operation with VFD system. VFD shall provide motor overload protection in operating conditions.
2. VFD output waveform shall be suitable for operating a squirrel cage induction motor (noninverter duty) without derating or requiring additional motor service factor. To ensure that there are no problems with motor heating, VFD output current waveform shall be inherently sinusoidal at all speeds, with a total harmonic current distortion not exceeding 5% referenced to full load output current fundamental between 10% and 100% speed regardless of loading. Under no conditions should special cabling to motor, be required due to high dv/dt spikes on cable. Buyer shall be able to use standard shielded 15 kV cables to connect motor to VFD.
3. System design shall not have inherent output harmonic resonances in operating speed range.
4. VFD output shall produce less than 2% of pulsating torque to output shaft of mechanical system eliminating possibility of exciting a resonance caused by VFD induced torque pulsations.
5. VFD shall inherently protect motor from high voltage dv/dt stress, independent of cable length to motor. VFD shall not require nonstandard insulation systems or insulation ratings above VFD output voltage rating. VFD system shall be designed to produce no standing waves or overvoltage conditions based on a cable length of 1000' from VFD to motor. If VFD requires an output filter to meet this requirement, it shall be an integral part of VFD system and included within VFD enclosure.
6. Input transformer or reactor shall be included to provide common mode voltage protection and allow use of a standard induction motor. Special high voltage motor insulation is not an acceptable method for protection against common mode voltages. Input transformer or reactor may be an integral part of VFD system and shall be included within VFD enclosure.
7. Contractor shall be responsible for complete coordination with motor manufacturer and shall work directly with assigned manufacturer to assure motor and VFD performs as a complete system without damage to either motor or VFD.

C. Power factor: VFD system shall maintain a 0.95 minimum power factor from 30% to100% speed. VFD system shall include necessary power factor correction and/or harmonic filters.

D. Power interrupt ride-through:
1. System shall be capable of maintaining continuous operation and producing full rated torque in event of a power loss of 8 cycles or less.
2. System shall be capable of automatically restarting in event of a momentary loss of power, or a clearing of a drive trip. VFD system shall provide choice of automatically restarting or not. Buyer shall be able to selectively apply this feature to some but not all conditions as appropriate for specific application. Automatic restart shall be enabled to maximize availability of VFD system.

3. System shall be capable of continuous operation with up to a ±10% voltage variation or up to a 30% voltage dip on input power line side. Some reduction in maximum power capability is acceptable. Motor shall not be allowed to reach a pull-out condition.

E. "Catch-A-Spinning-Load" capability:
1. System shall be able to catch and take control of a spinning load if started while rotating equipment is already spinning.
2. Appropriate safeguards shall be included in this operation to prevent damaging torques, voltages or currents from impacting any of equipment.
3. VFD shall ensure that load is spinning in proper direction prior to applying power to motor.
4. Should rotation be reversed, VFD will alarm and proceed to stop load and then restart in proper direction. Buyer shall have option of employing this feature or disabling it.
5. Enable feature to ensure maximum VFD availability.

F. Fault withstand: In event of a ground fault, VFD shall be capable of annunciating ground fault condition, safely operating and, by Buyer selection, either trip or continue operation. As a result of ground fault trip, VFD shall be capable of being reset and operating normally

G. Noise level: Less than 85 dB(A), ± 3dB(A) at 3' (1 m).

H. Waveform and filtering:
1. Output waveform filter shall be actively controlled and have low-pass frequency well below lowest inverter switching frequency.
2. Filter shall be contained within drive enclosure. Output waveform switching transients and harmonic content shall have negligible contribution to motor heating, acoustical noise in motor, torsional stress in power train, motor bearing currents, and common mode motor insulation voltage.
3. Minimize motor cable voltage reflections and resulting restrictions on motor cable length.
4. High-quality sinusoidal output voltage waveform with less than 3% THD shall be suitable for use with new or existing standard squirrel cage motors with 1.0 service factor and standard medium voltage insulation.

I. Control functions and adjustments:
1. User-entered data and parameters shall be held in nonvolatile memory.
2. Motor parameter function shall automatically or manually define motor equivalent circuit used by VFD.
3. Start/stop control functions: 3 wire start/stop, and emergency stops.
4. Automatic reset shall attempt to restart drive after undervoltage trip condition.
5. Output control features:
   a. Flux optimization by providing optimum magnetic flux for any given speed/torque operating point.
   b. Current and torque limit adjustments to limit maximum VFD output current and maximum torque produced by motor.
   c. Sensorless vector control.
   d. Selectable skip frequencies.
   e. Adjustable minimum speed output to be ramped to upon startup with zero speed demand.

J. Static and dynamic performance:
1. Open loop static speed regulation: ±0.5% (10% of motor slip).
2. Torque:
   a. Drive shall be capable of developing 100% torque at zero speed.
   b. Torque response time: 10 milliseconds or less.
   c. In torque regulating mode, torque regulating accuracy shall be 4% or less.

K. Operator control panel:
1. Provide large LCD display screen with user-friendly interface terminal. Display shall be capable of displaying operational status of VFD and diagnostic messages in plain English (no number codes).
2. Provide, at a minimum, following indications:
   a. Output voltage (provide 4-1/2" analog or large digital meter and display screen).
   b. Output current in amps (provide 4-1/2" analog or digital meter and display screen).
   c. Motor speed (provide 4-1/2" analog or large digital meter and display screen).
   d. Speed demand in percent (display screen only) input current in amps (display screen only).
   e. Input voltage (display screen only).
   f. Output frequency in Hertz (display screen only).
   g. Output kW total 3-phase (display screen only).
   h. Elapsed time running meter (display screen only).
3. Provide panel-mounted status lights for following functions (as a minimum). Use LED lamps for long life.
   a. Ready to run.
   b. VFD trouble.
   c. VFD trip (shutdown).
   d. VFD running.
   e. Remote control operation.
   f. Fan failure.
   g. Open and closed status lights for all contactors.
4. VFD shall have means of selecting remote or local operation. Provide local speed control potentiometer for local operation. Remote operation shall be via 4-20 mA control signal from plant DCS. Provide following capabilities locally on VFD:
   a. Local/remote selection with bi-directional bumpless transfer.
   b. Emergency stop.
   c. Trip reset.
   d. Alarm reset.
   e. Menu navigation.
   f. Parameter select/save.
5. During normal operation, speed reference, start/stop and local/remote status shall be displayed.
6. At least 3 selectable analog values shall be available for simultaneous display including, as a minimum:
   a. Motor speed.
   b. Output frequency.
   c. Output voltage.
   d. Output current.
   e. Output torque.
   f. Input voltage.
   g. Input power.
   h. Input kilowatt-hours.
   i. Cooling air temperature.
   j. Coolant liquid temperature.
   k. DC bus voltage.
7. Provide password protection to allow security against unauthorized access.

L. Control system interface:
1. Provide inputs and outputs to interface with control system.
2. I/O points, minimum:
   a. VFD speed demand analog input, powered from DCS:
      1) 4-20 mA.
      2) Upon loss of speed reference signal, drive shall remain at speed at which it is running. Drive shall have capability to transfer to local control without tripping and shall have speed controlled by local pot.
   b. Provide minimum of 6 analog outputs, powered from VFD:
      1) 4-20 mA.
      2) Independently programmable.

3) Function selections: Use to provide signals proportional to output speed, motor voltage, motor amperes, motor kW, frequency, and spare.

c. Provide minimum of 12 discrete outputs:
1) Rated to switch 5 amperes at 120-volt ac.
2) Function selections: Ready, running, alarm and trip indications.
3) General and specific warning fault indications shall be available.

3. Adjustable supervision limit indications shall be available to indicate programmed values of operating speed, speed reference, current, and torque.
4. Communications ports:
a. RS-485.
b. Ethernet TCP.
5. VFD system shall have capability to retrieve remote diagnostics and operational data via Ethernet communication link.

M. Protective functions:
1. For each programmed warning and fault protection function, drive shall display message in complete spanish.
2. At least 16 most recent fault messages shall be stored in drive fault history.
3. Input short circuit, ground fault, and input phase loss.
4. AC input overvoltage shall operate at 130% of maximum rated voltage and ac undervoltage shall operate at 65% of minimum rated voltage.
5. Output short circuit and ground fault protection in accordance with UL 508C. Motor phase loss protection shall be provided.
6. DC bus overvoltage and undervoltage functions shall be provided.
7. Stall protection: Programmable to provide warning or stop drive after motor has operated above programmed torque level for programmed time limit.
8. Stator winding RTD inputs:
a. Provide 6 RTD inputs for motor stator windings (2 per phase)
b. RTDs shall be 10-ohm copper.

N. Protective devices:
1. VFD shall include a surge arrester or transient suppression network to protect VFD, input transformers, and line reactors from voltage surges.
2. Protective relay communications shall be compatible with Schweitzer SEL-3332 intelligent communication server.
3. Fuses shall have blown fuse detection. Provide 3 spare fuses for each type and size of fuse for each device.
4. Input source side of VFD shall have following minimum protection:
a. Undervoltage.
b. Overvoltage.
c. Phase reversal.
d. Phase imbalance.
e. Instantaneous overcurrent.
f. Ground fault.
g. Overload.
h. Component over temperature protection.
i. Input transformer fault protection.
5. VFD system shall have following minimum protection:
a. Gate driver power supply undervoltage.
b. Control power undervoltage.
c. Control power overvoltage.
d. Component over temperature protection.
e. Regeneration from connected motor.
f. Loss of VFD input power.
g. VFD output open circuit.
h. Failure of inverter to commutate.
6. Output motor load side shall have following minimum protection:
a. Motor over speed.
b. Under and overvoltage.
c. Reverse phase/phase imbalance.

d. Instantaneous overcurrent.
e. Overload.
f. Ground fault protection.
g. Motor differential relay protection from CT inputs located at motor leads.
h. Over temperature via motor RTD input.
i. Stall conditions.

O. Diagnostics and fault recording:
1. VFD shall use comprehensive microprocessor based digital diagnostic system which constantly monitors its own control functions and displays faults and operating conditions. Device diagnostics shall detect and protect against device shorts, over or under gate voltages, loss of gating, loss of diagnostic feedback, heat sink temperature feedback and overload monitoring and protection.
2. Trending capability shall be provided that will monitor a minimum of 8 or more variables. Provided trending shall be capable of one-shot and multi-shot trending.
3. Fault and warning messages shall be stored in non-volatile memory that will retain information under all conditions.
4. Fault log shall be retained in diagnostic system that will record, store, display, and print time, date, and type of fault for 16 most recent events.
5. History log shall be retained in diagnostic system that will record, store, and display, following control variables at an adjustable time interval for 50 intervals immediately preceding a fault or trip:
a. Type of faults.
b. Speed demand.
c. Output speed.
d. Output demand in amps.
e. Output amperes.
f. Output volts.
g. Output frequency.
6. Fault and history logs shall be accessible via operator interface display, local RS232 serial link, and remotely via Ethernet communication port and Profibus DP port.

P. Provide "Windows-based" (Windows 7 compatible) software tool kit. Software shall provide operational, maintenance and diagnostic features. Using an IBM compatible PC, software shall permit programming of parameters, display block diagrams, show bar graphs, report adjustment data, display trends, provide troubleshooting information using first fault data, trace back data, and trouble records. Software package shall have capability to plot and display up to 16 different VFD parameters and have ability to freeze plot and print hard-copy versions of plots.

Q. Wiring:
1. Low-voltage components, circuits and wiring shall be separated with physical barriers from any sources of medium voltage
2. Sleeve-type wire marker tags or other acceptable means of permanent identification shall be applied to power and control wiring. Individual labels/nameplates shall be provided for all major components for VFD system.
3. Control power transformers shall be fused on primary and secondary with current limiting fuses.
4. Secondary of control power transformers shall have one terminal grounded.
5. Wiring shall be tagged with permanent labels at each termination, junction box, and device. Labels shall correspond to schematic and wiring diagrams.
6. Main power bus shall be constructed of tin-plated, high conductivity copper. Bus shall be appropriately sized for continuous current rating and be braced to withstand anticipated mechanical forces caused by a short circuit current. Bus connections shall be bolted or continuously welded.
7. Provide ground bus for each VFD and VFD enclosure. Connect ground bus of each VFD enclosure to ground bus provided with building in which it is contained.

R. Control power:
1. VFD shall contain control power transformers as necessary to provide for control power needs including power for cooling fans motor, coolant pump motors, etc.

2. VA rating of control power transformers shall be determined by manufacturer and shall have minimum of 25% spare capacity.
3. Secondary voltage rating of control power transformers shall be selected by manufacturer.
4. Provide 125-volt dc and 120-volt ac UPS power from plant for VFD controller and protection systems.

2.04 ENCLOSURE

A. VFD system components shall be mounted and wired by VFD system manufacturer in grounded enclosure. Provide 2 points to connect enclosure to ground using 4/0 ground cable.

B. Input filter, transformers, reactors, power conversion, output filters and auxiliary equipment enclosure sections shall be NEMA 1 Ventilated and shall have gasketed doors.

C. Microprocessor and control logic boards and their power supplies shall be housed in a NEMA 1 section, safely accessible without exposure to medium voltage and without drive shutdown. All low voltage wiring shall be fully isolated from medium voltages by barriers.

D. VFD cabinets and doors shall be fabricated using a minimum 12-gage steel for sturdy construction and dimensional integrity to assure long-term fit and function. Doors shall be gasketed to provide environmental protection and secure fit.

E. Enclosures shall be designed to avoid harmonic and inductive heating effects. Enclosure shall be designed to shield any outside equipment from interference.

F. Mechanical key interlocks shall be provided on all entrance doors to medium voltage components. Interlocking shall be fully coordinated to prevent access to all high voltage compartments, including transformer, filters, or any switchgear that is part of supply, when line power is applied to VFD system.

2.05 COOLING SYSTEMS

A. Liquid cooling system requirements:
1. Redundant full capacity pumps with automatic throw-over on pump failure.
2. Coolant storage reservoir with level indication, low-level alarm and low-level trip contact.
3. Coolant shall be suitable for ambient conditions specified.
4. Coolant deionizer with isolation valves, where deionizing cartridge can be changed without shutting down drive.
5. Drain valves to completely drain cooling system.
6. Liquid cooling system shall be an independent closed loop system.
7. System shall utilize an outdoor liquid-to-air heat exchanger. Liquid-to-air heat exchangers shall be constructed of heavy gauge galvanized steel casing, copper cooling coils with aluminum fins, and aluminum propeller fans.
8. Heat exchanger shall be equipped with a redundant cooling fan(s).
9. Pumps shall be contained in an integral cabinet with VFD.
10. Pressure, temperature, and failure alarms shall be provided for pumps and cooling fans. Provide sufficient coolant to fill VFD and radiator.

B. Air cooling system requirements:
1. HVAC conditioned air, VFD cooling fans:
   a. Heavy-duty construction and MTTF of 10 years. Plastic, muffin style fans not acceptable. Insofar as practicable, provide redundant cooling fans to allow continued operation with failed fan.
   b. Provide 2 spare cooling fans with drives if fans are not redundant. Provide fan failure alarm.
2. Cooling air derived from outside not allowed.

2.06 DRIVE INPUT POWER TRANSFORMER OR REACTOR

A. Transformer or reactor shall be rated sufficiently to provide continuous full-load capacity and harmonic heating of VFD without overheating.

B. Impedance shall be selected to limit available fault current to a value that is safe for line converter components.
   1. Transformer or reactor shall be designed, manufactured, and tested according to latest versions of applicable ANSI standards.
   2. Transformer and reactor shall be provided with four 2.5% full capacity taps, 2 above and 2 below nominal voltage. Design transformer with appropriate K-rating for type of drive. Transformer may form coordinated part with VFD and shall be suitable for converter application.

C. Provide transformer and reactor input relaying and/or fuse protection.

D. Transformer types:
   1. Oil-filled:
      a. OA cooling class with a maximum degree rise of 55°C.
      b. Copper winding.
      c. 95 kV basic impulse level (BIL).
      d. Mineral oil filled.
      e. HV and LV air filled terminal chambers.
      f. Automatic/manual pressure relief valve.
      g. Cover mounted pressure relief device with alarm contacts.
      h. Pressure-vacuum gage.
      i. Magnetic liquid level gage and alarm contacts.
      j. Top oil thermometer gage and alarm contacts.
      k. De-energized tap changer with pad-lockable handle.
      l. Base designed for jacking, pulling and rolling provisions.
      m. 2" drain valve with built-in 3/8" sampling device.
      n. 2 tank ground pads; 2-hole stainless steel.
      o. Painted ANSI 70 (light gray).
      p. Located outdoors on pad.
   2. Dry-type:
      a. Self-cooled (AA), forced-air-cooled (FA).
      b. Cast coil.
      c. Copper windings.
      d. 95 kV basic impulse level (BIL).
      e. Tap changers, terminals, leads, and other ancillary equipment shall not restrict loading.
      f. Temperature gauge and alarm contact.
      g. De-energized tap changer with pad-lockable handle.
      h. Base designed for jacking, pulling and rolling provisions.
      i. 2 tank ground pads; 2-hole stainless steel.
      j. Painted ANSI 70 (light gray).
      k. Integral to VFD.

2.07 SWITCHGEAR COMPONENTS

A. Equip VFD with input contactor. Provide interlocks to prevent access to contactor when contactor is closed.

B. Contactors shall have open and close status lights that use LED lamps.

2.08 VFD POWER CAPACITORS

A. Type: Self-healing film type or oil filled capacitors. Electrolytic capacitors not acceptable

B. Equip large capacitors used in dc link and harmonic filters with discharge resistors. Resistors shall be capable of reducing residual charge to 50 volts or less within 5 minutes after capacitor is disconnected from supply voltage.

C. VFD system shall be capable of monitoring dc link capacitor voltage before accessing medium voltage cubicle compartment.

D. Capacitors used by VFD shall be contained in VFD enclosure and not separately housed.

E. Capacitors used for harmonic filter applications shall meet requirements of IEEE 18 and IEEE 1036 for shunt power capacitors.

2.09 DC LINK AND HARMONIC FILTER INDUCTORS

A. DC link inductors shall meet requirements of ANSI C57.16 and shall be designed to prevent saturation under maximum fault current conditions. Inductors shall be integral to VFD system lineup.

B. Provide over-temperature protection for dc link inductors.

C. Inductors shall use Class H insulation system with Class B temperature rise and be of air-core design

2.10 FAILURE AND REPAIR RATES

A. Mean Time to Failure (MTTF) and Mean Time to Repair (MTTR) shall be stated for each of component and subsystems listed below. Source of data shall be identified. Actual field performance data is requested. Analytic predictions as a result of failure mode and effects analysis, design reviews, or other similar techniques will be accepted but shall be clearly stated. Failure and repair rates shall be supplied at 90% confidence level if source of data allows assessment.
1. Input transformer.
2. Input reactor.
3. Converter section.
4. Inverter section.
5. Cooling fans.
6. DC link.
7. Harmonic Filters.
8. Switchgear contactors.
9. Overall VFD.

B. MTTF is defined as total operation time (or cycles) divided by number of failures during this time (cycles) for VFD systems representative of equipment being proposed by manufacturer. Manufacturer shall assume that recommended routine maintenance has been performed.

C. MTTR is defined as total applicable repair time over specified time period divided by number of repairs made during that period. Do not include time required to obtain necessary parts, equipment, tools, etc. Identify whether repair time assumes repair in place or replacement type repair, and assumed repair crew size.

D. Expected service life for major components shall be provided with Bid.

2.11 IDENTIFICATION AND TAGGING

A. Securely attach nameplates with self-tapping stainless steel screws. Adhesive nameplates not acceptable.

B. Lettering shall be black on white background.

2.12 PAINTS AND FINISHES

A. Manufacturer standard finishes for corrosion resistance.

B. Provide two 1-pint spray cans of enamel for touch up.

2.13 SOURCE QUALITY CONTROL

A. Owner reserves right to witness testing. A projected test schedule and copy of proposed test procedures shall be provided at least 2 weeks in advance of each test date. Notify Owner 2 weeks in advance of testing.

B. Provide manufacturer's standard testing in addition to following requirements.

C. Printed circuit boards shall be visually inspected and functionally tested on a suitable test system to fully prove functionality to individual boards. Each board shall be tested per Manufacturer's standard testing procedure to minimize infant mortality failures.

D. Power assemblies shall be visually inspected and Hi-Pot tested. Complete diagnostics and logic shall be tested. Power conversion circuits shall be thoroughly tested at 100% load for a minimum of 1 hour and then tested for 1 minute at momentary overload rating.

E. System shall be given preliminary checks including verification of electrical connections. Grounding, power and control wiring connections shall be tested. EPROMs shall be checked for correct drive firmware versions. Perform visual check to verify:
   1. Degree of protection of cabinets.
   2. Input isolator (if supplied) is lockable in off position.
   3. Marking of terminals and wiring.
   4. Space availability for cable termination.
   5. Accessibility of components and ease of maintenance and repair.

F. VFD system shall be fully checked against approved drawings and this Specification for compliance.

G. Complete power circuit shall be Hi-Pot tested to ground after assembly.

H. Perform no-load test on complete system. Connect drive to unloaded motor and verify feedback signals. Output voltage shall be calibrated. Logic and interlocks including customer logic and instrumentation shall be tested.

I. Drive shall be given full power test at VFD rated current and a reduced voltage for a minimum of 4 hours (or until all system temperatures stabilize, whichever is longer) on dynamometer or reactor load. Test shall be performed as integrated system including all supplied input switchgear, input transformer, reactor, input filter, power section, and output filter.

J. Verification of VFD input harmonic voltage and current distortion shall be completed at rated speed and power as part of final startup and acceptance.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install in accordance with manufacturer's instructions, procedures, and recommendations.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Motor control centers rated 600 volts and below.

1.02 CLOSEOUT SUBMITTALS

A. Operation and maintenance manuals. Provide at a minimum:
1. General description and technical data.
2. Receiving, storage, installation, and testing instructions.
3. Operating and maintenance procedures.
4. Complete set of reviewed drawings that require no further action.
5. Complete documentation of inspections and tests performed, including any logs, curves, and certificates. Documentation shall note any replacement of equipment or components that failed during testing.
6. Manufacturer's warranty on parts, labor, materials, and equipment.
7. Spare parts lists.
8. Protective relay instruction manuals and curves.

1.03 MAINTENANCE MATERIALS

A. Provide complete set of special tools as necessary for installation and maintenance for each piece of equipment. Tools and intended use shall be identified in assembly instructions.

1.04 QUALITY ASSURANCE

A. Manufacturer's qualifications:
1. Manufacturer shall be ISO certified.
2. Manufacturer shall have produced similar electrical equipment for minimum period of 5 years.

B. Regulatory requirements: Equipment shall be in accordance with applicable requirements of ANSI C57.13, ANSI C37.20.3, NEMA standards for Class E-2 Industrial Control Equipment, NEMA ICS 1, NEMA ICS 3-2, NEMA ICS 6, NFPA 70, UL 347, UL 508, UL 869A, and EMACC G8.2 and E14.1.

PART 2 PRODUCTS

2.01 MOTOR-CONTROL CENTERS

A. Motor control center shall be continuous, coordinated, factory assembly ready for installation, connection, and immediate service designed for operation at site ambient conditions.

B. Motor control center may include, but is not limited to:
1. Horizontal power bus.
2. Dead-front metal enclosed compartments containing power buses.
3. Ground bus.
4. Feeder circuit breakers and combination motor controllers.
5. Auxiliary and transition compartments.
6. Auxiliary control devices.
7. Instrument transformers.
8. Relays.
9. Meters.
10. Control switches.

C. Ratings: In accordance with design requirements.

D. Enclosures: suitable for the installed environmental conditions.

E. Buses: Plated copper with full-size neutral bus and equipment ground bus.

F. Functional features: Modular compartmental arrangement.
   1. Controller units with fusible disconnecting means.
   2. Individually mounted overcurrent protective devices.
   3. Transient voltage surge suppressors.
   4. Spaces and blank units.
   5. Spare units.

2.02 CONTROLLERS

A. Controller type and features per design application requirements.

B. As a minimum provide the following accessories:
   1. Pushbutton stations, pilot lights, and selector switches.
   2. Stop and lockout push-button station.
   3. Control relays.
   4. Phase-failure and undervoltage relays.
   5. Current-sensing, phase-failure relays.
   6. Spare-fuse cabinet.

2.03 FEEDER CIRCUIT PROTECTIVE DEVICES

A. Feeder and nonmotor load breakers shall be 3-pole and shall be rated for symmetrical short circuit current as required. Neither series rating nor power fuses acceptable.
   1. Breakers rated 200 amperes and higher shall have microprocessor-based rms sensing trip units.
   2. Breakers shall be operated by a position indicating toggle-type handle and shall have quick-make, quick-break over center switching mechanism that is trip free.
   3. Automatic tripping of device shall be indicated by handle position.
   4. Provide with nonwelding, silver alloy contacts.

B. Do not use fuses unless specifically noted, or where recommended by manufacturer of driven equipment.

C. Provide hardware, terminations, and accessories to complete installation for intended use and operation of equipment.

D. Make adjustments necessary when ambient temperatures above 40°C may be encountered due to site conditions or physical installation location.

2.04 TERMINATIONS

A. Cable entrance shall, at a minimum, be in accordance with NEC cable bending requirements.

B. Main incoming cables shall terminate within control center on main lug or main breaker termination point as indicated.
   1. Cable sizing per design requirements.
   2. Terminations shall have adequate dedicated space for type, number, and size of cable used. Lugs shall be compression-type with anti-turn feature.

C. Feeder cable terminations shall facilitate installation with special attention given to larger size starters and feeder breakers.
   1. Position lugs such that cable opening is oriented in direction cable will enter from, and with sufficient distance between lug and enclosure to permit training of cable.
   2. Termination shall be possible without removing internal components.

2.05 SPACE HEATERS

A. Provide space heaters in each vertical section when required per manufacturer recommendations.

B. Control space heaters within each vertical assembly with single thermostat.

C. Furnish single-pole circuit breaker for protection and as supply disconnect.

D. Provide accessible terminal blocks for connection of single, external power source.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install in accordance with manufacturer's recommendations.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Nonsegregated phase bus duct system suitable for indoor and outdoor installation.

1.02 CLOSEOUT SUBMITTALS

A. Operation and maintenance manuals. Provide at a minimum:
1. General description and technical data.
2. Receiving, storage, installation, and testing instructions.
3. Operating and maintenance procedures.
4. Complete set of reviewed drawings that require no further action.
5. Detailed instructions for all required field assembly.
6. Installation field reports.
7. Complete documentation of inspections and tests performed, including any logs, curves, and certificates. Documentation shall note any replacement of equipment or components that failed during testing.
8. Spare parts list.
9. Copies of warranties.

1.03 MAINTENANCE MATERIALS

A. Provide complete set of special tools as necessary for installation for each piece of equipment. Tools and intended use shall be identified in assembly instructions.

1.04 QUALITY ASSURANCE

A. Manufacturer's qualifications:
1. Manufacturer shall be manufacturer of major components within assembly and shall be ISO certified.
2. Manufacturer shall have produced similar equipment for a minimum period of 5 years.

B. Regulatory requirements:
1. Design, manufacture, and test bus and accessories in accordance with applicable requirements of ANSI/IEEE C37.23.

1.05 TEMPORARY POWER

A. Connect space heaters to bus duct by use of temporary power source capable of being monitored. Maintain temporary power until bus is installed and normal power source is permanently energized

PART 2 PRODUCTS

2.01 SYSTEM DESCRIPTION

A. Nonsegregated phase bus duct system includes, but is not limited to:
1. Bus and enclosure.
2. Hardware and components for connections to equipment:
   a. Generator compartment and generator terminal equipment.
   b. Transformers.
   c. Generator breaker.
   d. Switchgear.
   e. Surge arrester and PT cubicles.
3. Flexible links for all connections.
4. Expansion joints.
5. T-tap connections.
6. Vapor barriers and wall penetrations.

7. All necessary bus support structures.

B. One-line diagrams, conceptual layout drawings, and phasing information are provided to show estimated lengths and required configuration of bus assembly.

2.02 DESIGN AND CONSTRUCTION

A. Provide required outdoor support structures, indoor hangers, and attachment accessories.

B. Bus ratings shall take into account site location ambient conditions and solar radiation gain.

C. Provide special sections and fittings where necessary to suit installation. Special consideration shall be made regarding seismic conditions, equipment vibration, and growth due to thermal expansion.

2.03 CONDUCTORS

A. Design bus duct systems for nominal voltages, BIL, number of poles, rated maximum voltages to meet design requirements.

B. Design bus duct systems for continuous, self-cooled current rating to the maximum capacity of the connected switchgear and/or transformers.

C. Bus duct system shall be designed and braced to withstand the maximum 3-phase fault currents and momentary 3-phase fault currents of the connected system.

D. Fabricate conductors from high-grade, 98% pure copper bus bars. Connection areas shall be tinned or silver-plated.

E. Insulate conductors throughout with flame-retardant, self-extinguishing, track-resistant insulation. Lap joints and connections to equipment shall be insulated with slip-on type boots, provided by manufacturer, to facilitate installation and inspection.

F. Joints shall be fastened with 2 or more bolts. Bolting hardware and accessories shall be compatible with conductor material and resistant to corrosion.

2.04 INSULATORS

A. Support bus conductors by blocks or post insulators of molded fiberglass, polymer, ceramic or porcelain.

B. Insulators shall be flame-retardant, track-resistant, and nonhygroscopic.

C. Locate insulators to provide mechanical strength to withstand forces from momentary and short-circuit conditions specified.

2.05 ENCLOSURE

A. Indoor and outdoor enclosures shall be of non-ventilated, totally enclosed, weatherproof-type in rectangular form.

B. Provide full-access covers for maintenance and inspection.
   1. Equip covers with corrosion-resistant, captive fastening hardware.
   2. Removable covers and plates shall have permanent match-mark identification.

C. Supply each section of enclosure with breather/drain for removal of condensation.

D. Enclosure system shall be electrically continuous to provide for ground fault return path. Provide joints with splice plates or with copper ground straps with adequate conductivity.

E. Provide continuous No. 4/0 AWG ground conductor in parallel to bus duct. Ground conductor shall be bolted to each bus section.

F. NEMA 2-hole copper grounding pads shall be provided on each terminal end of bus.

G. Provide outdoor metal terminal enclosure for bus connection to Owner-furnished equipment.
   1. Design enclosures and bus to mate to throat extensions and terminations provided on Owner-furnished equipment.
   2. Owner will provide drawings for equipment after award of Contract.
   3. Coordinate with equipment manufacturer's for final termination details.

2.06 WALL PENETRATIONS

A. Wall penetrations between indoor and outdoor locations shall be weather-resistant and watertight.

B. Wall penetrations shall include vapor barriers to prevent interchange of air between outdoor and indoor environments or environmentally controlled and non-environmentally controlled environments. Vapor barriers shall be either sealed or baffled to prevent interchange of air between bus sections in accordance with ANSI C37.23.

C. Bus assembly shall include mounting plates, gaskets, and hardware where bus penetrates building walls.

D. Install fire barriers where bus penetrates fire rated walls, floors, or ceilings. Fire rating of barrier shall equal or exceed rating of wall.

2.07 HEATERS

A. Provide thermostatically controlled space heaters to prevent condensation.

B. Control space heaters with thermostat.

C. Furnish single-pole circuit breaker for protection and as supply disconnect.

D. Provide accessible terminal blocks for connection of external power source.

2.08 SURGE ARRESTERS

A. If required, provide station class surge arresters.

2.09 IDENTIFICATION AND TAGGING

A. Securely fasten stainless steel or phenolic nameplate with stainless steel screws at each equipment termination. Nameplate shall be embossed with following information:
   1. Manufacturer.
   2. Purchase order number.
   3. Serial number.
   4. Rated voltage.
   5. BIL rating.
   6. Continuous current rating.
   7. Rated short time current.

2.10 FINISH

A. Enclosure shall be cleaned, rinsed, and phosphatized prior to painting.

B. Coating process: Electrostatically applied polyester powder with final baked-on average thickness between 1.5 and 4.0 mils.

C. Standard exterior finish color.

D. Finish shall have minimum pencil hardness of 2H as tested in accordance with ASTM D3363.

E. Finish shall pass ASTM B117 salt spray test for minimum of 1000 hours.

F. Finish shall pass ASTM D2794 impact testing with minimum values of 160 in-lb for direct impact and 120 in-lb for reverse impact.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install in accordance with manufacturer's recommendations.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Low-voltage variable frequency drive (VFD) designed for use on 3-phase squirrel cage induction motor.

1.02 CLOSEOUT SUBMITTALS

A. Provide, at minimum:
1. Final shop drawings and construction record drawings.
2. Operating and maintenance manual.
3. Spare parts lists with pricing.
4. Copies of warranty.

1.03 QUALITY ASSURANCE

A. Design and manufacture according to latest editions of applicable NEMA, UL, NFPA, IEEE, and ANSI standards.

B. Manufacturer shall be ISO 9001 certified and shall have produced similar electrical equipment for minimum period of 5 years.

C. Completed drive shall be tested for at least 3 hours with induction motor connected.

PART 2 PRODUCTS

2.01 SYSTEM DESCRIPTION

A. VFD shall convert incoming fixed frequency 3-phase ac power into variable frequency and voltage for controlling speed of 3-phase ac motor.

B. Motor voltage shall be varied with frequency to maintain desired motor magnetization current suitable for eliminating need for motor derating.

C. VFD shall be sinusoidal PWM type drive with sensor-less torque vector control capability. Control techniques other than PWM not acceptable.

D. Enclosure suitable for the installed environmental conditions.

E. Enclosure doors shall include electromechanical interlocking system with safety switch and electrical interlocks tied to main breaker. Whenever doors are open, safety ground switch shall connect plus, minus, and neutral dc buses to ground to ensure stored energy is discharged.

2.02 DESIGN REQUIREMENTS

A. Where manufacturer determines an input drive transformer, input filter, or output filter is required to meet installation requirements, they shall also be provided.

B. Point of Common Coupling (PCC) shall be defined as terminals on input side of circuit breaker directly feeding each individual drive.

C. Total Harmonic Distortion (THD) at each PCC shall not exceed 5%, as recommended for General Systems as listed in Table 10.2 of IEEE Standard 519.

D. Harmonic current distortion at PCC shall not exceed limits listed in Table 10.3 of IEEE Standard 519.

E. Design drive to provide 50,000 hours mean time between failures (MTBF) when specified preventative maintenance is performed.

F. Design motors furnished to meet NEMA MG1, Part 31 for VFD service.

G. Symbols shall conform to ANSI Y32.2/IEEE 315/CSA Z99.

H. Printed circuit boards shall be completely tested and burned-in, in accordance with UL347A before being assembled into completed VFD.

2.03 INPUT POWER

A. System shall be capable of maintaining rated torque and speed with bus voltage deviations of ±10% and frequency deviations of ±5%.

B. Line notching, transients, and harmonics on incoming line shall not affect VFD performance.

C. Below 70% bus voltage, motor will be allowed to coast. If bus voltage is restored within 2 seconds, system can be started, if selected. If bus voltage is not restored within 2 seconds, system shall be automatically shut down. Automatic or manual restart shall be selectable from control panel.

D. VFD shall have provisions for input line reactor to be incorporated into VFD enclosure.

E. Drive efficiency shall be 95% or higher at rated load.

2.04 OUTPUT POWER

A. Operating mode:
   1. Frequency at 60 Hz and below: Constant volts per Hz mode.
   2. Above 60 Hz: Selectively operate in either constant volts per Hz mode or constant voltage extended frequency mode.

B. Rated output voltage: Programmable for either 80 to 240 volts or from 320 to 480 volts depending on 3-phase motor nameplate rating.

C. VFD shall be capable of minimum of 110% of rated full-load current in continuous operation.

2.05 OPERATING RANGE

A. Speed range: 6 to 60 Hz. Both minimum and maximum speeds shall be field-adjustable.

B. VFD shall not have electrical resonance within operating speed range.

C. VFD shall be able to speed search and immediately pick up spinning motor in either forward or reverse direction.

2.06 TORSIONAL REQUIREMENTS

A. VFD, motor, and equipment load shall not develop adverse speed dependent oscillations.

2.07 NOISE

A. Drive shall not cause motor audible noise to increase more than 3 dB at 3' (1 m) above rated noise level for operation on full voltage starter.

2.08 MINIMUM DISPLACEMENT POWER FACTOR

A. PF 0.90 lagging, or higher, at any speed or load without use of power factor correction capacitors.

2.09 HARMONICS MITIGATION

A. Provide output filters, as required, such that motor insulation will not be damaged.

B. If additional equipment is necessary to meet IEEE 519 requirements, it shall be through use of one or more of following:
   1. Input isolation transformer.
   2. Input line reactor.
   3. Input harmonic trap filter with series reactor.
   4. Higher pulse rectifier.
   5. Mirus filter.
   6. Dc link reactor.

C. Drive manufacturer shall select and approve equipment provided.

2.10 DRIVE CONTROL

A. VFD shall use control strategy that maximizes efficiency, performance, and power factor while minimizing motor heating.

B. Drive regulator and control: Digital microprocessor design with following functions:
   1. Speed regulation.
   2. Current regulation.
   3. Load angle regulation.
   4. Drive protection.
   5. Drive diagnostics.
   6. System sequencing.

C. VFD regulator and control functions shall be stored on nonvolatile memory.

D. Drive shall have minimum of 3 programmable prohibited frequency ranges with adjustable span of 0 to 10 Hz.

E. Provide drive with local and remote controls:
   1. Locate 2-position maintained switch on front of enclosure for selection of "Local" or "Remote" control.
   2. Individual momentary buttons for "Local," "Start," and "Stop."
   3. Speed reference potentiometer.

F. Operation:
   1. Switch in "Local" position: Drive shall operate at speed set by potentiometer when local "Start" button is pushed. "Stop" button shall stop equipment without delay.
   2. Switch in "Remote" position: Drive shall be remotely controlled. Local potentiometer, "Start" button, and "Stop" button shall have no effect on operation.
      a. Speed control shall regulate motor speed corresponding to remote speed signal.
      b. When incoming signal is varying, rate of change of motor speed shall be limited by pre-selected acceleration/ deceleration rate.
      c. Drive shall be programmable to either run at constant speed as determined by minimum speed setting, last signal, preset speed, or to shut down, upon loss of speed signal. Remote speed signal falling below lower limit of range shall also be considered as loss of speed signal.
      d. If remote speed signal is above range upper limit, drive shall run at speed corresponding to upper limit.
      e. Alarms and indication:
         1) Loss of remote speed signal shall be alarmed.
         2) Drive failure alarm.
         3) Drive fault alarm.
         4) Drive in remote and local control indication.
         5) Drive running indication.

G. Following shall be available locally either on control panel display or by use of readouts and LEDs, and remotely through communication interface:
   1. Drive ready.
   2. Drive running.
   3. Current, amps.
   4. Line-line voltage, volts.
   5. Output horsepower, hp.
   6. Speed, rpm.
   7. Frequency, Hz: Digital readout.
   8. Drive alarm conditions.
      a. Missing run or start permissive.
      b. Low control voltage.
      c. Microprocessor problem.
      d. I/O addressing problem.
      e. Loss of speed reference.
      f. Common trouble alarm.
   9. Drive fault conditions requiring immediate attention, and may indicate impending shutdown of drive.
      a. Source undervoltage.
      b. Source overvoltage.
      c. Source loss of phase.
      d. Source reverse phase sequence.
      e. Load overcurrent.
      f. Overspeed.
      g. Ground fault.
      h. Dc Link overvoltage.

H. Provide communications interface for remote monitoring of VFD using Ethernet TCP/IP communications protocol.

2.11 DRIVE DIAGNOSTICS

A. Provide comprehensive diagnostics for maintenance and troubleshooting including:
   1. Self-test of microprocessor drive control system.
   2. LED indicators for status indication on control boards.
   3. Convenient maintenance test points.

2.12 COOLING

A. Provide integral filtered ambient air cooling by natural convection or forced air cooling system as required to maintain drive equipment at its full current rating.

2.13 IDENTIFICATION AND TAGGING

A. Securely attach nameplates with self-tapping stainless steel screws. Adhesive nameplates not acceptable.

B. Lettering shall be black on white background.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install in accordance with manufacturer's recommendations.

B. Perform manufacturer's recommended start-up and commissioning tests prior to placing into service.

C. Correct deficiencies with VFD and other furnished equipment until system operates as required for installed equipment, at no cost to Owner.

D. Refinish marred spots to match original finish.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Power diesel generator set, including accessories and enclosures.

1.02 CLOSEOUT SUBMITTALS

A. Operation and maintenance manuals. Provide, at a minimum:
1. General description and technical data.
2. Receiving, storage, installation, and testing instructions.
3. Operating and maintenance procedures.
4. Complete set of final drawings, Product data, and quality assurance data as listed above.
5. Complete documentation of inspections and tests performed, including any logs, curves, and certificates. Documentation shall note any replacement of equipment or components that failed during testing.
6. Spare parts lists.
7. Installation field reports.

1.03 QUALITY ASSURANCE

A. Manufacturer's qualifications:
1. Manufacturer shall be manufacturer of major components and shall be ISO certified.
2. Manufacturer shall have produced similar equipment for minimum period of 5 years.

B. Regulatory requirements:
1. Primary standards covering this equipment are ANSI C50.13, IEEE 115, IEEE 446, IEEE519, NEMA MG 1, NFPA 110, CSA 282, and NFPA 70.
2. Certifications: UL 2200

PART 2 PRODUCTS

2.01 SYSTEM DESCRIPTION

A. Provide completely assembled, wired, tested and operational skid-mounted unit, required accessories and enclosure including, but not limited to:
1. Diesel engine prime mover directly coupled to synchronous generator.
2. Solid-state controls and control devices.
3. Permanent magnet generator design.
4. Enunciator and control panel.
5. Exhaust system.
6. Cooling system using skid-mounted radiator.
7. Batteries, battery rack, and battery charger.
8. Skid-mounted fuel tank.
9. Skid-mounted main disconnect with load bank connectors.
10. Remote outlet for exhaust.

B. Rating of engine-generator set shall be based on operation of set with auxiliary systems operational under specified ambient temperature, and elevation above sea level.

C. Auxiliary systems shall include, but not be limited to; radiator(s), fan(s), air cleaner, lube oil pump, fuel transfer pump, fuel injection pump, jacket water pump, governor, regulator, charging alternator, alternating current generator, space heaters, lube oil heaters, and all fluids.

D. Arrange so standby/emergency loads are automatically transferred to engine generator upon loss of normal power, after engine generator has reached normal running speed and voltage.

E. Upon return of normal power, systems return to normal operation, and reset for next operation.

2.02 ENVIRONMENTAL REQUIREMENTS

A. Generator set shall be capable of operating and providing full power output in ambient conditions for installed location, including ambient temperature, altitude and seismic conditions.

2.03 ENCLOSURE SYSTEM

A. Enclosure shall be containerized, weather protective, reinforced steel housing with lockable, hinged doors and panels.

B. Enclose and protect to prevent dust from entering active mechanical and electrical parts of equipment.

C. Guards and shields shall protect personnel from moving parts.

D. Cooling system shall be sufficient to provide full protection over life of generator set at site conditions.

E. Enclosure shall contain adequate space for components, connections and area for accommodating cables for field connections. Enclosure shall be sized to facilitate inspection and maintenance of enclosed equipment and access to control panel.

F. Steel base shall incorporate vibration isolation system mounting for engine generator set.

G. Manufacturer shall provide required hardware and shims to permanently mount unit to concrete pad.

H. Grounding pads or lugs shall be provided inside termination boxes. A minimum of 2 NEMA 2-hole ground pads shall also be provided to ground skid to grounding grid.

I. Enclosure shall provide sound attenuation such that operating decibel level shall not exceed sound regulatory requirements at site location.

J. Provide lifting lugs on major components.

K. Enclosures shall be UL-listed.

2.04 ENGINE

A. Engine break horsepower shall be sufficient to deliver full rated generator set kVA when operated at rated rpm and equipped with required mounted parasitic and external loads.

B. Torque and horsepower shall be sufficient to carry alternator load with all dynamic parameters.

C. Crankshafts shall be forged in 1 piece from steel, heat treated, and dynamically balanced.

D. Main and connecting rod bearings shall be of precision insert type, steel or bronze backed, babbit or other such alloy linings.

E. Power pistons shall be heavy section contour ground, oil-cooled with floating piston pins.

F. Camshafts shall be made of heat-treated steel, accurately machined, ground to size and fitted for forced-feed lubrication.
   1. Connecting rods shall be made of forged steel with I-beam design.
   2. Valves shall be of forged alloy steel with 4 valves per cylinder. Valves shall be accessible for adjusting and grinding. Valve seats shall be replaceable.
   3. Cylinder block shall have replaceable wet liners. Cylinder heads shall be interchangeable. Provide base-type oil pan with access opening that provides sufficient area to permit inspection of main and connecting rod bearings.
   4. Engine speed shall not exceed rated rpm at normal full-load operation.

G. Accessories:
   1. Fuel strainer and filter one each, mounted between engine fuel pump and base tank along with water separator and clear sight glass indicator. Provide indicating pressure gauges on both upstream and downstream side of strainer and filter.
   2. Lube oil filter shall be conveniently located for servicing; equipped with a spring loaded bypass valve to ensure oil circulation if filters are clogged. Provide an oil drain extension line positioned to permit most convenient possible servicing of unit as installed. Provide oil drip pan for mounting underneath engine. Provide bayonet-type oil level dip stick.
   3. Intake air filter shall be one or more heavy-duty, dry-type, replaceable element type rated for normal service with restriction indicators that indicate service life of element.
   4. Fuel transfer pump shall be positive-displacement, engine-driven type. Relief valve shall be provided to prevent build up of excessive pressures if discharge line becomes clogged.
   5. Water pump shall be engine-driven, centrifugal type with thermostatic valve to maintain engine at recommended temperature level. Provide spin-on type engine water filters to treat coolant and prevent corrosion and scale deposits within cooling system.
   6. Pre-lube oil pump shall be electric-driven, continuously operating type for continuous circulation to ensure proper lubrication for automatic engine starts.
   7. Lube oil pump shall be gear type for supplying oil under predetermined constant pressure to main bearings, pistons, piston pins, timing gears, camshaft bearings and valve mechanism.
   8. Turbocharger lubrication shall be accomplished downstream of lube oil filtration assembly.
   9. Lube oil heater shall be an immersion-type with thermostatic control installed in crankcase. Size heater in accordance with manufacturer's recommendations to maintain engine lube oil to preset temperature for warm starts. Size to prevent charring of lube oil. Furnish pre-wired lockout to disconnect lube oil heater when engine starts.

2.05 GOVERNOR

A. Provide isochronous type to maintain engine speed within ±0.5%, steady state, and 5% during no load to full load application with recovery within 2 seconds after sudden load changes, with provisions for manual operation and adjustment.

B. Governor shall be integrated into engine-generator control panel by engine generator manufacturer, and include, but not be limited to:
   1. Actuator.
   2. Governor control module.
   3. Separate magnetic pickup not to be used to operate any other device but governor.
   4. Idle/run switch for warm-up after maintenance.
   5. 3-phase isochronous load sharing module.
   6. Auto synchronizer.

C. Speed sensor and decoupling system for start up motor shall prevent coupling of flywheel while in motion.

2.06 ENGINE START-UP SYSTEM

A. Include pre-charged, heavy-duty, gel-cell, maintenance free diesel starting storage battery, of adequate capacity to accommodate not less than six 10-sec starting attempts for specified Site ambient range.

B. Provide with required cables, cell interconnection ties, rack, and battery heater blanket.

C. Battery tray shall be plastic-coated metal or wooden tray treated for electrolyte resistance, constructed to contain spillage of electrolyte.

D. Battery charger shall be constant potential, solid-state, current-limiting type, dual rate, designed to float at 2.17 volts per cell and equalize at 2.33 volts per cell.
   1. Full wave rectifier.

2. Charge rate, float and equalizing charge potential to conform to battery manufacturer's recommendations.
3. Provide low battery voltage alarm contacts for remote annunciation.
4. Overload protection.
5. Dc voltmeter and ammeter.
6. Built-in adjustable equalizer charge timer.
7. Provide enclosure to meet NEMA 250, Type 1 requirements.
8. Breaker protection on input.

E. Provide solenoid activated starter motor, and jacket water heater designed for quick engine starting.

F. In event of false start, design start up system to restart starter only after restart motor has stopped.

G. Protection for prolonged start-ups shall include circuit interrupter to stop cranking after 75 seconds.

H. Provide separate red LEDs for loss of ac power, loss of battery voltage, and high battery voltage, and green LED for power "ON".

2.07 COOLING SYSTEM

A. Furnish engine with cooling system having sufficient capacity for cooling engine when generator set is delivering full rated load in ambient conditions including air cleaner and inlet silencer.

B. Equip engine with engine-driven, centrifugal-type water circulating pump and thermostatic valve to maintain engine at recommended temperature level.

C. Engine shall be equipped with readily accessible cooling radiator and fan. Fan shall be of type to draw air across engine-generator set and exhaust it through radiator. Size fan to maintain safe operation when fully loaded, within ambient conditions.

D. Provide ventilated rigid guard to enclose fan and belts and pulleys necessary to prevent personnel injury.

E. Design of radiator fan shall be for stationary power applications only. One-piece cast aluminum "truck type," stamped steel or riveted fans not acceptable.

F. Fill engine cooling system with manufacturer's recommended solution. Incorporate rust inhibitor in solution.

G. Furnish immersion-type jacket water heater to warm water in engine cooling system. Heater shall maintain water temperature at 120°F at site minimum ambient conditions by automatic thermostat control. In event more than 1 jacket water heater is required, no single unit shall require electrical circuit greater than 20-ampere ampacity.

H. Engine shall shut down on high temperature cooling liquid, low coolant, low oil level, low oil pressure or over speed signal.

I. Cooling system controls shall be factory set to allow for operation of generator assembly without load after transfer to normal load.

J. Provisions shall be made for filling and draining radiator. Location shall be easily accessible.

K. Provide expansion tank with pressure cap, level indicator, and low level alarm switch.

L. Provide connecting pipes and hoses between motor and radiator.

2.08 EXHAUST SYSTEM

A. Furnish horizontally-mounted, critical grade exhaust silencer (muffler) with companion bolted flanges including flexible, stainless steel, bolted flange fitting. Size according to engine manufacturer's recommendation.

B. Mount exhaust silencer and mounting hardware, inlet and outlet piping.

C. Furnish low-point drain plug or petcock in exhaust silencer to drain condensation.

D. Furnish rain cap at exhaust outlet.

2.09 FUEL SYSTEM

A. Fuel supply system shall be integral with engine consisting of transfer pump, camshaft driven injection pumps, tubing, hoses, valves, fittings, and vents in accordance with applicable codes and standards.

B. Pumps shall be variable displacement type to alter volume of fuel delivered to spray nozzles according to load. Nozzles shall inject fuel directly into cylinder in combustion.

C. Provide pipe, valves and fittings associated with fuel storage and connections in accordance with requirements of NFPA 30 and NFPA 37.

D. Provide UL-listed, double-wall, heavy-gage steel tank installed between engine-generator structural steel frame rails, double-contained, with baffles integral to primary containment, all-welded steel. Size secondary containment volume to hold total contents of primary containment volume in accordance with API-650.

E. Secondary containment volume shall be alarmed with solid-state electronic leak detection with audible alarm.

F. Manual fuel fill tube with screw-on vented-type cap shall be 2" (50 mm) in diameter and welded into primary fuel containment tank. Locate fill cap so as not to be covered or obstructed by snow, dirt, or other equipment. Furnish removable fuel strainer over fuel inlet.

G. Furnish 1" (25 mm) NPT capped, threaded drain and fill line connections at base of base tank for primary and secondary containment volume fuel drain and/or external pumped fill connections.
   1. Route connections to easily accessible connection points as near as practicable to manual fill tube location.
   2. Identify each connection clearly by 1/2" (13 mm) high stamped or welded bead lettering on structural steel frame through which lines protrude.

H. Furnish positive measuring fuel level assembly in primary containment volume. Furnish low and high/full level alarm annunciation contacts prewired to furnished junction box.

I. Fuel lines from base tank to engine components for supply and return shall be wire reinforced, flexible, fuel grade lines with threaded swivel connections for all connection points. Neatly dress and secure flexible lines.

J. Furnish diesel engine manufacturer's standard engine-mounted replaceable spin-on fuel filter conveniently located for servicing.

K. Furnish immersion-type, thermostatically-controlled electric fuel warming heater in primary fuel containment volume. Prewire to junction box within weatherproof enclosure. Terminate on identified terminal strips.

L. Furnish low-fuel lockout controller integrated with fuel level sensing specified elsewhere herein to prevent fuel warming heater from burnout under low fuel conditions.

M. Provide for remote shutdown of engine and remote shutdown of fuel supply as required by NFPA 37.

N. Fuel transfer pump, injection pumps, and timing mechanism shall be maintenance and adjustment free for life of equipment.

O. Fuel filter shall not require replacement more frequently than once a year or 250 hours of operation, whichever comes first.

P. If equipped with fuel water separators, system shall not require draining more frequently than once per week.

2.10 GENERATOR

A. Generator shall be capable of withstanding 3-phase load of 300% rated current for 10 seconds, and sustaining 150% of continuous load current for 2 minutes with field set for rated load excitation.

B. Generator set design shall withstand full voltage phase to ground short circuit at generator terminals when generator neutral is a solid ground.

C. Provide close-coupled, dripproof, and guarded design. Construct to NEMA 1 and IP 22 protection standards with single sealed bearing, salient pole, revolving field, synchronous generator directly connected to engine shaft through flexible drive coupling for permanent alignment. Secure using SAE Grade 8 hardware.

D. Windings: Copper magnet wire coated with underlay of polyester resins and superimposed heavy coat of resin. Insulation shall be Class H.

E. Rotor winding: Layer wound with thermosetting epoxy between each layer and final coat of epoxy for moisture and abrasion resistance.
   1. Amortisseur windings integral with rotor coil.
   2. Support shaft bearing shielded type with provisions for easy servicing through grease pipes which extend to exterior of generator frame.
   3. Single bearing type designed for minimum B-10 bearing life of 40,000 hours.
   4. Dynamically balanced for up to 25% overspeed.

F. Stator winding: Nonintegral pitch design to eliminate third harmonic waveform distortion and minimize harmful neutral circulating current when operating in parallel (2/3 pitch).
   1. Windings shall have 5 dips and bakes of varnish and final coating of epoxy for moisture and abrasion resistance.
   2. Waveform harmonic distortion not over 5% THD rms, measured line to line at rated load.

G. Rotating brushless exciter shall incorporate a full wave, 3-phase rotating rectifier with hermetically sealed, metallic type, silicon diodes to supply main field excitation. Connect multi-plate selenium surge protectors across diode network to protect it against transient conditions.
   1. Voltage regulation: ±0.5% from no load to 100% full load.
   2. Size exciter to handle 125% of maximum alternator output.
   3. Mount exciter for vibration isolation.
   4. Enclosure shall meet NEMA MG 1 standards, self-ventilated, and dripproof.

H. Telephone influence factor shall not exceed limits of balanced TIF established by ANSI C50.13 and NEMA MG 1.

I. Temperature rise shall not exceed 80°C during continuous operation and 105°C when operating at 10% overload in a 40°C ambient as measured by resistance.

J. Equip with space heaters to keep internal windings dry when unit is not in use. Logic to control heaters shall be furnished completely installed.

K. Provide surge arresters to protect from voltage spikes.

2.11 MOUNTING

A. Assemble engine generator to common base by manufacturer. Design and construct base to resist deflection, maintain alignment, and minimize resonant linear vibration.

B. Construct base of Form C section steel members. Incorporate flexible fuel lines, external oil and coolant drains, and external crankcase fumes disposal hose.

C. Support cross members shall add rigidity and allow installation of vibration isolators between fuel tank base and generator set.

D. Isolators: High-resilient rubber compound resistant to weather, heat, and aging. Isolators shall be impervious to oil, water, and antifreeze. Incorporate dual-spring rate for nonabrupt displacement.

E. Provide required space for ground stub-ups between members. Include bottom mounting holes.

F. Furnish skid-mounted connection box with load-break switch, such that load conductors can enter bottom of junction box.

2.12 VOLTAGE REGULATOR

A. Microprocessor design shall be suitable for handling shock and vibration associated with mounting within generator assembly.

B. Provide volts/hertz regulator capable of sensing line-line phases of generator output voltage. Generator voltage shall be maintained within 1% of rated value for any load variation between no-load and full load.

C. For addition of load up to 90% of rated load, dip shall not exceed 20% of rated voltage. Voltage shall recover to and remain within steady band in not more than 1.5 seconds.

D. Isochronous frequency regulation from no load to full load shall be in line with engine governor performance. For any addition of load up to 90% of rated load, frequency shall recover to steady-state band within 5 seconds.

E. Include manual controls to adjust voltage droop, ±10% voltage level. Voltage droop during motor starting shall not exceed 15%.

F. Provide capability for include voltage build-up, overcurrent protection, and remote voltage control.

G. Voltage regulation from no load to rated load shall be less than ±1% of rated voltage. Steady-state voltage stability shall remain within 0.5% band of rated voltage. Steady-state voltage modulation shall not exceed 1 Hz per second.

H. Alternator system: Tropicalized; self-ventilated; dripproof construction.

I. Equip alternator housing with space heater to prevent moisture condensation.

J. Provide protection against loss of voltage sensing and long-term overcurrent conditions. Overcurrent protection function shall automatically reset where regulator is de-energized. Regulator shall not be damaged or result in unsafe operation when subjected to power or shorted input due to sensing loss, or short to ground on adjacent conductor.

K. Electrical connections shall be through labeled screw terminals.

2.13 MAIN POWER CONNECTIONS

A. Size generator main breaker in accordance with manufacturer's recommendations. Locate switch in NEMA 3R termination box attached to connection enclosure on engine-generator assembly.

B. Interrupting capacity shall be based on allowable fault duty available from generator and/or connected system.

C. Breaker:
1. Manual operation for isolation during maintenance.
2. Thermal-magnetic, protective, quick-make, quick-break, trip-free from handle, and trip indicating.
3. Provide electronic trip unit that operates to protect alternator under all overcurrent conditions, or thermal-magnetic trip with other overcurrent protection devices that positively protect alternator under overcurrent conditions.

D. Generator phase conductors shall be brought out to isolated phase buses securely mounted within conductor termination box. Size phase bus bars for 100% of main breaker rated ampacity. Phase busses shall be tin or silver-plated copper, drilled, tapped, and furnished with lugs for copper conductors preinstalled with bolts and spring washers. Lugs shall be compression-type.

E. Generator conductor termination box shall have 100% capacity ground bus mounted inside. Ground bus shall be solidly connected to engine-generator frame rails with a properly sized NEC bonding jumper, and solidly connected to grounding electrode(s) at generator pad in accordance with NEC requirements. Mount to inside cabinet in accessible location. Furnish predrilled and tapped holes to match NEMA standard copper lug terminations for NEC-sized ground conductors. Furnish compression-type lugs preinstalled with bolts and spring washers.

F. Generator neutral conductors shall be brought out to isolated neutral bus mounted securely within conductor termination box. Neutral bus shall be tin or silver-plated copper, drilled, tapped, and furnished with lugs for copper conductors preinstalled with bolts and spring washers. Lugs shall be compression-type.

G. Neutral or grounded conductors shall not be bonded together at any location in emergency power distribution system except at service disconnecting means from which automatic transfer switch receives its normal source of power.

H. Grounding: Provide clamp-type terminal on end of generator base suitable for 4/0 AWG stranded copper wire.

I. Torque terminations to final settings in accordance with manufacturer's recommended values.

2.14 CONTROL PANEL

A. Controls shall be microprocessor-based with integrated control and protection. Design shall incorporate menu-driven digital display screen with membrane-style buttons and nonrotary style switches.

B. Control panel enclosure shall be constructed with steel, mounted in an easily readable and accessible location on generator set. Mount on vibration isolators.

C. Digital voltage regulation and engine speed governing, synchronizing, and load sharing. Include import/export controls for paralleling with infinite bus.

D. Digital starting control shall provide functions for fuel ramping, failure to crank, temperature dynamic governing, digital excitation control and cycle cranking. Selectable number of cycles, cranking, and off time periods.

E. Protection of alternator and power system shall be protected from overcurrent, over/under voltage, over/under frequency, and over load conditions.

F. Comprehensive display of engine and alternator data

G. Self-diagnostics and circuit boards diagnostic LED's.

H. Pushbuttons:

1. Local-Off-Auto.
2. Start.
3. Stop.
4. Reset.
5. Menu.

I. 3-phase digital meters:
1. Percent of current, amperes.
2. Percent of load meter, kW.
3. Frequency meter, ac.
4. Voltage meter, volts ac.

J. Network communications for future twisted, shielded pair connection to master paralleling control unit.

K. Panel shall provide protective functions to prevent damage to generator.

2.15 ALARM MODULE

A. NFPA 110 requirements shall be satisfied by microprocessor alarm module mounted in panel. Provide auxiliary contacts for NFPA 110 panel alarms.

2.16 ISOLATORS

A. Clearly indicate complete assembled unit center of gravity (CG) on frame rails on both sides and provide CG information on Shop Drawings from datum points.

B. Mount engine and generator on common structural steel frame sufficiently rigid to prevent deflection between vibration isolators. Mount structural steel frame on minimum 4" (100 mm) deflection open-type spring vibration isolators and independent snubbers. Isolators shall be individually selected from each load bearing location to maintain equal deflection without compensation.

C. Spring isolators shall be adjustable, freestanding, stable, open spring mounting of specified minimum static deflection with combination leveling bolt and equipment fastening bolt. Spring shall be rigidly attached to spring mounting baseplate and compression plate. Spring element shall have a 50% overload capacity. The overall diameter of spring shall be not less than 0.8 times operating height of spring.

D. Fabricate snubbers of steel plate to limit horizontal and vertical motion of isolated equipment. Affix minimum 1/4" (6 mm) thick neoprene pad at point of contact. There shall be no contact between snubbers and inertia base or equipment support frame during normal operation. Provide minimum of 1 snubber per side, 4 total, on each base.
1. Do not install snubbers until vibration isolators are in place and adjusted with actual operating loads.
2. Design snubbers to provide seismic restraint as required. Provide seismic calculations to demonstrate compliance with code requirements for Seismic Zone compliance criteria. R-001 R-001 Reglamento Sismico de Obras Publicas.

2.17 WIRING

A. Manufacturer shall pre-install all equipment, enclosures, internal wiring, wire markers, terminal blocks, raceways and accessories required for system ready for field installation and terminations.

B. Each interconnecting wire shall be identified at both ends with sleeve type wire markers.

C. Terminate control and monitoring circuits exiting generator set on terminal blocks specified for control circuits.

2.18 IDENTIFICATION AND TAGGING

A. Securely attach nameplates with self-tapping stainless steel screws or rivets. Adhesive nameplates not acceptable.

B. Lettering shall be black on white background.

C. Terminal blocks shall be clearly identified for wiring.

D. Boxes, enclosures, transfer switches, generators and power panels for emergency circuits shall be permanently marked and readily identified as emergency equipment.

E. Nameplate shall contain standard information in accordance with IEEE/ANSI C57.12.01 and serial number and year of manufacture.

PART 3 EXECUTION

3.01 INSTALLATION

A. Provide structural pad as required for permanent installation.

B. Install in accordance with manufacturer's recommendations.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Self-contained uninterruptible power supplies (UPS) including charger/rectifier, inverter, battery, and accessories.

1.02 CLOSEOUT SUBMITTALS

A. Operation and maintenance manuals, including:
1. General description and technical data.
2. Receiving, storage, installation, and testing instructions.
3. Operating and maintenance procedures.
4. Software instruction manual (if applicable).
5. Complete set of drawings.
6. Spare parts lists.
7. Copy of warranties.

1.03 QUALITY ASSURANCE

A. Manufacturer's qualifications:
1. Manufacturer shall be manufacturer of major components of UPS and shall be ISO certified.
2. Manufacturer shall have produced similar equipment for a minimum of 5 years. UPS shall be manufacturer's standard product.

B. Regulatory requirements:
1. Provide equipment in accordance with latest edition of NFPA 70, UL 1449, and UL 1778.

1.04 DELIVERY, STORAGE, AND HANDLING

A. Ship UPS fully assembled.

B. During delivery and storage, handle equipment to prevent damage, denting, or scoring.

C. Store UPS covered and upright in a space conditioned location, with battery fully charged.

D. Store equipment and associated components in a clean, dry place. Protect from weather, dirt, water, construction debris, and physical damage in accordance with manufacturer's instructions.

PART 2 PRODUCTS

2.01 SYSTEM DESCRIPTION

A. Design UPS to supply continuous source of uninterruptible ac power.

B. Upon failure or severe voltage drop in normal ac power source, UPS shall continue to supply ac power to UPS output for specified time without variation in output voltage or frequency.

C. Upon restoration of normal ac power source, rectifier/charger shall automatically, and without interruption, power UPS output and simultaneously recharge battery bank.

D. System equipment shall be designed, fabricated, and assembled for continuous service to operate with a field proven mean time between failures (MTBF) of at least 100,000 hours.

E. UPS shall be capable of continuous normal operation under installed ambient.

F. Battery shall be disconnected from inverter automatically when specified battery end voltage is reached, or when inverter has failed.

2.02 ENCLOSURE

A. UPS enclosure shall be manufacturer's standard for rack mount or freestanding type. Where enclosure weight is greater than 50 lb., provide lifting eyes for handling.

B. Enclosure access locations shall allow for ready access for component replacement or maintenance.

2.03 ALTERNATE POWER SOURCE

A. Provide alternate source capability, including static transfer switch and, if specified, alternate source isolation transformer. UPS shall maintain normal UPS output in phase with alternate source.

B. If required, provide isolation transformer for harmonic filtering of alternate source.

2.04 MANUAL BYPASS SWITCH

A. If required, provide manual bypass switch. Switch shall be manually operated, make-before-break, and shall allow loads to be supplied from normal ac source without any disruptions to loads while providing proper isolation of UPS equipment for safety during maintenance.

2.05 SOURCE QUALITY CONTROL

A. Perform factory tests on UPS. Tests shall confirm UPS meets specified requirements and other those of applicable regulating authorities.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install in accordance with manufacturer's recommendations.

3.02 MAINTENANCE

A. Design system to minimize scheduled maintenance. Design components for removal and replacement without requiring removal of other unaffected components or enclosure parts.

B. Batteries shall be user accessible and replaceable.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Industrial grade dc and safe ac system including, but not limited to:
1. Chargers/rectifiers.
2. Inverters.
3. Batteries.
4. Battery racks.
5. Interconnecting cables.
6. Terminations.
7. Meters and relays.
8. Dc distribution panels.
9. Ac distribution panels.
10. Accessories and appurtenances.

1.02 CLOSEOUT SUBMITTALS

A. Provide at minimum:
1. Receiving, storage, installation, and testing instructions.
2. Complete set of final drawings.
3. Complete documentation of inspections and tests performed, including any logs, curves, and certificates. Documentation shall note any replacement of equipment or components that failed during testing.
4. Operation and maintenance manual.
5. Spare parts list.
6. Copy of warranties.

1.03 MAINTENANCE MATERIALS

A. Furnish recommended spare parts as recommended by manufacturer.

B. Provide complete set of special tools as necessary for installation and maintenance of equipment furnished. Tools and their intended use shall be identified in assembly instructions.

1.04 QUALITY ASSURANCE

A. Regulatory requirements:
1. Equipment shall be in accordance with applicable requirements of ANSI C62.41; NFPA 70; IEEE 446, 450, 485, 519, 946, and 1184; FCC Class A; UL 1778 and 924.

B. Manufacturer's qualifications:
1. Manufacturer shall be manufacturer of major components and shall be ISO certified.
2. Manufacturer shall have produced similar equipment for minimum period of 5 years.

C. Equipment shall be designed, fabricated, and assembled for continuous service to operate with field proven mean time between failures (MTBF) of at least 50,000 hours.

PART 2 PRODUCTS

2.01 DESIGN REQUIREMENTS

A. Under normal operating conditions, charger/rectifier shall be fed from ac source and supply dc power to loads and inverter while simultaneously maintaining charge on batteries.

B. During interruption of ac source, batteries shall automatically supply dc power to loads and inverter.

C. Upon restoration of normal ac power source, charger/rectifier shall automatically, and without interruption, provide power to dc loads, inverter, and simultaneously recharge batteries.

D. Equipment furnished shall be capable of continuous normal operation under conditions encountered at Project Site.

E. System shall be capable of supplying regulated output during overloads of up to 125% of system rating for period of at least 90 seconds. Static switch shall transfer load to bypass source for overloads in excess of 125% for fault clearing purposes.

2.02 ENCLOSURES

A. Enclosures shall be manufacturer's standard for freestanding types. Where enclosure weight is greater than 50 lb, supply with lifting eyes for handling.

B. Provide adequate space within each enclosure for associated components and connections. Allow sufficient space to access each component without requiring removal of component or other components. Furnish sufficient space and separation to accommodate external wires and cables to be connected.

C. Provide copper NEMA 2-hole grounding pad on outside and inside of enclosure.

D. Separate equipment enclosures shall match and line up in similar assemblies of free-standing floor-mounted cabinets designed for indoor service.

E. Provide louvers for ventilation as required. Cabinet top shall be solid or drip shield.

2.03 CHARGER/RECTIFIER

A. Chargers shall be industrial grade, thyristor-based. Design for high-efficiency conversion of ac to dc power, while simultaneously supplying power to dc loads and inverters, and capable of charging station batteries at equalizing voltage level. Each charger shall be self-regulating, solid-state and suitable for parallel operation. If automatic load sharing is required, cross compensation shall be provided for equal sharing of charger loads.

B. Reliability of charger shall be no less than 140,000 hours MTBF.

C. Furnish input ac and output dc molded case circuit breakers.
   1. Ac breaker shall be 3 pole with interrupting current rating as required.
   2. Dc breaker shall be 2 pole with interrupting current rating as required.

D. Mount instruments such as breakers, lights, meters, and pushbuttons that provide external interface on front doors such that they are visible and accessible without opening doors or covers.
   1. Provide following standard features:
      a. LEDs for indicator lights.
      b. Lighted mimic panel display.
      c. Float/equalize pushbuttons, 0-100 Hr equalize timer with manual start and auto reset, float voltage and equalize voltage potentiometers.
      d. Dc output volt and amp meters.
      e. Low dc Voltage.
      f. Ac power available.
      g. Common summary alarm.
   2. Standard and optional alarms shall include single-pole, double-throw (SPDT) contacts for customer use.

E. Internal components shall be accessible through hinged front doors. Side or rear access not required.

F. Charger shall be capable of continuous operation with 95% relative humidity and ambient operating temperature range.

G. Surge protection shall be contained within charger cabinet.

H. Ripple voltage shall be less than 2% rms with battery connected, from full load to no load while maintaining ± 1% output voltage.

I. Ac-dc conversion shall be not less than 90% efficient.

J. Audible noise shall be less than 60 dBA at 1-meter distance.

K. Float and equalize voltages shall be individually settable with ±1% of nominal available.

L. Charger/rectifier shall have sufficient capacity to support fully loaded inverter and to recharge fully discharged battery bank to 95% of full capacity within 8 hours.

M. Surge capacity: 150% with load at unity power factor.

N. Float and equalizing charge voltages shall be in compliance with recommendation of battery manufacturer.

2.04 INVERTER

A. Inverters shall be industrial grade, ferroresonant design with static switch and manual bypass switch in single system with ride through capability for zero-break, with specified precise output power characteristics while operating from any dc source voltage within battery bank operating range.

B. Design for high-efficiency conversion of dc to ac power, capable of accepting dc power or bypass power and supplying power to ac loads.

C. Use insulated gate bi-polar transistors (IGBTs) to produce ac square wave with frequency maintained by use of crystal, controlled oscillator.

D. Output shall be filtered through ferroresonant transformer creating low distortion sine wave from square wave. Transformer shall be maintenance free and capable of handling nonlinear loads to power factor of 0.8 per unit.

E. Inverter shall have built-in current limiting feature for protection.

F. Reliability: Not less than 140,000 hours MTBF.

G. Overload capacity: 500% for 1 cycle, 120% continuous.

H. Harmonic distortion: Less than 5% THD.

I. Crest factor: 3:1 at full load.

J. Furnish input dc power, bypass ac power, and Inverter ac output power molded case circuit breakers.
   1. Ac breakers: 2 pole with interrupting current rating as required.
   2. Dc breaker: 2 pole with interrupting current rating as required.

K. Mount instruments such as breakers, lights, meters, and pushbuttons that provide external interface on front doors such that they are visible and accessible without opening doors or covers.
   1. Provide following minimum features:
      a. LEDs for indicator lights.
      b. Lighted mimic panel display.
      c. System output voltmeter.
      d. Ac inverter output voltmeter.
      e. Ac output amp meter.
      f. Inverter output frequency meter.

g. Bypass source Input voltmeter.
h. Bypass frequency meter.
i. Dc input volt and amp meters.
j. Low dc disconnect alarm.
k. Static switch transfer alarm.
l. Battery supplying load alarm.
m. Bypass source failure alarm.
n. In sync pilot light indicator.
o. Fan failure alarm.
p. Inverter failure alarm.
q. Common summary alarm.

2. Standard and optional alarms shall include SPDT contacts for customer use.

L. Inverter shall be capable of continuous operation with 95% relative humidity and ambient operating temperature range.

M. Dc-ac conversion shall be not less than 83% efficient.

N. Audible noise shall be less than 67 dBA at 1.5-meter distance.

O. Transfer from inverter to bypass:
1. Inverter bridge failure.
2. Load overcurrent.
3. Low inverter voltage.
4. Manual bypass operation.

P. Transfer from bypass to inverter:
1. Inverter in sync.
2. Auto re-transfer defeat switch is off.

Q. Output voltage regulation shall not deviate by more than ± 1% from no-load to full-load at maximum and minimum dc bus voltage.

R. Synchronize inverter to bypass source whenever bypass source is available.

2.05 BATTERIES

A. Use battery bank to provide dc power to both dc loads and to inverter.

B. Method of determining battery capacity shall be IEEE 485.

C. Battery cells shall be maintenance-free and shall comply with UL 924. Cell design shall be pre-filled with immobilized type electrolyte, hermetically sealed and ready for service. "Oxygen recombination" principle shall be used to achieve nonwatering criteria for cells.

D. Design battery bank for 20-year float life cycle at 25°C.

E. Construct battery cell containers and covers of nonconductive, flame- and heat-retardant material.
1. Hermetically seal cell cover to container to form nonleaking seal.
2. Cells shall not require special room or special installation requirements.

F. Separators: Spun glass, microporous matrix.

G. Arrester vents used on batteries shall comply with UL 924.

H. Provide stainless steel bolts washers and nuts for high-torque, low-resistance cable terminations.

I. Furnish batteries factory pre-charged to 90% of capacity to minimize charging time in field.

J. Water additions and scheduled equalization charges shall not be required. Limit scheduled maintenance to visual inspections, voltage readings, and connection re-torqueing.

K. Maintenance accessories:
1. Cell numbering scheme.
2. Warning labels.
3. Minimum of one cell removal device.

L. Provide 10% spare connecting hardware for rack and cell terminals.

M. Accessories:
1. Cell and rack connectors.
2. Five connectors to connect cells on either side of removed cell. Slot connectors to allow horizontal adjustment to compensate for unequal cell spacing.
3. Connector bolts with acid resistant nuts.
4. Solderless lugs for each battery.
5. Cell lifting apparatus including strap and spreader board.
6. Vinyl-coated assembly wrenches.
7. Grease that prevents oxidation.
8. One set of numerals (one unique number per cell) suitable for permanent attachment to cells.

2.06 BATTERY RACKS

A. Provide racks using manufacturer's standard design. Furnish in quantities sufficient to assemble batteries in smallest footprint available.

B. Installation instructions shall include manufacturer's recommended torque requirements.

C. Stack batteries in horizontal configuration.

2.07 BATTERY DISCONNECTING MEANS

A. Provide battery with circuit breaker to disconnect dc circuit between battery and inverter input.

B. Circuit breaker shall provide positive means of isolating battery from rest of system for maintenance or due to fault in battery system.

C. Auxiliary switch shall be used to provide circuit breaker position indication on system status panel.

2.08 STATIC AND MANUAL BYPASS SWITCHES

A. Provide static bypass transfer switch and manual maintenance bypass switch.

B. Input source for static bypass transfer switch shall be same as input source for battery chargers. Input source for manual maintenance bypass switch shall be as indicated by manufacturer recommendations.

C. Static bypass transfer switch shall automatically transfer inverter output to synchronized bypass source.
1. Transfer shall be adjustable to transfer upon an 80-100% under-voltage and 105-120% over-voltage. Transfer shall not occur if emergency source is less than preset undervoltage limit.
2. When normal source voltage and frequency are within acceptable limits, transfer switch shall retransfer to inverter after adjustable time delay. Retransfer can be defeated by manual switch selection.

D. Manual bypass switch shall allow operation of inverter load while inverter is isolated for maintenance purposes. Bypass switch shall make-before-break and shall be rated to transfer maximum inverter output.

E. Provide system with dedicated, electrostatically shielded, voltage-regulated transformer for bypass source.

2.09 WIRING

A. Purchase and preinstall equipment, enclosures, internal wiring, wire markers, terminal blocks, ducting and other supplies required. Field installation of components and internal wiring and terminations not allowed.

B. Size control and power wiring for equipment to handle 125% of expected load currents. In no case shall wiring be smaller No. 14 AWG.

C. Insulation shall be rated 600 volts ac. Type shall be in accordance with manufacturer's recommendations.

D. Tag wires on both ends with appropriate wire number using heat-shrink type wire markers.

2.10 TERMINATIONS

A. Terminal blocks for control wiring shall be molded-type with barriers, rated not less than 600 volts ac. Terminals shall be approved for purpose and shall be installed and properly tagged.

B. Allow for minimum of 20% spare terminals on each strip within enclosure.

C. Identify terminals using approved markers.

2.11 FINISH COATINGS

A. Surface preparation and paint shall be suitable for the installed environmental conditions.

2.12 IDENTIFICATION AND TAGGING

A. Provide permanent nameplates to identify each device mounted on enclosure cover and within enclosure.

B. Nameplates shall have black lettering on white background. Fasten in place by self-tapping Type 316 stainless steel screws. Adhesive nameplates not allowed.

C. Terminal blocks shall be clearly marked for wiring. Each internal interconnecting wire shall be identified at both ends with sleeve type wire markers.

D. Tag equipment with item number.

2.13 SOURCE QUALITY CONTROL

A. Prior to shipment, calibrate and perform factory tests on completely assembled system. Tests shall verify compliance with Contract Documents and other applicable regulating authorities. Testing shall include, but not be limited to:
   1. Burn-in test.
   2. Complete functional test.
   3. Functional operation test at 100% of load rating for 12 hours at unity power factor.
   4. Oscillographic observation of transfer at 50% of load rating.
   5. Dynamic response to step voltage changes.
   6. Verify current limiting feature.
   7. Verify harmonic content on battery charger input and inverter output.
   8. Power failure test.
   9. Function and calibration test of all metering points
   10. Function test of all alarm points.
   11. Function test of communications system.

B. Test complete system for efficiency at 25%, 50%, 75% and 100%.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install in accordance with manufacturer's recommendations.

END OF SECTION

1.01 SECTION INCLUDES

A. Integrated lightning protection system including, but not be limited to:
   1. Air terminals.
   2. Conductor and connections.
   3. Hardware.
   4. Interconnections of structure and other metal objects.
   5. Overhead shield wires.
   6. Electrodes.

1.02 QUALITY ASSURANCE

A. Qualifications:
   1. Manufacturer regularly engaged in production of lightning protection systems for a minimum of 5 years.
   2. Lightning protection system installer shall be a UL Listed Master Label Installer and shall offer a Master Label, UL certified installation when requested.

B. Lightning protection system, design, and installation shall conform to applicable requirements of NFPA 70, NFPA 780, UL 96, UL 96A, UL 467, LPI 175, and UL Electrical Construction Equipment Directory. Where specification requirements are more stringent, specification shall take precedence.

C. System furnished shall consist of standard products of manufacturer regularly engaged in production of lightning protection systems and shall be manufacturer's latest UL-approved design.

D. System components shall be furnished by a company that has been engaged in manufacturing of lightning protection systems and equipment for a minimum of 5 years.

E. Certifications:
   1. Where material or equipment is specified to comply with requirements of UL, provide proof of such compliance. Label of or listing in Electrical Construction Equipment Directory will be acceptable evidence.
   2. Instead of label or listing, written certificate from approved, nationally recognized testing organization equipped to perform such services, stating that items have been tested and conform to UL requirements and testing methods may be submitted.
   3. When requested, provide UL Listed Master Label for completed and certified lightning protection system installation.

PART 2 PRODUCTS

2.01 SYSTEM DESCRIPTION

A. Components shall be provided that will not be adversely affected by environmental conditions encountered.

B. Provide oversized conductors where unusual conditions exist which would cause corrosion of conductors.

C. Provide protective conduit for conductors exposed to mechanical hazard. When metallic conduit is used, conductor shall be electrically connected at upper and lower ends.

D. Design requirements:
   1. Design to provide shortest distance and most direct current path to ground for structure and other metal objects.
   2. Design shall produce drawings indicating zone of protection from lightning to prevent personal injury, structural damage, and equipment downtime, with calculations supporting design.

3. Do not use combination of materials that form electrolytic couple of such nature that corrosion is accelerated in presence of moisture unless moisture is permanently excluded from junction of such metals.
4. Fabricate, assemble, erect, and place in proper operating condition in full conformity with Contract Documents.

2.02 CONDUCTORS

A. Main and secondary conductors shall be copper unless required otherwise due to galvanized or aluminum mounting surface, or corrosive environment.

B. Conductors shall be in accordance with applicable parts of NFPA 780 and UL 96 for Class I or Class II materials.

2.03 AIR TERMINALS

A. Air terminals shall be copper or bronze. Terminals shall be in accordance with UL 96 and NFPA 780.

B. Tip of air terminals on buildings used for manufacturing, processing, handling, or storing explosives, ammunition, or explosive ingredients shall be at least of 2' (600 mm) above ridge parapet, ventilator, or perimeter.

C. Tip of air terminals on open or hooded vents emitting explosive dusts or vapors under natural draft shall be minimum of 5' (1.5 m) above opening.

D. On open stacks emitting explosive dusts, gases, or vapor under forced draft, air terminals shall extend minimum of 15' (4.5 m) above vent opening. Air terminals more than 2' (600 mm) in length shall be supported by suitable brace, with guides not less than one-half height of terminal.

2.04 GROUND RODS

A. Type: Copper-clad steel, stainless steel, or solid copper; UL 467.

B. Size: Not less than 3/4" (19 mm) in diameter and 10' (3 m) in length.

C. Do not mix ground rods of copper-clad steel, stainless steel, galvanized, ferrous, and solid copper on Project Site.

2.05 CONNECTORS

A. In general, connections, bonds, and splices shall be done by exothermic welds or by use of high-compression fittings.
1. Exothermic welds and high compression fittings shall be listed for purpose.
2. High compression fittings shall be type that requires hydraulically operated mechanism to apply minimum of 10,000 psi.

B. Clamp-type connectors may be used for connection of roof conductor to air terminal and to guttering. Conform to UL 96, class as applicable, and style and size as required for installation.

2.06 ACCESSORIES

A. Lightning protection components, such as, but not limited to bonding plates, air terminal supports, chimney bands, clips, and fasteners shall conform to UL 96, classes as applicable.

2.07 IDENTIFICATION AND TAGGING

A. Materials furnished for lightning protection system shall bear UL label.

PART 3 EXECUTION

3.01 INSTALLATION - GENERAL

A. Install in accordance with manufacturer's recommendations.

B. Install in neat and inconspicuous manner so components will blend in with appearance of structures.

3.02 CONDUCTORS

A. Main and secondary conductors shall preserve downward or horizontal course. Rigidly fasten at least every 3' (900 mm) along roof and down building to ground.

B. Connect roof conductors directly to roof or ridge roll along contours of flat roofs, ridges, parapets, and edges; and where necessary, over flat surfaces, in such a way as to connect all air terminals together forming a closed loop.

C. Bends less than 8" (203 mm) radius and angles less than 90º in conductors not acceptable.

D. If lightning protection system relies on structural steel frame of building for path to ground, structural steel shall be made electrically continuous.

E. Down conductors shall be electrically continuous from air terminals and roof conductors to grounding electrodes.
   1. Each building or structure shall have not less than 2 down conductors located as widely separated as practicable, at diagonally opposite corners.
   2. On irregularly shaped structures, total number of down conductors shall be sufficient to make average distance between them along perimeter not greater than 100' (30 meters).
   3. Structures exceeding 50' (15 m) in height, there shall be at least one additional down conductor for each additional 60' (18 m) of height or fraction thereof, except that this application shall not cause down conductors to be placed about perimeter of structure at intervals of less than 50' (15 m).

F. Extend down conductors directly to ground connection. Others shall be connected to lightning protection system of building structure that is an adjunct of building, near or touching perimeter.

G. Protect down conductors by placing in nonmetallic conduit for minimum distance of 72" (1800 mm) above finished grade level.

H. Metal doors, windows, and gutters shall be connected directly to grounds or down conductors using not smaller than No. 6 AWG (10 mm^2) copper conductor, or equivalent when located within flashover distance.

I. Interconnections made within side-flash distances shall be at or above level of grounded metallic parts.

J. Secondary conductors shall interconnect with grounded metallic parts within building.

K. Conductors placed where there is probability of unusual wear, mechanical injury, or corrosion shall be of greater electrical capacity than would normally be used, or shall be protected.

3.03 AIR TERMINALS

A. Design base supports for surface on which installed; securely anchored, rigidly connected to, and made electrically continuous with roof conductors by means of pressure connectors or crimped joints of T-shaped malleable metal and connected to air terminal by a dowel or threaded fitting.

B. Set air terminals at ends of structure not more than 2' (600 mm) from ends of ridge or edges and corners of roofs. Spacing of air terminals 2' (600 mm) in height on ridges, parapets, and around perimeter of buildings with flat roofs shall not exceed 20' (6.1 m).

C. Metal projections and metal parts of buildings, smokestacks, and other metal objects 3/16" (5 mm) thick or greater that do not contain hazardous materials and that may be struck but not appreciably damaged by lightning, need not be provided with air terminals. Bond metal objects at structure base to lightning conductor.

D. On large, flat or gently sloping roofs, as defined in NFPA 780, air terminals shall be placed at points of intersection of imaginary lines dividing surface into rectangles having sides not exceeding 50' (15 m) in length.

3.04 GROUNDING

A. Ground connection to metal doors and windows shall be by means of crimped mechanical connections or equivalent.

B. Metal roofs in form of sections insulated from each other shall be made electrically continuous by bonding. Metal roof, metal walls, and steel framework shall be bonded and made electrically continuous and considered as one unit.

C. Connect air terminals to and make electrically continuous with metal roof as well as roof and down conductors.

D. Exposed metal eave troughs, roof vents, guy wires, antennas, and mechanical equipment shall be bonded to lightning protection system in such a way that two paths to ground are provided.

E. Metal guy wires for tanks, towers, and stacks shall be grounded.

F. Metal guy wires or cables attached to anchor rods set in concrete or attached to buildings or non-conducting supports shall be grounded to a ground rod driven full length into ground.

G. Grounding electrode shall be provided for each down conductor located as shown.

H. Driven ground shall extend into earth for a distance of not less than 10' (3.0 m).

I. Ground rods shall be set not less than 3' (900 mm), nor more than 8' (2.5 m) from structures foundation.

J. Connections to pipes shall be by means of ground clamps with lugs. Connections to structural framework shall be by means of nut and bolt or welding. Connections between columns and ground connections shall be made at bottom of steel columns.

K. Connections between ground connectors and grounds or counterpoise and between counterpoise and grounds shall be electrically continuous.

L. Test ground rods individually prior to connection to system. Test system as a whole not less than 24 hours after rainfall.

M. Store equipment and their components in a clean, dry place. Protect from weather, dirt, water, construction debris, and physical damage in accordance with manufacturer's instructions.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Cathodic protection systems for corrosion mitigation of metallic structures.

1.02 QUALITY ASSURANCE

A. Provide NACE qualified cathodic protection engineer to design system. Cathodic protection engineer shall be acceptable to Owner.

PART 2 PRODUCTS

2.01 SYSTEM DESCRIPTION

A. Equipment or structures to be cathodically protected:
1. Underground steel, stainless steel, copper, or brass piping.
2. Bottoms of pad mounted metallic storage tanks.
3. Metallic structures at water intake structures, pier structures, condenser water boxes, and cooling water heat exchanger water boxes.

2.02 CATHODIC PROTECTION MATERIALS

A. Furnish materials including anodes, cable, connectors, exothermal welds, permanent reference electrodes, rectifiers, junction boxes, piping isolation fittings, conduit, underground marking tape, cable terminations and hardware, cable and equipment identification labels and test equipment as necessary for a complete cathodic protection system. The cathodic protection system may utilize galvanic anodes or an impressed current system, depending on the detailed design of each separate cathodic protection system.

2.03 TEST EQUIPMENT

A. Furnish the following test equipment to the Owner.
1. 8" (200 mm) saturated copper-copper sulfate solution portable reference electrode:
2. 500' #14 AWG cable reel for testing. Miscellaneous flexible test leads for multimeter.
3. High-input impedance dc voltmeter with millivolt scale and built-in ohmmeter.
4. Low-resistance dc milliammeter.
5. Pipe Flange Insulation checker.

PART 3 EXECUTION

3.01 ANODE INSTALLATION

A. Depth of burial of packaged galvanic anodes shall be such that uppermost part of packaged anode is at least as deep as bottom of pipe it is protecting.
1. Unless solid rock is encountered, uppermost part of packaged anode shall be at least 4' (1.2 m) beneath finished grade at burial location.
2. Penetration of layers of rock or movement of boulders may be required to properly place anodes. It is not intended that anodes be installed in such a manner, or in locations that penetration of solid rock is necessary.

B. If packaged galvanic anodes are received in a protective paper bag, remove bag immediately before burying anode.
1. Permeable cloth bag containing special backfill shall remain intact.
2. Galvanic anode burial location shall be approximately 10' from closest point on protected structure.
3. After burial of packaged galvanic anode but before backfilling of anode excavation, pour minimum of 5 gallons of water over and around anode package.

4. Backfill galvanic anodes with clean earth, free from rocks. Do not backfill anodes with sand.

3.02 WIRE AND CABLE ACCESSORIES

A. Install lead wire and cable at minimum of 3' (1 m) below grade. Where lead wire is connected to pipe or to field test stations, minimum of 18" (450 mm) of slack shall be left in lead wire to permit settling of backfill without stressing electrical connection.

B. Install and terminate lead wires as follows:
1. Attach pipe lead wires to pipe on top center line and separate minimum distance of 12" (300 mm).
2. After coating of pipe lead wire connections, strap each pair of pipe lead wires to pipe they are connected to using nonmetallic strapping material.
3. Structure lead wires shall contain minimum of 18" (450 mm) of slack near structure connection point to compensate for movement and backfill settlement.
4. Splices in cable is not permitted.
5. Cable shall be clearly identified, with regard to which structure they are connected to, from time they are initially connected using specified permanent cable markers. Continually maintain identification markings throughout construction and ensure each cable is clearly and correctly marked at terminations in field test stations, rectifiers and junction boxes.

3.03 FIELD TEST STATIONS

A. Install field test stations above buried pipeline. Where it is impracticable to locate field test station directly above pipe because of interference with normal use of area, field test station shall be located nearby, in a relatively protected location.
1. Where it will be out of path of vehicular traffic.
2. Does not interfere with normal use of area.

B. Cable terminations at field test stations shall be made with single hole, uninsulated, compression type terminal lugs made of corrosion-resistant copper, bronze, or nickel-plated brass.

C. Terminals, terminal lugs, jumpers, link bars, and any other terminal board metal parts or hardware installed in flush mounted field test stations at grade shall be coated with conductive, oxidation inhibiting compound as specified.

D. Attach permanent, legible identification markers to each lead wire in each field test station. Identify each structure description and service, as a minimum. Anode lead wires shall be identified as "Mg Anode." Underground reference electrode lead wires for pipe installation shall be identified as "Cu-$CuSO_4$".

3.04 EXOTHERMAL WELDS

A. Use: Cable-to- -pipe, and cable-to-steel structure connections.

B. Exothermal welds shall be made using new molds, sleeves, and cartridges sized in accordance with welding equipment manufacturer's recommendations for particular application.

C. Completed welds shall be capable of withstanding moderate hammer blows. Porous or deformed welds not acceptable.

D. Wire sizes 10 AWG (3.3 mm) and smaller: Exothermal connections shall be made by installing copper sleeve around copper wire in weld area prior to welding to improve quality of weld and to increase thermal capacity of wire in weld area.

E. Do not cover or coat connection to pipe until it has been observed for conformance by Owner. Owner may reject any connection if it fails when cable is pulled, breaks loose from pipe when struck at an angle with a hammer, or does not appear to be a complete, properly shaped or made. Owner observation in no way relieves Contractor of performance of connection.

3.05 SPLICES

A. Use tap splices to connect anode lead wire to anode header cable.
   1. In area where tap splice is to be made, remove insulation from anode header cable without cutting cable.
   2. Copper impressed current anode lead wires shall be tap-spliced to anode header cable with compression connectors and manufacturer's recommended compression tool. Exposed conductor to be inspected and insulated before burial.

3.06 UNDERGROUND REFERENCE ELECTRODES

A. Store and maintain underground reference electrodes in dry environment and above freezing temperatures until activation and installation.

B. Activate underground reference electrodes by complete immersion in clean, fresh water for approximately 8-12 hours prior to installation.

C. Install horizontally below frost line, in permanently moist soil, with minimum of 6" (150 mm) of clean earth fill surrounding electrode package. Underground reference electrodes shall be installed within 6" of structure.

D. After burial of packaged reference electrode, but before backfilling or covering excavation, test activated reference electrode for proper operation.

3.07 PIPING ISOLATION

A. Install flange insulating kits in pipe flanges and insulating unions or couplings.

B. Electrically isolate connecting piping and equipment, and maintain minimum of 6" (150 mm) physical separation from reinforcing steel, structural steel, copper grounding system, or other buried piping from piping designated to receive insulated fittings or cathodic protection.

C. Bolting at insulated flanges shall consist of studs and nuts with sufficient stud length to allow at least one full stud thread protruding through each nut. Sleeves shall extend into insulating washers.

D. Install insulated fittings above grade or inside underground vaults or manholes. Provide sufficient clearance around fitting to permit easy access for maintenance and testing.

E. Test insulated fittings after installation.

3.08 POLYETHYLENE MESH

A. To prevent cathodically protected pipe from contacting reinforcing steel due to pipe or reinforcing steel movement when concrete is being placed, concrete encased carbon steel, stainless steel, or copper pipe shall receive a single wrap of polyethylene mesh held in place with plastic tape.

3.09 UNDERGROUND CONDUIT

A. Encase below grade steel conduit with not less than 3" (75 mm) of concrete. Do not direct bury steel conduit in earth.

3.10 PIPE SYSTEM TESTS

A. Application: Underground piping cathodic protection system tests, associated piping isolation tests, and associated cathodic protection system component tests.

B. Perform aboveground insulated fitting tests using insulation checker after piping installations are completed. Tests shall verify ineffectively insulated pipe fittings and insulated flanges using high-frequency insulation checker.

C. Do not disassemble or rework insulated flange after insulated fitting tests are satisfactorily competed.

3.11 INSULATED FITTING EFFECTIVENESS TEST

A. Prior to performing tests, calibrate insulation checker as recommended by manufacturer. For insulation tests to be valid using specified instrument, establish firm metal-to-metal contact between each probe of insulation checker and applicable metallic components of fitting under test.

B. Test for effectiveness of insulated pipe fittings by connecting insulation checker probes on either side of insulating component. Insulating, nonmetallic component is normally visible.

C. For insulated flange, insulating component that separates piping components is flange gasket. Test for effectiveness of insulated flange by connecting one insulation checker probe to each pipe flange.

D. Number of tests required per insulated fitting shall be based on size of fitting. Perform tests at approximately 6" (150 mm) intervals around circumference of insulated fitting. Failure of insulation test at any location around circumference of fitting indicates ineffectively insulated fitting.

3.12 UNDERGROUND REFERENCE ELECTRODE TEST

A. 8" (200 mm) saturated copper-copper sulfate solution portable reference electrode: Clean reference electrode copper rod and fill with fresh copper-sulfate and distilled water saturated solution within 30 days of testing time.

B. Pour minimum of 10 gallons (38 liters) of water over and around underground electrode package after each underground reference electrode is installed to thoroughly saturate with water.

C. Place mild steel stake or rod in firm contact with soil, several feet from reference electrode package.

D. Connect negative test lead of specified dc voltmeter to reference electrode lead wire.

E. Firmly connect voltmeter positive test lead to mild steel stake or rod. Measure and record dc voltage on voltmeter. Copper-copper sulfate type underground reference electrodes, stable negative reading between -0.4 and -0.8 volts shall be obtained with lead wires connected as described above for installation to be acceptable.

3.13 GALVANIC ANODE CATHODIC PROTECTION TESTS

A. Above and underground electrical and mechanical connections made to cathodically protected piping systems, and electrical isolation shall be complete prior to final testing.

B. Cathodically protected piping and anodes shall have been completely backfilled for at least 30 days prior to initiating final testing.

C. Measure current from each pipe connected galvanic anode.

D. Anode open circuit potential test to determine if galvanic anodes are active and undamaged shall be made using voltmeter, flexible test leads, and portable reference electrode. After satisfactory anode current and anode open circuit potential measurements have been obtained for test station connected anodes on isolated piping system, pipe system potential measurements shall be made using voltmeter, flexible test leads, and portable reference electrode specified.

3.14 PIPE LEAD WIRE CONTINUITY TEST

A. Perform tests using voltmeter, flexible test leads, and milliammeter.
   1. At field test station, remove jumper between anode lead wire and pipe lead wire.
   2. Connect specified voltmeter between two pipe lead wires, measure and record potential.
   3. If no potential exists, use ohmmeter to measure resistance between two pipe lead wires. Resistance reading will be total reading. To get resistance of only pipe lead wires subtract

resistance of meter lead wires. Resistance readout shall not be fluctuating and shall measure less than 0.1 ohm to be acceptable.

B. In cases where potential exists, reading will not remain stable, high resistance exists between pipe lead wires, or one or both of pipe lead wires may be damaged.

3.15 FIELD QUALITY CONTROL

A. Test shall verify correct installation and performance of cathodic protection systems and associated equipment and materials.

B. Test data shall be recorded for each test performed and submitted as specified.

C. Underground reference electrode tests and component tests shall be performed prior to complete backfilling, otherwise tests may be conducted in any sequence selected by Contractor.

D. Ensure necessary safety precautions are taken and provide equipment, materials, and labor for performance of tests.

E. Within 15 calendar days after completion of cathodic protection tests, submit complete report of test results to Owner. Results will be interpreted and Contractor advised whether or not system is acceptable.

F. If test results indicate system to be unacceptable, make necessary repairs, retest, and resubmit new test results. Procedure shall be repeated until satisfactory results are obtained and materials, equipment, and installations meet specification requirements. Corrective action shall include restoration of other construction and facilities disturbed by repair work.

3.16 MANUFACTURER'S FIELD SERVICES

A. Provide qualified cathodic protection engineer to review installation procedures and supervise installation and testing of cathodic protection systems. Cathodic protection engineer shall be acceptable to Owner.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Interior lighting fixtures and accessories.

B. Exterior lighting fixtures and accessories.

C. Ballasts.

D. Poles.

E. Light control systems.

F. Emergency lighting systems.

1.02 QUALITY ASSURANCE

A. Manufacturer qualifications:
1. Manufacturer of major components within assembly.
2. ISO 9000 certified.
3. Manufacturer shall have produced similar electrical equipment for a minimum period of 5 years.

B. American National Standards Institute (ANSI)
1. ANSI C82.1 - Ballasts for Fluorescent Lamps.
2. ANSI C82.2 - Fluorescent Lamp Ballasts - Methods of Measurement.
3. ANSI C82.4 - Ballasts for High-Intensity-Discharge and Low-Pressure Sodium Lamps.
4. ANSI C2 - National Electrical Safety Code.
5. ANSI C78.1300 - Specifications for High Pressure Sodium Lamps Series.
6. ANSI C82.4 - Ballasts for High-Intensity-Discharge and Low-Pressure Sodium Lamps.
7. ANSI C136.20 - Roadway Lighting, Fiber-Reinforced Plastic (FRP) Lighting Poles.
8. ANSI C81.10-76 - Electric Lamp Bases and Holders - Screw-Shell Types (Revised and Consolidated into ANSI C81.61-90).
9. ANSI C82.1 - Specifications for Fluorescent Lamp Ballasts.
10. ANSI H35.1-88 - Alloy and Temper Designation Systems for Aluminum.

C. National Electrical Manufacturers Association (NEMA)
1. 270 - Procedure for Fluorescent Lamp/Ballast/Fixture Performance Comparison.
2. FA 1 - Outdoor Floodlighting Equipment.
3. OD 3 - Physical and Electrical Interchangeability of Photo Control Devices and Mating Receptacles.
4. SH 5 - Tubular Steel, Aluminum, and Pre-stressed Concrete Poles.

D. ASTM B429, "Standard Specification for Aluminum-Alloy Extruded Structural Pipe and Tube."

E. National Fire Protection Association (NFPA):
1. 70 - National Electrical Code (NEC)
2. 101 - Code for Safety to life from fire in Buildings and Structures.

F. Underwriters Laboratories (UL):
1. UL 57 - Electric Fixture.
2. UL 496 - Edison-Base Lamp holders.
3. UL 676 - Underwater Lighting Fixtures.
4. UL 542 – Lamp holders, Starters, and Starter Holders for Fluorescent Lamps.
5. UL 773 - Plug-in, Locking Type Photo controls, for Use with Area Lighting.

6. UL 773A – Non-industrial Photoelectric Switches for Lighting Control.
7. UL 884 - Lighting fixtures used in hazardous locations.
8. UL 935 - Fluorescent Lamp Ballasts.
9. UL 1029 - High-Intensity-Discharge Lamp Ballast.
10. UL 1570 - Fluorescent Lighting Fixtures.
11. UL 1571 - Incandescent Lighting Fixtures.
12. UL 1572 - High-Intensity-Discharge (HID) lighting fixtures.

G. Illuminating Engineering Society of North America (IESNA), LHBK - Lighting Handbook, References and Application Volumes.

PART 2 PRODUCTS

2.01 LIGHTING FIXTURES

A. Lighting fixtures shall be furnished completely assembled with wiring and mounting devices, ready for installation in their intended location.

B. Design fixtures with supports independent of ceiling supports.

2.02 LAMPS

A. Comply with standard of ANSI C78 series that is applicable to each type of lamp.

2.03 LIGHTING BALLASTS

A. Ballasts shall be suitable for lamp types and the installed environmental conditions.

2.04 EMERGENCY LIGHTING SYSTEM

A. System shall consist of emergency lighting fixtures supplied from inverter-type power units.

B. Provide nameplate on or near luminaire to identify "Emergency Light."

C. Power units:
1. Self-contained, including batteries, charger, inverter, and transfer devices to deliver rated output under normal and abnormal conditions, including complete power failure.
2. Load characteristics: Capable of powering incandescent, fluorescent and HID lighting.
3. Ratings:
   a. Input volts: per design requirements.
   b. Output volts: per design requirements. Output wave form shall be sine wave with less than 10% voltage total harmonic distortion.
   c. Output volts: per design requirements.
   d. Output voltage regulation: +10% no-load to full-load.
   e. Units shall be capable of delivering full-rated capacity for minimum of 90 minutes following failure of ac supply according to NFPA 101.
   f. Transfer time from normal to emergency supply and back to normal supply: 1 second maximum.
   g. Ambient temperature range: 0 to 50ºC.
4. Inverter, charger, transfer switches, and basic circuitry shall be of solid-state construction.
5. Batteries shall be wet cell, pocket plate, nickel cadmium type with 15-year prorated warranty and life expectancy of 20 years.
6. Assemble cells in high-impact, heat-resistant, injection molded plastic containers.
7. Provide complete with post straps and connecting hardware.
8. Battery charger: Automatic regulated type to maintain float voltage within capacity to fully recharge battery within 12 hours following 90 minutes of emergency operation.
9. Integral time-delay relay: Arranged to hold unit on for fixed interval after restoring power after an outage. Provides adequate time delay to permit high-intensity-discharge lamps to restrike and develop adequate output.

10. Instant high-pressure sodium restrike starters: Solid-state, potted module, mounted inside luminaire.
    a. Compatible with mogul-base high-pressure sodium lamps, ballasts, and sockets up to 150 W.
    b. Restrike range: 105- to 130-volt ac.
11. Accessories:
    a. Light to indicate normal ac supply is available.
    b. Light to indicate proper functioning of charger.
    c. Light to indicate unit is providing emergency power.
    d. Test switch to simulate loss of normal power supply.
    e. Ac ammeter to monitor output current.
    f. Dc voltmeter to monitor battery voltage.
12. Enclosure:
    a. Suitable for the installed environmental conditions.
    b. Mount controls in upper portion and batteries in lower portion. Provide barrier between control equipment and batteries.
    c. Provide lockable swinging doors for maintenance access to all equipment.
    d. Finish: Corrosion-resistant, manufacturer's standard color.
    e. Provide 4" high concrete housekeeping pad under unit.
13. Manufacturer: Per approved manufacturer and manufacturer lists.

2.05 FIXTURES FOR HAZARDOUS LOCATIONS

A. Fixtures conforming to UL 844, or FM-certified for the hazardous area classification and division.

B. Fixture shall conform to UL 595 for marine environments.

2.06 EMERGENCY LIGHTING UNITS

A. UL-listed, self-contained battery-powered units that automatically turn on lights upon ac power failure and turn off lights upon restoration of service.

B. Sign colors and lettering size: Comply with authorities having jurisdiction.

C. Battery:
    1. Type: sealed lead-calcium, rechargeable, sealed, maintenance-free with 5-year warranty.
    2. Voltage: 6 volts or 12 volts.
    3. Capacity: Capable of operating unit for 90 minutes following power failure.

D. Battery charger and switching circuits shall be of solid-state type for use on 115-volt ac supply.

E. Lamps: 2 sealed-beam LED or halogen-type, mounted on unit.

F. Suitable for use in ambient temperatures of 50ºC.

G. Accessories:
    1. Test switch for testing lamps and battery.
    2. Pilot light: Indicates that unit is connected to live ac supply.
    3. Rubber cord and plug.

H. Provide complete with mounting hardware.

I. Exit signs:
    1. Self-powered LED-type (battery backup):
        a. Provide with automatic power failure device, integral self-testing module and fully automatic high/low trickle charger in a self-contained power pack.
        b. Battery: Sealed electrolyte type, operate unattended, and require no maintenance, including no additional water, for a period of not less than 5 years.
        c. LED exit sign shall have emergency run time of 1-1/2 hours (minimum).
        d. LEDs shall have rated lamp life of 70,000 hours (minimum).

2. Remote-powered:
   a. Provide remote ac/dc signs with provisions for wiring to external ac and dc power sources.
   b. Provide signs with minimum of 2 ac lamps for normal illumination and a minimum of 2 dc lamps for emergency lighting.

J. Fluorescent emergency system:
1. Each system shall consist of an automatic power failure device, test switch operable from outside of fixture, pilot light visible from outside fixture, and fully automatic solid-state charger in a self-contained power pack.
2. Provide self-testing module integral to fixture.
3. Charger: Trickle, float, constant current, or constant potential type, or combination.
4. Battery:
   a. Sealed electrolyte type with capacity as required.
   b. Operate unattended and require no maintenance, including no additional water, for a period of not less than 5 years.
5. Emergency ballasts provided with fixtures containing solid-state ballasts shall be fully compatible with solid-state ballasts.

2.07 LIGHTING CONTROLS

A. Contactor, electrically-held, nonlatching type:
1. Ratings:
   a. Continuous current: As required.
   b. Contacts: 277 volts.
   c. Coil: 277 volts.
   d. Frequency: 60 Hz.
2. Accessories:
   a. Control transformer rated 277 volts.
   b. "Hand-Off-Auto" selector switch on contactor cover.
3. Enclosures: NEMA 12.
4. Control: Photocell or time switch as best suited for application.

B. Photocell controls :
1. Type: Locking; approved sealed cadmium-sulfide cell.
2. Ratings: 277 volts, 60 Hz, 1,800 VA.
3. Contacts: Single-pole for control of mechanically held contactors arranged to fail in on position
4. Switching range:
   a. On: 1 footcandle.
   b. Off: 4.5 to 10 footcandles with 15-second minimum time delay
5. Minimum time delay on turn-off: 15 seconds.
6. Temperature range: -10°C to 50°C.
7. Enclosure: Weatherproof (integral to fixture).
8. Mounting: Locking-type receptacle.

C. Time switch:
1. Astronomic, dial-type or electronic-type, arranged to turn "On" at sunset and turn "Off" at predetermined time between 8:30 p.m. and 2:30 a.m. or sunrise, automatically changing settings each day in accordance with seasonal changes of sunset and sunrise.
2. Provide switch having automatically wound spring mechanism or capacitor, to maintain accurate time for a minimum of 15 hours following power failure.
3. Provide time switch with a manual on-off bypass switch. Housing for time switch shall be surface mounted, enclosure conforming to NEMA ICS 6.

D. Photocell switch:
1. UL 773 or UL 773A, hermetically sealed cadmium-sulfide or silicon diode type cell.
2. Switch shall turn on at or below 32 Lux (3 foot-candles) and off at 22 to 107 Lux (2 to 10 foot-candles).
3. Time delay shall prevent accidental switching from transient light sources.

4. In high-impact-resistant, noncorroding and nonconductive molded plastic housing with locking-type receptacle conforming to IEEE C136.10, rated 1800 VA, minimum.

2.08 POLES

A. Provide poles, brackets, supports and foundation designed for the environmental design ambient conditions in Section 01 30 00.

B. Aluminum: Corrosion-resistant aluminum alloy conforming to AASHTO LTS-3 for Alloy 6063-T6 or Alloy 6005-T5 for wrought alloys and Alloy 356-T4 (3, 5) for cast alloys.

C. Steel: AASHTO LTS-3. Minimum 11-gage steel with minimum yield/strength of 331 MPa 48,000 psi and hot-dipped galvanized in accordance with ASTM A123/A 123M.

D. Fiberglass: ANSI C136.20. Design specifically for supporting luminaires and have factory-formed cable entrance and hand holes.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install equipment in strict accordance with manufacturer's recommendations.

B. Perform construction in accordance with NEC.

C. Grounding:
1. Ground noncurrent carrying parts of equipment including metal poles, luminaires, mounting arms, brackets, and metallic enclosures.
2. Where copper grounding conductor is connected to a metal other than copper, provide specially treated or lined connectors suitable for this purpose.

D. Lighting fixtures:
1. Support lighting fixtures from building framing or floor slabs, independent of conduit system and suspended ceilings.
2. To minimize equipment breakage, delay installation of lighting fixtures in locations near heavy piping and equipment until such equipment is in place.
3. When permanent lighting system becomes operable, re-lamp lighting fixtures, as directed by Owner.
4. Replace defective or damaged lighting fixtures and lamps at conclusion of job.

E. Wall-mounted equipment:
1. Concrete or masonry walls: Use expansion anchors and bolts; install collars around mounting bolts, or use other means to provide air space between wall and equipment enclosure.
2. Structural steel mounting: Bolt to steel or brackets attached to steel; provide air space between steel and equipment enclosure.

F. Floor-mounted equipment: Secure to concrete floor or foundation with expansion anchors.

G. Emergency lighting system: Install raceway and wiring for emergency lighting system in accordance with NEC Article 700.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Fire detection and alarm system including wiring; connections including coordination of alarm transmission to appropriate remote monitoring station; testing; and software and programming to perform following functions:
   1. Fire alarm and detection operations.
   2. Control and monitoring of equipment indicated.

1.02 CLOSEOUT SUBMITTALS

A. Operation and maintenance manuals (minimum of 4 copies):
   1. General system description, technical device and system data.
   2. Instructional software data with trouble shooting guidelines.
   3. System operation description and operating instructions.
   4. Automatic operations sequence.
   5. Manual operations sequence.
   6. Maintenance schedule and procedures.
   7. Complete set of final "as-built" drawings requiring no further review.
   8. Complete documentation of inspections and tests performed, including certificates. Documentation shall note replacement of system equipment or devices that failed during initial testing. Record of system field tests.
   9. List of recommended spare parts.
   10. Warranty data.

1.03 QUALITY ASSURANCE

A. Fire alarm control panel and peripheral devices shall be manufactured 100% by single U.S. manufacturer (or division thereof).

B. Fire alarm system shall be listed as standard product of single. fire alarm system manufacturer under appropriate category by UL and shall bear UL label. Control equipment shall be listed under UL Category UOJZ as single control unit. Partial listing is not acceptable. Manufacturer's name shall be displayed on each component.

C. Installer qualifications: Installers shall be certified in installation of smoke detection and fire alarm systems.

D. Contractor qualifications:
   1. Minimum of 5 years documented fire alarm installations.
   2. Able to provide parts and labor to expand system specified, if so requested, for period of 5 years from date of acceptance.

E. Manufacturer qualification
   1. Manufacturer of equipment shall have produced similar equipment for minimum period of 5 years.
   2. Fire alarm system shall be manufactured by ISO 9001 certified company and meet requirements of BS EN9001: ANSI/ASQC Q9001.
   3. Manufacturer's authorized service representative: Competent, factory-trained engineer or NICET-certified technician (minimum Level II Fire Alarm Systems) on Site to guide final checkout and to ensure system integrity.
   4. When requested by Owner Engineer, provide acceptable list of similar fire alarm installations complying with requirements of this specification.

F. Regulatory requirements:
   1. Fire alarm system shall comply with requirements of NFPA 72 except as modified and supplemented by this specification. System shall be electrically supervised and monitor integrity of conductors.

2. Fire alarm control panel shall meet UL 864 (control units).
3. System and its components shall be UL-listed under appropriate UL testing standard as listed herein for fire alarm applications and installation shall be in compliance with UL listing.
4. Complete installation shall conform to latest edition of applicable sections of NFPA 12B, 13, 13A, 15, 16, 17, 17A, 70, 70E, 71, 72, 90A, 101, and state and local building codes and requirements.
5. Wiring shall be in strict compliance with provisions of NFPA 70 Article 760 I and 760 III, Power-Limited Fire Protective Signaling Circuits or, if required, may be reclassified as Non-power Limited Fire Alarm Circuits and wired in accordance with NEC Article 760 I and II.
6. Complete installation shall be within guidelines of latest versions of ICBO, BOCA, SBCCI, IBC, IFC, and IMC.
7. System shall be listed by national agencies as suitable for pre-action extinguishing release applications, if applicable. System shall support release of both low- and high-pressure CO_2.
8. Standards of foreign organizations shall not be used without prior written approval from Owner.

PART 2 PRODUCTS

2.01 SYSTEM DESCRIPTION

A. Fire alarm system shall include microprocessor-controlled, intelligent reporting fire alarm equipment as necessary to form complete, operative, coordinated system. System shall include, but not be limited to, fire alarm control panel (FACP) configured for either stand-alone or networked operation, alarm initiating devices, alarm notification appliances, auxiliary control devices, annunciators, wiring, outlet boxes, junction boxes and any other necessary materials for complete and functional system installation.

B. Fire alarm control panel shall interconnect with other building systems as required, including but not limited to, HVAC system (air handling units and associated smoke/fire dampers), fire suppression system, electric passenger elevators, and automated building systems.

2.02 EQUIPMENT AND MATERIAL

A. Materials, appliances, equipment and devices shall be tested and listed by nationally recognized approval agency (UL, FM) for use as a protective signaling system.

B. FACP shall contain microprocessor-based central processing unit (CPU) and power supply in economical, space-saving, single board design. CPU shall communicate with and control following types of equipment used to make up system:
   1. Intelligent addressable smoke and thermal (heat) detectors.
   2. Addressable manual pull stations.
   3. Addressable modules.
   4. Printer.
   5. Annunciators.
   6. Other system controlled devices, with required system functions and operating features.

C. Control panel shall monitor addressable initiating and control devices, annunciate fire alarm device location, and initiate alarm and evacuation signals.

D. Control panel shall be capable of communicating with types of addressable devices specified. Addressable initiating devices shall only be used with addressable control panel.

PART 3 EXECUTION

3.01 INSTALLATION

A. Arrangement and routing of circuits shall be at Contractor's discretion in accordance with generally accepted good practices and requirements of NFPA 70.

B. Install in accordance with ADA and UL 1971 guidelines, NEC Article 760, NFPA 72, local and international codes and as recommended by manufacturer. Consult manufacturer's installation manuals for wiring

diagrams, schematics, physical equipment sizes, mounting type/style etc., before beginning system installation.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Soil and material testing.

B. Excavation, backfilling, and grading for structures.

C. Dewatering.

D. Protective and support systems and associated work.

E. Importing backfill and fill materials.

F. Disposal of excess or unsatisfactory materials.

G. Underground obstructions.

1.02 DEFINITIONS

A. Support system per Occupational Safety and Health Administration (OSHA): Structure such as underpinning, bracing, or shoring, which provides support to adjacent structure, underground installation, or sides of an excavation. Structures as: block, bracing, shoring, which provides support to an adjacent structure, underground installation, or the sides of an excavation

B. Protective system (per OSHA): Method of protecting employees from cave-ins, from materials that could fall or roll from an excavation face or into an excavation, or from collapse of adjacent structures. Protective systems include support systems, sloping and benching systems, and other systems that provide necessary protection.

1.03 QUALITY ASSURANCE

A. Owner will retain services of qualified professional soils consultant and testing laboratory.

B. Responsibilities of soils consultant and testing laboratory shall include:
1. Sampling, testing, and approval of backfill and fill materials prior to and during placement.
2. Sampling and testing to determine moisture-density and maximum density characteristics of materials in accordance with ASTM D698.
3. Observation of placement, selection of test locations, and testing of material during placement to determine that uniformity of compaction and specified compaction requirements are met. Determine in-place densities in accordance with ASTM D1556, D2167, or D2922, as applicable. Determine moisture contents in accordance with ASTM D2216 or D3017, as applicable. Conduct one test for every 1,000 sq ft (93 m^2) of backfill material placed.
4. Inspection and approval of soil at bottom of excavations under foundations, considering settlement and load-bearing characteristics of soil and design bearing capacity.
5. Providing reports to Owner's Representative giving information on materials and testing performed.
6. Making recommendations to Owner's Representative where deviations from Specifications occur or conditions are considered undesirable.
7. Binding reports and recommendations in one report at end of Project and giving one copy and a pdf file to Owner's Representative.

C. Responsibilities of Contractor shall include:
1. Providing samples of backfill and fill materials to testing laboratory.
2. Notifying soil consultant and testing laboratory a minimum of 5 working days before commencing work that requires testing and minimum of 3 working days notice of any work requiring testing thereafter.
3. Providing access in field for compaction testing and inspection and testing of natural bearing soils.

4. Allowing inspection and approval of subgrades and fill layers by soil consultant before further Work in that area is performed.

1.04 SCHEDULE

A. Provide Owner's Representative minimum of 7 days' notice of scheduled installation of components of support system that involve use of impact or vibratory hammers such as driven H- or sheet piling.

1.05 EXISTING CONDITIONS

A. Known underground utilities, foundations, and other underground obstructions in vicinity of new construction are not shown. Existing utilities are active and shall remain in service unless specifically identified on drawings as abandoned, to be removed or relocated.

B. Protect underground facilities encountered during excavation. Provide support of facilities as required to facilitate excavation and project construction. Repair, without compensation, existing active facilities damaged during operations.

PART 2 PRODUCTS

2.01 STRUCTURAL BACKFILL AND FILL

A. Use material removed from excavations or obtained by Contractor specified **or** shown as backfill and fill material unless shown or specified otherwise.

B. Exclude debris, large stones, rocks, roots, organic material, expansive material and other deleterious materials.

C. Type: Excavated or imported material conforming to one of following ASTM D2487 (Unified Soil Classification System) classifications: GW, GP, SW, or SP.

D. Use for all backfill and fill except where specified otherwise.

2.02 GRANULAR FILL

A. Type: Clean, medium or coarse sand conforming to ASTM D2487 (Unified Soil Classification System) classification SW.

B. Material: Free of earth, clay or other foreign substances.

C. Use:
1. Place 6" (150 mm) layer of granular fill under all interior slabs-on-grade.
2. Fill all depressions, resulting from compaction proofrolling or excavation of unsuitable bearing material under interior slabs-on-grade.
3. Backfill behind retaining walls and basement walls.

2.03 CRUSHED ROCK

A. Clean crushed rock.

B. Size and grading: 1" (25 mm) maximum, 10 to 35% passing No. 8 (2.38 mm) sieve, not over 15% passing No. 50 (0.30 mm) sieve, and not over 6% passing No. 200 (0.075 mm) sieve.

C. Material: Free of earth, clay, or other foreign material.

D. Use: Where deemed necessary by Contractor.

2.04 DRAINAGE FILL

A. Type: Clean, crushed rock or gravel.

B. Size and grading: 100% passing 1-1/2" (38 mm) sieve and not over 2% passing No. 4 (4.75 mm) sieve.

C. Material: Free of earth, clay, or other foreign substances.

D. Use: Backfill around underground structures that require continuous dewatering.

2.05 FILTER MATERIAL

A. Clean, well-graded gravel or crushed rock with maximum size of 3/4" (19 mm), not less than 95% passing 1/2" (13 mm) sieve and not more than 5% passing No. 4 (4.75 mm) sieve.

B. Use around perimeter drain and subdrains.

2.06 COHESIVE BACKFILL AND FILL

A. Type: Excavated or imported natural clay materials conforming to ASTM D2487 (Unified Soil Classification System) Classification CL.

B. Use: Surface water barrier.

2.07 SUPPORT AND PROTECTION SYSTEMS

A. Provide support and protection systems where required to protect public, workers, and existing and new utilities, property and structures.

B. Design of support and protection systems shall be responsibility of Contractor and shall conform to OSHA requirements.

C. Design of system shall include:
   1. Loading effects from:
      a. Soil.
      b. Ground water.
      c. Surcharge loading (construction and public traffic on adjacent roadways).
      d. Adjacent structure and equipment dead and live loads.
   2. Consideration of effects including vibration and settlement on completed structures. Installation and removal of support systems shall not cause damage to completed structures and facilities.

D. Certain facilities are vibration sensitive. Incorporate techniques that minimize vibrations transmitted to completed facilities.

PART 3 EXECUTION

3.01 EARTH EXCAVATION

A. Excavate as required for construction work. Extend excavation sufficient distance from walls and footings to allow for placement and removal of forms. Stockpile topsoil on site for reuse.

B. Use special care when excavating under and around completed facilities. Support completed facilities and earth under facilities to prevent settlement resulting from construction operations.

C. Excavation for soil supported foundations:
1. Excavate to elevations required for foundation work. Soils consultant shall inspect and approve soil at foundation levels shown.
2. Proofroll bottom of excavation with mat foundations 25-ton (22.7 metric ton) pneumatic-tired roller. Notify Owner's Representative of any soft spots which are detected.
3. If soils consultant determines that bearing capacity of soil is unsuitable at foundation levels shown, notify Owner's Representative of subsurface conditions and discontinue Work in area until Owner's Representative provides directive and notification to resume Work.
4. Where concrete is placed directly on natural soil, trim excavations by hand to remove material disturbed by machine excavation; produce neat, plane surface at elevation of bottom of footing
5. Provide concrete mud slab or blinding on exposed bearing soils to provide work surface or to protect exposed soils, where deemed necessary by Contractor.

D. Excavation for pile supported foundations:
1. Coordinate excavation with operations required for installation of piling.
2. Produce neat excavations as required for form construction or direct placement of concrete against sides of earth excavation. Bottom of excavation shall be firm and neat to provide adequate support for placement of foundation concrete.
3. Exercise special care when excavating around piling to prevent damage.

E. Floor slab excavation:
1. Excavate soil under floor slabs for thickness of granular material specified.
2. Proofroll bottom of excavation with 25-ton (22.7 metric ton) pneumatic-tired roller (verify with geotechnical report). Notify Owner's Representative of any soft spots which are detected.
3. If soils consultant determines that bearing capacity of any soil is unsuitable at elevation shown, notify Owner's Representative of subsurface conditions and discontinue Work in area until Owner's Representative provides directive and notification to resume Work.
4. Fill with granular fill, at no expense to Owner, unauthorized excavations for floor slabs carried below specified excavation elevation.

3.02 ROCK EXCAVATION

A. Rock is defined as boulders measuring over 1 cu yd (0.8 cu m) or natural occurring bedrock material that cannot be removed without special excavation techniques such as continuous loosening with pneumatic tools, rippers or drilling and blasting.

B. Use methods that produce solid, unshattered lines; roughen smooth, flat surfaces and cut steps in smooth sloping surfaces.

C. Explosives: Blasting is permitted under following conditions:
1. Use no explosives until written authorization is obtained from Owner's Representative.
2. Use no explosives until required insurance covering blasting operations has been obtained.
3. Conform to ordinances of applicable regulatory agencies.

3.03 BACKFILL AND FILL

A. Backfilling around structures and foundations:
1. Prevent displacement of construction during backfilling operations; backfill opposite sides of structures and foundations simultaneously.
2. Probe and compact existing soils around piles after pile installation. Use structural backfill to fill cavities around piles.

B. Backfill and fill to elevations required for drainage and work. Maintain surface and slopes for drainage during operations.

C. Placement:
1. Maintain surfaces free of water, debris, and excessively wet, or deleterious materials.
2. Place backfill and fill materials in successive horizontal layers not more than 8" (200 mm) in loose depth.
3. Place materials at proper moisture content for obtaining densities as specified. Generally maintain within -1% to +3% of optimum.
4. Material too dry or too wet to compact properly: Moisten or aerate to extent necessary to produce desired results.

D. Compaction:
1. Compact backfill and fill within structure outlines, beneath and within 10' (3 m) of sidewalks, streets, drives, and parking areas to at least 95% of maximum density as determined by ASTM D698.
2. Compact backfill and fill in other areas to at least 90% of maximum dry density as determined by ASTM D698.
3. Perform sampling and testing in each layer of backfill and fill placed to confirm adequacy of compaction. Minimum of one sample and test for each 1,000 sq ft (93 m^2) of each layer.
4. Do not use pneumatic tired rollers, sheeps-foot type heavy mechanical tamping rollers or heavy vibratory compactors within 6' (1.8 m) of structure, walls, pipes, or other construction which might be damaged by compaction equipment.
5. If tests indicate inadequate compaction, remove, replace and recompact material until compliance with these specifications is achieved.

3.04 DEWATERING

A. Furnish, install, and remove dewatering equipment necessary to drain and keep excavations free of water under all circumstances.

B. Prevent surface water from flowing into excavations and into existing or new structures; promptly remove any water accumulated.

C. Maintain dewatering operations until Work area is accepted as complete or turned over to another contractor.

3.05 SUPPORT AND PROTECTION SYSTEMS

A. Where utilities are in vicinity of support and protection systems that has components to be drilled or driven into soil, expose utilities to verify location prior to start of installation of support and protection systems components to avoid damage to utilities.

B. Remove support and protection system in manner to avoid damage or disturbance to Work. Leave support system in place, where removal will endanger Work, public, workers, adjacent utilities, property or structures or where it has been used as permanent formwork for concrete construction.

3.06 SITE GRADING

A. Grade areas disturbed by construction operations.

B. Finish grade to smooth, uniformly sloping surfaces to elevations shown and required for drainage.

C. Fill depressions and provide for positive drainage away from buildings and structures.

D. Finish with 4" (100 mm) layer of topsoil in area to be seeded.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Medium-voltage cable and related splices, terminations, and accessories for cables rated at or above 2001 volts and at or below 35 kV.

1.02 CLOSEOUT SUBMITTALS

A. Operation and maintenance manuals. Provide at a minimum:
1. General description and technical data.
2. List accessories supplied, listing manufacturer, model number and operating ranges.
3. Receiving, storage, installation, and testing instructions.
4. Complete documentation of inspections and tests performed, including logs, curves, and certificates.

1.03 QUALITY ASSURANCE

A. Installer qualifications: Installer shall have minimum of 10 years documented experience as an installer of medium-voltage electrical systems, medium-voltage cable, and medium-voltage terminations and splices.

B. manufacturer's qualifications:
1. manufacturer of cable and any accessories shall be ISO certified.
2. manufacturer shall have produced similar equipment for a minimum period of 5 years.

C. Regulatory requirements:
1. Cables and accessories shall be in accordance with applicable standards
   a. Armored and unarmored shielded power cable ICEA S-93-639 and NEMA WC74.
   b. IEEE 383, ASTM B3 and B8, UL 1072.
   c. NETA Acceptance Testing Specifications for Electrical Power Distribution Equipment and Systems.
   d. AIEC CS6.
   e. IEEE 48 and IEEE 386.
2. Standards of foreign organizations shall not be used without written approval from Engineer.

D. Cable shall not have had more than 1 year elapse from date of manufacture to date of delivery to job Site.

E. Testing services: Employ and pay for services of qualified independent testing agency to perform field quality control testing. Test equipment shall be calibrated within 3 months prior to cable test date. Certified test reports shall be furnished to Owner. Interpretation of test results with regards to compliance to this specification shall accompany test reports.

PART 2 PRODUCTS

2.01 SYSTEM DESCRIPTION

A. Components may include, but are not limited to:
1. Tape.
2. Break out boots.
3. Lugs and termination kits.
4. Strain relief devices.
5. Splices.

B. Asbestos in any form is prohibited from cable, including fillers and binding tapes even if encapsulated or if asbestos fibers are impregnated with binder material.

2.02 POWER CABLE

A. Single-conductor and multi-conductor, unarmored:
1. Conductor material: copper.
2. Stranding: Class B.
3. Cable sizes and types: Per design requirement.
4. Insulation levels and voltage classes: Per design requirement.
5. Temperature: 105ºC continuous; 140ºC emergency; and 250ºC short circuit.
6. Conductor semi-conductor shield: Extruded semi-conducting, thermosetting polymeric layer over conductor applied in tandem with and firmly bonded to insulation, and shall be free stripping from conductor.
7. Conductor insulation: In accordance with design requirements. Provide ethylene propylene rubber (EPR) or cross-linked polyethylene (XLPE).
8. Insulation semi-conductor shield: Cover insulation with extruded semi-conducting thermosetting material.
9. Metallic shield: Tape shields shall be helically applied, minimum 5-mil, nonmagnetic, uncoated copper tape over insulation with minimum lap of 12.5%. Apply binder tape and jacket to meet NEC Article 318, on sizes No. 1/0 AWG and larger.
10. Jacket: In accordance with design requirements.
11. Multiconductor cable shall be rounded with nonhygroscopic fillers. Solid, extruded fillers not permitted. Install grounding conductor in one outer filler interstice and cover with binder tape.
12. Cable shall be rated for application's use, such as in cable tray, aerial, direct burial, conduit, and underground duct installations. Cables smaller than No. 1/0 AWG (70 mm^2) shall be provided in multiconductor cable either 3/C or 4/C with ground.
13. Cable assemblies shall be tested and shall pass ICEA 70,000 Btu/hr and 210,000 Btu/hr vertical tray flame tests.

B. Multiconductor, armored:
1. Conductor material: copper.
2. Stranding: Compact, Class B.
3. Cable size and type: Per design requirements.
4. Ground conductor: Class B compressed concentric stranded bare copper.
5. Insulation level and voltage class: Per design requirements.
6. Temperature: 105ºC continuous, 140ºC emergency and 250ºC short circuit.
7. Conductor shield: Extruded semi-conducting, thermosetting polymeric layer over conductor applied in tandem with and firmly bonded to insulation, and shall be free stripping from conductor.
8. Conductor insulation: Per design requirements. Provide ethylene propylene rubber (EPR) or XPLE. Insulation shield: Cover insulation with extruded semi-conducting thermosetting material.
9. Metallic shield: Helically applied, minimum 5-mil, nonmagnetic, uncoated copper tape over insulation with minimum lap of 12.5 and a helically applied overall binder tape.
10. Armor: Single strip of interlocked or continuously welded and corrugated aluminum armor applied over cable assembly.
11. Armor jacket: Sunlight-resistant, red or yellow PVC conforming to IEEE 1202 and ICEA T-29-520 vertical cable tray flame tests.
12. Multiconductor cable shall be rounded with nonhygroscopic fillers. Solid, extruded fillers not permitted. Install grounding conductor in one outer filler interstice and cover with binder tape.
13. Cable shall be rated for installation in cable tray.

2.03 CABLE MARKING

A. Surface print each length of conductor or cable at least every 3' (1 m) with:
1. Voltage rating.
2. Conductor size.
3. Conductor quantity.
4. Conductor material.
5. Insulation type.
6. manufacturer's identification.
7. Running length of cable.

B. Permanently attach metal tags to both sides of each cable reel displaying:
   1. manufacturer.
   2. Date of manufacture.
   3. Job order number.
   4. Unique reel identification number.
   5. Purchaser's name.
   6. Voltage rating.
   7. Conductor size.
   8. Conductor quantity.
   9. Feet on reel.
   10. As shipped weight of cable and reel.

2.04 SPLICING

A. Splices not allowed unless specifically approved by Owner.

B. Splice kits: 3M "Cold Shrink" for shielded cable or as recommended by manufacturer for specific application.

C. Use compression-type, 2-hole lugs with corrosion-resistant bolting material or compression barrel connectors.

D. Shield shall be appropriately connected at splice to provide continuous shield for complete cable installation.

2.05 TERMINATIONS

A. Design terminations for shielded cables and include shield ground strap. Only Class 1 terminations acceptable.

B. Termination kits: 3M "Cold Shrink" silicon rubber; compression-type connectors and lugs. Field-verify lug type and arrangement with equipment configurations.

2.06 UNDERGROUND WARNING TAPE

A. Use: Underground installation including direct-buried cable, direct-buried conduit and concrete-encased duct banks.

B. Type and size: Permanent, vinyl; not less than 6" wide x 4 mils thick (150 mm wide x 0.102 mm thick).

C. Compounded for permanent direct-burial service.

D. Embedded continuous metallic strip or core.

E. Printed legend shall indicate type of underground line.

2.07 SOURCE QUALITY CONTROL

A. Factory-test cables in accordance with AEIC CS6.

B. Provide certificate of compliance and manufacturer's test reports showing results of tests required by AEIC CS6. Reports shall include reel numbers for tests performed on each length of completed cable.

C. Include manufacturer's flame test data in test reports. Prototype data is acceptable instead of flame testing, as long as conductor size, insulating and jacketing materials, and insulation and jacket thickness are same as worst-case flame test configuration being provided.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install in accordance with manufacturer's recommendations, IEEE 576.

B. Support cables in accordance with requirements of NEC.

C. Install direct-buried cables in minimum 3" (80 mm) thick bed of clean sand. Separate multiple sets of 3-phase cables by minimum of 4" (105 mm).

D. Place underground warning tape 6" to 12" (150 mm to 300 mm) above electrical lines.

E. Install underground cables with minimum earth cover to final grade in accordance with NEC requirements.

F. Cable installed underground in cable vaults, manholes, and hand holes shall have arc-proof taping installed for additional protection. Clean cable sheath and apply half-lap layer of tape. Secure with electrical tape in accordance with manufacturer's instructions.

G. Unarmored cable installed in cable tray shall transition out of cable tray by use of conduit or wireway, or as allowed by the NEC. Armored cable may transition out of cable tray without use of conduit or wireway as long as it is supported by approved methods. Cable glands shall be used where conduit or wireway is not provided.

H. Cable in cable tray:
   1. Install single conductor cables in triplexed or quadriplexed configuration. Maintain free air space minimum 2.15 x cable OD of largest conductor in group and adjacent conductor configurations or cable. Refer to corresponding sections of NEC for acceptable ampacity tables.
   2. Install multiconductor cables with maintained spacing of not less than one cable diameter of largest cable, between cables.

I. Terminations and shields.
   1. Install terminations at ends of conductors with standard kits. Comply with kit manufacturer's written instructions and with classes of terminations indicated.
   2. Provide break out boots for multiconductor cables.
   3. Connect shield ground strap to cable shield after cable passes through ground sensors. Route ground shield strap back through ground sensor to cancel effect of circulating currents.
   4. Connect shields to ground on both ends of cable. Connection of shield to a shield ground strap shall be with solder and mechanical clamp.

J. In manholes, handholes, pull boxes, junction boxes, and cable vaults, train cable through walls by longest route from entry and exit. Support cables at intervals adequate to prevent sag.

K. Install cable accessories in accordance with manufacturer's recommendations.

L. Use heat shrinkable caps for storing unused cable.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Minimum requirements for substation and plant electrical system protection requirements.

1.02 QUALITY ASSURANCE

A. Regulatory requirements: Design, fabricate, and test equipment in accordance with applicable standards of ANSI, NEMA, NFPA, and IEEE and in accordance with applicable requirements of OSHA, specifically:
1. ANSI/IEEE C-37.91 Guide for Protective Relay Applications to Power Transformers
2. ANSI/IEEE C37.97 Guide for Protective Relay Applications to Power System Busses
3. ANSI/IEEE C37.101 Guide for Generator Ground Protection
4. ANSI/IEEE C37.102 Guide for AC Generator Protection
5. ANSI/IEEE C37.106 Guide for Abnormal Frequency Protection for Power Generating Plants
6. ANSI/IEEE C37.110 Guide for Application of Current Transformers Used for Protective Relaying Purposes
7. ANSI/IEEE C37.113 – Guide for Protective Relay Applications to Transmission Lines
8. ANSI/IEEE Std. 666: Design Guide for Electric Power Service Systems for Generating Stations
9. ANSI/IEEE Std. 141: Recommended Practice for Electric Power Distribution for Industrial Plants
10. ANSI/IEEE Std. 242: IEEE Recommended Practice for Protection and Coordination of Industrial and Commercial Power Systems
11. ANSI/NFPA 70: National Electrical Code (NEC)
12. ANSI/NFPA 70E: National Electrical Safety Code (NESC)

PART 2 PRODUCTS

2.01 SYSTEM PROTECTION: GENERAL

A. Provide microprocessor-based (digital) protective relay and metering devices.

B. Power supply voltage: 125 volts dc for high voltage and medium voltage systems.

C. Provide electrical system coordination study and protective device settings for electrical system covered by scope of this project. Perform a coordination study at design stage to establish basis for system design and to enable completion of an arc flash analysis.

D. Provide electrical system protective scheme to:
1. Operate only under those conditions for which protection is needed and remain either passive or biased for all other conditions.
2. Isolate affected portion of electrical system without interrupting service of unit auxiliaries. This isolation should be as rapid as possible to minimize damage to components and effect on rest of electrical system.
3. Reduce duration of available short-circuit current to minimize potential damage to service system and its components.
4. Limit duration of undervoltage transients due to faults in service system and prevent unnecessary loss of equipment operation.
5. Utilize alternate circuits, automatic throwovers (or transfers), and automatic reclosing devices (where applicable) to minimize duration and extent of equipment outages.

E. Design and implementation of electrical system protection shall consider measures to reduce incident energy level and to enhance personnel safety with consideration to practical design limitations, available technology, and industry practice.

F. Protective relaying scheme will be designed to remove and/or alarm any of following abnormal occurrences:
1. Overcurrent.

2. Undervoltage or overvoltage.
3. Frequency variations.
4. Over temperature.
5. Abnormal pressure.
6. Open circuits and unbalanced current.
7. Abnormal direction of power flow.

G. Provide primary and backup protection to ensure that a single component or relay failure will not prevent isolation or clearing of a fault in affected portion of electrical system.

2.02 GENERATOR PROTECTION

A. Generator manufacturer should be consulted for specific protection requirements. The protective scheme shall incorporate protective devices such as stator temperature, cooling medium temperature, voltage regulator control, over speed protection, and other protective function that may be required to provide proper protection of generator unit per generator manufacturer requirements and industry standards practices. Primary and backup microprocessor-based (digital) protective relay devices shall be provided for each generator unit.

B. Phase faults protection: Provide a primary current differential relay scheme and an independent back-up differential relay scheme, employing independent current sources and independently pro- tected dc control circuits. The backup scheme may consist of overall generator and unit transformer differential. A simultaneous trip of generator breakers, excitation system and turbine valve is required.

C. Stator ground faults protection: Provide a high impedance ground to limit magnitude of ground fault current and reduces risk of transient over-voltages during ground faults. Provide two independent schemes with independent current or voltage sources and independently protected dc control circuits. At least one of schemes shall provide protection for 100 percent of stator winding. The relays shall coordinate with other protective devices and generator voltage transformer fuses. A simultaneous trip of generator breakers, excitation system, and turbine valves is required.

D. Generator rotor field winding is normally ungrounded. The presence of one ground, therefore, will not affect generator's operation. The presence of first ground, however, greatly increases probability that a second ground will occur, causing imbalances, and overheating. The generator shall be equipped with rotor field ground fault protection. Tripping of generator is acceptable but not mandatory. At a minimum, protection shall initiate an alarm and upon receipt of this alarm, generator should be shut down as quickly as possible.

E. Loss of excitation protection: Loss of excitation will cause generator to lose synchronism, subject generator to thermal damage, and may impose an intolerable VAR load on power system. A primary relay scheme and an independent back-up relay scheme are required, using independent current and voltage sources and independently protected dc control circuits. Tripping of generator output breaker(s) is required. A simultaneous trip of excitation system and turbine valves is recommended.

F. Unbalanced currents (negative sequence) protection: Unbalanced currents are a result of unbalanced loading (e.g., one phase open) or uncleared unbalanced system faults. These unbalanced currents produce negative sequence current (I2) in generator rotor causing overheating. Provide a negative sequence time overcurrent relay with sufficient sensitivity to detect unbalanced conditions exceeding continuous rating of generator. The protection shall initiate an alarm at an appropriate level. For higher levels, tripping generator output breakers is required and a simultaneous trip of excitation system and turbine valves is recommended.

G. Loss of synchronism protection: Loss of synchronism, out-of-step operation, and pole slipping are synonymous and can result from transients, dynamic instability, or loss of excitation. This condition may be both damaging to unit and highly disruptive to power system. Provide detailed stability studies to determine if out-of-step protection is required. If apparent impedance locus during an unstable swing is expected to pass through step-up transformer or generator impedance, out-of-step protection is generally necessary because condition will be undetectable by line relaying. The protection shall in-

itiate an alarm. Tripping generator output breakers is required and a simultaneous trip of excitation system and turbine valves is recommended. The generator shall be tripped within first slip cycle.

H. Overexcitation protection: Overexcitation is excessive flux in generator core. This condition can cause rapid overheating, even to point of core failure. Volts/Hertz is a measure of an overexcitation condition. Two independent protection schemes shall be provided using independent potential sources and independently protected DC control circuits. A multi-setpoint (or inverse time) overall Volts/Hertz tripping characteristic shall be implemented. Operation of scheme shall result in an alarm at a low level of overexcitation followed, if no action is taken, by simultaneous tripping of generator breakers and excitation system after an appropriate time delay. A simultaneous trip of turbine is also recommended.

I. Reverse power (anti-motoring) protection: Generator motoring is caused by lack of energy supplied to prime mover resulting in electrical system driving machine as a motor. Sustained synchronous motoring will not damage generator, but may damage prime mover. Anti-motoring protection, which initiates an alarm followed by a simultaneous trip of generator breakers, excitation system, and turbine valves, is recommended. Provide a backed up, fully-redundant reverse power relay acting independently of valve position switches but with a longer time delay for security against tripping during transient power swings.

J. Abnormal frequency protection: The generator can withstand off-frequency operation for long periods of time provided load and voltage are reduced a sufficient amount. The turbine, however, is usually limited in its capability due to possible mechanical resonance caused by off-frequency operation under load. Provide abnormal frequency protective function for protection of turbine. For security, two underfrequency relays connected with "AND" tripping logic and connected to separate voltage sources are required. A sequential trip of turbine valves, excitation system, and generator breakers is recommended.

K. Generator breaker failure protection: Breaker failure protection shall be provided for all relay-initiated generator trips with exception of anti-motoring.

L. Generator open breaker flashover protection: Generator open breaker flashover is more likely to occur on generator breakers since 2.0 per-unit voltage will appear across open contacts prior to synchronizing. Protection for this condition shall be provided for all gas and/or air circuit breakers used for generator synchronizing.

M. Additional generator protective monitoring equipment will be provided to protect against following:
   1. High bearing temperatures.
   2. Over speed conditions.
   3. Excessive vibrations.
   4. Generator overheating.
   5. Loss of generator coolant.
   6. High generator coolant temperature.

N. Provide as a minimum following generator protective relay functions:
   1. 21G Distance.
   2. 21GX Aux to 21G.
   3. 24 Overexcitation.
   4. 27 Undervoltage.
   5. 27TN Undervoltage (Third Harmonic).
   6. 32 Power Direction.
   7. 40 Loss of Excitation.
   8. 46 Current Unbalance.
   9. 49R Overload (RTD).
   10. 51GN Time Overcurrent (Ground).
   11. 51V Time Overcurrent (V Restraint).
   12. 59 Overvoltage.
   13. 60V Voltage Balance.
   14. 64F Ground (field).

15. 64G Ground (stator).
16. 78 Out-of-step.
17. 81L/H Frequency.
18. 86G Lockout Auxiliary.
19. 87G Differential Out-of-step (Device 78).

2.03 GENERATOR LEAD PROTECTION

A. The generator leads, which consist of phase conductors from generator terminals to unit power transformer and unit auxiliary transformer, shall be protected by a primary current differential relay scheme.

B. The generator leads shall be included within a second differential zone if either (1) conductors are not segregated into bus ducts for their entire exposure or, (2) generator is not grounded through a high impedance to limit ground faults to levels undetectable by current differential relays.

C. When two schemes are required, independent current sources and independently protected dc control circuits are required. A simultaneous trip of generator breakers, excitation system, and turbine valves is required.

2.04 GENERATOR STEP-UP TRANSFORMER PROTECTION

A. Generator step-up transformer will be protected against effects of following conditions:
1. Phase faults.
2. Ground faults.
3. Sudden pressure.
4. Winding thermal.
5. Liquid thermal.
6. Liquid level.
7. Overexcitation.

B. Primary protection for transformer shall consist of current differential relays and a sudden pressure relay.

C. Back-up protection for transformer shall consist of current differential relays whose zone of protection may also include other equipment such as transformer leads, generator, unit auxiliary transformer and its leads.

D. Primary and back-up protection requires independent current sources and independently protected dc control circuits.

E. Overexcitation protection shall be provided by generator overexcitation protection.

F. As a minimum provide following protective relay functions:
1. 87T Differential.
2. 86T Lockout auxiliary.
3. 50/51 Overcurrent and short circuit.
4. 50GS Ground fault.
5. 24 Overexcitation.
6. 63 Integral fault pressure.
7. 63X Fault pressure auxiliary.
8. 49 Winding thermal.
9. 26 Liquid thermal.
10. 71 Liquid level.

G. Loss of cooling and resulting high temperature will be alarmed.

2.05 START-UP AND UNIT AUXILIARY TRANSFORMER PROTECTION

A. Unit auxiliary transformer will be protected against effects of following conditions:
   1. Phase faults.
   2. Ground faults.
   3. Sudden pressure.
   4. Winding thermal.
   5. Liquid thermal.
   6. Liquid level.

B. Primary protection for transformer and low-side leads shall consist of current differential relays.

C. Transformer and low-side lead back-up protection shall consist of a current differential scheme or high-side overcurrent relays or sudden pressure relay with transformer low-side overcurrent relays.

D. Primary and back-up protection requires independent current sources and independently protected dc control circuits.

E. If transformer low-side neutral is grounded through an impedance, transformer neutral overcurrent relaying shall be provided.

F. As a minimum provide following protective relay functions:
   1. 87T Differential.
   2. 86T Lockout auxiliary.
   3. 50/51 Overcurrent and short circuit.
   4. 50GS Ground fault.
   5. 63 Integral fault pressure.
   6. 63X Fault pressure auxiliary.
   7. 49 Winding thermal.
   8. 26 Liquid thermal.
   9. 71 Liquid level.

G. Loss of cooling and resulting high temperature will be alarmed.

2.06 POWER TRANSFORMER HIGH SIDE LEAD PROTECTION

A. Transformer high-side leads shall be included in a current differential scheme (the unit differential).

B. Back-up differential protection is also required for transformer high-side leads (or any other equipment connected directly to generator) if:
   1. Phase conductors are not segregated in bus duct for their entire exposure, or
   2. Ground faults are not limited to levels not detectable by unit differential relays.

C. Primary and back-up protection requires independent current sources and independently protected dc control circuits.

D. As a minimum provide following protective relay functions:
   1. 87T Differential
   2. 50/51 Overcurrent and short circuit

2.07 SUBSTATION BUS PROTECTION

A. Primary and backup microprocessor-based (digital) protective relay devices shall be provided for protection of substation equipment. Provide primary and secondary bus differential relays for each substation bus. The zone of protection for each substation bus shall extend to high voltage bushings of generator step-up transformers.

B. As a minimum provide following protective relay functions:
1. 87B Differential.
2. 51 Phase overcurrent.
3. 51N Ground fault.

2.08 SUBSTATION CIRCUIT BREAKER PROTECTION

A. As a minimum provide following protective relay functions:
1. 25 Sync check
2. 50BF Breaker failure

2.09 INCOMING TRANSMISSION LINE PROTECTION

A. Provide primary and secondary protective relays to provide line differential and distance protection. Both primary and secondary protective relays shall be configured in a permissive overreaching transfer-trip (POTT) scheme.

B. As a minimum provide following protective relay functions:
1. 21 Distance.
2. 67 Directional overcurrent.
3. 50 Instantaneous overcurrent.

2.10 DISTRIBUTION TRANSFORMER (2500KVA OR LESS, MEDIUM AND LOW VOLTAGE WINDINGS) PROTECTION

A. As a minimum provide following protective relay functions:
1. 50/51 Overcurrent and short circuit
2. 50GS Ground fault

2.11 DISTRIBUTION TRANSFORMER (2500KVA OR ABOVE, MEDIUM VOLTAGE WINDINGS) PROTECTION

A. As a minimum provide following protective relay functions:
1. 87T Differential.
2. 86T Lockout auxiliary.
3. 50/51 Overcurrent and short circuit.
4. 50G Ground fault.
5. 51G Time overcurrent.
6. 63 Integral fault pressure.
7. 63X Fault pressure auxiliary.
8. 49 Winding thermal.
9. 26 Liquid thermal.
10. 71 Liquid level.

2.12 MEDIUM VOLTAGE SWITCHGEAR BUS PROTECTION

A. A primary current differential or high impedance voltage differential protection scheme.

B. As a minimum provide following protective relay functions:
1. 87B Differential.
2. 51 Phase overcurrent.
3. 51N Ground fault.

2.13 MEDIUM VOLTAGE SWITCHGEAR INCOMING LINE (MAIN BREAKER) PROTECTION

A. As a minimum provide following protective relay functions:
1. 25 Sync-check (for multi-source connections).
2. 27 Undervoltage.
3. 32 Power direction.

4. 47 Phase undervoltage and reverse phase sequence.
5. 50 Instantaneous overcurrent.
6. 51 Phase time overcurrent.
7. 51N Residual time overcurrent.
8. 51G Ground overcurrent.
9. 59 Overvoltage.
10. 67 Directional phase overcurrent.
11. 67N Directional ground overcurrent.
12. 81 Frequency.

2.14 MEDIUM VOLTAGE MOTOR PROTECTION

A. As a minimum provide following protective relay functions:
1. 27/59 Under and overvoltage.
2. 37 Undercurrent.
3. 46 Current unbalance.
4. 47 Undervoltage/reverse phase sequence.
5. 48 Incomplete sequence.
6. 49 Overload.
7. 49R Winding over temperature (RTD).
8. 49S Locked rotor.
9. 50/51 Instantaneous and time overcurrent.
10. 50GS/ Instantaneous and time overcurrent.
11. 51GS Ground sensor.
12. 66 Successive starts.
13. 81 Frequency.
14. 86 Lockout Auxiliary.
15. 87 Differential.

2.15 FEEDER PROTECTION

A. As a minimum provide following protective relay functions for non-directional circuits:
1. 50/51 Phase overcurrent and short circuit.
2. 50G Instantaneous ground fault.
3. 51G Time delay ground fault.
4. 25 Sync-check (for bus tie and/or feeder tie connections to alternate source).

B. As a minimum provide following protective relay functions for directional circuits:
1. 67 Directional overcurrent and short circuit.
2. 67N Directional time delay and instantaneous ground fault.
3. 25 Sync-check (for feeder with tie connection to alternate supply source).

2.16 LOW-VOLTAGE ELECTRICAL DISTRIBUTION SYSTEM

A. Provide overcurrent protection for electrical equipment, motors, and feeder circuits per requirement of National Electrical Code.

B. Provide bus differential, optical relay, zone selective interlock, maintenance switch (instantaneous trip enable/disable), as applicable to mitigate selective coordination and arc flash incident energy level.

C. Secondary Unit Substation Feeder(s): Each secondary unit substation transformer shall be provided with protective devices to detect and take appropriate action against effects of following conditions:
1. Phase faults.
2. Ground faults.
3. Overloads.

D. Motor Feeder(s): Each motor feeder shall be provided with protective devices to detect and take appropriate action against effects of following conditions:
1. Phase faults.

2. Ground faults.
3. Overloads.

E. Secondary Unit Substations: Overload and fault protection for loads connected to Secondary Unit Substations (SUSs) shall be provided by solid-state trip devices (SSTs) which are an integral part of draw-out type power circuit breakers.
1. Solid-state trip devices shall have adjustable instantaneous, long-time and short-time SST elements for phase protection with zone selective interlock.
2. Ground fault detection shall be provided.

F. Motor control centers: Each combination starter within a motor control center which supplies power to a motor shall be equipped with a magnetic circuit protector and solid state thermal overload protection. Panels and individual loads fed from MCC shall be served with solid state adjustable trip feeder circuit breakers.

G. Power panels: Power panels shall be supplied with thermal-magnetic circuit breakers sized to protect individual loads.

H. Provide surge protective device (SPD) on service entrance equipment.

I. Provide SPD for surge protection of sensitive or critical electronic equipment or when specifically required. Provide surge protection for following systems, including related systems:
1. PMCS.
2. DCS.
3. Fire alarm systems.
4. Telephone systems.
5. Computer and electronic equipment data circuits.
6. Security systems.
7. Intercom systems.

2.17 AUTOMATION AND INTEGRATION EQUIPMENT

A. Provide system computing platform with network access to provide following functions including, but not limited to, integration monitoring, control, and communication of microprocessor-based (digital) protective relay devices, automatic transmission of outgoing messages and parsing of responses, data aggregation, simultaneous collection of data from serial and Ethernet® server devices, and simultaneous data access for multiple client devices. The system computing platform computer shall conform to various industry standards, operate in harsh environments, and provide operational and functional requirements as described below.
1. Power supply: Computing platform shall be capable of operating on power supply voltages: 38–140 volts dc.
2. Temperature: Computing platform shall be capable of continuous operation over a temperature range of –40° to +75°C (–40° to +167°F) for Intel® Pentium M processors and –20° to +60°C (–20° to +140°F) for AMD Athlon 64 2600 processors at 50 percent processor burden in order to allow mounting in an outdoor control cubicle. The Computing Platform shall be type tested to IEC 60068-2-1:1990 (Test Ad 16 hr at –20°C [AMD], –40°C [Intel]), IEC 60068-2-2:1974 (Test Bd 16 hr at +60°C [AMD], +75°C [Intel]), and IEC 60068-2-30:1980 (Test Db 12 + 12-hour cycle at 25° to 55°C, 6 cycles [Intel]).
3. Environmental testing: Computing platform shall be tested to same standards as protective relays including IEC 60255-21-1, IEC 60255-21-2, IEC 60255-21-3, IEC 60255-22-1, IEC 60255-22-2, EN 61000-4-2, IEC 60255-22-3, IEC 60255-22-4, EN 61000-4-4, and IEEE C37.90.1.
4. Communication ports: Computing platform shall have two USB front-panel ports and one RJ-45 Ethernet front-panel port. Four USB ports, 16 serial ports, and two Ethernet ports shall be located on rear panel. Two pins on each serial port shall be available as a demodulated IRIG-B time-synchronization signal. Sixteen rear ports shall have a selectable +5 volts dc output on Pin 1. Each rear serial port shall be capable of operation at 300–115200 bps. Ethernet ports shall be independent. All communication ports shall be ESD and RFI protected.
5. Password security: With Microsoft Windows operating system option, computing platform shall have a standard Microsoft Windows® logon system. The passwords shall be user configurable

and allow up to 12 characters including case-sensitive letters, digits, and special characters including !, @, #, $, %, ^, and, *, (,), -, _=, +, ;, :, < ,.>,/, ?, ", \, |.

6. Configuration of messages and data processing functions shall be through a simple GUI interface. Configuration interface shall be through local keyboard, mouse, and monitor port or via Windows Remote Desktop.
7. Alarm output: There shall be an alarm contact output to signal internal errors and malfunctions. The alarm contact shall be controlled by an internal watchdog system that independently monitors operating system.
8. Operating system: Computing platform shall allow for at least following operating systems: Microsoft Windows 7 Ultimate, Microsoft Windows Embedded Standard, and Linux®.
9. Configuration storage: Computing platform shall store all settings and configuration in nonvolatile memory, allowing recovery after prolonged loss of power including failure of internal battery.
10. Nonvolatile storage: There shall be flash memory used as nonvolatile storage of incoming and calculated data within computing platform. Data stored in nonvolatile memory shall be available for retrieval after sustained power outage including failure of internal battery. Moving parts and vent holes. Computing platform shall exclude all rotating disk drives, fans, moving parts, and vent holes.
11. Warranty: Computing platform shall be warranted for a minimum of 10 years.

B. Provide Schweitzer SEL-3354 Embedded Automation Computing Platform or Owner approved equivalent product.

2.18 TRANSMISSION LINE PROTECTION RELAY

A. Provide Siemens 7SA522 Distance Relay, Part Number 7SA5221-5AB90-4QP4+LOS, or Owner approved equivalent product.

B. Provide Siemens 7SD52 Differential Relay, Part Number 7SD5221-5AB99-7HK0+LOS+MOA, or Owner approved equivalent product.

C. Provide redundant pilot communication relays compatible with Owner's pilot communication equipment for primary and secondary relaying and transfer-trip functions.

2.19 SUBSTATION BREAKER PROTECTION RELAY

A. Provide Schweitzer SEL-451-5 Protection System Relay or Owner approved equivalent product.

2.20 SUBSTATION BUS PROTECTION RELAY

A. Provide Schweitzer SEL-387-5 Current Differential and Overcurrent Relay or Owner approved equivalent product for primary bus protection.

B. Provide Schweitzer SEL-587Z High-Impedance Differential Relay or Owner approved equivalent product for secondary bus protection.

2.21 TRANSFORMER PROTECTION RELAY

A. Provide Schweitzer SEL-387 Current Differential and Overcurrent Relay or Owner approved equivalent product.

2.22 GENERATOR PROTECTION RELAY

A. Provide Schweitzer SEL-300G Generator Protection Relay or Owner approved equivalent product.

2.23 MOTOR PROTECTION RELAY

A. Provide Schweitzer SEL-710 Motor Protection Relay or Owner approved equivalent product.

2.24 SWITCHGEAR BUS PROTECTION RELAY

A. Provide Schweitzer SEL-587Z High-Impedance Differential Relay or Owner approved equivalent product.

B. Provide Schweitzer SEL-387 Current Differential and Overcurrent Relay or Owner approved equivalent product.

2.25 SWITCHGEAR MAIN BREAKER PROTECTION RELAY

A. Provide Schweitzer SEL-351S Protection System Relay or Owner approved equivalent product.

2.26 DISTRIBUTION FEEDER PROTECTION RELAY

A. Provide Schweitzer SEL-351 Protection System Relay or Owner approved equivalent product.

2.27 POWER QUALITY AND REVENUE METER

A. Provide Schweitzer SEL-735 Power Quality and Revenue or Owner approved equivalent product.

2.28 TEST SWITCHES

A. Test Switches shall be provided for:
1. Microprocessor based relays or meters that do not have integral isolating switches.
2. Isolate ac voltage inputs.
3. "Positive" and "negative" connections to all dc relay inputs and outputs.
4. "Positive" connections to lockout contacts.
5. AC current inputs using "shorting" switches.

B. Type: Knife blade. 10-pole or 14-pole with potential and current elements as required.

2.29 LOSS OF CONTROL POWER RELAYS

A. Style: Ice cube relay, connected to monitor load side of dc fuse pairs.

B. Provide relays for, but not limited to, trip circuits, close circuits, lockout relays, protection relays, communication equipment, etc.

C. Coil voltage: 125-volts dc; furnish complete with integral pilot light, push to test, and 10 ampere contacts.

2.30 AUXILIARY LOCKOUT RELAYS (DEVICES 86)

A. Lockout relays shall be used to receive inputs from protective relays and to provide contact outputs needed to initiate protective action and alarms.

B. The lockout relays shall have a local manual reset for an operator to manually reset lockout relay after operation prior to returning affected equipment to service.

C. Provide lockout relay with integral LEDs: White to indicate LOR ready and coil has continuity. Amber shall be illuminated when LOR is in "Tripped" position.

D. Wire LOR indicating light wires to terminal block behind relay inside of panel. Wire from terminal block to LOR and other locations internally to allow replacement of LOR lighted target nameplate without removal of wires from LOR decks.

E. Rated operating trip voltage: As necessary to allow coil operation at 75% of rated voltage. Wire contacts to terminal blocks.

2.31 MULTI-CONTACTS AUXILIARY RELAYS (DEVICES 94) OR OSCILLOGRAPHY TRIGGERING OR TRIPPING

A. Provide high speed auxiliary relays for applications where a number of auxiliary functions must be performed simultaneously.

B. Electrically separate and easily reversible from normally open to normally closed or vice versa.

C. Current-closing rating of contacts: 30 amperes.

D. Current-carrying rating: 12 amperes.

E. Relay pickup time of no more than 1/2 cycle (60 Hertz basis).

PART 3 EXECUTION

3.01 DESIGN AND IMPLEMENTATION

A. Design and implementation of electrical system protection shall be in accordance with industry standards practice and recommendations, equipment manufacturer's instructions and procedures, and applicable codes.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Design, furnish, deliver, and install:
1. Substation steel structures, stands, and bus supports required for mounting equipment located above ground or at foundation level.
2. Substation bus system, including buses, connectors, insulators, and accessories.
3. Shielding masts.
4. Anchor bolt assemblies for structures, stands, shielding masts and pad-mounted equipment.
5. Hardware and assemblies as required to install specified structures and equipment.

B. Electrical connectors for equipment unless specified otherwise.

C. Grounding for equipment mounted on structures.

D. Switch operator grounding platforms.

1.02 CLOSEOUT SUBMITTALS

A. Project Record Documents.

B. Operation and maintenance manuals. In addition to requirements of Section 01 78 23, provide at a minimum:
1. General description and technical data.
2. Receiving, storage, installation, and testing instructions.
3. Operating and maintenance procedures.
4. Complete set of final drawings.
5. Complete documentation of inspections and tests performed, including any logs, curves, and certificates. Documentation shall note any replacement of equipment or components that failed during testing.
6. Spare parts lists.
7. Installation field reports.
8. Data sheets updated to reflect field installation conditions.

1.03 QUALITY ASSURANCE

A. Regulatory requirements:
1. Detail in accordance with AISC Structural Steel Detailing Manual.
2. When applicable, equipment and materials supplied shall be of types listed in "List of Materials Acceptable for Use on Systems of RUS Electrification Borrowers, "Informational Publication 202-1."
3. Structures shall be designed, fabricated, assembled, and tested in conformance to:
   a. American Institute of Steel Construction (AISC), Manual of Steel Construction.
   b. NEMA SG6 - Power Switching Equipment and TT1- Tapered Tubular Steel Structures.
   c. RUS Bulletin 1724E-300 (when applicable).
   d. American Welding Society (AWS).

B. Substation structures shall be designed and furnished by single manufacturer.

C. manufacturer qualifications:
1. manufacturer of major components within assembly.
2. ISO 9001 certified.
3. Produced similar electrical equipment for a minimum period of 5 years.
4. Qualified design staff regularly devoted to development of structural plans associated with substation structure design and fabrication.
5. Regularly engaged in design and fabrication of substation structures.

6. When requested by Owner, provide acceptable list of similar equipment installations complying with requirements of this specification.

D. Fabricator qualifications: Fabricators of steel structures shall be subject to review of Owner and shall have following qualifications:
1. Regularly engaged in fabrication of substation structures.
2. Previously designed and fabricated substation structures of general types specified.
3. Qualified design staff regularly devoted to design and detailing of substation structures.
4. When applicable, fabricators of steel structures shall have a working familiarity with RUS Bulletin1724E-300, June 2001 Edition, "Design Guide for Rural Substations," Chapter VII, Structures.

1.04 DELIVERY, STORAGE, AND HANDLING

A. Handle and transport structural steel with care to avoid bending or damage to coating system.
1. Pieces bent in handling may be used only if they can be straightened without injury to coating system.
2. Material on which coating system has been damaged shall be repaired unless, in opinion of inspector, damage is local and can be repaired in field in accordance with provisions of Specifications.

B. During delivery and storage, handle equipment to prevent damage, denting, or scoring.

C. Store equipment and components in clean, dry place. Protect from weather, dirt, water, construction debris, and physical damage in accordance with manufacturer's instructions.

D. Site Conditions: Refer to Section 01 30 00.

PART 2 PRODUCTS

2.01 DESIGN REQUIREMENTS

A. Materials and equipment shall be furnished in a fully engineered and coordinated design package.

B. Structure and bus system shall be complete with required insulators, connectors, fastenings, and accessories.

C. Design substation for voltages listed on Section 01 36 26.

D. Structures and buses shall be designed and built to meet the following requirements:
1. Substation shall be of low-profile type using rolled and formed structural shapes. Lattice-type structures not acceptable.
2. Line exits: shall enter substation as required to conform to Section 01 36 26.
3. As appropriate to design, arrange power fuses and disconnects to be operable from ground level.
4. Design structures and buses for connection of 3-phase power transformers, as required.
5. Individual cantilevered columns supporting equipment shall be tubular sections.

2.02 STEEL STRUCTURES

A. Dimensions:
1. As required to provide structural strength, maintain electrical clearances, and to suit equipment provided.
2. Required clearances and spacings:
a. Bus and line clearances: Meet the requirements of NEMA SG6 and NESC.
b. Phase spacing, outdoor switches, and fuses: Meet the requirements of NEMA SG6.
3. Minimum equipment spacing: As recommended by equipment manufacturer for electrical clearance and maintenance.

B. Shielding mast:
   1. Type: Self-supporting, continuously tapered tubular; galvanized steel; with welded baseplate; anchor bolts; hand-hole at base; internal damping cable, or equivalent means.
   2. Grounding: Provide 2 ground lugs on opposite sides.

C. Structure design and fabrication:
   1. Loading shall be determined for all structures.
      a. Design: Conform to ASCE Substation Structure Design Guide Manual No. 113, NEMA SG6 and TT1 manufacturing standards with following additions.
      b. Proper provisions shall be made for temporary stresses caused by erection or maintenance.
      c. Design structures to take maximum unbalanced condition of external line load which can be imposed upon structures.
      d. Design deadend structures for a minimum incoming line angle of 15 degrees unless noted otherwise.
      e. Design structures for loading conditions that include short circuit fault current forces.
      f. Design anchor bolts to support structures and stands on leveling nuts.
   2. Manufacturing standards for steel structures shall conform to NEMA SG6 with following additions:
      a. Material:
         1) Conform to AISC "Specification for Structural Steel Buildings." Minimum thickness of any metal shall be 3/16". Any metal in contact with or near ground surface or tops of concrete piers or slabs shall be not less than 1/4" thick. Except for equipment mounting bolts, minimum diameter of bolts shall be 5/8"; where size of member will not permit, 1/2" bolts may be used.
         2) Structural steel: ASTM A36, A992, or A500, except use ASTM A572 or A871 for tapered multi-sided shapes.
         3) Connection bolts: ASTM A394 and ASTM A325, galvanized.
         4) Nuts: ASTM A194 2H or ASTM A563 DH, domestically manufactured.
         5) Steel washers: ASTM F436; hardness of 38 to 45 HRC.
         6) Bolt, nut, and washer galvanizing: ASTM B695, Class 50 or ASTM A153. Tapping and lubricating of nuts in accordance with ASTM A563.
         7) Locknuts: MF No. 1 (hex head), galvanized.
         8) Anchor bolts: Anchor bolts shall be in accordance with ASTM A36 or ASTM F1554 and shall be galvanized on the threaded end a minimum of 12" in accordance with ASTM A123, A153 and A385. Furnish anchor bolts with 2 washers, 1 heavy hex leveling nut, 1 heavy hex nut, 1 locknut, and setting templates. Nuts and washers shall be fully galvanized. Nuts shall conform to ASTM F563. Washers shall conform to ASTM F436. Alternate anchor bolt material may be proposed for Engineer's approval.
         9) Structural steel galvanizing: ASTM A123. Minimum average coating weight shall be 3 ounces/square foot.
      b. Fabricate structures in accordance with AISC standards to provide individual structures with common structural members consistent with that structure and to provide overall aesthetic substation. Members with prepunched holes on standard spacing will not be acceptable.
      c. Where future bays common to present structures are indicated on Drawings, design and detail present structures for field attachment of future structural members. Assume future members identical to those designed for present bay.
      d. Metal protection: Steel work, including bolts, shall be hot-dip galvanized after fabrication, unless otherwise specified.
      e. Allowable stresses: Conform to AISC "Specification for Structural Steel Buildings," except increase in allowable stresses for wind loading shall not be applied to members subjected to stresses produced by winds in conjunction with other specified loads.
      f. Connections: Use high-strength bolts for field-connections. Conform to "Specification for Structural Joints Using ASTM A325 or A490 Bolts", as approved by Research Council on Structural Connections of the Engineering Foundation, and published by AISC. Furnish at least 5% extra of each size bolt and nut required in assembly. Drawings shall indicate sizes of bolts used and location.
      g. Welded connections may be used for factory-assembled structures if welding is done prior to galvanizing.

h. Structural members with concealed surfaces may be used provided their thickness is increased 1/16" greater than thickness required for strength or deflection to allow for loss of metal from corrosion. Concealed surfaces shall be galvanized.
i. Straightening: Members which are bent or out of line after galvanizing shall be carefully straightened with use of straightening roller machine. Use of sledges or other methods in which material or its finish may be mutilated shall not be allowed.
j. Marking: Each individual piece shall be marked with correct mark designation, as shown on shop detail drawings.

3. Shop assembly: Subassemblies of structures shall be preassembled in shop to extent necessary to ensure proper fit in field. Reaming of unfair holes not permitted.
4. Deflections of structures under specified unfactored loads shall be less than those required by ASCE Substation Structure Design Guide Manual No. 113.

D. Finish:
Steel work, including bolts, shall be hot-dip galvanized after fabrication, unless otherwise specified. Galvanizing, tests, and inspection: ASTM A123 and A385.

E. Grounding (above-grade):
1. Provide grounding for equipment mounted on structures.
2. Structure ground attachment locations:
   a. Provide NEMA 2-hole attachment 12" (300 mm) above each baseplate.
   b. Provide single-hole attachment every 4' (100 mm) (maximum) on vertical and horizontal members to structure mounted equipment.
3. Ground cable: 4/0 AWG stranded soft-drawn copper.
4. Ground clamps:
   a. Provide bolted, NEMA 2-hole, bronze or copper clamp on each structure leg or column 12" (300 mm) above baseplate.
   b. Provide bolted, bronze or copper clamp for support of ground cable on vertical and horizontal members;
      1) Double-cable clamp: Burndy Type GC, or equal.
      2) Single-cable clamp: Burndy Type GB, or equal.
5. Grounding operator's platforms: 3'-0" x 4'-0" (900 mm x 1200 mm) galvanized steel grating with 1" x 3/16" (25 mm x 5 mm) serrated bearing bars at 1-3/16" (30 mm) oc, cross bars at 4" (100 mm) oc. Furnish for each group-operated switch and circuit breaker.

2.03 BUSES AND CONDUCTORS

A. Rigid buses: Aluminum tubular bus conductor AA Schedule 40 pipe (standard pipe size), ASTM B429, 6063-T6 alloy of sizes as required for bus ampacity design requirements.

B. Cable for jumper buses shall be size and type as required for bus ampacity design requirements, and in accordance with:
1. ACSR:
   a. ASTM B232.
   b. Each individual aluminum wire entering into construction of completed conductors shall conform to ASTM B230.
   c. Core wire shall be galvanized steel wire, ASTM B245.
2. 1350-H19 (EC) grade aluminum: ASTM B230.

C. Provide damping conductor for horizontal bus runs of aluminum bus over 5' (1.5 m).
1. Damping conductor shall have multistrand steel core (ACSR).
2. Minimum sizes for damping conductor:

Tube Size	Cable Size
3" and less	266.8 kcmil
3-1/2"	397.5 kcmil
4"	795 kcmil
5"	1,431 kcmil
6"	1,590 kcmil

3. Two damping cables may be substituted for single damping cable provided weight of two cables is at least as great as single cable and does not exceed weight of single cable by more than 10%.

2.04 BUS AND CONDUCTOR ACCESSORIES

A. Furnish bus fittings, bus supports, connectors, electrical connection bolts and miscellaneous hardware as required.

B. Contractor is responsible for hardware and is required to furnish replacements for material lost in shipping or incomplete shipping in a timely manner not to delay erection.

C. Tubing bus connectors: Welded type unless otherwise noted.

D. Provide end plugs for tubing at all open ends, including at connectors.

E. Provide connectors, fittings and hardware as required for a complete installation. Connectors shall be either welded or compression type.

F. Suspension clamps, bus support clamps, compression-type terminals, deadend fittings, and strain clamps for use with ACSR conductor shall be aluminum alloy and shall be equal to reference details and manufacturer's references, except that clevis connections shall be made with threaded hex-head bolts, nuts, and stainless steel self-locking cotter pins.

G. Compression-type deadend fittings shall develop not less than 95% of ultimate strength of conductor and shall have conductivity of not less than that of conductor with which they are used.

H. Couplers: High-strength aluminum alloy tubing, slotted design equal to Anderson Type WCI.

I. Aluminum-to-aluminum and aluminum-to-copper connections: Use aluminum connectors unless otherwise indicated.

J. Aluminum connectors: Aluminum Alloy SC70A in accordance with ASTM B26 (AA Alloy Designation No. 356). Design and proportion for contact with copper surfaces without use of plating or bushings.

K. Copper-to-copper connections shall be made with bronze connectors.

L. Terminal pads shall be in accordance with latest NEMA Publication No. CC-1.

M. Electrical connection bolts:
1. Each bolt assembly shall consist of 1 bolt, 2 flat washers, 1 split lock washer, or 1 compression-type Belleville washer and 1 hex nut.
2. Aluminum-to-aluminum connection: Aluminum Alloy 2024-T4 anodized, lubricated bolts, aluminum Alloy 6061-T6 nuts, aluminum Alloy 7075-T6 large, flat washers, aluminum Alloy 7075-T6 split lock washers.
3. Aluminum-to-copper connection:
   a. 18-8 stainless steel bolts, nuts, and flat washers.
   b. Use compression-type Belleville washer instead of split lock washer.
   c. Belleville washers shall be stainless steel with cadmium plating.
4. Copper-to-copper connection: High-strength silicon bronze bolt, nut, flat washers, and split lock washer.

N. Identification tags:
1. Furnish porcelain enamel phase identification tags with 4" (100 mm) black letters on white background mounted to structures at ends and midway of each bus, at each incoming/outgoing line position, over each circuit breaker position, and at each VT or CCVT.
2. Furnish porcelain enamel phase identification tags with 3" (75 mm) black letters on white background with all numerals on single line.
3. Furnish one equipment identification tag for each switch and circuit breaker.

4. Switch identification tags shall be located on steel next to switch operator.
5. Mounting:
   a. Provide suitable devices for mounting tags.
   b. Provide stainless steel mounting hardware.

2.05 INSULATORS

A. Conform to NEMA SG6, NEMA HV1, and these Specifications.

B. Insulators shall be of type and size as required for the design requirements.

C. Color: ANSI Z55.1 No. 70 light gray.

PART 3 EXECUTION

3.01 EXAMINATION

A. Verify Site conditions.

3.02 INSTALLATION

A. Install in accordance with manufacturer's installation instructions.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Environmentally controlled, packaged electrical center (PEC) consisting of coordinated grouping of electrical power and control equipment.

1.02 CLOSEOUT SUBMITTALS

A. Operation and maintenance manuals. Provide, at minimum:
1. General description and technical data.
2. Receiving, storage, installation, and testing instructions.
3. Operating and maintenance procedures.
4. Complete set of final drawings.
5. Complete documentation of inspections and tests performed, including any logs, curves, and certificates. Documentation shall note any replacement of equipment or components that failed during testing.
6. Spare parts lists.
7. Installation field reports.
8. Documents updated to reflect field installation conditions.

1.03 QUALITY ASSURANCE

A. manufacturer qualifications:
1. manufacturer shall be ISO 9001 certified and shall have produced similar equipment for minimum period of 5 years.
2. When requested by Owner, provide acceptable list of similar equipment installations complying with requirements of this specification.

PART 2 PRODUCTS

2.01 DESIGN REQUIREMENTS

A. Design and construct for outdoor use based on prevailing wind and seismic conditions for the site, and in accordance with UBC or governing state guidelines, whichever are stricter.

B. Code-required clearances shall be Contractor's responsibility.

C. Arrange equipment and doors such that a piece of equipment may be removed from PEC without necessitating removal of other equipment.

D. Site conditions: Refer to Section 01 30 00.

2.02 SKID

A. Welded seamless construction using ASTM A36 structural steel or better. Size and arrange members for proper strength and ability to withstand stress and loads that result when lifting complete factory fabricated and equipped assembly. Deflection shall be L/240.

B. Equip with 2 stainless steel ground pads located at opposite corners of skid. Pads shall be easily accessible for connection to external grounding system by others when building has been placed in final location.

C. Provide bare No. 4/0 AWG copper ground ring that consists of loop located inside, near perimeter of building at ceiling height. Firmly attach to structural steel base assembly using Cadweld, or equal, connectors at grounding pads.

D. Provide with 8 - 10 mil thick bituminous mastic undercoating.

E. Foundation shall be either piers or concrete slab. Skid design shall accommodate embedded welding plates for attachment to piers.

2.03 FLOOR

A. Construction: Minimum of 0.25" ASTM A36 smooth steel plate welded to perimeter and longitudinal or transverse structural members of skid.

B. Floor loading: Not less than 250 lb/sq ft.

C. In general, cable shall enter from below. Provide floor cutouts where required for power and control cable entry or exit from installed equipment.
   1. Provide cutouts with 12-gage galvanized cover plates.
   2. Cover plates shall be removable from above.

D. Insulate floor with polyurethane spray foam insulation with rating as required for the jobsite conditions.

2.04 WALLS, ROOF, AND CEILING

A. Building walls, roof and ceiling shall be fabricated from G90 galvanized steel, minimum 18-gage thickness, rated to withstand loading requirements of jobsite conditions and equipment mounted to structure.

B. Exterior walls, exterior roof, and interior ceiling shall be self-framing, interlocking design, with maximum panel width of 16". Buildings of framed construction are not acceptable.

C. Slope roof at 0.25" per linear foot and slope away from entrance and equipment access doors. Provide drainage gutters if runoff above access doors cannot be avoided.

D. Where bulkhead penetrations are required, cutouts shall be completely framed with 0.25" thick aluminum cover plates with neoprene gasket.
   1. Wall penetrations shall be made in walls prior to bending with appropriate machinery.
   2. No manual cutting of wall penetrations by use of jigsaw, plasma torch or other means allowed.

E. Fastening hardware shall be zinc-plated. Do not weld galvanized steel or use rivets as method of exterior fastening.

F. Provide exterior walls and roof with fiberglass batt-type insulation meeting R11 rating, minimum.

2.05 DOORS AND EQUIPMENT ACCESS

A. Doors shall be double-wall construction with threshold built into door frame. Each door shall have following:
   1. Brushed aluminum panic hardware.
   2. Built-in hold-open device and automatic closure device.
   3. Cylinder lock and thumb latch.
   4. Prime coated hinges.
   5. Neoprene gasket.
   6. Drip shields and water flashing.

B. Provide minimum of 2 doors. Size one door to adequately remove largest piece of equipment installed within building; door may be double door with removable transom installed above door.

C. Where required, provide 14-gage galvanized steel, gasketed and hinged equipment rear exterior access doors. Access doors shall have 3-point latching system with rust-resistant pad lockable handles, drip shields and water flashing.

D. For doors used for equipment access, provide signage that reads: "DANGER, HIGH VOLTAGE, KEEP OUT." Permanently attach with self-tapping stainless steel screws.

E. Provide buildings elevated above finished grade with landing and set of stairs at each door used for personnel and equipment access in and out of building. Provide elevated platform with guardrail and ladder for working access at rear of equipment requiring exterior rear access.

F. Stairs and platforms shall be built in compliance with UBC code, NEC clearance requirements, and shall be hot-dipped galvanized after fabrication.

2.06 HVAC SYSTEM

A. Provide HVAC system appropriately sized taking into consideration ambient conditions of job site, dimensions of building, solar heat gain, and heat generated by equipment from within building when operating at 100% capacity.

B. HVAC system shall consist of 2 independent units each sized at 60%, when system is operating at 100%. Building interior shall be maintained at ambient temperature of between 12°C and 27°C. Provide system with electronic automatic changeover thermostat.

C. Building shall remain positively pressurized at 0.1" Hg.

D. Provide industrial grade filtration system for dust control.

2.07 BUILDING SYSTEMS

A. Building system wiring and raceways shall be provided in accordance with Section 26 05 00.

B. Provide electrical distribution equipment required for proper operation of interior and exterior building services. Operating voltages for distribution systems shall be as required.

C. Use either 2-lamp or 4-lamp, 48" industrial fluorescent fixtures with wire guards for protection of T8 lamps. Fixtures shall provide minimum of 50 foot-candles within any location of building.
   1. Control with 3-way wall switches located at each entry door.
   2. Provide minimum of 2 fixtures with battery backup to provide illumination in event of power failure.

D. Exterior lighting shall consist of fully shielded 70-watt, metal halide fixture located above each building access door and one at exterior switchgear doors.
   1. Each fixture shall be controlled automatically by photocell mounted integrally within each fixture.
   2. Breaker used for lighting circuit shall be switch-duty rated.
   3. Fixtures shall not interfere with doors or movement of equipment.

E. Provide 125-volt ac, 20-ampere spec-grade duplex receptacles at locations as required. At a minimum, provide one duplex receptacle interior and exterior for each access door. Exterior outlets shall be GFI-protected.

F. Provide cable tray systems as required to route control cables within the PEC. Cable tray shall be provided with structural steel channel supports embedded in ceiling. Unistrut fastened directly to ceiling for cable tray support not allowed. Supports shall be by means of "All-Thread" and Unistrut hangers.

G. Provide fire detection meeting requirements of NFPA 850 and local site requirements. At minimum, provide heat and smoke detectors and hand held fire extinguishers.
   1. Extinguishers and placards shall be located inside PEC at each door.
   2. Heat and smoke detectors shall have alarm contacts wired into fire alarm control panel located near door.
   3. Fire alarm control panel shall have dry contacts for connection to remote alarm systems furnished by others.
   4. Provide red warning beacon mounted on outside of PEC above roof level over personnel door. Warning beacon shall become energized when heat or smoke is detected in PEC.

2.08 TESTING AND INSPECTION

A. Test and inspect building and electrical equipment and systems prior to shipment.
   1. Continuity checks of wiring.
   2. Equipment function tests.
   3. Electrical apparatus checks in accordance with specific equipment specifications.

B. Provide certified test report.

2.09 IDENTIFICATION AND TAGGING

A. Nameplate lettering shall be black on white background. Securely attach nameplates with self-tapping stainless steel screws. Adhesive nameplates not allowed.

B. Tag equipment installed in building in accordance with applicable specification sections.

PART 3 EXECUTION

3.01 EXAMINATION

A. Verify site conditions.

3.02 PREPARATION

A. Interior and exterior of equipment shall be cleaned prior to placing into service. Debris shall be removed and appropriately discarded.

3.03 INSTALLATION

A. Install in accordance with manufacturer's recommendations.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Free-standing panels containing protective relaying, control equipment, metering, and accessories.

1.02 CLOSEOUT SUBMITTALS

A. Complete set of Record Drawings.

B. Operation and maintenance manuals. Provide at a minimum:
1. General description and technical data.
2. Receiving, storage, installation, and testing instructions.
3. Operating and maintenance procedures for all devices in panels.
4. Complete set of final drawings.
5. Instruction and installation manuals for all equipment furnished in panels.
6. Complete documentation of inspections and tests performed, including any logs, curves, and certificates. Documentation shall note any replacement of equipment or components that failed during testing.
7. Spare parts lists.
8. Installation field reports.

C. Complete instruction manuals and software for protective relays, metering equipment, instrumentation.
1. General description and technical data, including actual weights and dimensions.
2. List of instruments and accessories supplied, listing manufacturer, model number, operating ranges, and equipment tag numbers.
3. Receiving, storage, installation, handling, and testing instructions.
4. Operating and maintenance procedures.
5. Complete set of reviewed drawings that require no further action.
6. Documentation modified to include field installation conditions.
7. Complete documentation of inspections and tests performed, including logs, curves, and certificates. Documentation shall note any replacement of equipment or components that failed during testing.
8. Recommended spare parts list, including circuit breakers.
9. Nameplate information and shop order numbers for each item of equipment furnished.
10. Certified copies of final test reports.

1.03 QUALITY ASSURANCE

A. manufacturer qualifications:
1. manufacturer of major components within assembly.
2. ISO 9001 certified.
3. manufacturer shall have produced similar electrical equipment for a minimum period of 10 years.

B. Regulatory requirements:
1. Work shall be in accordance with NFPA 70.
2. Panels and equipment contained in or on panels shall be designed, fabricated and tested in accordance with applicable standards of IEEE, ANSI and NEMA including, but not limited to: IEEE C37.21 – IEEE Standard for Control Switchboards.

PART 2 PRODUCTS

2.01 SYSTEM DESCRIPTION

A. Panels shall include instruments and equipment as specified herein.

B. Panels shall be free standing completely assembled, wired, and tested with equipment, relays, meters, controls, instruments, wiring, miscellaneous equipment, and accessories. .

C. Panels shall be wired and constructed for individual installation.

D. Design panels to permit future addition of switchboards to each panel row end.

2.02 DESIGN REQUIREMENTS

A. Determine required equipment from one-line diagram.

B. Equipment shall include required accessories.

C. All like equipment shall be interchangeable.

D. Where specifications are not provided, Contractor shall use its standard design.

E. Cabling design principles:
1. Classify wiring according to relative sensitivity to electromagnetic interference exhibited by circuits connected to wire and relative ability to generate interference in adjacent wires.
2. Interference level shall be defined by assigned number and, where applicable, by additional letter.
3. Low number wire shall be one that is susceptible to interference, while high number shall be one prone to producing interference in wires of lower levels.
4. Group wires of similar level classification together in cable raceway, combining both sides of circuit leads; signal leads for lower levels shall be twisted and individually shielded by signal pairs.
5. For higher levels no shield required.
6. Power cables shall contain necessary wires to contain sources currents in one cable to minimize induction of undesired voltages in other wiring.
7. Provide definite separation between levels and prevent unnoticed intermixing of levels.
8. Separate cables of different level ratings by more than minimum distance to set limits on electrical interference generated.
9. Avoid multiple crossing of one level of cables with another, even when in trays or conduit.
10. Where 2 cables of different levels must cross, perform once, at right angles to each other with appropriate spacing.
11. Cabling interference level designation:
    a. Level 1 - Analog low level signals.
        1) Analog (continuous) signals from 0.0 to 5.0 volts dc and current less than 60 mA. Typical: Analog control signals, display signals.
        2) Analog signals up to 12 volts dc rms, less than 5 kHz. Typical: Analog signals for circuit voltage supply, LVDT excitation and signals, servo valve signals, current type transmitter signals.
    b. Level 2 - Digital signals (logic level) and pulsed information (medium level). Digital signals to 18 voltage supply wiring. Typical: Standard digital signal circuits, voltage to frequency converter pulse outputs, and digital communication lines.
    c. Level 3 - High level signals and control.
        1) Signal circuits, dc or ac rms of 18 to 130 volts and less than 20 amperes.
        2) Typical: Noise tolerant pressure switch, circuit inputs such as position switch contacts, 125 volts dc lighting circuits.
        3) DC switching circuits greater than 36 volts up to 250 volts dc and less than 20 amperes.
        4) Continuous dc voltages with rating less than 20 amperes, and 250 volts.
    d. Cable type requirements:
        1) Provide shield cable with external insulation cover to prevent grounding of cable to metallic containment along its length.
        2) Shield shall be unbroken electrically through entire cable length.
        3) Provide bare copper drain wire running entire length of cable in contact with shield for tape or metallized tape shielded cables.
        4) Ground cable shield of Level 1 and Level 2 cables to signaling ground bus.
        5) Cable shields may be aluminum, either tape or metallized insulating material or copper braid having at least 85% coverage.

6) Cables shall have continuous, unspliced runs between, junction boxes or equipment termination. This applies to both internal copper conductors and shielding.
7) Twisting of wires in cable shall have maximum lay of 2", 6 turns per foot. Smaller lay numerical value will significantly reduce electromagnetic interference.

e. Specific requirements for each interference level:
1) Level I - Analog signals: Shielded cables. Multiple pair cable with single shield overall acceptable, although individually shielded, twisted pairs will provide better isolation on runs over 300' (91 m).
2) Level 2 – Digital medium level: Cable will be selected as for Level 1.
3) Level 3 - High level signal: Twisting or shielding not required. Arrange wiring to same device or destination to be in same cable to avoid undesired loop induction. Overall shield may be used.
4) Minimum spacing for between each classification of cable:

	Level 2	Level 3
Level 1	2"	6"
Level 2	---	6"

F. Environmental requirements: Design equipment in accordance with relevant sections of the most recent local Building Code (R-009 of Ministerio de Obras Publicas.

2.03 PANEL CONSTRUCTION

A. Type: Vertical, stationary equipment panels with open back.

B. Nominal dimensions: 90" high (2 m); width as per manufacturer standard recommendation. Minimum 30" (762 mm) depth.

C. Free standing metal enclosure construction, minimum 11-gage, cold-rolled sheet steel, or equivalent hot-rolled stretcher leveled steel, formed with rolled lip on top, bottom, and sides.

D. Provide stiffening members no less than welded 1-1/4" (31 mm) by 1/4" (6 mm) flat stock stiffeners welded to doors and panel to provide adequate strength to support structure and any door panels.

E. Provide structural steel supporting framework with floor channels, or equivalent means, suitable for anchoring to concrete floor.

F. Metal work shall be free from burrs and sharp edges.

G. Color of finish: ANSI No. 61, semi-gloss, light gray.

H. Incoming cables:
1. External cable wires shall connect to terminal blocks.
2. Provide ample space for entrance of external cables into panels and for routing to their terminating points within panels.
3. Make provisions for supporting incoming cables from field, for horizontal and vertical wire ways, and for mounting terminal blocks.
4. Provide for entrance of control cables from either above or below.
5. Holes for cables from field shall have grommets to protect cable from metal edge.
6. Hole size shall be not less than 2" (50 mm).

I. Provide closure plates for cable ways.

J. Terminal blocks:
1. Equipment terminals shall be readily accessible from rear of panels, without removal of equipment or fixed or swinging doors or auxiliary panels.
2. Terminal blocks facing opposite side of individual panel acceptable if adequate working space for connection of control cables in field is available.
3. Provide for interpanel wiring on both sides of panels.

4. Provide not less than 2 vertical rows per side in each panel of terminal blocks.
5. Provide adequate number of terminal blocks to fill vertical rows from top of panel to bottom.
6. Panel shall be filled with terminal blocks required for terminations plus 10% spare.
7. Unused terminal blocks shall be considered "spare."
8. Terminal labels:
   a. Label all terminal blocks.
   b. Label terminals of terminal blocks regardless if it is used or not.
   c. Terminal labels shall not cover terminal screws.
   d. Locate terminal labels for shorting-type terminal blocks on side of terminals.
9. Terminate current transformer secondary leads on short-circuiting type terminal blocks.
10. Construct to accept wire sizes being terminated.
11. Terminal groupings:
    a. Group for specific purposes.
    b. Prepare wiring diagrams to accommodate groupings.

K. Equipment mounting:
1. Mount components on vertical surfaces only.
2. Mounting height of devices on front panel shall not exceed 6' (1.8 m) (top of device to finished floor).
3. Mount accessories not designed for semiflush mounting on rear swinging auxiliary panels or doors.
4. Rear swinging auxiliary panels shall have same requirements as doors.
5. Do not obstruct access to devices mounted on front panel.

L. Welding:
1. Procedures:
   a. Welding shall be in accordance with panel manufacturer's standard welding procedures.
   b. As a minimum, production fillet and butt welds shall satisfy following visual acceptance criteria:
      1) No cracks or lack of fusion shall be acceptable.
      2) Sum of weld porosity diameters shall not exceed 3/8" (10 mm) in any linear inch (linear mm) of weld and shall not exceed 3/4" (19 mm) in any 12" (300 mm) length of weld.
      3) Fill weld craters to full cross section of weld.
2. Undercut:
   a. Undercut shall not exceed 1/32" (0.8 mm).
   b. Establish lesser value of undercut if required to satisfy design requirements.
3. Weld filler metal reinforcement: 0 to 1/8" (0 to 3 mm) maximum between abutting surfaces. Provide gradual transition (30□maximum) to plane of base metal surfaces.

M. Finish:
1. Primer coat: Rust-resisting primer.
2. Finish coat color: . ANSI Z55.1 No. 70 sky gray, weather resistant enamel. Suitable for the installed environmental conditions as outlined in Section 01 30 00.
3. Protect undersurface of metering and relaying panels and aisle from corrosion with suitable protective coating.
4. Provide 1 quart of matching touch-up paint in aerosol spray cans.

2.04 POWER DISTRIBUTION

A. Provide 2 separate distributed circuits integral to entire panelboard lineup.

B. Circuits and services:
1. 125 volts dc: DC loads including, but not limited to, control, protection relays, dc communication equipment, etc.
2. Provide one uninterruptible power system circuit which services all 120-volt ac communication equipment.
3. Provide wiring and receptacles for 120-volt ac outlets (1 receptacle in PIP, one receptacle in TRP).
4. Receptacles shall have red cover plates labeled "UPS Circuit."

2.05 INSTRUMENT AND CONTROL SWITCHES

A. Type: Rotary, enclosed, rear mounting;

B. Breaker control switches (Device 52CS):
1. Trip-close escutcheon, center normal position, and spring return to normal from close and trip.
2. Pistol-grip handles.
3. Furnish with red and green indication lights.

C. Local-Remote switches (Device 43 LS).

2.06 LOCKOUT RELAYS

A. Mount lockout relays on concerned breaker panel.

B. Wire to trip breaker and simultaneously block closing of breaker.

C. Rated operating trip voltage shall be capable of allowing coil operation at 75% of rated voltage.

D. Furnish with required number of contacts to perform functions and with additional spare contacts for Owner use.

E. Wire normal and spare contacts to terminal blocks.

F. Provide all used and spare contacts with test switches wired in series to facilitate relay testing.

G. Provide with local tripped indication and pistol-grip handle. Lockout relays shall be manually reset.

H. Provide LEDs integrated into nameplate.
1. Green light shall be illuminated to indicate LOR is ready to respond and coil continuity is intact. If coil fails, light shall go out and contact shall close to initiate alarm.
2. Red light shall illuminate when LOR has tripped, and shall stay lit until relay is reset regardless of whether trip signal is maintained or not.

2.07 PROTECTIVE RELAYS

A. Mounting:
1. Mount relays on front of switchboard with panel-mounted option hardware to provide level surface when viewed from the front.
2. Relays surface-mounted within switchboard shall have molded plastic or metal cases and shall be suitable for connection from front.
3. Mount accessories not designed for flush mounting on rear-hinged sub panels.
4. Hinged rear panels shall contain 30% extra space to mount future unnamed devices.

B. Relay ranges: As required for the application.

C. Provide auxiliary relays and accessories as required.

D. Protective relays:
1. Relays shall be solid-state microprocessor-type; flush panel mounted self-contained units; operable from designated control power source.
2. Relay functions, type and manufacturer shall be in accordance with the design requirements.
3. Programming of relay shall be from face of unit without requiring additional equipment. Programming of relay shall also be possible from lap top computer.
4. Provide all software required for relay settings and communications.
5. Operation, troubleshooting, and trip indication information shall be displayed on unit face.
6. Relays shall have built-in self-test functions with Form C relay failure alarm contact for remote indication.
7. Separate Form C trip alarm contact shall also be furnished for remote trip indication.

E. Provide relays in draw-out type cases, whenever available. If draw-out type cases are not available, exception shall be noted in Bid and relay shall be connectorized for quick removal.

F. Provide relays with test switches on VT and CT circuits to isolate relay for testing.

2.08 AUXILIARY RELAYS

A. Auxiliary relays shall be surface-mounted inside same metering and relaying panels cubicle in which it is used. Provide with following ratings:
   1. Relay: 300-volt minimum.
   2. Coil: 115-volt.
   3. Continuous duty.
   4. Number of poles as required or as indicated.

B. Contacts shall be universal or convertible type for connection as either normally open or normally closed, rated NEMA B150, minimum.

C. Wire all auxiliary relay spare terminals to terminal blocks.

2.09 AUXILIARY LOCKOUT RELAYS (DEVICES 86**)

A. Contacts: 20 NO and 20 NC.

B. Integral LEDs: White to indicate LOR ready and coil has continuity. Amber shall be illuminated when LOR is in "Tripped" position.

C. Wire LOR indicating light wires to terminal block behind relay inside of panel. Wire from terminal block to LOR and other locations internally to allow replacement of LOR lighted target nameplate without removal of wires from LOR decks.

D. Rated operating trip voltage: As necessary to allow coil operation at 75% of rated voltage. Wire contacts to terminal blocks.

E. Panel rack mounting: Provide one set for lockouts and relays that are not connectorized type, unless specified otherwise.

2.10 TEST SWITCHES

A. Unless specifically noted, wire current and voltage inputs to relays and meters, relay trip outputs, and normally-open lockout relay contacts through test switches

B. Identify each voltage and current switch by group and phase.
   1. Orientation shall be Phase A-B-C, left-to-right when looking at test switch from front.
   2. Extend voltage and current wiring for each relay and meter for incorporation into single test block.

C. Provide screw-on black covers for protection when not in use.

D. Test switches shall be back-wired unless installed in location requiring front-wired type.

E. Test switches shall be industrial grade, manually operated, knife-blade type, 10-pole with voltage and current elements with screw-on cover for personnel protection.

F. Nameplate:
   1. Label each bank of test switches "Meter Test Switches," "Protection Relay Test Switches," or "Lockout Relay Test Switches," as appropriate.
   2. Provide one 10- or 14-line nameplate per test switch bank with test switch letters A-J or A-M as appropriate. Labels shall be abbreviated statements about switch circuit function.
   3. Labels shall have lettering not less than 1/4" (6 mm) in height and 1/4" (6 mm) in width.
   4. Locate test switch nameplate directly above tests switches to which it applies.

5. Wired spare test switches shall be left blank on nameplate for future engraving.
6. Label shall be not less than 5" (125 mm) in length and 2" (50 mm) tall.

G. Color:
1. Trip circuit, breaker or lockout relay test switch: Red.
2. Other switches: Black.

H. Lockout relay tests switches, 10-pole:
1. Switch A: LOR trip circuit.
2. Switches B-J: Normally open contracts on LOR.
3. Wire tests switches to LOR.

2.11 LOSS OF CONTROL POWER RELAYS

A. Style: Ice cube relay, connected to monitor load side of dc fuse pairs.

B. Provide relays for, but not limited to, trip circuits, close circuits, lockout relays, protection relays, communication equipment, etc.

C. Coil voltage: 125-volts dc; furnish complete with integral pilot light, push to test, and 10 ampere contacts.

D. PVR style relays: Not acceptable.

2.12 METERS

A. Meters shall be microprocessor-based, multifunction type. Metering unit shall provide local indication and be capable of remote communication for all functions.

B. Meters mounted on front of panel shall be semi-flush, draw-out type with test facilities and rear-connecting terminals if draw-out type cases are not available, exception shall be noted in Bid. Meter functions, type and manufacturer shall be in accordance with the design requirements..

C. Provide meters with test switches on VT and CT circuits to isolate meter for testing.

D. Programming of meters shall be
1. From face of unit without requiring additional equipment.
2. Possible from lap-top computer. Provide software required for meter settings and communications

E. Meters shall be digital, LED display with at least 1% accuracy, 4-1/2" (114 mm) square switchboard type, with taut band suspension, unless otherwise specified.

F. Revenue quality meters shall have accuracy guaranteed by testing traceable to NBS. Revenue power meters shall meet requirements of ANSI C12.20.

2.13 ALARMS

A. Provide alarm contact wired to terminals for functions indicated.

B. Wire alarm contacts to physically adjacent terminal blocks.

2.14 CONTROL INTERCONNECTION EQUIPMENT

A. Provide wiring to terminal blocks in each panel for incoming and outgoing connections from other panels.

B. Provide wiring to terminal blocks.

C. Provide terminations for following functions:
1. Metering analog points.
2. Relay diagnostic alarm for each relay.
3. Lockout relay operation.
4. Operation indication for each relay.

D. Locate terminal blocks in same location on panel.

2.15 CIRCUIT PROTECTION

A. Provide cartridge type fuses and fuse blocks for, but not limited to:
1. Lockout and auxiliary relays.
2. Provide 6 spare fuses of each size used.
3. Power supply for each relay and meter provided.
4. Fuse blocks: Single piece, Bussman.

B. Provide control power distribution system to accept single 125-volt dc power circuit from station battery. Provide and isolate with circuit breakers following power circuits:
1. Feeder protection communications processor.
2. Synchronizing and motor protection relay communications processor.

C. VT Secondary circuit:
1. Protect by use of DIN rail-mounted, miniature circuit breakers with dry contact wired to terminal blocks for alarm signal on VT circuit trip.
2. Wire contacts in parallel at terminal blocks.
3. An external single connection shall allow for common alarm condition.

2.16 GROUNDING

A. Equipment ground bus:
1. Provide equipment ground bus bar at bottom of each panel.
2. Provide equipment ground bus bar with holes and terminal lugs as required for panel equipment ground connections with 25% spares.
3. Provide ground bus, grounding facilities, and connections in accordance with ANSI C37.20.
4. Provide ground bus full-length in each panel; minimum 1/4" (6 mm)x 1"(25 mm) copper bar
5. Provide 2-hole pad connections for external ground connection to ground grid with terminal lugs at each end of switchboard panel for No. 2 AWG to 1/0 AWG copper ground cable.
6. Provide washer-head connecting screws for connection of ground wires from switchboard panel and control circuits.
7. Provide inter-panel bus connections for continuous ground bus along adjacent panels.
8. Ground equipment cases to panel by use of external star backwashers on at least 1 mounting stud.

B. Equipment cases: Ground to panel by use of external star backwashers on at least 1 mounting stud.

2.17 INDICATING LIGHTS

A. Provide each breaker with at least following LEDs:
1. Red LED: Illuminated when breaker is closed or if trip coil has failed.
2. Green LED: Illuminated when breaker is open.

B. Type: Round, light-emitting diodes (LEDs), low drain, 125-volt dc; Provide color caps as required.

C. Ship lamps separately packed in cartons. Provide minimum of 12 spare lamps.

2.18 SUPERVISORY EQUIPMENT CONNECTIONS

A. Provide wiring to terminal blocks in each panel for supervisory connection for the following:
1. Metering analog points.
2. Local/remote switch position.
3. Relay diagnostic alarm for each relay.
4. Meter diagnostic alarm for each meter.
5. Communication system alarms.
6. Operation indication for each lockout.
7. Operation indication for each relay.
8. Loss of DC voltage at breaker close circuit, breaker trip circuit, or lockout relay circuit.
9. Circuit breaker operation.

B. Locate terminal blocks in auxiliary compartment.

2.19 RELAY COMMUNICATIONS PROCESSORS

A. Microprocessor to communicate as master with protection relays.

B. Install protection communications processor, and terminal strips for all communications and control field wiring.

C. Control power:
1. Provide and isolate with circuit breakers for the following power circuits:
2. Provide control power distribution system per panel:
a. 125-volt dc power circuit from station battery.
b. 120-volt ac power circuit from station uninterruptible power supply (UPS) bus.

D. UL-listed; ANSI 37.90.1 for surge withstand and fast transient voltage.

E. Serial ports: 1 front panel and 16 rear panel, DB-9 connectors, MOV protected.

F. Protocol: SEL-ASCII, DNP3, and Modbus RTU protocols.

G. Communications rates: Up to 38.4 kbps.

H. Mounting: Panel mount.

I. Memory: Expanded database and setting storage, 1 MB shared RAM storage plus archive storage memory.

J. I/O board: 4 outputs, 16 inputs, 125 volts dc.

K. Protocol cards: Ethernet.

2.20 SOFTWARE

A. Provide 2 copies of software and corporate license for each type of microprocessor-based relay and meter.

2.21 NAMEPLATES

A. Nameplates and placards including warning signs and safety placards shall meet NFPA 70E requirements.

B. Material: Laminated letters on white background, with 1/8" (3 mm) engraved black letters

C. Locations:
1. Front and rear of each panel identifying panel including identification number of equipment being served.
2. Each device including, but not limited to, protective relays, lockout relays, meters, switches, instruments, and indicating lights shall have nameplate on outside and on inside of panel.
3. Each terminal block.

D. Lettering: Engraved approximately 3/16" (5 mm) high.

E. Caution nameplates: Yellow with black letters.

F. Warning nameplates: Red with white letters.

G. Adhesive nameplates: Not acceptable.

2.22 WIRING

A. Furnish wiring, raceway and terminal blocks in accordance with requirements of Section 26 05 00.

B. Wire markers:
Permanent, legible sleeve-type wire markers on both ends of each wire, identification on sleeves shall match.

C. Level 3 control power wiring:
1. Cable shall be selected for electrical and environmental conditions of installation, and suitable for unusual service conditions where encountered.
2. Proper temperature application cable shall be used throughout, but shall not be less than 90ºC rated.
3. Conductors routed over hinges shall utilize extra flexible stranding.
4. Cable insulation shall be rated for maximum service voltage utilized, but not less than 600 volts.
5. Splices not acceptable.
6. Panel: Flame-retardant, cross-linked polyethylene (XLP) or flame-retardant ethylene-propylene rubber (EPR) insulation that meet or exceed requirements of UL 44 for Types SIS, and XHHW.
7. Conductors: Annealed bare copper Class B stranding passing IEEE 1202 and UL VW-1 flame test.
8. Wire: Stranded, tinned copper. Flame-resisting switchboard panel type, SIS No. 12 AWG minimum, 600-volt, 90ºC, tinned copper, NEC type SIS, UL listed.
9. Minimum size: No. 14 AWG.
10. Current transformer: 10 AWG, 600-volt, 90ºC, tinned copper, NEC type SIS, UL listed.

D. Wireways:
1. Provide wiring troughs and wireways.
2. Use "Panduit" style wiring organization on back of doors.
3. Use "Panduit" on inside panel as applicable.
4. Size and quantity by Contractor.

E. Terminations:
1. Conductor terminal connectors: Insulated, ring tongue, compression type connectors properly sized for conductor and terminal.
   a. Construct connectors of copper and tin-plate.
   b. Interior surface of connector wire barrel shall be serrated; exterior surface of connector wire barrel shall be furnished with crimp guides.
2. Use uninsulated terminal connectors for conductors terminated on devices equipped with individual fitted covers, such as, but not limited to, control switches and lockout relays.
3. Provide connections requiring disconnect plug and receptacle type devices with factory-terminated conductors on each plug and receptacle.

a. Plugs and receptacles shall be factory wired into junction boxes containing terminal blocks for external connections.
b. Conductors on disconnect portion of plug-receptacle assemblies shall be in common jacket.

4. Temporary wiring installed in factory for equipment testing shall be removed prior to shipment of equipment.
5. Current transformers shall terminate on shorting type terminal blocks and shall be shipped with shorting jumpers installed.
6. Unless otherwise specified or shown, fuse voltage transformer and control circuits appropriately with pull-out type fuse blocks.

F. Identification and labeling:
1. Provide conductor identification sleeve on each end of each internal conductor.
2. Mark each sleeve with opposite end destination identification.
3. Conductor identification sleeves: UV-resistant, self-adhesive type or PVC, not less than 1/2" (13 mm) long. Print conductor identification on sleeve with nonsmudging, permanent black ink.
4. Identify each internal interconnecting wire at both ends with sleeve-type wire markers. Label markers with "from" and "to" information.
5. Each terminal block, terminal, conductor, relay, breaker, fuse block, and other auxiliary devices shall be permanently labeled to coincide with identification indicated on manufacturer's drawings.
6. Cable identifications shall be visible after installation without requiring physical movement of cable.

2.23 TERMINAL BLOCKS AND TERMINATIONS

A. Terminations:
1. Use ring-type crimp-on terminals for wires in current transformer circuits.
2. Use locking-spade type crimp-on terminals for all other circuits.
3. Terminate wires with insulated sleeve ring-type terminals, T&B "Sta-Kon," or equal. Install with ratchet controlled tool recommended by manufacturer, T&B "Shure-Stake," or equal.

B. Provide 600-volt rated blocks for connection to external circuits and terminal for internal circuits crossing shipping splits.
1. Equip terminal blocks with washer head binding screws, covers, and white terminal identification marking strips General Electric Type EB-25, Marathon Type 1600, or equal. Screw shall accept standard holding type screw drivers only.
2. Furnish with white marking strips, with each terminal marked as identified on wiring diagrams.
3. Where permitted by safety codes and standards, provide without covers.
4. Maximum 2 conductors in accordance with termination point.

C. Spares:
1. Provide minimum of 20% spare terminals interspersed with wire terminals and out-going terminal blocks.
2. If necessary, provide additional row of terminal blocks on each side of panel.
3. Provide 10% spare terminals for circuit modifications.
4. Each control switch and lockout relay shall have minimum of 2 spare normally open and 2 spare normally closed contacts wired out to terminal blocks, if available.

2.24 ACCESSORIES

A. Required software for microprocessor-based relays and meters.

B. Test plug for each style of relay case and test switch.

C. Test plug for each style of current and potential test switch.

2.25 SOURCE QUALITY CONTROL

A. Notify Owner at least 30 days prior to final testing so arrangements can be made for Owner to witness tests.

B. Completed unit assembly shall be energized and checked completely for operation before shipment.

C. Perform routine factory test in compliance with applicable ANSI, IEEE, and NEMA standards.

D. Assemble panel and equipment in manufacturer's plant as required and test circuits, including those from terminal strips through device to assure proper functioning of all items of equipment.

E. Panels shall be completely interconnected and tested to ensure correctness of interconnection wiring.

F. Panel shop tests:
   1. Perform test in addition to all those included in IEEE C37.21
   2. Assemble switchboard and equipment in manufacturer's plant as required and test all circuits, including those from control building terminal cabinet through device to assure proper functioning of all items of equipment.
   3. All panels shall be completely interconnected and tested to ensure correctness of all interconnection wiring.
   4. Preliminary inspections and tests:
      a. When received, all relays, instruments, and other components shall be checked for external, internal, or concealed shipping damage. If damages have occurred, notify Owner.
      b. Perform continuity checks of all circuits.
      c. Check all wiring for loose connections.
   5. Perform production tests on complete switchboard assemblies in accordance with IEEE C37.21, including the following:
      a. Grounding of instrument transformer cases tests.
      b. Control wiring insulation tests.
      c. Instrument transformer polarity tests.
      d. Dielectric tests: In accordance with latest revision of ANSI C37.90 shall be performed on all electrical components and wiring except any equipment specifically stated as an exception to these tests by its manufacturer.
      e. Functional tests:
         1) Relays:
            a) Test all relays, instruments, meters, and control devices by application of secondary 3-phase voltage to voltage circuits, and injection of current in current transformer secondary circuits.
            b) This shall include testing for proper operation and direction of relays.
            c) Documentation shall demonstrate proper operation of relays including oscillographs and charts.
         2) Control and trip circuits:
            a) Test devices shall be connected into circuits to simulate operation of controlled remote equipment such as breaker trip coils, close coil, and auxiliary contacts.
            b) Test shall include testing for proper operation of relay targets.
   6. Operating devices shall be unblocked, checked, and reblocked after test for shipment.
   7. Perform tests at 60 Hz.
   8. Provide 2 certified copies of test data and reports. Test results shall indicate equipment meets standards specified before shipment can be made.
   9. Provide Owner with notice 2 weeks in advance of shop test so Owner may determine attendance.

G. Perform tests at 60 Hz.

H. Dielectric tests: Perform in accordance with latest revision of ANSI C37.90 on all electrical components and wiring, except any equipment specifically stated as exception to these tests by its manufacturer.

I. Test results shall indicate that equipment meets standards specified before shipment can be made.

J. Perform following tests on equipment specified in accordance with latest edition of ANSI standards.
   1. manufacturer's standard production inspections and testing on panel assemblies.
   2. Complete wiring check including function operation.
   3. Provide Engineer with certified copies of test data and reports.

4. Polarity verification of phase-sensitive circuits including VT and CT circuitry.
5. Test communications of devices including control devices, relays and meters.
6. High-potential insulation check of main bus.
7. Control wiring insulation check.

K. Communications:
1. Select and set relay and meter communications settings according to equipment furnished.
2. Communications shall be shown to be fully functional prior to shipment.

L. Test results shall indicate that equipment meets specified standards before shipment can be made.

PART 3 EXECUTION

3.01 PREPARATION

A. Interior and exterior of panels shall be cleaned prior to placing into service.

B. Debris shall be removed and appropriately discarded.

3.02 INSTALLATION

A. Install in accordance with manufacturer's recommendations.

B. Leveling: Level panel to within manufacturer's tolerances such that metering and relaying panels can be installed directly on top of pad without additional leveling.

C. Provide anchors and other hardware necessary.

D. Anchor in place in accordance with manufacturer's instructions.

E. Seal conduit, cable, and bus duct penetrations into panels with materials and methods designed for intended use maintaining NEMA rating of enclosure.

F. Provide connections to ground grid, using fittings designed and rated for intended use.

3.03 NAMEPLATES

A. Securely attach nameplates with minimum of 2 self-tapping, stainless steel screws.

3.04 WIRING

A. Install wiring from terminal to terminal. Splices not acceptable.

B. Provide wiring, fuse blocks, and terminal blocks within panel as necessary.

C. Control components mounted within assembly, such as fuse blocks, relays, pushbuttons, and switches shall be suitably marked for identification corresponding to appropriate designations on wiring diagrams.

D. Wiring, raceway and terminal blocks shall be installed in accordance with requirements of Section 26 05 00.

E. Wire in neat and organized manner.

F. Bundle and secure wiring with nylon ties.

G. Each internal interconnecting wire shall be identified at both ends with sleeve type wire markers.

3.05 TERMINAL BLOCKS AND TERMINATIONS

A. Install shorting-type terminal blocks nearest current transformer in accessible location for each set of CTs supplied with equipment furnished, no other shorting-type terminal blocks allowed, unless specified otherwise.

B. Terminate each conductor in multiconductor control cable.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Substation equipment and hardware for voltages greater than 12 kV including switches, circuit switcher, surge arresters, and instrument transformers.

1.02 CLOSEOUT SUBMITTALS

A. Operation and maintenance manuals. Provide, at a minimum:
1. General description and technical data.
2. Receiving, storage, installation, and testing instructions.
3. Operating and maintenance procedures.
4. Complete set of final drawings.
5. Complete documentation of inspections and tests performed, including any logs, curves, and certificates. Documentation shall note any replacement of equipment or components that failed during testing.
6. Spare parts lists.
7. Installation field reports.

1.03 QUALITY ASSURANCE

A. manufacturer qualifications:
1. manufacturer of equipment shall be manufacturer of major components within assembly.
2. ISO 9001 certified.
3. manufacturer shall have produced similar electrical equipment for a minimum period of 5 years.

B. Regulatory requirements
1. Design, fabricate, and test equipment in accordance with applicable standards of ANSI, NEMA, NFPA 70, IEEE, and shall be in accordance with applicable requirements of OSHA.
2. Where applicable, equipment and materials supplied shall be of type listed in "List of Materials Acceptable for Use on Systems of RUS Electrification Borrowers," Bulletin 43-5.
3. Design equipment in accordance with relevant sections of most recent local Building Code of R-009 Ministerio de Obras Publicas.

1.04 DELIVERY, STORAGE AND HANDLING

A. Handle equipment to prevent damage, denting, or scoring during shipping and delivery.

B. Protect from weather, dirt, water, construction debris, and physical damage in accordance with manufacturer's instructions.

PART 2 PRODUCTS

2.01 SYSTEM REQUIREMENTS

A. Design equipment using system characteristics and ratings per design requirements.

B. Site conditions: Refer to Section 01 30 00.

2.02 DISCONNECT SWITCH

A. Insulator units: ANSI C29.9.

B. Operating mechanism:
1. Switches rated 69 kV and below: Manual, heavy-duty, swing-handle operated complete with accessories, including flexible grounding cable and provision for padlocking in "Open" and "Closed" positions.

2. Switches rated greater than 69 kV: Heavy-duty, gear-operated complete with accessories, including flexible grounding cable and provision for padlocking in "Open" and "Closed" positions.
3. Stainless steel or galvanized after fabrication.
4. Size to eliminate twisting or sag.
5. Switch mechanism shall be such that, if properly aligned, it is impossible to remain in partially opened or closed position.

C. Switch poles shall be fully coordinated and field adjustable per pole and for alignment and 3-phase timing coordination.

D. Insulation and BIL:
1. Open-gap withstand voltage shall be at least 10% greater than line-to-ground withstand voltage.
2. Coordinate insulation, switch, and use with specified creepage distance per design requirements.

E. Switch contacts:
1. Self-wiping.
2. Field-adjustable.
3. Field-adjustable contact pressure.

F. Linkage: Provide between operator and switch including flexible grounding strap.

G. Standards: NEMA SG6 and ANSI C37.32.

2.03 MOTOR-OPERATED DISCONNECT SWITCH

A. Insulator units: ANSI C29.9.

B. Operating mechanism:
1. Motor: High-speed (4 seconds maximum), heavy-duty motor operator including:
2. Motor operator:
a. "Close" and "Open" test pushbuttons for local control of motor operator.
b. Mechanical indicator for local indication of operator position.
c. Provide decoupling mechanism and following additional features:
1) Hand crank for manual operation of motor operator with motor de-energized.
2) Means for electrical operation of motor operator without operation of primary switch.
3) Swing handle operator for manual operation of switch with motor operator unit decoupled.
3. Stainless steel or galvanized after fabrication.
4. Size to eliminate twisting or sag.
5. Switch mechanism shall be such that, if properly aligned, it is impossible to remain in partially opened or closed position.

C. Switch poles shall be fully coordinated and field adjustable per pole and for alignment and 3-phase timing coordination.

D. Insulation and BIL:
1. Open-gap withstand voltage shall be at least 10% greater than line-to-ground withstand voltage.
2. Coordinate insulation, switch, and use with specified creepage distance per design requirements.

E. Switch contacts:
1. Self-wiping.
2. Field-adjustable.
3. Field-adjustable contact pressure.

F. Linkage: Provide between operator and switch including flexible grounding strap.

G. Standards: NEMA SG6 and ANSI C37.32.

2.04 CIRCUIT SWITCHER

A. Operating mechanism: If provided with decoupling mechanism, should permit operation of interrupter and motor operator with disconnect blades locked open, provided with padlocking provisions.

B. Mounting pedestals:
1. Construction: Galvanized steel with frame to support 3 poles of switchers.
2. Galvanized anchor bolts with 2 washers and 2 heavy hex nuts.

C. Operations and controls:
1. Pushbuttons for local control of circuit switcher.
2. "Local-Remote" selector switch.
3. Operating linkage between operator and switch.
4. Position indicator or indicating light for operator.
5. Electric operation counter.
6. If disconnect switch specified, decoupling mechanism to permit operation of interrupter and motor operator with disconnect blades locked open.
7. Manual trip lever for interrupter.

D. Terminals: 4-hole with NEMA drilling.

E. Standard: NEMA SG6.

2.05 HIGH-VOLTAGE SURGE ARRESTERS

A. Type: Metal-oxide station class.

B. Connectors: Primary and ground.
1. Monitor.
2. Compatible with arrester provided.
3. Resetable impulse current counter.
4. Continuous reading of arrester discharge current in mA.
5. Provide mounting hardware for mounting to base of arrester.

C. Provide with full-capacity, copper connections, maximum 750 kcmil conductor size to allow connection to arresters.

D. Standard: ANSI C62.11.

2.06 COUPLING CAPACITOR VOLTAGE TRANSFORMERS

A. Type: Base-mounted, high-capacitance, coupling capacitor voltage transformer with dual main windings

B. Terminals:
1. Primary: Standard 4-hole NEMA pad.
2. Secondary: Enclosed connection in corrosion-resistant, weatherproof, padlockable, metal box with conduit entrances.
3. Ground: At minimum, provide 1 standard NEMA 2-hole pad on mounting base.
4. Polarity and terminals: ANSI C57.13. Clearly indicate by permanent markings not easily obliterated.
5. Primary and secondary terminals shall be electrically and mechanically suitable for use with aluminum and copper conductors.

C. Nominal capacitance: Provide manufacturer's standard, meeting or exceeding design requirements.

D. Short circuit capability: Capable of withstanding for 1 second mechanical and thermal stresses resulting from short-circuit on secondary terminals with full voltage maintained in primary terminals in accordance with ANSI C57.13 and C93.2.

E. Other ratings and features: NEMA SG 2.

F. Accessories:
1. Ferroresonance-suppressing filter. Device shall pass ANSI C93 ferroresonance test.
2. Potential grounding switch and terminal box for secondary voltage connections with conduit entrance plugs.
3. Provide corona suppression rings for CCVT units rated 230kV and above.
4. Provide lifting hooks or eyes for lifting filled unit by overhead crane.

G. Potential device: Factory calibrated.

H. Nameplates: Provide each unit with permanent nameplates to identify manufacturer information including name, type, serial number, weight, and ratings as noted in specifications.

I. Transformer oil:
1. Oil furnished with transformer shall be Type 1 mineral insulating oil in accordance with ASTM standards.
2. Certify that oil being supplied is classified as noncontaminated by PCBs.

J. Standard: ANSI C93.1.

2.07 SWITCH TERMINAL PAD DESIGN LOADINGS

A. Longitudinal switches (parallel to switch blades) shall be capable of resisting, without injury or failure, force listed in ANSI C37.32, Table 2.

2.08 FINISHES

A. Stainless steel or galvanized. Apply to exposed parts after fabrication.

2.09 SOURCE QUALITY CONTROL

A. Perform factory testing in accordance with applicable standards of IEEE, ANSI, and NEMA.

B. Tests shall be performed at 60 Hz.

C. Certified accuracy tests on metering type current and voltage transformers shall be in accordance with ANSI C57.13.

D. Each CCVT shall be completely assembled and tested at manufacturer facility.
1. Perform tests on units in accordance with test codes in ANSI C93.1 as applicable.
2. Testing:
   a. If requested by Owner, perform double test on each unit.
   b. As a minimum, provide Owner with maximum acceptable double test limits to be used as criteria for field-testing supplied units.
3. Perform short circuit test on one or more units in accordance with latest version of ANSI C93.1.
4. Control wiring and associated devices shall be inspected and tested prior to shipment.

E. Test results shall indicate that equipment meets standard specified before shipment can be made.

PART 3 EXECUTION

3.01 EXAMINATION

A. Install in accordance with applicable codes and standards, manufacturer's instructions and recommendations.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Design, manufacture, test, deliver, assemble, and install Class I medium power transformers and accessories for oil-immersed, self-cooled, forced-air cooled, and forced-oil cooled, with self-cooled ratings as follows:
   1. High voltage windings above 110 kV BIL to below 450 kV BIL.
   2. Transformers base rated 50,000 kVA and lower.

1.02 CLOSEOUT SUBMITTALS

A. Provide at a minimum:
   1. Operation and maintenance manual.
   2. General description and technical data.
   3. Receiving, storage, installation, and testing instructions.
   4. Complete set of approved drawings and documents.
   5. Certified copies of final transformer and communications test reports.
   6. Certified copies of field installation tests.
   7. Final transformer nameplate drawings including transformer test impedances.
   8. Current transformer excitation and ratio correction factor curves.

1.03 MAINTENANCE MATERIALS

A. Extra materials: Provide 2-quarts of touch-up paint for each transformer, in pressurized aerosol cans.

1.04 QUALITY ASSURANCE

A. Regulatory requirements: Design, fabricate, and test equipment in accordance with applicable standards of ANSI, NEMA, and IEEE and in accordance with applicable requirements of OSHA, specifically:
   1. IEEE C57.12.00 – General Requirements for Distribution, Power, and Regulating Transformers.
   2. IEEE C57.12.10 – Requirements for Transformers 230 kV and Below, 833/958 through 8333/10417 kVA, Single phase, and 750/862 through 60,000/80,000/100,000 kVA Three Phase With and Without Load Tap Changers.
   3. IEEE C57.12.80 –Standard Terminology for Power and Distribution Transformers.
   4. IEEE C57.12.90 – Test code for Distribution, Power, and Regulating Transformers and Guide for Short Circuit Testing Distribution and Power Transformers.
   5. IEEE C57.98 –Guide for Transformer Impulse Tests.
   6. IEEE C57.116 –Guide for Transformers Directly Connected to Generators.
   7. IEEE C57.131 – IEEE Standard Requirements for Load Tap Changers
   8. NEMA TR 1 – Transformers, Regulators, and Reactors.

B. Perform routine production and required tests on equipment prior to shipment, in accordance with ANSI C57.12.00.

1.05 SERVICE CONDITIONS

A. Transformer shall be capable of operating at rated kVA under usual operating conditions as defined in IEEE C57.12.00 including ambient temperatures, cooling medium temperatures, frequency, voltage, altitude, and load current.

B. See Section 01 30 00 for site service environmental conditions.

PART 2 PRODUCTS

2.01 SYSTEM DESCRIPTION

A. Transformer shall be capable of withstanding without injury mechanical and thermal stresses resulting from short circuit currents as outlined in ANSI C57.12.00.

B. Unit auxiliary transformer or generator step-up transformer shall be capable of withstanding, without injury, mechanical and thermal stresses caused by through faults on external terminals of any winding, up to 125% of its rated voltage in accordance with IEEE C57.116.
   1. Thermal and time duration shall be as stated in ANSI C57.12.00.
   2. Transformer shall be capable of operating 10% above rated secondary voltage at no-load, and 5% at full load.

C. Provide appropriate hole spacing and hole quantities at termination location on bushings as required for connections to both high-voltage and low-voltage bushings.

D. Provide auxiliary equipment and services as required.

2.02 DESIGN REQUIREMENTS

A. Design equipment in accordance with seismic requirements a listed in Section 01 30 00.

B. Audible sound levels shall not exceed standard values for transformer class and size when measured in factory in accordance with NEMA TR 1 test code.

C. If Load Tap Changer is specified, transformer shall be capable of delivering rated kilovolt amperes at rated low voltage position and on all positions above rated low voltage.

2.03 COOLING CLASS

A. Cooling class designation shall be per ANSI C57.12.00.

2.04 MECHANICAL CONSTRUCTION

A. Fabricate tanks, bases, radiators, covers, junction boxes, and other attached compartments from materials of sufficient strength to withstand normal service stresses without distortion or damage.

B. Base shall be suitable for rolling or skidding in a direction parallel with either centerline.

C. Design tanks and enclosures:
   1. Suitable for vacuum filling and vacuum drying in field.
   2. Maximum tank pressure shall comply with ANSI C57.12.00.

D. Transformer tank top shall be domed to prevent water accumulation, and have a skid-resistant surface.

E. Main tank cover, joints in transformer tanks, non-removable flanges, and bases shall be made gastight and oiltight by welding.

F. Recessed gaskets shall be used for flange connections on manhole, bushings, and other bolted connections.

G. Equip transformer with provisions for jacking in accordance with ANSI C57.12.10. Provide lifting hooks on tank, and lifting eyes on cover.

H. Unless alternate method is used to prevent corrosion of exterior of bottom of transformer tank, transformer tank design shall be such that ventilation is provided between concrete supporting slab and bottom of transformer tank.

I. Only supporting steel beneath bottom of transformer tank may touch concrete slab. Design of steel supporting transformer tank bottom shall be such that bottom is accessible for inspection after installation.

J. Provide recommendation for attachment of transformer to foundation with design drawings. Method of attachment will take into account seismic requirements of project site.

K. Gages and indicators mounted more than 5' (1.5 m) above bottom of base supports shall be sized and angled such that they are easily read from ground line elevation.

L. Wiring:
   1. Wiring, thermocouple wiring, and connections shall be separately supported and protected to prevent damage during shipment or after final installation.
   2. Wiring shall be neatly bundled, terminated and marked in accordance with connection diagrams.

2.05 GROUNDING

A. Two copper-faced steel grounding pads, each not less than 2" x 3-1/2" (50 mm x 88 mm) with 2 holes vertically spaced on 1-3/4" (44 mm) centers drilled and tapped for 1/2" (13 mm), 13 UNC thread. Minimum threaded depth of holes: 1/2" (13 mm).

B. Protect threads by use of noncorrosive material.

C. Weld ground pads on tank wall at diagonally opposite sides of transformer, located at, or near base.

D. Provide ground conductors from equipment mounted on transformer that require grounding, to ground pads. Use No. 4/0 AWG, minimum

E. Provide separate ground strap or conductor from neutral bushing to ground pad for transformers with solidly grounded neutrals. Ground strap to be sized for maximum ground fault with maximum duration. For transformers with impedance grounded neutral, neutral ground strap shall be insulated from transformer and metallic parts for line-to-line voltages.

2.06 CORE AND COILS

A. Brace to withstand short-circuit forces without damage or displacement of coil or core in accordance with IEEE C57.12.00.
   1. 3-phase transformers rated less than or equal to 5.0 MVA: Limited only by transformer impedance – Category II.
   2. 3-phase transformers rated greater than 5.0 MVA: Limited by transformer and system impedance in accordance with Category III and IV.

B. Core and coils shall withstand forces normally expected from shipping, moving and handling without use of special internal shipping braces.

C. Provide suitable cooling liquid passages to limit hot spot temperature rise above average winding temperature rise at rated load.

D. Complete core and coil assembly shall be readily removable from tank for repairs.

E. Insulate coils from core and each other with sufficient insulation to withstand standard impulse and low frequency test for transformers of specified voltage class.

F. Core ground connection shall be accessible at manhole without removing oil from transformer tank or climbing into tank.

G. Transformer cores: Circular in cross section for transformers 10 MVA and larger.

H. Windings: Circular in cross-section and made up of copper conductor.

I. Tertiary windings (if applicable):
   1. kVA rating as required to meet short circuit withstand, but not less than 35% of transformer rating.
   2. Loading conditions: Transformer shall be suitable for operation for the design loading conditions.
   3. Impedance: Per design requirements.

2.07 TOP OIL TEMPERATURE INDICATOR

A. Provide dial-type, liquid temperature indicator relay for visible indication of top oil temperature.

B. Indicator:
   1. Gage: Not less than 6" (150 mm) in diameter; clearly readable from ground elevation.
   2. Temperature controller:
      a. Microprocessor temperature monitor and controller.
      b. 3 temperature monitoring probes.
      c. RS232 with DNP3.0.
      d. Software:
         1) Complete set of software to operate, communicate, and analyze data.
         2) Corporate license to software for Owner's use.
      e. Communications wired to auxiliary control cabinet.
      f. manufacturer: Advance Power Technologies TTC 1000, or equal.

C. Equip indicator with separate alarm contact and trip contact and manually resettable maximum temperature indicating hand.

D. Mount so sensing element can be removed without loss of oil and not interfere with tanking and untanking transformer core and coils.

2.08 COOLING EQUIPMENT AND CONTROLS

A. Furnish integrally mounted equipment to provide required cooling capacity to maintain specified transformer rating.
   1. Radiators: Furnish radiator valves when detachable radiators are required by design of unit.
   2. Position to not obstruct access to manholes, hand holes, or other inspection/maintenance locations.
   3. Design to inhibit collection or retention of water or debris.

B. Temperature control shall be provided by electronic winding temperature indicator arranged, and designed to automatically operate transformer cooling equipment in steps proportionate to transformer load and temperature.

C. Winding temperature indication:
   1. At a minimum, electronic hot spot winding temperature indicator shall have alarm contacts and 4 levels of operation.
   2. Contacts shall be provided for customer remote indication for high temperature and high-high temperature.
   3. Provide current transformer required for winding temperature indicators.
   4. Hot spot thermal relay shall be provided with test switch so test can be circulated through relay with transformer in service and current transformer shorted out.

D. Arrange cooling equipment controls so no single fault in control circuitry will cause loss of more than one half of cooling system capability.

E. Arrange transformer cooling equipment controls so single remote contact will shut down all fans, regardless of mode of operation selected (manual or auto).

F. Arrange ODAF cooling controls as follows:
   1. "Auto-Manual" selector switch and local "On-Off" switches for each fan bank and each pump bank.
   2. When in "Auto" state, cooling shall be initiated from integral winding hot spot detection.
   3. Provide 2 external control override when control switch is in "Auto." One external connection shall start cooling system regardless of hot spot temperature; second shall stop cooling systems regardless of hot spot detection.

G. Provide cooling fan and pump motor contactor status for remote monitoring of cooling system.

2.09 AUXILIARY POWER AND CONTROL CABINET

A. Enclose control equipment in weatherproof cabinet with NEMA rating suitable for installed environment conditions.

B. Location:
   1. Locate cabinet at height above bottom of base support such that it is suitable for operation and inspection by person standing at level of bottom of base support.
   2. Top of cabinet height shall be no more than 6'-7" (2 m) measured from bottom of base support elevation.

C. Extend auxiliary power and control circuits that require an external connection to a common weatherproof control cabinet wired to terminal blocks.

D. Wiring:
   1. Provide wiring, raceway, and terminal blocks in accordance with Section 26 05 00.
   2. Equip terminal blocks with washer head binding screws, covers, and white terminal identification marking strips General Electric Type EB-25, Marathon Type 1600, or equal. Screw shall accept standard holding type screw drivers only.
   3. Minimum No.12 AWG for control and minimum No.10 for current transformer wiring. Provide ring-tongue terminals on each end of control wiring.
   4. Use either molded-case or DIN-rail mounted miniature circuit breakers to protect individual branch circuits integral to control cabinet for external circuits entering cabinet.

E. Auxiliary power source:
   1. Provide single or dual source of ac power and single source of dc power to control cabinet for fans, space heaters, auxiliaries, and control per design requirenents.
   2. If second source of power for fans is required, use transfer switch to automatically switch between sources. Transfer switch shall be break-before-make and integral to control cabinet.
   3. If transformer equipment is furnished that operates on voltages other than that provided, equipment required to transform voltage of auxiliary power shall be furnished with transformer and shall be integral to control cabinet. Locate transformer to prevent damage or field personnel usage as step.

F. Provide control cabinet with space heaters capable of maintaining cabinet internal temperature above dew point.
   1. Heaters shall be spaced away, and be thermally insulated from devices and painted surfaces.
   2. Controlled by adjustable thermostat, factory set to close on falling temperature at 80°F (On) and open on rising temperature at 95°F (Off).

G. Interior lighting:
   1. Furnish interior cabinet fluorescent light fixture that illuminates automatically when door is opened.
   2. Overcurrent protection device within cabinet shall protect fixture.
   3. Confirm cabinet lamps are readily available within Owner's service area.

H. Furnish duplex 120-volt, 20-ampere, general use GFI receptacle within each enclosure to provide power for maintenance personnel. Overcurrent protection device within cabinet shall protect receptacle.

I. Paint inside of cabinet white.

J. Fan and/or pump motor starters, control power transformers, and protective devices as required for a complete and operational transformer shall be furnished as part of control cabinet.

K. Provide undervoltage relays to actuate alarm on loss of any external auxiliary power source with contacts wired to terminal blocks for external use.

L. Communications:
   1. Provide central communications panel for communication connection to transformer mounted and/or provided equipment.
   2. Panel shall be clearly labeled including communications ports of any type.
   3. Communications shall be fully tested through panel as part of testing procedure and detailed reports provided.

M. Provide operating and maintenance manual holding slot integral to control cabinet.

N. Provide red shipping jumpers on current transformer terminals. Use of shorting-type terminal blocks only not acceptable.

O. Locate transformer nameplate on door of transformer control cabinet.

2.10 CURRENT TRANSFORMER CIRCUITS

A. Extend current transformer leads into transformer control cabinet. Terminate current transformer leads on shorting- terminal blocks mounted in transformer control cabinet.

B. Ratios of multi-ratio current transformers shall be wired to transformer control cabinet.

2.11 INSULATING OIL

A. Ship transformer filled whenever possible.

B. Furnish sufficient quantity of insulating oil for complete vacuum filling to manufacturer's recommended level.

C. Design transformer with sufficient bracing and strength to permit full vacuum filling with insulating liquid.

D. Insulating oil shall meet requirements as defined by ANSI/ASTM D3487 and following:
   1. Chemically stable.
   2. Free from acidity or other corrosive ingredients.
   3. Possess high dielectric strength.
   4. Contain less than 15 ppm water when tested in accordance with procedures of ASTM D1533 (Karl Fischer method).
   5. Test at least 30 kV upon receipt at final destination when tested in accordance with procedures of ASTM D877.
   6. If dielectric test strength of any oil received in field, whether shipped separately or in transformer, tests less than 30 kV, provide labor, supervision, material, and equipment required to replace oil in its entirety until test meets these specifications.

E. Insulating oil sampling and test procedures at factory shall conform to requirements of ASTM D117 for mineral oil.

F. Insulating oil shall be inhibited with 0.3% by weight of DBPC (2, 6-Ditertiary-Butyl Para-Cresol). Transformer nameplate shall state that oil is inhibited.

G. Certify and warrant that equipment furnished mineral oil without PCBs. Replace equipment at no cost should testing indicate that equipment does not meet this condition. Affix sign to transformer near drain valves which states that mineral oil used in equipment. Wording: "CONTAINS NO PCBs."

2.12 INSULATING LIQUID PRESERVATION SYSTEM

A. Provide transformer with manufacturer's standard oil conservation system.

B. Conservator oil preservation system:
1. If proposed by manufacturer, furnish conservator liquid preservation system as defined in accordance with IEEE C57.12.80.
2. Type: Automatically maintained system that seals liquid from atmosphere. Provide required tank, piping, liquid level gage, upper filter press connection, and sampler.
3. Design conservator system to withstand full vacuum. Provision shall be made for filling of main tank and conservator while under vacuum.
4. System shall maintain constant atmospheric pressure on oil. Provide sufficient capacity in conservator tank to prevent low level alarms for complete operating temperature range of transformer for ambient conditions.
5. Volume of oil shall be adjusted such that no oil shall be released until after top oil temperature exceeds 120°C.
6. Conservator system shall include, but not be limited to:
   a. Conservator shut off valve.
   b. Main tank shut off valve.
   c. Drain valve.
   d. Dehydrating breather with oil seal used with air cell breather.
   e. Pressure/vacuum bleeder with gage. Set to operate at lowest level consistent with reliable operation mounted on conservator air space.
   f. Dual pressure/vacuum switch to operate prior to bleeder operation mounted on conservator air space.
   g. Vent valves with easy open/close feature.
   h. Liquid level gage with high and low level alarm contacts.
   i. Buchholz relay 2-float version of flow-through type installed between tank and conservator system. Selected and installed in accordance with Buchholz requirements. Relay contacts shall be supplied with Form "C" contacts for each of functions and shall be wired to control cabinet.
   j. Interconnecting piping: Metallic.

C. Inert gas system:
1. Provide automatically maintained system to provide dry nitrogen gas atmosphere above oil. System shall include electronic monitoring system with alarm contacts arranged for remote indication of low, low/low, and high gas pressure.
2. Provide valves to permit purging gas space and testing tank seal by admitting dry nitrogen under pressure.
3. Nitrogen gas:
   a. Bottled in 200 cu ft cylinders with connection No. 580 of ANSI/CGA-V-1.
   b. Gas shall be in accordance with ASTM D1933, Type III.
   c. Filling pressure: 2,200 ft-lb/sq in at 21.1°C.
   d. Provide gas for initial charge on transformer and one full extra bottle for future use.
4. Nitrogen control equipment, including adequate space for nitrogen bottles, shall be protected by easily accessible, weatherproof enclosure mounted on transformer tank.

2.13 CURRENT TRANSFORMERS (CT)

A. Provide bushing type CTs with fully distributed windings for relaying or metering service in quantities, ratios, and ratings per design requirements.

B. Extend current transformer leads into transformer control cabinet and terminate on shorting-type terminal blocks.

2.14 BUSHINGS

A. Suitable for service conditions specified herein.

B. Bushing insulation class: Not less than that of winding to which connected.

C. Bushing electrical characteristics and tests: ANSI C57.12.00 and IEEE C57.19.00.

D. Bushing dimensions: IEEE C57.19.01 and NEMA TR1.

E. Bushing color: manufacturer's standard.

F. Terminals: Per design requirements.

G. 110 kV BIL and above: Oil-filled, IEEE C57.19.00 and IEEE C57.19.01.

H. Above 110 kV BIL: Provide with facilities for power factor testing.

I. Minimum clearances: NEMA TR 1-1980, Table TR 1-0.06.

2.15 SURGE ARRESTERS

A. Provide metal-oxide station class arresters with voltage ratings per design requirements. General Electric "Tranquell," Ohio Brass "DynaVar," or ABB "ExlimQ."

B. Mount near bushings such that they do not interfere with connections with minimum clearances specified in NEMA TR 1 for bushings are achieved with clearances approaching NEMA SG6 where practicable.

C. Provide with full-capacity, copper connections, maximum 750 kcmil conductor size, between arrester and transformer bushing terminals to allow connection to arresters.

D. Provide with ground connections.

E. Connections between bushings and arresters shall contain provisions for expansion and contraction.

2.16 TAP CHANGER

A. Provide tap voltages per design requirements. Each tap position shall be fully rated and shall not limit kVA rating of transformer.

B. De-energized tap changer (NLTC):
1. Provide operator for de-energized tap changer with extension to allow manual operation of tap changer at base elevation.
2. Mount manual operating mechanism with tap position indicator and provisions for padlocking on transformer case minimum 48" (1.2 m) above bottom of baseplate support.
3. Locate mechanism inside tank above core and coils if possible. If this location is impractical, mechanism shall be accessible through ports.
4. Each tap position shall be fully rated.

C. Load tap changer (LTC):
1. Operating mechanism with motor drive, local position indicator, operation counter, and raise/lower switches for manual operation.
2. Equipment for LTC shall be mounted in a weatherproof compartment adjacent to tap changer compartment.
3. Meet requirements of IEEE C57.131
4. High-speed resistance or vacuum reactance.
5. Design for minimum of 500,000 operations before contact or vacuum bottle replacement.

6. Preventative transformer or series transformer required shall be power class, copper wound, and of a round core/coil design.
7. Mount tap changer in separate oil-filled compartment, capable of withstanding full vacuum in main tank without bypass piping.
8. LTCs intended for automatic operation shall have at a minimum:
   a. Top filling plug.
   b. Drain valve with sampling device.
   c. Cover mounted pressure relief device.
   d. Pressure control switch with alarm contacts.
   e. Liquid level gage with alarm contacts.
   f. Local position indicator.
   g. Operations counter.
   h. Space for mounting equipment for circulating current method for parallel operation.
   i. Selsyn-type transmitter for position indication.
   j. Raise and lower switches for manual control.
   k. Current transformer for input to LDC shall be provided separate of other required transformer CTs.
   l. Digital control package Beckwith M2001C with line-drop compensator (LDC) with resistance and reactance adjustments and one current transformer.
   m. Auto-manual selector switch.
   n. Testing terminals.
   o. Static voltage regulating relay.
   p. Control and time delay relays.
   q. Reactance reversing switch.
   r. Control compartment mounted to transformer with terminal blocks, space heaters, interior lighting, and convenience receptacle.
   s. Continuous oil filtering system.
9. LTCs intended for remote operation shall have at a minimum:
   a. Remote-Local selector switch.
   b. Remote tap position indicator for mounting on remote control cabinet.
10. Design drive mechanism such that LTC can be manually operated, while transformer is operating under load, safely with no risk to transformer or operator.
11. If mechanism stalls in "Off-Tap" position, whether in automatic or manual operation, LTC shall be capable of maintaining full load indefinitely and an alarm contact shall be provided for remote monitoring.
12. manufacturer: Reinhausen, ABB or equivalent.

2.17 ACCESSORIES

A. Provide standard accessories in accordance with ANSI C57.12.10.

B. Provide following devices with at least one set of single-pole, double-throw (SPDT) alarm contacts for each:
   1. Magnetic liquid level indicator.
   2. Pressure relief device piped such that releases occur away from bushings, control cabinets etc. Include dry Form C contact for remote indication. Wire to control cabinet.
   3. Top oil temperature indicator.
   4. Loss of control power.
   5. Loss of auxiliary ac power alarm devices.

C. Alarm contacts: Indicator contacts, switches, and relays used as alarm contacts shall be ungrounded and suitable for interrupting 0.02 ampere dc inductive, 0.2 ampere dc noninductive, or 2.5 amperes ac noninductive load at 250 volts maximum.

D. Liquid drain and sampling devices.

E. Upper and lower filter press connections.

F. Lifting, moving and jacking facilities.

G. Tilt transformer gages for ease of reading from ground. Mount within 5' (1.5 m) elevation of transformer base.

H. Provide Buchholz fault pressure relay system, sensitive to rate of pressure increase including single-pole, single-throw (SPST) primary element controlling auxiliary seal-in relay and reset switch arranged and connected to provide manually resettable lockout function on operation of primary element.
   1. Design auxiliary relay for satisfactory operation on specified dc system. Provide electrically separate contacts for use with remote equipment. Mount inside main control cabinet.
   2. Wire rate of pressure rise relay equipment to terminal points in main control cabinet. Provide complete provisions for testing.
   3. Fault pressure relay: "Quailitrol."

2.18 IDENTIFICATION AND TAGGING

A. Provide permanent nameplates to identify protective relays, meters, instruments, selector switches, indicating lights, terminal blocks, and other devices within various compartments.

B. Nameplates shall have black lettering on white background. Fasten in place using Type 316 stainless steel, self-tapping screws. Nameplates shall be heat- and UV-resistant.

C. Terminal blocks shall be clearly marked for wiring using permanent printed markers. Each internal interconnecting wire shall be identified at both ends with sleeve type wire markers with from/to information.

2.19 PAINTS AND FINISHES

A. Type: Polyurethane or epoxy, durable.

B. Tank paint: manufacturer's standard ANSI gray.

C. Radiators: manufacturer's standard ANSI gray or bare galvanized steel.

2.20 SOURCE QUALITY CONTROL

A. Transformer no-load and load-loss test results shall be certified by a licensed professional Engineer.

B. Perform routine production and required tests on equipment prior to shipment, in accordance with ANSI C57.12.00.

C. Perform routine accuracy tests on each metering accuracy current transformer in accordance with ANSI C57.13.

D. Witness testing. Notification in writing shall be provided not less than 30 days prior to scheduled starting date of factory test. Provide notification of performance date for each test not less than 10 days prior to date of test to allow witness testing if so desired.

E. Unusual events or damage occurring during fabrication of transformer and of tests, which do not meet specified standard values shall be reported. Inspection of such damages or test failures may be witnessed. Corrective measures to overcome such damage or failure shall be subject to acceptance by Owner.

F. Temperature test: Not required on individual units if tests exist for thermal duplicate unit of previous manufacture. Copy of test on file shall be furnished.

G. Special tests:
   1. Impulse tests:
      a. Perform in accordance with ANSI Standard C57.12.90 using neutral current method of fault detection.
      b. Oscillographic records of test shall be included in test reports.

2. Partial discharge test:
   a. Test for partial discharge in accordance with partial discharge procedures specified in ANSI/IEEE C57.12.14, "Induced Voltage Test for Class II Power Transformers" and "Partial Discharge Measurement" and IEEE C57.113.
   b. Test voltage shall be determined in accordance with ANSI/IEE C57.12.00.
   c. Acceptable measured partial discharge above background:
      1) RIV level:
         a) Lower than 100 microvolts with increase in RIV not exceeding 30 microvolts during 1-hour test.
         b) Shall not exceed 250 microvolts at any time during test.
      2) Apparent charge measurement level below 500 picocoulombs.
   d. Perform partial discharge test after other dielectric tests are completed.
   e. Test report:
      1) Provide test results in both microvolts and picocoulombs
      2) Curve of data obtained in test shall be included in test reports.
3. Megger tests: Perform in accordance with following procedure. Resistance measurements shall be corrected to 20°C.
   a. Perform with transformer filled with oil and with appropriate bushings interconnected to measure resistance from high to ground, low to ground, and from high to low. Perform using applied potential of 2,500 volts.
   b. Perform between core and ground using applied potential of 500 volts.
4. Gas-in-oil: Before testing begins and after tests specified are completed, dissolved gas-in-oil analysis shall be made of main tank oil.
5. Audible sound level: Not to exceed values given in NEMA TR 1 when measured in factory in accordance with NEMA TR 1 test code.
6. Communications test: Perform communications testing on devices with external communications capability and provide test report to document satisfactory operations. Tests shall include, but not be limited to:
   a. Original device manufacturer installation and operational tests.
   b. Signal levels and communications panel.
   c. Demonstration of equipment operation during Owner witness tests.
   d. Submit test report to document satisfactory operations.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install in accordance with manufacturer instructions, recommended procedures, industry standards and practices, and applicable codes and regulations.

B. Install in accordance with manufacturer's recommended procedures in presence of manufacturer's service representative.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Design, manufacture, test, deliver, assemble, and install power transformers and accessories for oil-immersed, self-cooled, forced-air cooled, and forced-oil cooled, with self-cooled ratings as follows:
   1. 450 kV BIL and higher.
   2. 50,000 kVA and higher with any BIL.

1.02 CLOSEOUT SUBMITTALS

A. Operation and maintenance data. Provide at a minimum:
   1. General description and technical data.
   2. Receiving, storage, installation, and testing instructions.
   3. Operating and maintenance procedures.
   4. Complete set of approved drawings and documents submitted for review.
   5. Certified copies of final transformer and communications test reports.
   6. Certified copies of field installation tests.
   7. Final transformer nameplate drawings including transformer test impedances.
   8. Current transformer excitation and ratio correction factor curves.

1.03 MAINTENANCE MATERIALS

A. Extra materials: Provide 2-quarts of touch-up paint for each transformer, in pressurized aerosol cans.

1.04 QUALITY ASSURANCE

A. Regulatory requirements: Design, fabricate, and test equipment in accordance with applicable standards of ANSI, NEMA, and IEEE and in accordance with applicable requirements of OSHA, specifically:
   1. IEEE C57.12.00 – General Requirements for Distribution, Power, and Regulating Transformers.
   2. IEEE C57.12.10 – Requirements for Transformers 230kV and Below, 833/958 through 8333/10417 kVA, Single phase, and 750/862 through 60,000/80,000/100,000 kVA Three Phase With and Without Load Tap Changers.
   3. IEEE C57.12.80 –Standard Terminology for Power and Distribution Transformers.
   4. IEEE C57.12.90 – Test code for Distribution, Power, and Regulating Transformers and Guide for Short Circuit Testing Distribution and Power Transformers.
   5. IEEE C57.98 –Guide for Transformer Impulse Tests.
   6. IEEE C57.116 –Guide for Transformers Directly Connected to Generators.
   7. NEMA TR 1 – Transformers, Regulators, and Reactors.

B. Perform routine production and required tests on equipment prior to shipment, in accordance with ANSI C57.12.00.

1.05 SERVICE CONDITIONS

A. Transformer shall be capable of operating at rated kVA under usual operating conditions as defined in IEEE C57.12.00 including ambient temperatures, cooling medium temperatures, frequency, voltage, altitude, and load current.

B. See Specification Section 01 30 00 General Design Requirements for site service conditions.

PART 2 PRODUCTS

2.01 SYSTEM DESCRIPTION

A. Transformer shall be capable of withstanding without injury mechanical and thermal stresses resulting from short circuit currents as outlined in ANSI C57.12.00.

B. Unit auxiliary transformer or generator step-up transformer shall be capable of withstanding, without injury, mechanical and thermal stresses caused by through faults on external terminals of any winding, up to 125% of its rated voltage in accordance with IEEE C57.116.
   1. Thermal and time duration shall be as stated in ANSI C57.12.00.
   2. Transformer shall be capable of operating 10% above rated secondary voltage at no-load, and 5% at full load.

C. Provide appropriate hole spacing and hole quantities at termination location on bushings as required for connections to both high-voltage and low-voltage bushings. Provide auxiliary equipment and services as required.

2.02 DESIGN REQUIREMENTS

A. Design equipment in accordance with seismic requirements a listed Specification Section 01 30 00 General Design Requirements.

B. Audible sound levels shall not exceed values when measured in factory in accordance with NEMA TR 1 test code.

2.03 COOLING CLASS

A. Cooling class designation shall be in accordance with ANSI C57.12.00.

2.04 MECHANICAL CONSTRUCTION

A. Fabricate tanks, bases, radiators, covers, junction boxes, and other attached compartments from materials of sufficient strength to withstand normal service stresses without distortion or damage.

B. Base shall be suitable for rolling or skidding in a direction parallel with either centerline.

C. Design tanks and enclosures
   1. Suitable for vacuum filling and vacuum drying in field.
   2. Maximum tank pressure shall comply with ANSI C57.12.00.

D. Transformer tank top shall be domed to prevent water accumulation, and have a skid-resistant surface.

E. Main tank cover, joints in transformer tanks, non-removable flanges, and bases shall be made gastight and oiltight by welding.

F. Recessed gaskets shall be used for flange connections on manhole, bushings, and other bolted connections.

G. Equip transformer with provisions for jacking in accordance with ANSI C57.12.10. Provide lifting hooks on tank, and lifting eyes on cover.

H. Unless alternate method is used to prevent corrosion of exterior of bottom of transformer tank, transformer tank design shall be such that ventilation is provided between concrete supporting slab and bottom of transformer tank.

I. Only supporting steel beneath bottom of transformer tank may touch concrete slab. Design of steel supporting transformer tank bottom shall be such that bottom is accessible for inspection after installation.

J. Provide recommendation for attachment of transformer to foundation with design drawings. Method of attachment will take into account seismic requirements of the project site.

K. Gages and indicators mounted more than 5' (1.5 m) above bottom of base supports shall be sized and angled such that they are easily read from ground line elevation.

L. Wiring:
   1. Wiring, thermocouple wiring, and connections shall be separately supported and protected to prevent damage during shipment or after final installation.
   2. Wiring shall be neatly bundled, terminated and marked in accordance with connection diagrams.

2.05 GROUNDING

A. Two copper-faced steel grounding pads, each not less than 2" x 3-1/2" (50 mm x 88 mm) with 2 holes vertically spaced on 1-3/4" (44 mm) centers drilled and tapped for 1/2" (13 mm), 13 UNC thread. Minimum threaded depth of holes: 1/2" (13 mm).

B. Protect threads by use of noncorrosive material.

C. Weld ground pads on tank wall at diagonally opposite sides of transformer, located at, or near base.

D. Provide ground conductors from equipment mounted on transformer that require grounding, to ground pads. Use No. 4/0 AWG, minimum.

E. Provide separate ground strap or conductor from neutral bushing to ground pad for transformers with solidly grounded neutrals. Size ground strap for maximum ground fault with maximum duration. For transformers with impedance grounded neutral, neutral ground strap shall be insulated from transformer and metallic parts for line-to-line voltages.

2.06 CORE AND COILS

A. Brace to withstand short-circuit forces without damage or displacement of coil or core in accordance with IEEE C57.12.00.
   1. 3-phase transformers rated less than or equal to 5.0 MVA: Limited only by transformer impedance – Category II.
   2. 3-phase transformers rated greater than 5.0 MVA: Limited by transformer and system impedance in accordance with Category III and IV.

B. Core and coils shall withstand forces normally expected from shipping, moving and handling without use of special internal shipping braces.

C. Provide suitable cooling liquid passages to limit hot spot temperature rise above average winding temperature rise at rated load.

D. Complete core and coil assembly shall be readily removable from tank for repairs.

E. Insulate coils from core and each other with sufficient insulation to withstand standard impulse and low frequency test for transformers of specified voltage class.

F. Core ground connection shall be accessible at manhole without removing oil from transformer tank or climbing into tank.

G. Transformer cores: Circular in cross section for transformers 10 MVA and larger.

H. Windings: Circular in cross-section and made up of copper conductor.

I. Tertiary windings (if required by the design):
   1. kVA rating as required to meet short circuit withstand, but not less than 35% of transformer rating.
   2. Loading conditions: Transformer shall be suitable for operation for the design loading conditions.
   3. Impedance: Per design requirements.

2.07 TOP OIL TEMPERATURE INDICATOR

A. Provide dial-type, liquid temperature indicator relay for visible indication of top oil temperature.

B. Indicator:
   1. Gage: Not less than 6" (150 mm) in diameter; clearly readable from ground elevation.
   2. Temperature controller:
      a. Microprocessor temperature monitor and controller.
      b. 3 temperature monitoring probes.
      c. RS232 with DNP3.0.
      d. Software:
         1) Complete set of software to operate, communicate, and analyze data.
         2) Corporate license to software for Owner's and Engineer's use.
      e. Communications wired to auxiliary control cabinet.
      f. manufacturer: Advance Power Technologies TTC 1000, or equal.

C. Equip indicator with separate alarm contact and trip contact and manually resettable maximum temperature indicating hand.

D. Mount so sensing element can be removed without loss of oil and not interfere with tanking and untanking transformer core and coils.

2.08 COOLING EQUIPMENT AND CONTROLS

A. Furnish integrally mounted equipment to provide required cooling capacity to maintain specified transformer rating.
   1. Radiators: Furnish radiator valves when detachable radiators are required by design of unit.
   2. Oil-air heat exchangers (oil coolers):
      a. Acceptable on transformers used for generator step-up applications.
      b. Detachable and suitably braced.
      c. Direct welding of bracings and appurtenances to fins or tubes not permitted.
      d. Fin -tube type construction with internal baffles between each fan section to prevent loss of efficiency if fan fails.
      e. Construction shall be completely corrosion-resistant.
      f. Furnish with valves with blanking plates for openings.
      g. Equip with:
         1) Drain valve with threaded plug
         2) Vent with threaded plug to facilitate draining
         3) Lift eyes both top and bottom
         4) Pressure differential switches for each cooler terminated in control cabinet
      h. Cooling air shall flow away from transformer to mitigate hot air recirculation
   3. Position to not obstruct access to manholes, hand holes, or other inspection/maintenance locations.
   4. Design to inhibit collection or retention of water or debris.

B. Temperature control shall be provided by electronic winding temperature indicator arranged, and designed to automatically operate transformer cooling equipment in steps proportionate to transformer load and temperature.

C. Winding temperature indication:
   1. At a minimum, electronic hot spot winding temperature indicator shall have alarm contacts and 4 levels of operation.
   2. Contacts shall be provided for customer remote indication for high temperature and high-high temperature.

3. Provide current transformer required for winding temperature indicators.
4. Hot spot thermal relay shall be provided with test switch so test can be circulated through relay with transformer in service and current transformer shorted out.

D. Arrange cooling equipment controls so no single fault in control circuitry will cause loss of more than one half of cooling system capability.

E. Arrange transformer cooling equipment controls so single remote contact will shut down all fans, regardless of mode of operation selected (manual or auto).

F. Arrange ODAF cooling controls as follows:
1. "Auto-Manual" selector switch and local "On-Off" switches for each fan bank and each pump bank.
2. When in "Auto" state, cooling shall be initiated from integral winding hot spot detection.
3. Provide 2 external control overrides when control switch is in "Auto." One external connection shall start cooling system regardless of hot spot temperature; second shall stop cooling systems regardless of hot spot detection.

G. Provide cooling fan and pump motor contactor status for remote monitoring of cooling system.

2.09 AUXILIARY POWER AND CONTROL CABINET

A. Enclose control equipment in weatherproof cabinet with NEMA rating suitable for the installed environment conditions. Permanently attach to transformer.

B. Location:
1. Locate cabinet at height above bottom of base support such that it is suitable for operation and inspection by person standing at level of bottom of base support.
2. Top of cabinet height shall be no more than 6'-7" (2 m) measured from bottom of base support elevation.

C. Extend auxiliary power and control circuits that require an external connection to a common weatherproof control cabinet wired to terminal blocks.

D. Wiring:
1. Provide wiring, raceway, and terminal blocks in accordance with Section 26 05 00.
2. Equip terminal blocks with washer head binding screws, covers, and white terminal identification marking strips General Electric Type EB-25, Marathon Type 1600, or equal. Screw shall accept standard holding type screw drivers only.
3. Minimum No.12 AWG for control and minimum No.10 for current transformer wiring. Provide ring-tongue terminals on each end of control wiring.
4. Use either molded-case or DIN-rail mounted miniature circuit breakers to protect individual branch circuit integral to control cabinet for external circuits entering cabinet.

E. Auxiliary power source:
1. Provide single or dual source of ac power and single source of dc power to control cabinet for fans, space heaters, auxiliaries, and control per design requirements.
2. If second source of power for fans is required, use transfer switch to automatically switch between sources. Transfer switch shall be break-before-make and integral to control cabinet.
3. If transformer equipment is furnished that operates on voltages other than that provided, equipment required to transform voltage of auxiliary power shall be furnished with transformer and shall be integral to control cabinet. Locate transformer to prevent damage or field personnel usage as step.

F. Provide control cabinet with space heaters capable of maintaining cabinet internal temperature above dew point.
1. Heaters shall be spaced away, and be thermally insulated from devices and painted surfaces.
2. Controlled by adjustable thermostat, factory set to close on falling temperature at 80°F (On) and open on rising temperature at 95°F (Off).

G. Interior lighting:
   1. Furnish interior cabinet fluorescent light fixture that illuminates automatically when door is opened.
   2. Overcurrent protection device within cabinet shall protect fixture.
   3. Confirm cabinet lamps are readily available within Owner's service area.

H. Furnish duplex 120-volt, 20-ampere, general use GFI receptacle within each enclosure to provide power for maintenance personnel. Overcurrent protection device within cabinet shall protect receptacle.

I. Paint inside of cabinet white.

J. Fan and/or pump motor starters, control power transformers, and protective devices as required for a complete and operational transformer shall be furnished as part of control cabinet.

K. Provide undervoltage relays to actuate alarm on loss of any external auxiliary power source with contacts wired to terminal blocks for external use.

L. Communications:
   1. Provide central communications panel for communication connection to transformer mounted and/or provided equipment.
   2. Panel shall be clearly labeled including communications ports of any type.
   3. Communications shall be fully tested through panel as part of testing procedure and detailed reports provided.

M. Provide operating and maintenance manual holding slot integral to control cabinet.

N. Provide red shipping jumpers on current transformer terminals. Use of shorting-type terminal blocks only not acceptable.

O. Locate transformer nameplate on door of transformer control cabinet.

2.10 CURRENT TRANSFORMER CIRCUITS

A. Extend current transformer leads into transformer control cabinet. Terminate current transformer leads on shorting-type General Electric EB-27 terminal blocks mounted in transformer control cabinet.

B. Ratios of multi-ratio current transformers shall be wired to transformer control cabinet.

2.11 INSULATING OIL

A. Ship transformer filled whenever possible.

B. Furnish sufficient quantity of insulating oil for complete vacuum filling to manufacturer's recommended level.

C. Design transformer with sufficient bracing and strength to permit full vacuum filling with insulating liquid

D. Insulating oil shall meet requirements as defined by ANSI/ASTM D3487 and following:
   1. Chemically stable.
   2. Free from acidity or other corrosive ingredients.
   3. Possess high dielectric strength.
   4. Contain less than 15 ppm water when tested in accordance with procedures of ASTM D1533 (Karl Fischer method).
   5. Test at least 30 kV upon receipt at final destination when tested in accordance with procedures of ASTM D877.
   6. If dielectric test strength of any oil received in field, whether shipped separately or in transformer, tests less than 30 kV, provide labor, supervision, material, and equipment required to replace oil in its entirety until test meets these specifications.

E. Insulating oil sampling and test procedures at factory shall conform to requirements of ASTM D117 for mineral oil.

F. Insulating oil shall be inhibited with 0.3% by weight of DBPC (2, 6-Ditertiary-Butyl Para-Cresol). Transformer nameplate shall state that oil is inhibited.

G. Certify and warrant that equipment furnished mineral oil without PCBs. Replace equipment at no cost should testing indicate that equipment does not meet this condition. Affix sign to transformer near drain valves which states that mineral oil used in equipment. Wording: "CONTAINS NO PCBs."

2.12 INSULATING LIQUID PRESERVATION SYSTEM

A. Provide transformer with manufacturer's standard oil conservation system.

B. Conservator oil preservation system:
1. Provide conservator liquid preservation system as defined in accordance with IEEE C57.12.80.
2. Type: Automatically maintained system that seals liquid from atmosphere. Provide required tank, piping, liquid level gage, upper filter press connection, and sampler.
3. Design conservator system to withstand full vacuum. Provision shall be made for filling of main tank and conservator while under vacuum.
4. System shall maintain constant atmospheric pressure on oil. Provide sufficient capacity in conservator tank to prevent low level alarms for complete operating temperature range of transformer for ambient conditions.
5. Volume of oil shall be adjusted such that no oil shall be released until after top oil temperature exceeds 120°C.
6. Conservator system shall include, but not be limited to:
   a. Conservator shut off valve.
   b. Main tank shut off valve.
   c. Drain valve.
   d. Dehydrating breather with oil seal used with air cell breather.
   e. Pressure/vacuum bleeder with gage. Set to operate at lowest level consistent with reliable operation mounted on conservator air space.
   f. Dual pressure/vacuum switch to operate prior to bleeder operation mounted on conservator air space.
   g. Vent valves with easy open/close feature.
   h. Liquid level gage with high and low level alarm contacts.
   i. Buchholz relay 2-float version of flow-through type installed between tank and conservator system. Selected and installed in accordance with Buchholz requirements. Relay contacts shall be supplied with Form "C" contacts for each of functions and shall be wired to control cabinet.
   j. Interconnecting piping: Metallic.

C. Inert gas system:
1. Provide automatically maintained system to provide dry nitrogen gas atmosphere above oil. System shall include electronic monitoring system with alarm contacts arranged for remote indication of low, low/low, and high gas pressure.
2. Provide valves to permit purging gas space and testing tank seal by admitting dry nitrogen under pressure.
3. Nitrogen gas:
   a. Bottled in 200 cu ft cylinders with connection No. 580 of ANSI/CGA-V-1.
   b. Gas shall be in accordance with ASTM D1933, Type III.
   c. Filling pressure: 2,200 ft-lb/sq in at 21.1°C.
   d. Provide gas for initial charge on transformer and one full extra bottle for future use.
4. Nitrogen control equipment, including adequate space for nitrogen bottles, shall be protected by easily accessible, weatherproof enclosure mounted on transformer tank.

2.13 INSULATING OIL MONITOR

A. Type: Continuous, intelligent, online, incipient fault gas monitor.

B. Provide gas monitor with transmitter and intelligent controller.

C. Modem communications capability plus RS485 and RS232 outputs.

D. Analog and contact outputs.

E. Corporate license for HOST, or equal, software for use on Owner's and Engineer's computer and SCADA systems.

F. manufacturer: General Electric Energy Management "Hydran 201R Model I," or equal

2.14 CURRENT TRANSFORMERS (CT)

A. Provide bushing type CTs with fully distributed windings for relaying or metering service in quantities, ratios, and ratings per design requirements.

B. Extend current transformer leads into transformer control cabinet and terminate on shorting-type terminal blocks.

2.15 BUSHINGS

A. Suitable for service conditions specified herein.

B. Bushing insulation class: Not less than that of winding to which connected.

C. Bushing electrical characteristics and tests: ANSI C57.12.00 and IEEE C57.19.00.

D. Bushing dimensions: IEEE C57.19.01 and NEMA TR1.

E. Bushing color: manufacturer's standard.

F. Terminals: Per design requirements.

G. 110 kV BIL and above: Oil-filled, IEEE C57.19.00 and IEEE C57.19.01.

H. Above 110 kV BIL: Provide with facilities for power factor testing.

I. Minimum clearances: NEMA TR 1-1980, Table TR 1-0.06.

2.16 SURGE ARRESTERS

A. Provide metal-oxide station class arresters with voltage ratings per design requirements. General Electric "Tranquell," Ohio Brass "DynaVar," or ABB "ExlimQ."

B. Monitor:
   1. Provide with following features:
      a. Compatible with arrester provided.
      b. Resetable impulse current counter.
      c. Continuous reading of arrester discharge current in mA.
   2. Provide mounting hardware for mounting to base of arrester.
   3. manufacturer: ABB, Cooper Power Systems, Joslyn, or equal

C. Mount near bushings such that they do not interfere with connections with minimum clearances specified in NEMA TR 1 for bushings are achieved with clearances approaching NEMA SG6 where practicable.

D. Provide with full-capacity, copper connections, minimum750 kcmil conductor size, between arrester and transformer high voltage bushing terminals sized for 30°C rise at full MVA to limit thermal conduction to bushing.

E. Provide with ground connections.

F. Connections between bushings and arresters shall contain provisions for expansion and contraction.

2.17 TAP CHANGER

A. Provide tap voltages per design requirements. Each tap position shall be fully rated and shall not limit kVA rating of transformer.

B. De-energized tap changer (NLTC):
1. Provide operator for de-energized tap changer with extension to allow manual operation of tap changer at base elevation.
2. Mount manual operating mechanism with tap position indicator and provisions for padlocking on transformer case minimum 48" (1.2 m) above bottom of baseplate support.
3. Locate mechanism inside tank above core and coils if possible. If this location is impractical, mechanism shall be accessible through ports.
4. Each tap position shall be fully rated.

C. Load tap changer (LTC):
1. If required, LTC shall include operation mechanism with motor drive, local position indicator, operation counter, and raise/lower switches for manual operation.
2. Equipment for LTC shall be mounted in a weatherproof compartment adjacent to tap changer compartment.
3. Meet requirements of IEEE C57.131
4. High-speed resistance or vacuum reactance.
5. Design for minimum of 500,000 operations before contact or vacuum bottle replacement.
6. Preventative transformer or series transformer required shall be power class, copper wound, and of a round core/coil design.
7. Mount tap changer in separate oil-filled compartment, capable of withstanding full vacuum in main tank without bypass piping.
8. LTCs intended for automatic operation shall have at a minimum:
   a. Top filling plug.
   b. Drain valve with sampling device.
   c. Cover mounted pressure relief device.
   d. Pressure control switch with alarm contacts.
   e. Liquid level gage with alarm contacts.
   f. Local position indicator.
   g. Operations counter.
   h. Space for mounting equipment for circulating current method for parallel operation.
   i. Selsyn-type transmitter for position indication.
   j. Raise and lower switches for manual control.
   k. Current transformer for input to LDC shall be provided separate of other required transformer CTs.
   l. Digital control package Beckwith M2001C with line-drop compensator (LDC) with resistance and reactance adjustments and one current transformer.
   m. Auto-manual selector switch.
   n. Testing terminals.
   o. Static voltage regulating relay.
   p. Control and time delay relays.
   q. Reactance reversing switch.
   r. Control compartment mounted to transformer with terminal blocks, space heaters, interior lighting, and convenience receptacle.
   s. Continuous oil filtering system.
9. LTCs intended for remote operation shall have at a minimum:
   a. Remote-Local selector switch.

b. Remote tap position indicator for mounting on remote control cabinet.
10. Design drive mechanism such that LTC can be manually operated, while transformer is operating under load, safely with no risk to transformer or operator.
11. If mechanism stalls in "Off-Tap" position, whether in automatic or manual operation, LTC shall be capable of maintaining full load indefinitely and an alarm contact shall be provided for remote monitoring.

2.18 ACCESSORIES

A. Provide standard accessories in accordance with ANSI C57.12.10.

B. Provide following devices with at least one set of single-pole, double-throw (SPDT) alarm contacts for each:
1. Magnetic liquid level indicator.
2. Pressure relief device piped such that releases occur away from bushings, control cabinets etc. Include dry Form C contact for remote indication. Wire to control cabinet.
3. Top oil temperature indicator.
4. Loss of control power.
5. Loss of auxiliary ac power alarm devices.

C. Alarm contacts: Indicator contacts, switches, and relays used as alarm contacts shall be ungrounded and suitable for interrupting 0.02 ampere dc inductive, 0.2 ampere dc noninductive, or 2.5 amperes ac noninductive load at 250 volts maximum.

D. Liquid drain and sampling devices.

E. Upper and lower filter press connections.

F. Lifting, moving and jacking facilities.

G. Tilt transformer gages for ease of reading from ground. Mount within 5' (1.5 m) elevation of transformer base.

H. Provide Buchholz fault pressure relay system, sensitive to rate of pressure increase including single-pole, single-throw (SPST) primary element controlling auxiliary seal-in relay and reset switch arranged and connected to provide manually resettable lockout function on operation of primary element.
1. Design auxiliary relay for satisfactory operation on specified dc system. Provide electrically separate contacts for use with remote equipment. Mount inside main control cabinet.
2. Wire rate of pressure rise relay equipment to terminal points in main control cabinet. Provide complete provisions for testing.
3. Fault pressure relay: "Quailitrol."

2.19 IDENTIFICATION AND TAGGING

A. Provide permanent nameplates to identify protective relays, meters, instruments, selector switches, indicating lights, terminal blocks, and other devices within various compartments.

B. Nameplates shall have black lettering on white background. Fasten in place using Type 316 stainless steel, self-tapping screws. Nameplates shall be heat- and UV-resistant.

C. Terminal blocks shall be clearly marked for wiring using permanent printed markers. Each internal interconnecting wire shall be identified at both ends with sleeve type wire markers with from/to information.

2.20 PAINTS AND FINISHES

A. Type: Polyurethane or epoxy, suitable for the environmental conditions.

B. Tank paint: manufacturer's standard ANSI gray.

C. Radiators: manufacturer's standard ANSI gray or bare galvanized steel.

2.21 SOURCE QUALITY CONTROL

A. Transformer no-load and load-loss test results shall be certified by a licensed professional Engineer.

B. Perform routine production and required tests on equipment prior to shipment, in accordance with ANSI C57.12.00.

C. Perform routine accuracy tests on each metering accuracy current transformer in accordance with ANSI C57.13.

D. Witness testing. Notification in writing shall be provided not less than 30 days prior to scheduled starting date of factory test. Provide notification of performance date for each test not less than 10 days prior to date of test to allow witness testing if so desired.

E. Unusual events or damage occurring during fabrication of transformer and of tests, which do not meet specified standard values shall be reported. Inspection of such damages or test failures may be witnessed. Corrective measures to overcome such damage or failure shall be subject to acceptance by Engineer.

F. Temperature test: Not required on individual units if tests exist for thermal duplicate unit of previous manufacture. Copy of test on file shall be furnished.

G. Special tests:
1. Impulse tests:
   a. Perform in accordance with ANSI Standard C57.12.90 using neutral current method of fault detection.
   b. Oscillographic records of test shall be included in test reports.
2. Partial discharge test:
   a. Test for partial discharge in accordance with partial discharge procedures specified in ANSI/IEEE C57.12.14, "Induced Voltage Test for Class II Power Transformers" and "Partial Discharge Measurement" and IEEE C57.113.
   b. Test voltage shall be determined in accordance with ANSI/IEE C57.12.00.
   c. Acceptable measured partial discharge above background:
      1) RIV level:
         a) Lower than 100 microvolts with increase in RIV not exceeding 30 microvolts during 1-hour test.
         b) Shall not exceed 250 microvolts at any time during test.
      2) Apparent charge measurement level below 500 picocoulombs.
   d. Perform partial discharge test after other dielectric tests are completed.
   e. Test report:
      1) Provide test results in both microvolts and picocoulombs
      2) Curve of data obtained in test shall be included in test reports.
3. Megger tests: Perform in accordance with following procedure. Resistance measurements shall be corrected to 20°C.
   a. Perform with transformer filled with oil and with appropriate bushings interconnected to measure resistance from high to ground, low to ground, and from high to low. Perform using applied potential of 2,500 volts.
   b. Perform between core and ground using applied potential of 500 volts.
4. Gas-in-oil: Before testing begins and after tests specified are completed, dissolved gas-in-oil analysis shall be made of main tank oil.
5. Audible sound level: Not to exceed values given in NEMA TR 1 when measured in factory in accordance with NEMA TR 1 test code.
6. Communications test: Perform communications testing on devices with external communications capability and provide test report to document satisfactory operations. Tests shall include, but not be limited to:
   a. Original device manufacturer installation and operational tests.
   b. Signal levels and communications panel.

c. Demonstration of equipment operation during Owner witness tests.
d. Submit test report to document satisfactory operations.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install in accordance with manufacturer instructions, recommended procedures, industry standards and practices, and applicable codes and regulations.

B. Install in accordance with manufacturer's recommended procedures in presence of manufacturer's service representative.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. 3-phase, liquid-filled, pad-mounted, compartmental, power distribution transformers up to 3,750 kVA.

1.02 CLOSEOUT SUBMITTALS

A. Operation and maintenance manuals. Provide as a minimum:
1. General description and technical data, including actual weights and dimensions.
2. Complete Bill of Material.
3. Receiving, storage, installation, handling and testing instructions.
4. Operating and maintenance procedures.
5. Complete set of reviewed drawings that require no further action.
6. Complete documentation of inspections and tests performed, including logs, curves, and certificates. Documentation shall note any replacement of equipment or components that failed during testing.
7. Recommended spare parts list. Bushings shall be included on spare parts list with breakout price.
8. Nameplate information and shop order numbers for each item of equipment furnished.

1.03 MAINTENANCE MATERIALS

A. Provide complete set of special tools required for installation and maintenance for each piece of equipment furnished. Tools and their intended use shall be identified in assembly instructions.

1.04 QUALITY ASSURANCE

A. manufacturer qualifications: Manufacture major components of transformer, ISO compliant, and shall have produced similar equipment for a minimum period of 5 years.

B. Regulatory requirements:
1. Transformers shall be in accordance with applicable requirements of ANSI C57.12.00, C57.12.26, C57.12.22, C57.12.28, C57.12.90, and C57.91.
2. Transformers with a kVA rating smaller than 167 kVA, IEEE/ANSI C57.12.25 shall apply.

PART 2 PRODUCTS

2.01 ENCLOSURE

A. Locate full height, high-voltage and low-voltage cable terminating compartments side-by-side. Grounded steel barrier shall separate compartments.

B. Each terminating compartment shall have a separate door designed such that access to high-voltage compartment is available only after low-voltage compartment has been opened. Provide an additional fastening device accessible only after low-voltage door has been opened, which must be removed to open high-voltage door. Mount doors flush with cabinet frame.
1. Low-voltage door shall have handle-operated, 3-point latching mechanism secured with single padlock. Hex-head bolt shall be used on low-voltage compartment door.
2. Equip high- and low-voltage doors with lift-off type stainless steel hinges and doorstops to secure in open position.
3. Compartment sills, doors, and covers shall be removable to facilitate cable pulling and installation.

C. Cabinet security shall meet NEMA Standards Publication for Transformers, Regulators and Reactors, NEMA TR-1 and ANSI C57.12.28.

D. Size compartments, at minimum, to dimensions of ANSI C58.12.25 or C57.12.26. Compartments shall be large enough to accommodate cable terminations and cable terminating devices including stress cones and elbows.

E. Tank and compartments shall be an integral unit suitable for flush mounting on a pad and capable of anchoring to bolts, or welding to embedded steel channel. Four lifting lugs shall be integral to entire assembly.

F. Furnish grounding provisions in both compartments.

2.02 TANK

A. Main tank shall be of sealed-tank construction designed to withstand a pressure of 7 psig without permanent deformation. Where high molecular weight hydrocarbon or silicone fluids are used shall be manufactured to withstand 12 psig without rupture.

B. Tank covers:
   1. Transformers rated 45-1,000 kVA: Bolted cover for tank access, bolts shall be concealed by cover-guards accessible only from inside of cabinet and be supplied with tamper-resistant access hand holes sized to allow access to internal bushing and switch connections.
   2. Transformer rated 1,500 – 7,500 kVA: Welded cover with hand holes.

C. Construction shall be of cold-rolled or carbon steel plate with seams and joints continuously welded on inside and outside of joints.

D. Construct base to permit rolling or sliding in any direction perpendicular to a tank wall.

E. Tank cover shall be domed to facilitate moisture run-off.

F. Transformer shall remain effectively sealed for a top oil temperature of -5°C thru 105°C.

G. Transformer tank shall meet requirements outlined in ANSI C57.12.25 or C57.12.26.

2.03 INSULATING FLUID

A. Conform to requirements of ASTM D3487 and test in accordance with ASTM D117.

B. Certify that transformer is nonPCB containing no detectable PCBs.

C. Transformer shall be vacuum-filled with appropriate fluid. Process shall be of sufficient vacuum and duration so core and coil assembly is free of moisture prior to filling tank.

2.04 RADIATORS

A. Each radiator assembly shall be individually welded and receive a quality control pressurized check for leaks. Entire tank assembly shall receive similar leak test before tanking. Final 6-hour leak test shall be performed.

B. Provide lifting eyes on each radiator to facilitate removal of radiators. Drain valves shall be provided.

2.05 CORE AND COIL

A. Coil windings shall be 2-winding type, designed to reduce losses. High-voltage and low-voltage conductor shall be copper.

B. Percent impedance voltage, as measured on rated voltage connection, shall be in accordance with ANSI C57.12.26, with tolerances as specified in ANSI C57.12.00.

C. Core material shall be high-grade, grain-oriented, nonaging silicon core steel with high magnetic permeability, low hysteresis, and eddy current losses. Keep magnetic flux densities well below saturation to allow for minimum of 10% overvoltage excitation.

D. Core and coils shall withstand normal moving and handling without use of special shipping braces.

E. Design and manufacturer core and coil assembly to meet short-circuit requirements of ANSI C57.12.90. Brace to withstand short-circuit forces without damage or displacement of coil on core limited only by transformer impedance.

F. Maximum loading capabilities shall be in accordance with ANSI C57.
   1. Tap changers, terminals, leads, and other ancillary equipment shall not restrict loading.
   2. Transformer windings shall be limiting part during overload.

G. Grounded wye to grounded wye transformers shall be designed with a 5 legged, distributed gap, wound core designed with low flux density to reduce noise.

2.06 SOUND LEVEL

A. Meet sound level standards for liquid filled transformers as defined by NEMA and ANSI.

B. Audible sound level for transformers shall not exceed values given in NEMA TR 1 when measured in factory in accordance with NEMA TR 1 test code.

2.07 CONNECTORS AND TERMINALS

A. High-voltage line and neutral bushings shall be externally removable and clamped, suitable for cable sizes and quantities as required.

B. Dead front: Epoxy bushing wells with load-break inserts and elbows.

C. Low-voltage line and neutral bushings shall be molded epoxy with NEMA standard spade terminals.

D. Electrical characteristics of completely assembled, high-voltage connectors shall be as indicated in ANSI C57.12.25 or C57.12.26.

E. Insulation class shall not be less than that of winding to which connected.

F. Quantity, location, and arrangement of high-voltage and neutral connectors and low-voltage and neutral terminals shall conform to ANSI C57.12.25 or C57.12.26.

2.08 TAPS

A. Furnish high-voltage full-capacity taps with a de-energized tap changing mechanism. Tap changer shall be externally operable from tank and located within one of the lockable compartments.

2.09 HIGH-VOLTAGE SWITCHING

A. Where radial or loop feed system switch is required, provide oil-immersed, 3-phase, gang-operated, switch with spring-loaded mechanism for load break and latch operation. Switch shall be mounted near core and coil assembly.
   1. Radial feed: 2-position.
   2. Loop feed: 4-position.

2.10 HIGH-VOLTAGE FUSING

A. Provide overcurrent protection as follows:
   1. Protective fuse link: Internal, oil-immersed, expulsion-type. Sized to operate only in event of an winding failure and isolate transformer high voltage side from source.
   2. Expulsion type fuse: Bayonet-type, oil-immersed, and draw-out for replacement. Hook-stick operable load-break design available for either overload or fault sensing as specified.

3. Current-limiting fuses: Air-immersed in drywell canisters, dead-break draw-out for replacement and hook-stick operable. Limits both current magnitude and energy associated with low impedance faults. Effective for minimizing probability of tank rupture.
4. Partial range current limiting fuses: Oil-immersed, internally block mounted. Applied in series with expulsion-type fuse. Protects against tank rupture.

2.11 ARRESTERS

A. Live front designs shall have mounting nuts welded on tank wall for arrester mounting.

B. Dead front arresters shall not hinder dead front construction in cabinet and usable wherever a load-break elbow can be used.

C. Furnish distribution class surge arresters.

2.12 IDENTIFICATION AND TAGGING

A. Transformer shall be furnished with stainless steel nameplates attached with stainless steel screws or pins in locations clearly visible and readable without requiring unsafe condition. Where nameplate is mounted on removable part, manufacturer's name and transformer serial number shall be permanently affixed to nonremovable part of transformer.

B. Nameplate shall contain standard information in accordance with IEEE/ANSI C57.12.01 and additional information as specified below:
1. Year of manufacture.
2. Certification that transformer is nonPCB as defined in ASTM D4059.
3. Job site temperature.

C. Affix nonPCB decal adjacent to each drain valve.

D. Each internal interconnecting wire shall be identified at both ends with sleeve type wire markers. Markers shall be labeled with from and to information.

2.13 SOURCE QUALITY CONTROL

A. Perform standard factory tests as indicated in ANSI/IEEE C57.12.00. Tests shall be in accordance with latest applicable ANSI and NEMA standards and performed at rated frequency.

B. Test results shall be tabulated, submitted, and approved by Owner prior to shipment.

C. Defects and defective equipment revealed or noted during testing shall be corrected prior to shipment.

D. Jacking points shall be at minimum dimension of 18" (450 mm) from floor line.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install in accordance with manufacturer's recommendations.

B. Provide 4" (100 mm) high housekeeping pad under each indoor transformer, unless indicated otherwise. Level pad such that transformer can be installed directly on top of pad without additional leveling. Provide anchors and other required hardware. Follow manufacturer's instructions for anchoring in place.

C. Make connections to ground grid using fittings designed and rated for intended use.

3.02 FIELD QUALITY CONTROL

A. Testing of transformer shall be performed by a qualified testing agency. Tests shall include:
   1. Measure primary and secondary voltages for proper tap settings.
   2. Megger primary and secondary windings.
   3. Test insulating liquid for proper di-electric strength.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Design, production, testing, delivery, and assembly of outdoor SF6 gas-insulated power circuit breakers (PCB) and related equipment. PCBs shall be complete with accessories ready for installation, connection, and immediate service.

1.02 RELATED REQUIREMENTS

A. Section 26 05 00 – Common Work Results for Electrical.

1.03 CLOSEOUT SUBMITTALS

A. Operation, maintenance, and installation manuals:
   1. In addition to requirements of other sections, provide copies as follows:
      a. One copy of manual set shipped with each breaker.
      b. One copy of manual set shipped directly to site.
      c. One copy of manual set shipped to Engineer.
   2. Manuals shall contain at least following:
      a. General description and technical data.
      b. List of instruments and accessories supplied, listing manufacturer, model number, operating ranges, and equipment tag numbers.
      c. Receiving, storage, installation, and testing instructions.
      d. Operating and maintenance procedures.
      e. Complete set of reviewed drawings that require no further action.
      f. Final test reports clearly indicating satisfactory performance.
      g. Recommended spare parts list.
      h. Complete documentation of inspections and tests performed, including logs, curves, and certificates.

B. Complete set of Record Drawings:
   1. One copy shipped with equipment.
   2. One copy shipped directly to site.

1.04 QUALITY ASSURANCE

A. manufacturer's qualifications:
   1. manufacturer of equipment shall be manufacturer of major components within assembly.
   2. manufacturer shall be ISO 9001 certified.
   3. manufacturer shall have produced similar electrical equipment for a minimum period of 5 years.

B. Regulatory requirements: Design, fabricate, and test equipment in accordance with applicable standards of ANSI, NEMA, NFPA 70, IEEE, and shall be in accordance with applicable requirements of OSHA.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. In accordance with approved Manufacturers and manufacturers list.

2.02 SYSTEM DESCRIPTION

A. Outdoor, 3-pole, single-throw, SF6 gas-filled, single-tank or 3-tank, frame-mounted on common base.

B. If more than one breaker is specified, breakers of same ratings shall be of same design and rating, be duplicates, and have mechanically interchangeable parts.

C. Design with current transformers on both sides of interrupter and on all 6 bushings.

2.03 DESIGN REQUIREMENTS

A. Design shall comply with any unusual service conditions as outlined in C37.010 and ASTM D1472.

B. Design equipment according to applicable sections of most recent local building code R-009.

C. Site conditions: Refer to Section 01 30 00.

2.04 CONTROL WIRING

A. Fusing:
1. Provide 3 separately fused circuits, one for each of following.
   a. Closing circuit.
   b. Trip coil 1.
   c. Trip coil.
2. Fuses for each circuit shall be provided in separate pull-out type fuse blocks.

B. Wiring:
1. Provide control wiring in accordance with ANSI C37.11 as a minimum.
2. Install internal wiring, conduit, terminal boxes, etc. in accordance with Section 26 05 00.
3. Tag internal wiring on both ends with from/to information.
4. Interfaces with external wiring shall be done in terminal boxes provided on circuit breaker.
5. Provide no smaller than No. 14 for control circuits.
6. Provide No. 10 for current transformers.

C. Provide "X" and "Y" relays arranged in an "anti-pump" scheme in closing circuit.

D. Stranded conductors shall have compression, ring-type terminals.

E. Provide fused disconnect switches for control power, heaters and compressor, pump or spring-charging motor.

F. Terminate wiring for external connections by Owner on terminal blocks, General Electric Type EB-25, or equal, with secondary current transformer leads terminated on General Electric Type EB-27, or equal, terminal blocks in control cabinet.

G. Control voltage ranges for closing and tripping shall be in accordance with ANSI C37.06.

2.05 FUNCTIONAL COMPONENTS

A. Circuit breaker:
1. Ratings: As specified.
2. Operating mechanism: Pneumatic, hydraulic, or motor-charged spring with features and performance in accordance with NEMA SG4, Section 3.
3. Aange mechanism and control for three phase operation.
4. Provide mechanical operation counter.
5. Mechanical indicator shall show breaker position and condition of stored-energy mechanism. Provide position indicator for external viewing.
6. Provide emergency manual trip device operable from outside control cabinet.

B. Provisions for travel recorder connection.

C. Welds on breaker tank assembly shall meet AWS D1.1 Section 5.30. Remove weld splatter.

D. Bushings:
1. Type: Porcelain, in accordance with IEEE C57.19.01.
2. Conform to general requirements of and test in accordance with IEEE C57.19.00.

3. Use manufacturer's standard dimensions and characteristics. Electrical characteristics shall comply with IEEE C57.19.01.
4. Terminals:
   a. Provide terminal connectors with tinned bronze pads with NEMA drilling, suitable for connection to aluminum hardware.
   b. Provide bushing stud connector corona rings.
   c. Provide terminals with vertical aluminum or tinned copper pads, NEMA 4-hole drilling.

E. Pressure components and systems shall comply with NEMA SG4, Part 4.

F. Auxiliary switches:
1. Provide minimum of 16 "a" and 16 "b" contacts, all electrically separate, in addition to those normally required as part of circuit breaker operation and indicating light functions.
2. Wire contacts to terminal blocks in control cabinet even if not used.

G. Provide NEMA 2-hole grounding pads; 2 per breaker located on diagonally opposite corners.

H. Provisions for travel recorder connection for each shipping component.

I. Trip coils:
1. Provide each breaker with dual trip coils.
2. Trip coils shall be electrically, magnetically, and mechanically independent of each other.
3. Each trip coil shall operate from direct current and be wired to separate terminal blocks.

J. Close and trip coils shall not be wound as a common armature. Coils shall be capable of independent replacement.

K. Provide emergency manual trip device operable from outside control cabinet.

L. Provide ANSI Device 43 "Local-Remote" selector switch. Wire spare contacts to terminal blocks.

M. LED indicating lights.
1. 1-tank design: 1 red for each trip coil; 1 green for close.
2. 3-tank design: Each tank shall have 1 red for each trip coil and 1 green for close.

N. Provide mechanical or electrical operation counter for each tank.

O. Compressor or pump motors:
1. Provide elapsed operating time indicator for each tank.
2. Fuse each tank separately.

P. Provide position indicator for each tank.

Q. Pressure gage:
1. Temperature-compensated pressure gage with 2-level pressure switches, one level for alarm purposes and other for tripping and blocking closing circuit on critical pressure.
2. Provide at least 2 spare Form C contacts for each level and rated for alarming and tripping duty.
3. Provide nameplates with normal, alarm, and critical pressure levels.

R. Provide common SF6 gas system and one pressure gage for each breaker.

S. Alarms:
1. Wire alarm contacts to terminal blocks located in control cabinet.
2. Provide common alarm contact from annunciator for remote indication.

T. Accessories:
1. Provide 2 each, total:
   a. General maintenance tools.
   b. Touch-up paint kit.

2. Filling hose, gages, fittings, connectors, and adapter fittings for attaching gas cylinders to breakers for filling.
3. Other components and accessories in accordance with NEMA SG4, Section 3.

U. TRV capacitors:
1. If TRV capacitors are required to meet interrupting ratings, capacitors shall be rated as appropriate by manufacturer.
2. Mount capacitors on each breaker pole and provide with hardware and accessories necessary.
3. Coordinate ratings with CCVTs and other capacitors located within substation.

2.06 CURRENT TRANSFORMERS

A. Accuracy classification, characteristics, and performance data in accordance with IEEE C57.13 and NEMA SG4.

B. Turns between any 2 taps on secondary windings shall be uniformly distributed along entire coil.

C. If external current transformers are supplied separate from breaker, provide metal, watertight NEMA 12 junction box mounted on center phase of current power circuit breaker stands and leads shall terminate on General Electric Type EB-27, or equal, terminal blocks inside of box.

D. Provide secondary wiring leads from all 3 current transformers in rigid metal conduit.

E. Provide housing covers to prevent birds from building nests.

F. Furnish with accuracy class, ratios, and quantities per design requirements.

G. Provide following for each type:
1. Relaying: Bushing-type, fully distributed, 5-lead, multiratio.
2. Metering: Bushing-type, fully distributed, single- or dual-ratio.

H. Wire ratios to terminal blocks in control cabinet.

2.07 INSULATING MEDIUM

A. Design circuit breakers to operate with single-pressure sulfur hexaflouride (SF6) gas.

B. SF6 shall comply with applicable ASTM standards.

C. Furnish gas in standard industrial-type cylinders with OSHA-approved mounting device.

2.08 AUXILIARY POWER AND CONTROL CABINET

A. Enclose control equipment in weatherproof cabinet suitable for the installed environmental conditions.

B. Locate on power circuit breaker at height suitable for operation by a person standing at ground level.

C. Ventilation shall be weatherproof, bug-proof type; and covered with noncorrosive replaceable screen or filter.

D. Doors:
1. Arrange doors(s) to make accessible those parts of mechanism usually requiring inspection or maintenance.
2. Door(s) shall be hinged and have provisions for installing a lock.

E. Locate wiring terminations, including CT secondaries and power and control circuits, in control cabinet only.

F. Terminal block shall include 10% spare capacity for future use (10 terminal minimum).

G. Fuse holders:
   1. Mount spare fuse holders inside control cabinet.
   2. Clearly label fuse holders with fuse type and size.

H. Provide 2 space heaters in mechanism housing; 1 arranged for continuous operation and 1 controlled by adjustable thermostat for heat and humidity control.

I. Provide single-phase, 120 volts ac, 20-ampere, duplex ground fault circuit interrupter receptacle.

J. Cabinet light:
   1. 120-volt ac, 100-watt with "On-Off" switch in control mechanism housing and compressor cabinet for illumination.
   2. Overcurrent protection device within cabinet shall protect fixture.
   3. Confirm cabinet lamps are readily available within Owner's service area.

2.09 IDENTIFICATION AND TAGGING

A. Nameplates:
   1. Provide permanent nameplates to identify protective relays, meters, instruments, selector switches, indicating lights, terminal blocks, and other devices within various compartments.
   2. Electrical control components shall be clearly and indelibly identified with reference designation numbers and/or letters on or near them and so designated on wiring and schematic diagrams.
   3. Nameplates shall have black lettering on white background.
   4. Fasten in place by Type 316 stainless steel, self-tapping screws.

B. Terminal blocks:
   1. Terminal blocks shall be clearly marked for wiring.
   2. Each internal interconnecting wire shall be identified at both ends with sleeve type wire markers, Floy Tag Manufacturing, Inc., or equal.

C. Tag equipment with tag number per Owner requirement.

2.10 PAINTS AND FINISHES

A. Primer coat:
   1. Pigment shall include zinc-chromate with no rust exciting pigments.
   2. Vehicle used shall be designed to give maximum adhesion to equipment being painted as well as to provide tight undercoat for succeeding coats.

B. Intermediate and finish coats:
   1. Finish: Extremely resistant to fumes, weather, temperature changes, oil and other environmental conditions to which it may be exposed.
   2. Paint shall have longwearing, nonchalking, nonfading qualities and be applied to a thickness to be highly durable.

C. Method of applying paint:
   1. Surfaces of tanks, covers, and bases shall be grit blasted to SSPC SP10-63 near white metal before painting.
   2. Surfaces shall be free from moisture, oil, dirt, rust, scale, and other foreign material prior to painting.
   3. Surface and paint shall be same temperature at time of painting.
   4. Primer coat shall be applied within 3 hours of grit blasting.
   5. After primer coat has thoroughly air dried, 2 coats of paint shall be applied.
   6. Each coat shall be allowed to thoroughly air dry before next coat is added.
   7. Paint shall be applied in dust-free atmosphere.
   8. Surfaces shall be sprayed, dipped, or painted by "flow method."
   9. Each coat, including primer coat, shall be at least 1.5 to 2.0 mils thick.
   10. Total thick-ness of all coats shall be minimum of 4.5 to 6.0 mils.

11. Hinges, joints, bends, crevices, and other parts exposed to external atmosphere shall be thoroughly protected with primer and paint.

2.11 SOURCE QUALITY CONTROL

A. Each circuit breaker furnished shall be completely assembled and tested at manufacturer's facility.
   1. Perform production tests in accordance with NEMA SG4 and ANSI/IEEE C37.09.
   2. Operating mechanisms shall be tested for proper operating speed in accordance with ANSI C37.09.
   3. Components shall be given dielectric test if applicable, in accordance with ANSI/IEEE C37.09.
   4. Furnish certification each type, style, and model bushing has passed test requirements of IEEE C57.19.01.
   5. Furnish certification bushing-type current transformers have been tested and meet requirements of ANSI C57.13 for continuous thermal current, thermal short-time and mechanical short-time ratings, and applied potential.

B. Tests shall be performed at rated frequency specified.

C. Notify Owner at least 2 weeks prior to breaker shop test to give Owner opportunity to observe test if desired. Each bushing shall be power factor tested.

D. Provide 3 certified copies of test data and reports.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install in accordance with manufacturer instructions, recommended procedures, industry standards and practices, and applicable codes and standards.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Design, manufacturing, installation, and testing of generator circuit breaker.

B. Generator circuit breaker (GCB) and related equipment shall be designed and fabricated for connection between generator and generator step-up transformer using isolated-phase bus.

C. Design shall be in accordance with accepted industry practices for electrical power generation.

D. Provide components necessary to form complete generator circuit breakers as specified.

E. Provide on site testing and technical support by manufacturer's engineering representative to assist with commissioning of generator circuit breakers.

F. Generator circuit breaker shall be installed on elevated steel platform located at project site and provide generator circuit breaker connections to isolated-phase bus duct.

1.02 CLOSEOUT SUBMITTALS

A. Operation and maintenance manuals.
1. General description and technical data.
2. Receiving, storage, installation, and testing instructions.
3. Operating and maintenance procedures.
4. Complete set of final drawings.
5. Complete documentation of inspections and tests performed, including logs, curves, and certificates. Documentation shall note replacement of equipment or components that failed during testing.
6. Spare parts lists.
7. Installation field reports.

1.03 MAINTENANCE MATERIALS

A. Supply with each generator circuit breaker all spares and tools required for startup. Provide , as minimum:
1. 20% spare fuses.
2. 20% spare indicating lights,.
3. 1 auxiliary relay of each type used.
4. 1 motor contactor of each type used.

1.04 QUALITY ASSURANCE

A. manufacturer of equipment shall be manufacturer of major components within assembly.

B. manufacturer shall be ISO 9000 certified.

C. manufacturer of equipment shall have produced similar electrical equipment for a minimum period of 5 years.

D. When requested by Engineer, provide acceptable list of similar equipment installations complying with requirements of this specification.

E. Design, fabricate, and test equipment in accordance with applicable standards of ANSI, NEMA, NFPA 70, IEEE, and shall be in accordance with applicable requirements of OSHA.

F. Testing:
   1. manufacturer:
      a. Furnish type written certified test reports for equipment offered.
      b. As a minimum, perform tests as specified in ANSI C37.013 on furnished equipment and provide type written certified test results for all tests performed in factory and on site.
      c. Provide quality plan to review manufacturing procedure of equipment.
      d. Tests shall comply with relevant standards and requirements according to system data.
   2. Design tests/type tests: Verify adequacy of design to meet specified ratings under specified operating conditions shall be made on GCB system.
   3. Production tests/routine tests: Bidder shall submit list of routine tests anticipated.
   4. Tests after delivery/site tests:
      a. Site tests shall be performed on GCB system to confirm equipment was not damaged during shipping and to check operation of GCB system under actual conditions at Site.
      b. manufacturer shall furnish technical support to review commissioning procedures and list of tests to be performed at Site.

1.05 ENVIRONMENTAL REQUIREMENTS

A. Design shall comply with any unusual service conditions as outlined in C37.013 and ASTM D1472

B. See Section 01 30 00 for environmental design conditions.

PART 2 PRODUCT

2.01 SYSTEM DESCRIPTION

A. Three-pole, single-throw, SF6 gas-filled, 3-tank, frame-mounted on common base.

B. At a minimum include following components:
   1. Current transformers on transformer side.
   2. Surge arrester on transformer side.
   3. Surge capacitors on transformer side.
   4. Voltage transformers on transformer side.
   5. Series disconnector.
   6. Short circuiting link/breaking switch.
   7. Circuit breaker.
   8. Earthing switch on generator side.
   9. Voltage transformers on generator side.
   10. Surge capacitors on generator side.
   11. Current transformers on generator side.

2.02 GENERAL REQUIREMENTS

A. Performance of generator circuit breakers supplied under this EPC Contract shall meet ratings and performance specifications of this technical section.

B. Environmental exposure to presence of one or more of following:
   1. Salt spray.
   2. High humidity area.
   3. Strong industrial emissions.
   4. Excessive or abrasive dust.
   5. Dripping water.

C. Generator circuit breaker shall be:
   1. Suitable for outdoor installation.
   2. Suitable for application at generator terminals with no transformation of voltages between generator and breaker.
   3. Design and associated ratings shall be capable of switching load currents, transformer magnetization currents, out-of-phase currents, and fault currents.

4. Capable of synchronizing generator to electrical system.
5. Supplied to withstand project site ambient and environmental conditions.
6. Supplied as a complete stand-alone assembly and be designed for installation in a run of isolated-phase bus duct .
7. Not require external connections other than control and auxiliary power supplied by others for normal operation.

D. Provide coordination of isolated-phase bus duct design. Communicate required details to manufacturer of isolated-phase bus duct for proper design and coordination requirements between generator breaker and isolated-phase bus duct.

2.03 RATINGS

A. In accordance with Contractor's design requirements for the power generation units and the connected electrical system.

2.04 FUNCTIONAL COMPONENTS

A. Provide completely assembled circuit breaker.

B. Interrupter:
1. For current interruption, self-blast interrupting principle shall be applied.
2. Arc voltage of circuit breaker shall be high enough to ensure current zeros in case of generator-source short-circuit currents with delayed current zeros.
3. Provide breaker with 2 separate contact systems, one for load current carrying and one for arc interruption.
4. Capable of interrupting currents under out-of-phase conditions with out-of-phase angles up to 180°.
5. Circuit breaker with contacts open and insulating gas at atmospheric pressure shall be capable of withstanding 3 times phase to ground voltage to ensure circuit breaker in open position is capable of withstanding voltages under conditions when 2 systems are out-of-phase.
6. All parts of insulation structure, including those between phases to earth and across open contacts, shall be of an inherently stable nature with minimum susceptibility to dielectric tracking.

C. Operating mechanism:
1. Pneumatic, hydraulic, or motor-charged spring with features and performance in accordance with NEMA SG4, Section 3.
2. Breaker operating mechanism and control shall be arranged to permit multiple trip and close.
3. Drive linkages and other parts,shall have ample mechanical strength to withstand, without damage, stresses incident to operation within rated short-circuit current or related required capabilities of circuit breaker, and stresses resulting from mounting, moving or maintaining circuit breaker in proper manner.
4. Only external requirement for operation shall be electrical supplies.
5. Mechanism operates circuit breaker through mechanical linkage operating all 3 poles.
6. Capacity of energy facilities: Of sufficient size to store at least 2 complete close-open operations.
7. Design shall be co-coordinated to ensure positive opening of circuit breaker and circuit interruption, whether tripping impulse is received in fully closed or any partially closed positions.
8. For purposes of inspection and adjustment, provide means to permit local operation of circuit breaker.
9. Supply emergency operating lever to allow manual opening and closing of circuit breaker.
10. Time between first and last pole to open or close shall not exceed 36 electrical degrees (2 ms).

D. Electrical trip-free and prevent pumping.

E. Bushings:
1. Porcelain type provided in accordance with IEEE C57.19.01.
2. Conform to general requirements and be tested in accordance with IEEE C57.19.00.
3. Use manufacturer's standard dimensions and characteristics. Electrical characteristics shall comply with IEEE C57.19.01.

4. Terminals: Provide terminal connectors with tinned bronze pads with NEMA drilling compatible with isolated phase bus connections,
5. Provide bushing stud connector corona rings.

F. Pressure components and systems shall comply with NEMA SG4, Part 4.

G. Auxiliary switches: Provide minimum of 16 "a" and 16 "b" contacts, all electrically separate, in addition to those normally required as part of circuit breaker operation and indicating light functions. Contacts shall be wired to terminal blocks in control cabinet even if not used.

H. Provide NEMA 2-hole grounding pads; 2 per breaker located on diagonally opposite corners.

I. Provisions for travel recorder connection for each shipping component.

J. Trip coils:
1. Provide each breaker with 2 trip coils.
   a. Primary circuit: Wired in normal circuit breaker control scheme.
   b. Secondary circuit: Wired to terminal blocks for customer use. Include interlocking associated with primary circuit.
2. Trip coils shall be electrically, magnetically, and mechanically independent of each other.
3. Each trip coil shall operate from direct current and be wired to separate terminal blocks.

K. Circuit breaker control: For each circuit breaker, upon loss of drive energy, control power supply or SF6-gas, breaker shall remain in fully closed or open position.

L. Close and trip coils shall not be wound as a common armature. Coils shall be capable of independent replacement.

M. Provide emergency manual trip device operable from outside control cabinet.

N. ANSI Device 43 "Local-Remote" selector switch as required.

O. LED indicating lights. Each tank shall have one red for each trip coil and one green for close.

P. Provide mechanical or electrical operation counter for each tank.

Q. Compressor or pump motors:
1. Provide elapsed operating time indicator for each tank.
2. Fuse each tank separately.

R. Provide position indicator for each tank.

S. Pressure bage:
1. Provide temperature-compensated pressure gage with 2-level pressure switches, one level for alarm purposes and other for tripping and blocking closing circuit on critical pressure.
2. Provide at least 2 spare Form C contacts for each level and rated for alarming and tripping duty. Also, provide nameplates with normal, alarm, and critical pressure levels.

T. Provide common SF6 gas system and one pressure gauge for each breaker.

U. Alarms:
1. Provide alarm contacts wired to annunciator located in control cabinet.
2. Provide a common alarm contact from annunciator for remote indication.

V. Accessories: Provide 2 each, total for contract.
1. General maintenance tools.
2. Touch-up paint kit.
3. Gas fill kit : Include filling hose, gages, fittings, connectors, and adapter fitting(s) for gas cylinders to breakers for filling.

4. Operation counter.
5. SF6 density monitor.
   a. Supply SF6 gas density monitor, equipped with temperature compensated density switch, for monitoring 3 phases of circuit breaker.
   b. Provide minimum of 2 contacts of density switch to indicate gas density has reached level where refilling gas volume is necessary.
   c. Provide minimum 2 additional contacts, connected to each trip circuit, to prevent tripping of circuit breaker when gas density falls below critical level.
6. Mechanical position indicator to indicate open or closed position of circuit breaker.
7. Manual operation device for maintenance purposes.

W. Conductors of active parts:
1. Highly-conductive copper or aluminum.
   a. Bus joints shall have silver-to-silver contact surfaces.
   b. Insulating supports shall meet dielectric strength requirements specified, and capable of withstanding mechanical forces imposed by closing and opening operations and by currents specified.
2. Make connections of current path with bolted, flexible connectors, to be supplied by isolated-phase bus manufacturer.
3. GCB switchgear manufacturer shall furnish to isolated-phase bus manufacturer pertinent details including forces transmitted to bus during circuit breaker operations and terminal configuration required for design of connections.

X. Generator circuit breaker system enclosure:
1. Design GCB switchgear for welded connections to isolated-phase bus enclosures. Construct each single-phase enclosure out of aluminum capable of carrying induced sheath current equal to current ratings specified.
2. In order to avoid pollution due to ingress of dust and moisture, design enclosure to allow airtightness and to withstand slight internal overpressure.
3. Provide inspection windows in each single phase enclosure to allow visual checks of individual GCB switchgear assembly's positions.

Y. Grounding pads:
1. Copper grounding pads on GCB switchgear and supports.
2. Locate at base of supporting structures and switchgear.

2.05 DISCONNECTOR

A. Provide on transformer-side in series to circuit breaker.

B. Telescopic unit with sliding tubular contact, with its hinged point on transformer-side and with operating mechanism operating through mechanical linkage all 3 poles.

C. Isolating gap of disconnector: In air of atmospheric pressure and window provided in GCB-system enclosure to allow visual checking of its position.

D. Control of disconnector including interlocking circuit: Accommodated in GCB-system control cubicle. Provide local/remote switch and push-buttons for local control.

E. Operating mechanism:
1. Operated by 3-phase motor, heavy-duty construction type designed to complete normal travel to either "Open" or "Close" position, once started, without holding control switch continuously in that position. Any means of stopping travel between fully open and closed position are not acceptable.
2. Key interlocking shall be available to allow different modes of operation to be selected. Provide mechanically driven semaphore for signaling close/open-position and crank handle for manual operation in case of emergency.

2.06 GROUNDING SWITCHES

A. Provide on generator side of circuit breaker.

B. Blade-type, air-insulated, gang-operated with motor drive, with switch hinge point connected to ground and integrated together with circuit breaker and disconnector into each of single-phase tubular aluminum enclosures, forming straight section in run of isolated-phase bus.

C. Making- or breaking capability is not required for grounding switches.

D. Interlock operation with circuit breaker and disconnector.

E. Control:
1. Interlocking circuits shall be accommodated in GCB-system control cubicle.
2. Provide local/remote switch and push-buttons for local control.

F. Operating mechanism:
1. Operated by 3-phase motor, heavy-duty construction type and designed to complete its normal travel to either "Open" or "Close" position, once started, without holding control switch continuously in that position.
2. Any means of stopping travel between fully open and closed position are not acceptable.
3. Key interlocking shall be available to allow different modes of operation to be selected.
4. Provide mechanically driven semaphore for signaling close/open-position and crank handle for manual operation in case of emergency.

2.07 CONTROL WIRING

A. Fusing:
1. Provide 3 separately fused circuits; 1 for each of following:
   a. Closing circuit.
   b. Trip Coil 1.
   c. Trip Coil 2.
2. Fuses for each circuit shall be provided in separate pull out type fuse blocks.

B. Wiring:
1. Internal wiring, conduit, terminal boxes, etc. installed by manufacturer shall be done in accordance with applicable articles of Section 26 05 00.
2. Provide control cubicle with conventional, hard-wired control and supervisory equipment. WAGO-terminals, halogen free cables and wires, rated at 120°C with cross section 1.5mm^2 for internal wiring, 2.5mm^2 for motor circuits, internal wiring of instrumentation transformers and 6mm^2 for instrument transformers, conventional apparatuses.
3. Terminal marking with connection designation
4. Tag internal wiring on both ends with from/to information.
5. Perform interfaces with external wiring in terminal boxes provided on circuit breaker.
6. Provide no smaller than No. 14 wire for control circuits.
7. Provide No. 10 wire for current transformers.

C. Provide "X" and "Y" relays arranged in "anti-pump" scheme in closing circuit.

D. Stranded conductors shall have compression, ring-type type terminals.

E. Provide fused disconnect switches for control power, heaters and compressor, pump or spring-charging motor.

F. Control voltage ranges for closing and tripping shall be in accordance with ANSI C37.06.

2.08 CURRENT TRANSFORMERS

A. Accuracy classification, characteristics, and performance data in accordance with IEEE C57.13 and NEMA SG4. Turns between any 2 taps on secondary windings shall be uniformly distributed along entire coil.

B. If external current transformers are supplied separate from breaker, provide metal watertight NEMA 12 junction box mounted on center phase of current power circuit breaker stands and leads shall terminate on terminal blocks inside of box. Provide secondary wiring leads from all 3 current transformers in rigid metal conduit.

C. Provide housing covers that prevent birds from building nests.

D. Current transformers shall be furnished with an accuracy class, ratios, and quantities as required.

E. Provide following for each type:
1. Relaying: Bushing type, fully distributed, five lead, multi-ratio.
2. Metering: Bushing type, fully distributed, single or dual ratio.

F. Wire all ratios to terminal blocks in control cabinet.

2.09 INSULATING MEDIUM

A. Design circuit breakers to operate with single-pressure sulfur hexaflouride (SF6) gas.

B. SF6 shall comply with ASTM standards.

C. Furnish gas in standard industrial type cylinders with OSHA approved mounting device.

2.10 AUXILIARY POWER AND CONTROL CABINET

A. Accommodate necessary equipment for local/remote changeover facilities, control, monitoring, supervision and interlocking of system.

B. Degree of ingress protection suitable for installed environmental conditions.

C. Enclose control equipment in weatherproof cabinet located on power circuit breaker at height suitable for operation by a person standing at ground level. Ventilation shall be weatherproof bug-proof type, and covered with noncorrosive replaceable screen or filter.

D. Doors(s) shall be arranged to make accessible those parts of mechanism usually requiring inspection or maintenance. Door(s) shall be hinged and have provisions for installing a lock.

E. Locate wiring terminations, including CT secondaries and power and control circuits, in control cabinet only.

F. Terminal Block shall include 10% spare capacity for future use (10 terminal minimum).

G. Mount spare fuse holders inside control cabinet. Clearly label fuse holders with fuse type and size.

H. Provide 2 space heaters in mechanism housing, 1 arranged for continuous operation and 1 controlled by adjustable thermostat for heat and humidity control.

I. Provide single-phase, 120-volt ac, 20-ampere, duplex ground fault circuit interrupter receptacle.

J. Cabinet lighting:
1. Provide 100-watt cabinet light with "On-Off" switch in control mechanism housing and compressor cabinet for illumination
2. Overcurrent protection device within cabinet shall protect fixture.

3. Confirm that cabinet lamps are readily available within Owner's service area.

K. Mimic diagram:
1. Provide with position indicators integrated in lighted (LEDs) push-button switches for circuit breaker, disconnector, earthing switch.
2. Mount behind glass window in control cubicle front panel.

L. Wire spare auxiliary contacts on proposed equipment to terminal blocks. Identify terminals and control wires in proper manner.

M. Installation: Next to breaker assembly.

2.11 VOLTAGE TRANSFORMERS (VTs)

A. Single-phase, cast resin type with 1 or 2 secondary windings.

B. Accessible through removed top cover of GCB-system enclosures.

C. Provide basic impulse level and power frequency withstand level as specified for system.

D. Secondary windings: Permanently wired to terminal blocks into GCB-system control cubicle.

E. VTs shall have capability of withstanding secondary short circuit for not less than 1 second.

F. Protection:
1. Primary circuit: Current-limiting fuses. Mount on draw-out type removable carriage unit designed to isolate and ground potential circuits when unit is in fully withdrawn position.
2. Secondary circuit: Protect by use of DIN rail-mounted, miniature circuit breakers with dry contact wired to terminal blocks for alarm signal on VT circuit trip. Wire contacts in parallel at terminal blocks.

2.12 SURGE PROTECTION EQUIPMENT

A. Surge arresters: Metal-oxide with polymer housings and sheds of silicone fitted at transformer side in each phase of GCB-system to provide protection against overvoltages for equipment connected to generator busbar.

B. Surge capacitors:
1. Metalhoused-type using synthetic aromatic oil as dielectric.
2. Mount on generator and transformer side in each phase of generator circuit breaker to provide additional protection for equipment connected to generator busbar against overvoltages and to limit rate-of-rise of transient recovery voltage.
3. Fit externally to GCB-system enclosures and connect via porcelain bushings to main conductor.
4. Rated as appropriate by manufacturer for use and application specific to project.
5. Mount capacitors on each breaker pole. Provide with hardware and accessories necessary for a complete and operable system.

2.13 SHORT-CIRCUITING SWITCH FOR RELAY SETTING

A. Provide for facilitation of ungrounded 3-phase short-circuit on generator side of GCB-system unit.

B. Short-circuiting connection with switch shall expedite testing and adjustment of power plant protection system.

C. Closure of switch shall establish ungrounded 3-phase short-circuit, which can be switched to generator terminals by closing circuit breaker.

2.14 IDENTIFICATION AND TAGGING

A. Provide permanent nameplates to identify protective relays, meters, instruments, selector switches, indicating lights, terminal blocks, and other devices within various compartments.

B. Electrical control components shall be clearly and indelibly identified with reference designation numbers and/or letters on or near them and so designated on wiring and schematic diagrams.

C. Nameplates shall have black lettering on white background. Fasten in place by Type 316 stainless steel, self-tapping screws.

D. Terminal blocks shall be clearly marked for wiring. Each internal interconnecting wire shall be identified at both ends with sleeve type wire markers.

2.15 PAINTING

A. Design surfaces of circuit breaker, operating mechanism and other parts exposed to possible corrosion to prevent accumulation of moisture.

B. Primer coat:
1. Pigment shall include zinc chromate with no rust exciting pigments.
2. Vehicle used shall be designed to give maximum adhesion to equipment being painted as well as to provide a tight undercoat for succeeding coats.

C. Intermediate and finish coats:
1. Finish: Extremely resistant to fumes, weather, temperature changes, oil and other environmental conditions to which it may be exposed.
2. Paint shall have longwearing, nonchalking, nonfading qualities and be applied to a thickness to be highly durable.

2.16 SOURCE QUALITY CONTROL

A. Notify Owner at least 2 weeks prior to breaker shop test to give Owner opportunity to observe test if desired. Each bushing shall be power factor tested.

B. Each circuit breaker furnished shall be completely assembled and tested at manufacturer's facility.
1. Perform production tests in accordance with NEMA SG4 and ANSI/IEEE C37.09.
2. Operating mechanisms shall be tested for proper operating speed in accordance with ANSI C37.09.
3. Components shall be given dielectric test if applicable, in accordance with ANSI/IEEE C37.09.
4. Furnish certification each type, style, and model bushing has passed test requirements of IEEE C57.19.01.
5. Furnish certification bushing-type current transformers have been tested and meet requirements of ANSI C57.13 for continuous thermal current, thermal short-time and mechanical short-time ratings, and applied potential.

C. Tests shall be performed at rated frequency.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install generator circuit breaker on elevated platform at project site in accordance with manufacturer's recommendations and installation instructions.

B. Assemble as required and install on concrete foundation(s) provided by others.

C. Installation shall be in strict accordance with instructions furnished by manufacturer.

D. Storage procedures:
1. Energize and maintain 1 heater in circuit breaker mechanism housing.

2. Store gas cylinders in accordance with OSHA requirements and with manufacturer's instructions.

E. Furnish and install bushing terminal connectors as required for connections to buses.

F. Furnish and install connectors as required for connections to ground grid.

G. Placement of insulating medium: If gas is shipped separately from equipment, gas placement shall be in accordance with manufacturer's instruction.

3.02 GAS FILLING

A. Filling of circuit breakers with gas insulating medium shall be conducted in strict accordance with manufacturer's instructions and under supervision of manufacturer's service representative.

B. Sample and test gas being installed to demonstrate compliance with requirements of circuit breaker manufacturer.

C. Contractor shall be responsible for and shall replace any gas contaminated by faulty handling at no additional cost to Owner.

3.03 MANUFACTURER'S FIELD SERVICES

A. Service representative shall be provided by manufacturer to supervise and/or check installation. Provide labor required to assist service representative in checking and testing equipment.

3.04 FIELD QUALITY CONTROL

A. Inspection after delivery/site tests:
1. Perform inspections, adjustments, and tests on generator circuit breaker system in accordance with manufacturer's instructions.
2. Confirm equipment was not damaged during shipping and to check operation of GCB-system under actual conditions at Site.

B. Perform checks, adjustments, and tests required by ANSI C37.013, manufacturer's instructions and service representative before circuit breaker is placed in service.

C. manufacturer shall provide generator circuit breaker system commissioning procedures, a list of tests to be performed at Site, and manufacturer's engineering representative to assist with commissioning of generator circuit breaker system at project site.

D. Perform acceptance test as described in NETA testing requirements.

E. Wiring checkout shall include insulation and continuity tests of cables and conductors installed under this Contract.

F. Contractor shall bear all costs in connection with field-testing and correcting deficiencies disclosed as well as any costs of damages to wiring, instruments or equipment that may be damaged in checkout process.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Grounding system requirements providing protection of equipment and personnel.

1.02 QUALITY ASSURANCE

A. manufacturer qualifications:
   1. Grounding assembly manufacturer shall be manufacturer of major components of ground system.
   2. manufacturer shall be ISO certified.

B. Regulatory requirements: Design, manufacture, and test ground system and accessories in accordance with applicable requirements of NFPA 70, IEEE STD 80, IEEE STD 81, IEEE STD 142 IEEE STD 837 codes and regulations.

1.03 DELIVERY, STORAGE, AND HANDLING

A. During delivery and storage, handle equipment to prevent damage.

B. Store equipment in clean, dry place. Protect from weather, dirt, water, construction debris, and physical damage in accordance with manufacturer's instructions.

PART 2 PRODUCTS

2.01 SYSTEM DESCRIPTION

A. Grounding system includes, but is not limited to, rods, cable, connectors and miscellaneous hardware and materials.

2.02 MATERIALS

A. Grounding materials shall be new and undamaged.

B. Ground rods: Copper-clad steel not less than 3/4" (19 mm) in diameter and 10' (3 m) in length. Ground rods shall be UL listed with not less than 10 mils of Copper cladding and stamped near top of rod to show manufacturer, diameter, and length with one end pointed to facilitate driving. If ground rod is longer than 10' (3 m), use sectional, threaded ground rods.

C. Bare ground cable: Soft drawn copper in accordance with ASTM B3, Class A or B stranding, not less than No. 4/0 AWG (120 mm^2) in accordance with ASTM B8.

D. Insulated ground conductors shall have green colored insulation.

E. Ground conductors shall be bare or have green colored insulation or marked with green colored tape or adhesive labels at each end and at every point where conductor is accessible.

F. Connections shall be made using an exothermic welded process or compression system.
   1. Exothermic molds and weld metal shall be selected for connection and be made in strict accordance with manufacturer's instructions.
   2. Where compression type connections are used, provide tools and proper dies as recommended by manufacturer.
   3. Where flush ground plates are to be embedded in concrete, ground cable shall be exothermally welded to plate and plate firmly secured to concrete forms.

G. Above-grade connections shall be provided as required to ground all structures, fence, buildings, electrical and control equipment.

H. Above-grade clamps and other hardware used with grounding system shall be bronze or copper alloy.

I. Above ground bolts, washers, and nuts shall be silicon bronze alloy or approved type of cadmium-plated steel.

J. Connections to ground rods and ground cables to be buried in earth or concrete shall be suitable for direct burial and shall be identified for such use.

K. Ground fence components including posts, gates, fabric, and barbed wire.
   1. Ground gates using flexible, tinned copper braid.
   2. Connectors to posts shall be non-corrosive, high-conductivity copper. Connect ground to a maximum of every third post unless indicated otherwise on the drawings.
   3. Cable to fence fabric and barbed wire shall be aluminum.

PART 3 EXECUTION

3.01 EXAMINATION

A. Verify Site conditions are acceptable for installation.

B. Verify grounding system components are in good condition and undamaged.

3.02 INSTALLATION

A. Install at locations as required to provide an effective ground system and in accordance with manufacturer's recommendations.

B. Coordinate interface installation with existing grounding systems.

C. Connect electrical equipment to ground grid with ground conductor. Electrical equipment shall be designated as metallic structures including equipment mounted thereon, instrument transformers, surge arrestors, overhead shield wires, transformers, breakers, voltage regulators, enclosures, switchgear, raceways, junction boxes, outlet boxes, cabinets, machine frames, and other conductive items in close proximity with electrical circuits, operate continuously at ground potential, and provide low impedance path for possible ground fault currents.

D. Install separate, green-insulated equipment grounding conductor in conduit with related phase and neutral conductor.

E. Multiconductor power cables shall have dedicated grounding conductor integrated within cable construction.

F. Ground medium-voltage cable shields at each end using cable termination shield grounding kits supplied with medium voltage terminations. Install in strict accordance with manufacturer's instructions.

G. Ground motors with ground conductor originating at ground lug in equipment where motor power is supplied and connected to motor frame inside motor terminal conduit box. Where motor has separately mounted starter or disconnect switch, ground conductor shall be bonded to starter and disconnect device enclosures and motor frame.

H. Above-grade connections to permanent and removable equipment shall be exothermic-weld, bolted, or compression-connection type.

I. Connections to exposed structural steel within buildings or plants shall be exothermic-welded type, unless noted otherwise. Connections to structural steel within substations shall be bolted type. Connections to galvanized steel shall be by bolting.

J. Above-grade conductors:
   1. Install exposed conductors inconspicuously in vertical or horizontal positions on supporting structures.
   2. When located on irregular supporting surfaces or equipment, conductors shall run parallel to or normal to dominant surfaces.
   3. Conductors routed over concrete, steel, or equipment surfaces shall be kept in close contact with surfaces by using fasteners located at intervals not to exceed 3' (1 m).

K. Conduits extending into equipment shall be grounded through grounding bushings in enclosure where terminated. Grounding bushings shall be wired together and connected internally to enclosure ground lug or ground bus with bare copper conductors.

L. Conduits connected to metal enclosures shall be grounded to enclosure by either grounding bushing or double locknuts, with one conduit locknut on each side of enclosure, to provide continuous ground path back to source voltage. Provide grounding bushing for knockout holes in metal enclosures that are oversized, elongated, or deformed.

M. Install bare grounding conductor for entire length of power cable tray. Connect grounding conductor to each tray section and bond tray grounding system to station ground grid at minimum of every 100' (30 m). Cable tray shall additionally be continuous and rated for carrying fault current in accordance with NEC. Trays shall be bonded either by direct connection to or by bonded conduit or jumper conductor to panels, switchgear, and equipment tray cable serves. Conduit takeoffs from tray shall use UL-approved grounding clamps.

N. Bare conductor, used for the building or facility lightning protection system, shall be connected to the below grade grounding system.

O. Install ground conductor below grade around building perimeters, foundations, and equipment skids as required. Repair or replace damaged ground system conductors.

P. Exothermic welds shall encompass 100% of cable end being welded and shall resist moderate hammer blows.

Q. Connect building and pipe support structure columns to grid with No. 4/0 AWG (120 mm^2) cable. Equipment skid frames, switchgear and motor control center ground bars, dry-type transformer cases, and other required solid grounds shall be connected to site grid by "stingers" extended from grid. Where indicated on Drawings, stingers shall be same diameter as ground cable. Provide 5' (1.5 m) of coiled cable above grade for equipment connection.

R. Extend plant ground grid system to utility substation ground grid or adjacent grounding systems where required. Care shall be taken when exposing and connecting to existing grounding systems to maintain continuity and backfill correctly.

S. Excavate for grid conductor to depths of 18" (50 mm) minimum. Use special care for excavation near existing foundations and utilities. Excavate by hand in such areas. After installation of grid conductor, backfill with material from excavation, excluding large stones and organic material. Backfill around conductor completely, thoroughly tamping to provide good contact between earth and ground conductor.

T. Install ground rods in firm soil outside of excavated areas. Drive top of rod to depth of 18" below grade as a minimum to match conductor depth, unless otherwise shown on Drawings. Use driving studs or other suitable means to prevent damage to threaded ends of sectional rods.

U. Maximum resistance-to-ground of single driven ground rod shall not exceed 25 ohms. Maximum resistance-to-ground of ground grid system shall not exceed 2 ohms. If measured resistance exceeds above values, add rods and bond together to achieve desired resistance. Measurements shall be made and data recorded in presence of Owner's Representative.

V. Install ground conductor near top and on each side of concrete encased duct bank. Connect duct bank ground conductor to plant grounding system. Install duct bank ground conductors through manhole walls to provide grounding for metallic noncurrent-carrying cable supports, metallic sheaths of cable, and enclosures. Metallic conduits within duct bank shall be provided with grounding bushings within manholes. Connect grounding bushings to grid conductor with minimum No. 8 AWG (10 mm^2) conductor.

W. Install ground conductor in cable trenches along with power conductors or other raceway as required.

X. Ground fence components including posts, gates, fabric, and barbed wire. Fence shall be connected to the ground grid at a maximum of every 50' and each corner and gate post shall be directly connected to the ground grid.

Y. Ground connections to operator platform shall consist of one connection from platform to the equipment being operated.

3.03 FIELD QUALITY CONTROL

A. Ground grid resistance measurements and data recording shall be made by using fall-of-potential method in accordance with IEEE 81.

B. Tests shall be made with approved ground resistance tester in accordance with instrument manufacturer's instructions.
   1. Make measurements made in presence of Owner's Representative and record data.
   2. Volt-ohmeter not acceptable.
   3. Tests shall be performed by personnel knowledgeable in ground system testing.

3.04 MAINTENANCE

A. Grounding system shall not require maintenance after final installation, testing, and acceptance.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Equipment cleaning.

B. Pipe system field cleaning.

C. Pre-boiler cleaning.

D. Steam line blow.

PART 2 PRODUCTS

NOT USED

PART 3 EXECUTION

3.01 PIPE SYSTEM FIELD CLEANING

A. Rap and blow out piping and valves with compressed air before erection.

B. Before assembly, completely remove temporary preservative coatings from valves and other piping accessories

C. After erection, provide temporary piping and labor to flush or blow out all piping not specifically covered by cleaning procedures described herein.

D. Water flush:
1. Flush out water systems.
2. Clean criteria: Strainers and filters remain clean and flush discharge water is clear.
3. Flushing velocity: Greater than 10 ft/s.
4. Piping systems shall be complete and pressure tested prior to cleaning.
5. Provide startup strainer elements (temporary).
6. Remove instrument and control tubing or isolate from flush.
7. Remove control instruments prior to flush.
8. Supply temporary piping as necessary to complete flushes.
9. Bypass equipment or remove internals that may be damaged during flushes.
10. Stop or sharply reduce flow periodically.
11. Periodically blow down drain and vent lines.
12. Clean strainers periodically during flush, as necessary. Remove and clean strainers and remove temporary startup strainers at conclusion of water flush.

E. Oil flush:
1. Flush out oil systems, including but not limited to:
   a. Boiler feed pump and associated equipment lube oil piping.
   b. Hydraulic coupling working and lube oil piping.
   c. Turbine-generator lube oil piping.
2. Clean oil systems and flush in accordance with equipment manufacturer recommendations.
3. Piping systems shall be complete and pressure tested prior to cleaning.
4. Provide startup strainer elements (temporary).
5. Remove instrument and control tubing or isolate from flush.
6. Remove control instruments prior to flush.
7. Supply temporary piping as necessary to complete flushes.
8. Bypass equipment or remove internals that may be damaged during flushes.
9. Stop or sharply reduce flow periodically.
10. Clean strainers periodically during flush, as necessary. Remove and clean strainers and remove temporary startup strainers at conclusion of flush.

F. Air blowout:
   1. Blowout air and gas systems with dry oil-free, filtered, low-pressure compressed air.
   2. Clean criteria: Discharges from all outlets is clean and dry.
   3. Equipment that may be damaged during blow shall be bypassed or have internal parts removed prior to blow.

3.02 PRE-BOILER CLEANING

A. Complete hydrostatic testing and system flushes prior to start of pre-boiler cleaning operations.

B. Pre-boiler cleaning will consist of detergent flushing of main cycle water circuit.

3.03 BOILER CLEANING

A. Complete hydrostatic testing prior to start of boiler cleaning operations.

B. Provide materials and labor to perform boiler chemical cleaning and boilout in accordance with boiler manufacturer's recommendations.

3.04 STEAM LINE BLOW

A. Blow out main steam (including main steam bypass line), cold reheat, hot reheat, and steam seal piping in accordance with boiler and steam turbine manufacturer's recommendations and procedures.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Basic control system requirements for furnishing hardware, unconfigured software, configuration and programming, training, testing, startup and commissioning.

1.02 DEFINITIONS

A. Terms defined to describe use and performance of instruments used process industry and in accordance with ISA SP51.1 as follows:
   1. Accuracy: Degree of conformity of indicated value to a recognized accepted standard value, or ideal value.
   2. Availability: Ability of device or system to be used or acquired over a period of time.
   3. Redundancy: Amount of duplication for purpose of preventing failure of entire system upon failure of single component.
   4. Reliability: Probability that a device or system will perform its objective adequately, for period of time specified, under operating conditions specified.
   5. Repeatability: Ability to reproduce, among a number of consecutive measurements, output for same operating conditions, approaching from same direction for full range traverses.

B. Network diagram: Diagram detailing major components and communication interconnections of system. Diagrams shall show interfaces between equipment, communication highway details including differentiating between fiber optics and copper cables, and listing communications protocols.

C. Following definitions will be used in project correspondence and documentation. Owner will establish common library of terminology to be used by all parties.
   1. Initialization: Process by which initial values of mode, setpoint and output of a control block are set.
   2. Running: State in which device, which has been commanded to start, has achieved commanded state.
   3. Stopped: State in which device, which has been commanded to stop, has achieved commanded state.
   4. Tripped: Device has been stopped by something other than an operator command either within control system or external to control system.
   5. Failed: State in which device, which has been commanded, has not achieved requested state within predefined time period.
   6. Electrical protection: Tripping of device for electrical reasons, changed device state independent of any system output or command, i.e. overcurrent, undervoltage, etc.
   7. Hot Cut-Over (HCO): Initiation of an active, operating system control loop onto DCS control.

1.03 QUALITY ASSURANCE

A. Qualifications:
   1. Contractor shall be certified under International Standards Organization (ISO9001) Quality Guidelines.
   2. System integrator: Company specializing in programming systems specified with minimum 5 years documented experience. Contractor shall demonstrate minimum of 5 years of experience for projects of similar size and complexity involving control systems with continuous process operation, PID loop control, data communications, graphic screens and reports in similar applications.

B. After functional testing is witnessed by Owner, necessary corrections shall be made to system to satisfaction of Owner before system is shipped.

C. Manufacturer's qualifications: Contractor shall use manufacturers who's equipment will continue to be manufactured for a period of at least 3 years or who will maintain a stock of compatible spare parts for a period of 10 years after startup of control system.

D. Regulatory requirements: Work shall be in accordance with applicable requirements of following codes and standards.
   1. Electronic Industry Association (EIA) 232-D: Interface Between Data Terminal Equipment and Data Communication Equipment Employing Serial Binary Data Interchange.
   2. Institute of Electrical and Electronic Engineers (IEEE)
      a. ANSI/IEEE C37.90.1: Standard Surge Withstand Capability (SWC) Tests for Protection Relay Systems.
      b. ANSI/IEEE C37.90.2: Trial Use Standard Withstand Capability of Relay Systems to Radiated Electromagnetic Interference from Trans-receivers.
   3. National Fire Protection Association (NFPA):
      a. 70: National Electrical Code.
      b. 85: Boiler and Combustion Systems Hazards Code.
   4. National Electrical Manufacturer's Association (NEMA):
      a. AB-1: Molded Case Circuit Breakers.
      b. ICS-1: General Standards for Industrial Control and Systems.
      c. ICS-2: Standards for Industrial Control Devices, Controllers and Assemblies.
      d. ICS-4: Terminal Blocks for Industrial Use.
      e. ICS-6: Enclosures for Industrial Controls and Systems.
   5. International Society of Automation (ISA):
      a. ANSI/ISA-50.00.01: Compatibility of Analog Signals for Electronic Industrial Process Instruments.
      b. ANSI/ISA-51.1: Process Instrumentation Terminology.

E. Equipment located in hazardous areas shall be rated for appropriate Class, Group, and Division per NEC requirements.

1.04 WARRANTY

A. Manufacturer's warranty:
   1. Warranty shall not begin until acceptance after final inspection of system by Owner.
   2. Specified availability shall be maintained throughout warranty period. Failure to achieve specified availability may at Owner option result in extension of warranty period until specified performance has been met for a continuous period equivalent to warranty period.

B. Special warranty:
   1. Provide extended warranty for software and firmware supplied. Warranty shall provide parts and maintenance for installed system to Owner for period extending through startup and acceptance period of plant and for period extending 5 years beyond that date.
   2. Warranty provisions of license agreement shall cover system software and firmware including any third party software supplied with system.
   3. Provide telephone support service for period beginning with delivery of equipment and extending throughout software warranty period. Service shall provide telephone consultation services as required on operation, configuration development, trouble shooting, and maintenance of system hardware or software by persons in Contractor's organization who are thoroughly familiar with equipment and software supplied.

C. Extended correction period: Provide post-warranty software maintenance program. Program shall provide operating and configuration software upgrades for installed system to client for a period extending through startup and acceptance period of plant and for a period extending 5 years beyond that date.

1.05 LICENSE

A. Assign standard software license to Owner for software provided upon initial installation of each software component. Software licenses shall be issued in Owner's name and transferred without restrictions to Owner upon completion of Project.

B. Extend to Owner all rights of software purchase including telephone support during warranty period.

PART 2 PRODUCTS

2.01 SYSTEM REQUIREMENTS

A. System operation shall maintain constant duty cycle regardless of upsets, operator activities, or remote access of system from LAN.

B. Process variables shall be scanned, limit checked, broadcast and updated on monitor displays each second, synchronously.

C. Software maintenance functions shall not affect any drop in system except during download procedures.

D. System components shall be of solid-state, standardized, modular, plug-in construction. Modules shall be removable without need for rewiring.

E. Equipment shall be provided with operation indicating lights, test panels and other features to assist in testing and diagnostics. On-line self-diagnostic routines shall run automatically and notify operator of any malfunctions and location of malfunction.

F. Owner shall receive latest hardware technologies until equipment is purchased.

G. Provide special tools, test equipment, and software required for system installation, operation, and maintenance.

H. Expandability:
1. System shall be expandable and easily changeable using "fill-in-the-blank" software.
2. Expandable by addition of more drops. Addition of drops and new functions shall not affect existing operations and shall not degrade current performance.
3. Expansion shall include addition of:
   a. Field equipment such as process controllers, local I/O modules, remote I/O communications modules, remote I/O modules, and serial interfaces to peripheral devices.
   b. Operator/engineering interface equipment such as operator workstation, engineering workstation, monitors, printers, and data archiving devices.
   c. Configuration additions such as I/O points, control loops, alarming, logging, performance calculations, environmental monitoring, graphics displays, sequence of events reporting, and historical data collection.
   d. Remote monitoring of system from existing LAN.
4. Define overall system limitations proposed in terms of total I/O and update rates under all operating conditions.
5. Expansion of system shall be implemented with hardware and software identical to that of base system if at all possible, or at a minimum shall be totally compatible with original system.

I. Reliability:
1. Control system shall operate in power plant environment with high degree of reliability.
2. Hardware shall consist of latest solid-state technology and packaged to operate in environment required.
3. Control software shall implement simple, predictable, high-level task-specific organizations of modules.
4. Failure of one drop will not affect any other drop in system.
5. On-line diagnostics shall be provided to disconnect drop from process data highway should malfunction occur.
6. Diagnostics shall be provided to quickly define failed part. Graphical representation for card-level diagnostics shall be provided.

J. Maintainability:
1. Materials and equipment shall be standard products of reputable manufacturer regularly engaged in production of same. Where more than one unit of same item is required, items provided shall be identical.

2. Contractor shall define number of different printed circuit cards, power supplies, and connectors required in system.
3. Maintenance procedures shall be simple, straightforward and well documented.
4. Software tools required to maintain, expand, reconfigure, and reload system shall be provided with each workstation.

K. Communications:
1. Communication system shall provide redundancy such that single failure does not affect operation.
   a. Process data highway failure shall be reported to system immediately.
   b. System shall be capable of automatic detection and wrapping.
2. Provide redundant process data highway. Process data highway shall be high-speed utilizing dual bus/star topologies, in accordance with ANSI 802.3.
3. Highway data communication:
   a. Communication bus: Distributed controllers shall be interconnected with high-throughput network.
   b. Redundancy: Network shall implement redundant copper or fiber optic media backbone.
   c. Communication processors: Separate data highway network interface cards at each drop shall handle inter-drop communication and data transmission.
   d. Communication rate: Up to 100 MB/sec, sufficient to support at least 200,000 periodic data point values each second. Process variable information shall be available to every drop in system at least every 100 milliseconds.
   e. Communication media: Data highway backbone shall be copper or fiber optic media. Communication between highway and drops shall be copper or fiber optic media as required to meet system speed requirements.
   f. Communication protocol: Data highway communication shall use both synchronous and asynchronous modes.
   g. Reliability: No single drop point of failure shall disable any part of data highway. Self-diagnostics shall cause any drop to disconnect itself from system upon detection of any unrecoverable error.
4. Management information communication:
   a. Communication Bus: Workstations shall interconnect to process data highway for new LAN. It shall be possible for remote devices to interconnect via bridges, switches, or routers.
   b. Communication protocol: Network shall be TCP/IP compliant.
   c. Redundancy: When used in redundant configuration network shall be capable of automatic error detection and wrapping when failure of primary bus or device is detected.
5. Data highway drops:
   a. Each data highway drop shall have universal access to process point variables in system wide global database.
   b. Each drop functional processor shall provide intelligence to perform drop's task and interface with global database.
   c. Each drop shall be reconfigurable and serviceable, including removal from highway, without affecting other drops.
   d. Drop shall be physically distributed anywhere in plant.
   e. Drop shall be able to be added in parallel without affecting currently operating drops.

2.02 PERFORMANCE REQUIREMENTS

A. Accuracy: System shall report values conforming to standard values indicated by field instruments.

B. Availability: Overall system availability (operator workstation to field instruments) shall be 99% over 30-day test period. System is defined as available during periods where redundant component is out of service and network is still functional.

C. Reliability: Overall system reliability shall be 99% over 30-day test period.

D. Repeatability: System shall produce consistently acceptable results over 30-day test period.

E. Screen access and update within network shall be less than 2 seconds.

2.03 SOURCE QUALITY CONTROL

A. Prior to shipment of control equipment hardware and software, Owner shall witness performance tests at Contractor's manufacturing facility.

B. Contractor shall be responsible for hardware and software provided for Contract and shall notify Owner, in writing, when it is considered complete, in good operating condition, and ready for performance tests.

C. Testing costs:
   1. Pre-tests: Costs of conducting tests shall be borne by Contractor.
   2. Factory demonstration test:
      a. Include cost of conducting factory demonstration test in Bid.
      b. Owner will include cost of up to 6 persons including round trips for 10-day duration to Contractor's facility for factory demonstration tests.
      c. Owner will render bill to be paid by Contractor covering costs incurred by retesting or supplemental testing exceeding limits noted herein.
      d. Billings to Contractor for Owner costs for retesting and supplemental testing exceeding limits noted herein shall be paid directly to Owner within 30 calendar days from receipt by Contractor. Contractor's failure to pay such billings shall be cause for withholding final payment in amount equal to such costs.

D. Factory demonstration tests:
   1. Contractor's factory demonstration test shall include but not be limited to following requirements as described herein.
   2. Visual inspection.
      a. Verify correctness of required tag identification of each system component and accessory including system processors, enclosures, peripherals, cabling, I/O boards, circuit breakers, power supply terminals, etc.
      b. Verify physical appearance and workmanship, hardware redundancy, furnished spare allocations and expandability conforms to specifications.
      c. Verify equipment is complete, marked and located according to parts lists, cabinet layouts and termination schedules.
      d. Check cable bundles, plugs and sockets, termination blocks and equipment racks and connections are clearly labeled.
   3. Demonstration test:
      a. Input/output points: Confirm point-to-point wiring by continuity and verify database addressing, ranges, and alarm assignments by simulating one I/O point per I/O module at termination unit and viewing response on operator workstation. If any I/O point fails testing outlined above, Owner reserves right to test points on associated I/O module.
         1) Analog inputs scaling, engineering unit values, and scan rates shall be verified. While cycling through input span, database alarm functions shall be demonstrated by noting graphic displays, alarm displays, and hard copy alarm documentation when alarm limits are exceeded.
         2) Analog output values shall be checked.
         3) Digital inputs shall be toggled to confirm status change and scan rate. Database linkages shall be verified by observing associated display data fields while changing state of database points and noting changes in state/color in respective fields. If alarms are generated, verify alarm listings and hard copy documentation.
         4) Digital output shall be checked.
      b. Demonstrate functionality of each control strategy.
         1) Use functional descriptions and control logic diagram.
         2) Simulate analog and discrete inputs as well as operator commands to demonstrate functionality of each control loop and sequence including both manual and automatic modes.
         3) Verify output signals response in proper direction and magnitude.
         4) Verify override and interlock logic.
         5) Verify action of controllers in both manual and automatic modes.
      c. Demonstrate functionality of digital communication interfaces:

1) Verify communication interface with PLCs by forcing values in control program and monitoring response from operator workstation. Approximately 10% of values will be verified.
2) Digital communications interfaces for variable frequency drives (VFD), reduced voltage soft starter (RVSS), and power quality meters will not be factory tested since hard ware is not available for testing. Contractor shall demonstrate that interface has been completed.

d. Demonstrate on-line diagnostic capabilities including performance information statistics of stations and peripheral equipment.

e. Demonstrate data management functions including one display of each type. Owner to select displays and trends to be demonstrated.
1) Review graphic display displays for content and verification of data field linkages.
2) Include verification that data collection occurs and that data collected and stored can be retrieved and displayed in form of reports or historical trends.
3) Simulated input data shall also be used to generate sample reports to confirm report format, calculation algorithms, and reporting frequencies.
4) Check trend displays during testing period.

f. Demonstrate system report generation including one specific report and one overall plant report. Owner will select report to be demonstrated.
1) Report content shall be verified to insure proper linkages, format, calculations and reporting frequencies.
2) Report format and logging capabilities shall be verified by introduction of real time data into database.
3) Report content shall be verified to ensure proper linkages, format, calculations and reporting frequencies.

g. Demonstrate effects of system malfunctions on process controls.
1) Check power and grounding systems according to drawings. With main power disconnected, test earth grounds on power supply system be checking that there is an open circuit between cabinet frame and power rails.
2) Disconnect primary power supply to one of power modules in power supply systems. System should be unaffected in operation and supply failure alarm should be generated to operator for each system.
3) Disconnect highways and field buses to verify operation of redundant highway maintains system performance and a highway failure or backup highway selected alarm is generated.
4) Check redundant cards to verify that backup cards maintain system performance and appropriate alarm is generated.
5) Check that system properly reboots after power outage.

4. After factory demonstration testing, witnessed by Owner, necessary corrections shall be made to system to satisfaction of Owner before system is shipped.

E. Tests results:
1. If system fails to perform properly:
a. Make necessary changes and adjustments to equipment.
b. Notify Owner when system is ready for retesting.
c. Repeat factory demonstration testing at no cost to Owner or impact to project schedule.
2. If testing is substantially correct with minor defects, Contractor shall verify deficiencies are corrected in writing to Owner.
3. Upon completion of hardware factory demonstration testing, Contractor shall submit certificate of test performance and compliance to Owner.
4. Upon completion of application software application factory demonstration testing, Contractor shall submit certified copy of test results to Owner. Included shall be a statement that system and application software have been tested and operate in accordance with specifications.

PART 3 EXECUTION

NOT USED

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Pipe materials.

B. Welding and dielectric fittings.

C. Nozzles, pipe bends, and taps.

D. Provisions for pipe expansion.

E. Access and maintenance areas.

F. Pipe flanges, unions, and gaskets.

G. Sleeve seals.

H. Identification of materials.

I. Welding.

J. Nondestructive examinations.

K. Tests and inspections.

1.02 DEFINITIONS

A. Piping 2-1/2" and larger nominal size defined as "large bore" piping.

B. Piping 2" and smaller nominal size defined as "small bore" piping.

1.03 DELIVERY, STORAGE AND HANDLING

A. Weld end larger than 2": Fit pipe with protective end caps lined with 3/4" soft wood to prevent damage to machined ends. Seal with waterproof tape.

B. Female opening 2" and smaller: Install plastic insert and seal with waterproof tape.

C. Nonflanged nipples 2" and smaller: Fit pipe with plastic cap and seal with waterproof tape.

D. Flanged opening: Bolt 1/2" waterproof disk with 1/8" rubber gasket. Use at least half available holes.

PART 2 PRODUCTS

2.01 PIPE MATERIALS

A. Comply with ASME B31.1, and where applicable, ASME "Boiler and Pressure Vessel Code."

B. Piping material shall be new. Materials showing signs of scaling or rust will be rejected.

C. Provide carbon steel with minimum incidental chromium content of 0.1% as documented by mill certification test record for following feedwater piping and fittings:
   1. Deaerator feedwater heater outlets to booster pump inlets.
   2. Booster boiler feed pump outlets to main boiler feed pump inlet.
   3. Main boiler feed pump outlet to economizer terminal point, including superheater attemperator supply to terminal point.

4. Main boiler feed pump inner stage bleed connection to reheat attemperator terminal point.

2.02 FITTINGS

A. Use long radius fittings except were not practical.

B. Use welding tees for socket-welded piping and for branch tees in butt-welded piping.

C. Mitering of pipe to form elbows, notching straight pipe to form tees, and similar construction not allowed.

D. Seamless, unless noted otherwise.

2.03 DIELECTRIC FITTINGS

A. Install dielectric fitting at connections of dissimilar piping materials to prevent current flow.

2.04 NOZZLES

A. Branch connections in shop-fabricated piping for pipe up through ASME Class 150: Nozzle welds or "Weldolets".

B. Pipe above ASME Class 150: Use of "Weldolets" limited to 4" diameter pipe branches or 50% of main run pipe diameter, whichever is smaller.

C. Other branch connections: Tees.

D. Piping which has previously been fitted and welded in place: Nozzle welds or "Weldolets" not permitted.

E. Cut nozzle holes in pipe to obtain accurate fit.

F. Use shaped nozzle branches cut to fit contour of pipe hole.

G. Branch connections projecting inside pipe not accepted.

H. Fit nozzles to assure alignment with main piping.

I. Reinforce nozzle welds as required to provide joint at least equivalent in strength to bursting strength of straight pipe, as determined by formulas specified in ASME B31.1 "Code for Pressure Piping."

J. Fabricate and reinforce all nozzles as required by ASME B31.1 "Code for Pressure Piping."

2.05 PIPE BENDS

A. Cold Pipe bending not permitted, unless approved by Owner.

2.06 TAPS

A. Make tapped or socket weld piping branches, 2" in size and smaller, by welding extra-heavy half couplings to pipe, or by using "Sockolets" or "Thredolets."

B. Make taps in main piping before piping is fitted in place. No burning of holes permitted after piping is fitted.

C. Make taps for thermometer separable sockets in locations permitting installation of thermometers for convenient observation from floor or platform elevations.

D. Make taps for test thermometer wells in top of or 45º either side of vertical for horizontal runs of piping; locate to permit convenient accessibility.

E. Locate taps and space so installation of thermometer wells, thermocouple wells, pressure taps and flow meter differential pressure taps, etc., will not interfere with each other.

F. Locate wells, sampling nozzles, flow nozzles, etc., so stream of flowing fluid passing through or around each device will not be turbulent as result of passing through or around device located upstream.

G. In general, do not locate wells and/or sampling nozzles closer than 10' in same plane, nor closer than 2 pipe diameters in planes separated by 45º or more.

H. Locate pressure taps upstream of temperature taps.

2.07 PROVISIONS FOR PIPE EXPANSION

A. Provide bends, offsets, or loops in piping as required to permit pipe expansion due to temperature change and equipment movement.

B. Provide sufficient flexibility in copper piping to eliminate stress transmission to fixtures.

C. See Section 40 05 29 for additional pipe expansion and support requirements.

2.08 PIPE FLANGES

A. Pressure class, type, material, and facings: In accordance with applicable codes.

B. Steel flanges mating with cast iron flanges or steel equipment flanges shall have same facing as mating flange.

C. Use weld neck flanges. Slip-on flanges shall not be used..

2.09 UNIONS

A. Use unions on small bore circulating water piping where required to allow for disassembly. Use flanges for other piping.

2.10 GASKETS

A. Use full-face gasket with flat-face flanges. Use ring gasket with raised-face flanges.

2.11 SLEEVE SEALS

A. Furnish and install sleeve seals between sleeve and piping for piping penetrations below grade.

PART 3 EXECUTION

3.01 INSTALLATION - GENERAL

A. Carbon dioxide piping system shall comply with NFPA 12 requirements.

B. Cold springing of pipe not acceptable.

C. Warning tape shall be installed over each underground pipe, conduit, or duct bank.

3.02 IDENTIFICATION OF MATERIALS

A. Affix permanent metal tag to each valve or other specialty; tag shall bear equipment name as well as numerical reference, where applicable.

B. Valves and piping specialty items shall bear manufacturer's permanently affixed stamp or tag indicating manufacturer, catalog number, pressure and temperature rating, and alloy steel construction materials, and tag number.

3.03 WELDING

A. Refer to Section 01 43 30.

3.04 NONDESTRUCTIVE EXAMINATIONS

A. Piping and welded joints shall be examined and tested in accordance with applicable ASME and ANSI codes.

B. Examination and testing of pipe, fittings, welds, and piping components:
1. Test materials in accordance with requirements of applicable codes and standards as specified.
2. Pressure piping shall be examined and tested in accordance with ASME B31.1.
3. Acceptance criteria shall be in accordance with ASME B31.1.

C. Radiography: Field welded joints in main steam, hot reheat and cold reheat shall be 100% radiographed.

D. Owner, at its option, may perform examinations, inspections, and tests of piping and welded joints to verify compliance with ASME B31.1 including, but not limited to, visual observation, ultrasonic, liquid-penetrant, and magnetic particle methods.

3.05 JOINTS AND EQUIPMENT CONNECTIONS

A. Install piping with sufficient unions and flanged connections to permit dismantling equipment for maintenance.

B. Perform continuity check to ensure insulating flanges and dielectric unions are not electrically continuous.

3.06 PIPE SLEEVES

A. Piping routed through walls and floors shall pass through steel pipe sleeves. Sleeves shall extend 4" above floors.

B. Sleeve material: Standard weight carbon steel pipe.

C. Sleeves through concrete: Install during floor or wall construction where practicable. Where required through construction in place, cut holes and grout.

D. Select sleeve sizes to allow the following minimum concentric radial clearance between sleeve and outer covering of piping. Provide additional clearance as necessary to accommodate thermal growth of hot piping.

E. Sleeves for penetrations utilizing mechanical modular type seals shall be sized in accordance with seal manufacturer's recommendations.

F. Cut circular openings where piping passes through steel grating and checkered plate; band all openings with 1" x 1/8" steel straps welded to grating bars; reinforce grating as required to restore original structural strength.

3.07 DRAIN FUNNELS

A. Provide for equipment waste drains and for other open drains as required.

3.08 TESTS AND INSPECTIONS

A. Test piping after erection in accordance with applicable listed piping code and as specified herein.

B. Pressure tests:
1. Boiler external piping shall be hydrostatically tested in accordance with ASME Boiler and Pressure Vessel Code in presence of authorized inspector.
2. Test steam and water piping with water; test air and oil piping with air.
3. Valve-off, or otherwise isolate, instruments, controls, or other piping accessories which will be damaged by test pressure.
4. Maintain test pressure on piping for not less than 2 hours.
5. Check joints in piping tested with air by coating with a soapsuds solution.
6. Carefully examine joints during time pressure is on pipe.
7. Refit piping showing visible leakage.
8. Replace defective pipe or fittings disclosed during test.
9. HDPE pipe: Hydrostatically test in accordance with pipe manufacturer's recommendations.

C. Relief and safety valves shall be shop tested to demonstrate correct relieving pressure. Documentation of test pressure shall be submitted for each valve.

D. Provide helium gas supply and helium detector for hydrogen gas piping system testing and for testing for air leaks in-piping systems and equipment subject to vacuum.

E. Coated piping shall be tested in accordance with AWWA C210.

F. Rubber-lined piping shall be spark tested.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Ducts and supports for transporting secondary air from FD fan to air heater and from air heater to burner windboxes.

B. Ducts and supports for transporting primary air from primary air fans to air heater and from air heater to pulverizers.

C. Ducts, and supports for transporting flue gas from steam generator flue gas outlet to air heater, from air heater to scrubber, from scrubber to baghouse, from baghouse to ID fan, and from ID fan to stack.

D. Design requirements.

E. Steel sheet and plate work.

F. Stiffeners and flanges.

G. Expansion joints.

H. Appurtenances.

I. Field fabrication and erection.

1.02 QUALITY ASSURANCE

A. Design and construct equipment in compliance with applicable laws, ordinances, and regulations of principality having jurisdiction of plant site; ASME Boiler Code Section 1, ASME 31.1, NFPA 85, and OSHA.

B. Unless noted otherwise, latest editions, including addenda and supplements, of codes, standards, laws, ordinances, and regulations in effect on date of this EPCContract shall apply.

PART 2 PRODUCTS

2.01 DESIGN REQUIREMENTS

A. Size shall be such that velocity of flue gas or air will not exceed 3,200 fpm at predicted maximum temperature of flue gas or air in breeching or duct section at fan rating.

B. Design shall be optimized using appropriate methods:
1. Minimize ash loading and flue gas temperature stratification entering air heater and baghouse.
2. Minimize pressure losses at bends and restrictions
3. Ensure even flow distribution at ID fan.

C. Minimum design pressures: Design for continuous operating pressure and transient design pressure in accordance with NFPA 85.
1. Primary air ducts: Primary air fan test block head as a transient design pressure.
2. Secondary air ducts: FD fan discharge test block head as a transient design pressure.
3. Flues: ±35" wc.
4. Boiler enclosure transient design pressure: ±35" wc.
5. If maximum head capability of forced or induced draft fans, with ambient air, exceeds design pressure of these systems, provide field instruments and logic to implement a furnace pressure control system in accordance with NFPA 85 in Owner's distributed control system (DCS).

D. Structural loads:
   1. Rectangular gas ducts: Dust loading of 80 lb/cu ft for 12" depth on bottom surface of duct.
   2. Round gas ducts: Compute depth that would result in same volume as 12" depth in a square duct of equal cross sectional area.
   3. Damper actuator forces: As applicable.
   4. Refer to Section 01 32 13 for wind and seismic loads required.

E. Ducts shall have structural reinforcements as required to prevent distortion or vibration. Maximum plate deflection between stiffeners under most stringent combination of loadings: L/240 where L is center-to-center spacing in inches of plate supports. Large deflection theory with deflection not exceeding 2x plate thickness may be used instead of L/240" criteria.

F. Ductwork shall be designed to "The Structural Design of Air and Gas Ducts for Power Stations and Industrial Boiler Applications" by ASCE. The design shall also include effects of following:
   1. Operating, static unbalanced, dynamic unbalanced and transient pressures.
   2. Gas flow velocity.
   3. Gas turbulence and vortex shedding.
   4. Operating and excursion temperatures.
   5. Vibrations, including flow-induced vibrations.
   6. Pressure fluctuations.
   7. Thermal fluctuations.
   8. Differential/gradient temperatures.
   9. Fatigue.
   10. Expansion joint actuation forces.
   11. Friction forces.
   12. Minimum duct shell plate thickness shall be as required to satisfy stress and stability consideration. Minimum corrosion allowance of 1/16" shall be added to carbon and low alloy steel plates.
   13. Design ductwork, supports, and expansion joints so excessive loads are not transmitted to equipment.

2.02 STEEL SHEET AND PLATE WORK

A. Welded construction with flanged joints for field assembly. Flanged joints shall be seal welded, except where attached to equipment to be removed for maintenance.

B. Material: Carbon steel plate, ASTM A283, Grade B, C, or D or ASTM A36.

C. Construction:
   1. Minimum steel plate thickness: 1/4"
   2. All-welded gastight construction for field assembly.
   3. Structural members shall be seal-welded with full welds to plates to prevent corrosion.
   4. Provide structural support for all components.
   5. Provide gasket, packing, and bolting materials for joints.

D. Surface preparation and painting as specified in Section 09 90 00. Provide shop prime painting on interior and exterior structural steel framing, high- and low-temperature pipe, miscellaneous structural steel, and miscellaneous metals. Shop prime painting not required on surfaces to be covered with insulation and lagging or interior surfaces of ducts.

2.03 STIFFENERS AND FLANGES

A. Structural shapes: ASTM A36 or ASTM A992.

B. Surface preparation and painting as specified in Section 09 90 00. Provide shop prime painting on interior and exterior structural steel framing, high- and low-temperature pipe, miscellaneous structural

steel, and miscellaneous metals. Shop prime painting not required on surfaces to be covered with insulation and lagging.

2.04 DAMPERS

A. Type:
1. Shutoff dampers: Guillotine positive shutoff with sealed bearings.
2. Control dampers: Overlapping multiblade.

B. Size: Full size of duct.

C. Damper sealing efficiency:
1. Shutoff dampers such as those for mills and baghouse compartments shall be selected and arranged with leakage low enough to allow man-safe maintenance access in isolated equipment with unit on line without use of respirators or external air source.
2. Control: Leakage shall be limited so that control is not compromised.

D. Design and construction:
1. Frame:
a. Heavy steel fabricated channels arranged for bolting and seal welding to mating duct or equipment flange.
b. Design to support static and dynamic loads from damper operator and drive mechanism.
2. Design to transmit axial and transverse loads due to flues thermal movement without impairing damper operation.
3. Design components of damper including blade seals for application without adverse effects due to temperature or flue gas composition.
4. Damper blade: Double-skinned, heavy-gage steel, formed and welded to steel shaft. Capable of operating in modulating intermediate positions without fluttering or deflecting.
5. Packing glands: Continuously welded to damper frame at each shaft hole. Design so packing can be replaced without removal of bearings or linkage.
6. Bearings:
a. Sleeve-type, unlubricated carbon/graphite bearings, preferred or,
b. Grease-lubricated bearings.
1) Permanently sealed greased bearings, or
2) Standard alemite grease fittings. Grease fittings not accessible from adjacent floor or platform shall be extended with stainless steel tubing to within 6' above access platform.

E. Permanently scribe visible end of each damper shaft to show position of damper blade.

F. Provide standard alemite grease fittings for grease-lubricated bearings. Grease fittings not accessible from adjacent floor or platform shall be extended with stainless steel tubing to within 6' above access platform.

G. Arrange driven input shaft or blade linkage for position limit switches

2.05 EXPANSION JOINTS

A. Metallic: Construction utilizing manufacturer's standards shall be used.

B. Nonmetallic:
1. Temperature rating: 110% of duct design temperature with 125% of design temperature for excursions.
2. Pressure rating: 125% of duct design pressure, ±35" w.g. minimum.
3. Provide means to eliminate fly ash accumulation.

2.06 APPURTENANCES

A. Access doors:
1. Provide hinged, bolted, and gasketed access doors in each duct and breeching section.
2. Size: 18" x 24" minimum.
3. Accessible from floor or platform without using ladders. Provide auxiliary platform if access not available.
4. Provide ladder inside flue, duct, or breeching, from access door to bottom, if vertical distance is greater than 4'.
5. Provide framed opening at access door for support and to permit removal of insulation and lagging. Door shall be opened without disturbing adjacent insulation and lagging.

B. Guide vanes:
1. Install in turns as needed to ensure minimum pressure drop and to provide appropriate distribution.
2. Use 3/16" minimum steel plate.
3. Reinforce as necessary to avoid vibration.

C. Injection doors: Quantity and location of doors and permanent platform for use in precoating fabric filter dust collector bags, if required, to be determined by Contractor and reviewed by Owner.

D. Furnace bottom: Provide drip lip shield and seal plate for water sealed ash hopper connection.

E. Economizer hopper:
1. Design for full ash and water load.
2. Material and construction: Same as specified for ducts.
3. Slope: Valley angle at junction of adjacent sides not less than 55° above horizontal.
4. Outlet connections: 12" steel pipe flanges, ANSI 125 lb. face and drilling. Bolt holes to straddle center line.
5. Rodding openings: Two 2" NPT male connections at each hopper outlet with screwed pipe caps secured by chain. Locate connections 90° from each other in plan view of drawing.

PART 3 EXECUTION

3.01 FIELD FABRICATION AND ERECTION

A. Round bends in rectangular duct runs on internal corners or turning vanes.

B. Install expansion joints where necessary to permit unrestricted thermal movement of flues and breeching, avoiding transmission of forces to equipment, including fans, baghouse module inlet and outlet, structural supports, etc.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Perform pipe stress analysis on all piping 300°F and above.

B. Design of pipe support systems, equipment support systems, and supplementary support steel.

1.02 PIPE SUPPORT SYSTEM DESIGN

A. Design all pipe support systems.

B. Pipe support system shall result in pipe stress conforming to requirements of ASME B31.1.

C. Where possible, pipe support locations shall be located to prevent individual structural members from being excessively loaded such that stiffening of member is required.

D. Pipe support selection and application: Using pipe support spacing shown in MSS SP-58 Table 4 with following additional requirements:
1. Additional supports are required at concentrated loads between supports such as flanges, valves, specialties, etc.
2. Support spacing values in MSS SP-58 Table 4 shall be reduced by 25% when pipe changes horizontal direction between supports.
3. Support spacing for plumbing systems shall not exceed maximum allowed by International Plumbing Code.

E. Incorporate seismic limit ties, guides, and stops to resist lateral loads.

F. Locate supports for pipe connected to equipment to limit equipment reactions to allowable reactions specified by equipment manufacturer.

G. Supports for pipe at equipment connections shall accommodate thermal movement and loads imposed by equipment.

1.03 PIPE SUPPORT DESIGN

A. Design all pipe supports.

B. Conform to MSS SP-58.

C. Design supports such that total of pipe global and local stresses shall not exceed allowable stresses specified in ASME B31.1.

D. Design of all welded attachments to pipe per ASME B31.1. Design of welded attachment shall not exceed allowable stresses specified in ASME B31.1. Welded attachment shall be of similar material as pipe.

E. Design to accommodate hydrostatic testing of pipe when applicable.

1.04 EQUIPMENT SUPPORT DESIGN

A. Design equipment support system, supports, and associated supplementary support steel.

B. Base equipment support design upon following parameters:
1. Support loads.
2. Equipment movements at supports.
3. Equipment manufacturer's requirements.

C. Equipment support design, selection, and application: MSS SP-58.

1.05 QUALITY ASSURANCE

A. Pipe hangers and supports, fabrication, and installation practices shall be in accordance with MSS SP-58.

B. Following shall be designed with the documents and drawings sealed by a professional engineer licensed in accordance with Dominican Republic law; retained by Contractor:
1. Pipe stress analysis.
2. Semi-engineered pipe support design.
3. Completely engineered pipe support design.
4. Design of equipment supports.
5. Design of attachment of support to existing structure or supplementary support steel where attachment details and allowable loads are not included in published pre-engineered standard support data by manufacturer (e.g., weld requirements, bolts, anchor rods, expansion anchors, etc.)
6. Design of supplementary support steel.
7. Design of localized stiffening of existing steel and supplementary support steel.

C. Contractor's professional engineer's seal is not required for design of support where published pre-engineered standard supports with published ratings, loads, and movements are used. Pre-engineered standard supports (including all components) shall be certified by Contractor as acceptable for intended use on this project.

PART 2 PRODUCTS

2.01 PIPE AND EQUIPMENT SUPPORTS

A. Materials and manufacture: MSS SP-58 and ASME B31.1.

B. Supports and accessory items shall have manufacturer's standard shop-applied primer and standard finish coat, unless specified otherwise. Support located within tunnels or trenches and exterior supports shall be galvanized or stainless steel.

C. Provide insulation protection shields of sufficient size and gage to prevent crushing of insulation at supports.

D. Supports for pipe designed to receive anti-sweat insulation shall be sized to allow insulation to be continuous through support. Provide insulation protection shields sized to prevent insulation damage at each support.

E. Beam clamps are generally prohibited but may be permitted for small loads, subject to approval of Owner.

F. Neither chains nor straps shall be used as permanent pipe supports.

G. Provide variable and constant spring cans, snubbers, and struts with load/travel scales or name plates on both side of support component, and orientated such that tag information is easily accessed and read.

H. Pipe support component in contact with pipe shall be compatible with pipe material so that neither have a deteriorating action on each other. For piping under 150°F, neoprene liner may be used to isolate piping from clamp-on pipe support component.

2.02 SUPPLEMENTARY SUPPORT STEEL

A. Shapes: ASTM A6.

B. Material: ASTM A36; A572, Grade 50; or ASTM A240, Type 304.

C. Supplementary support steel located within tunnels or trenches: ASTM A240, Type 304.

D. Design of supplementary support steel shall be in accordance with AISC "Specification for Structural Steel Buildings - Allowable Stress Design.

E. Welding to beam flanges permitted only where welds are parallel to and directly opposite webs. Submit other welding details to Owner for review.

F. Welding: AWS D1.1. Refer to Section 01 43 30.

PART 3 EXECUTION

3.01 PIPING SUPPORTS

A. Fabrication and installation: MSS SP-58.

B. Pipe supports for piping systems requiring continuous vapor barriers:
1. Refer to Section 40 42 00.
2. Use factory assembled, pre-insulated supports when available.
3. Refer to article "Pipe and Equipment Support" for pipe designed with anti-sweat insulation.

3.02 EQUIPMENT SUPPORTS

A. Fabrication and installation: MSS SP-58.

B. Arrange supports to provide clear access to equipment and to maintain clear aisle and access ways. Arrangement of equipment supports shall be subject to review by Owner.

3.03 ADJUSTMENTS

A. After hydrostatic testing of pipe, adjust supports to appropriate cold settings.

B. Adjust supports to accommodate movements through entire range of operation. Monitor movements during startup and make final adjustments to assure proper support.

C. Ensure support hangs within 4° of vertical under all conditions. Adjust supports as required by design drawing.

D. Modify or replace supports that cannot be properly adjusted for full range of conditions.

E. Adjust supports as necessary to limit reaction to rotating equipment, including turbine.

3.04 SUPPORT INSPECTION AND HANGER RECORD SHEET

A. Pipe hangers and supports, fabrication and installation practices: MSS SP-58.

B. Inspection after installation and prior to hydrostatic testing:
1. Each hanger assembly shall be verified against hanger drawing to assure that components have been installed and are in proper position, including temporary hangers and supports that are required for hydrostatic testing.
2. Check threaded components of each hanger for proper thread engagement.
3. Locking nuts on threaded components, cotter pins, temporary locking devices (travel stops) and other locking means furnished with spring units shall be properly engaged.
4. When possible, orient springs for convenient reading of load/travel scales. Damaged scales shall be removed and replaced. Prior to removal, exact position of scale shall be noted and replacement installed in same location.

5. Restraint control devices using hydraulic fluids shall be checked for tight seals and proper amount of fluid. If additional fluid is necessary, provide same type specified by restraint supplier.
6. Sliding supports using Teflon, graphite, bronze, or steel to steel slide plates shall be installed in strict accordance with hanger detail drawings with particular attention to offset dimensions and clearances where specified. Sliding surfaces shall be free of foreign matter, flush and parallel, with uniform contact between sliding surfaces.

C. Inspection after hydrostatic testing and prior to heating up system:
1. Remove spring locking devices and temporary hangers and supports required for hydrostatic testing.
2. Check spring hangers to verify that load/travel indicators are approximately in cold position setting and that pipe is at proper elevation.
3. Check restraint control devices to verify that travel indicators are approximately at cold position setting.
4. Record actual cold position of load/travel indicators on springs and restraint control devices in hanger record sheet (see MSS SP-58 Figure 3).

D. Inspection at operating conditions:
1. Inspect piping systems in their entirety to verify that no interference exists between pipe and/or pipe insulation and building structure or equipment.
2. Check spring hangers to verify that load/travel indicators are approximately in hot position setting and that pipe is at proper elevation.
3. Check restraint control devices to verify that travel indicators are approximately at hot position setting.
4. Record line temperature and actual hot position of load/travel indicators on springs and restraint control devices in hanger record sheet (see MSS SP-58 Figure 3).

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Equipment and piping insulation and jacketing requirements.

1.02 SUBMITTALS

A. Schedule identifying insulation materials, including adhesives, fastening methods, fitting materials, and intended use.

B. Manufacturer's data sheets and installation recommendations for each product furnished.

1.03 SYSTEM DESCRIPTION

A. Provide insulation and jacketing for installed equipment, piping, and piping accessories conveying fluids above 140°F or below 60°F (anti-sweat) that are not otherwise insulated.

B. Equipment and devices installed in insulated piping line (i.e. valves, strainers, etc.), shall be same insulation class as insulated main piping and equipment operating under similar temperatures.

C. Valves 12" and larger and control valves (all sizes) shall be insulated with removable blankets.

1.04 QUALITY ASSURANCE

A. Products shall possess flame spread rating of not over 25 without evidence of continued progressive combustion and a smoke developed rating no higher than 50.

PART 2 PRODUCTS

2.01 INSULATION

A. Insulation thickness shall be such that surface temperature does not exceed 140°F based on an ambient temperature of 90°F and an ambient wind speed of 1 mph, 1" minimum. Anti-sweat insulation shall be 1" minimum.

B. Anti-sweat insulation for fire protection system is not required.

C. Insulation materials shall be asbestos-free and shall meet requirements of MIL-I-24244 Amendment 3 regarding stress corrosion cracking of austenitic stainless steel.

D. Piping insulation materials:
   1. Calcium silicate:
      a. Service: Main steam, hot reheat steam, and cold reheat steam.
      b. Type: ASTM C533 Type 1.
      c. Temperature rating: 1,200°F.
      d. Density: Not less than 14.5 lb/cu ft.
   2. Mineral fiber:
      a. Service: Hot systems not requiring calcium silicate.
      b. Type: ASTM C547.
      c. Temperature rating: 1200°F.
      d. Density: 8 to 10 lb/cu ft.
   3. Anti-sweat:
      a. Type: Rigid fiberglass insulation.
      b. Temperature rating: 850°F.
      c. Density: 2.5 lb/cu ft.
      d. Conductivity: Not more than 0.23 Btu-in/hr-sq ft-ºF at 75ºF.

E. Equipment insulation: Mineral fiber block or board.
   1. Type: ASTM C612, Type III.
   2. Density: 8 to 10 lb/cu ft.

F. Removable mineral fiber blankets:
   1. Type: ASTM C592.
   2. Density: 8 lb/cu ft.
   3. Outer jacket: Teflon-coated Nomex cloth 7 oz/sq yd x 0.010" thick.
   4. Gusset: Teflon-coated Nomex cloth 7 oz/sq yd x 0.010" thick.
   5. Inner jacket: Stainless steel crimped mesh.
   6. Sewing thread: 3-ply Type 304 stainless steel and pure Nomex thread.
   7. Seam fasteners: Stainless steel lacing hooks.
   8. ID tags: Type 304 stainless steel, embossed lettering.
   9. Other hardware: Type 304 stainless steel.
   10. Do not use hog-ring style construction. Seams shall be sewn.

G. Insulation cements: Mineral fiber, thermal; ASTM C195.

H. Packing for expansion joints, seals, etc.: Asbestos-free ceramic refractory fiber, packing density as required (3.0-12.0 lb/cu ft).

2.02 JACKETS

A. Equipment jacketing:
   1. Equipment with regular surfaces:
      a. Box ribbed stucco embossed aluminum.
      b. ASTM B209 Alclad 3003 or 3004.
      c. Minimum thickness 0.040" on insulation over.
   2. Equipment with irregular surfaces:
      a. Stucco embossed sheet aluminum.
      b. ASTM B209 Alclad 3003 or 3004.
      c. Minimum thickness: 0.050".

B. Pipe jacketing:
   1. Material: Aluminum Alloy No. 3003 with H-14 temper, No. 3105 with H22 temper, or 5005 conforming to ASTM B209-89.
   2. Thickness: 0.016" unless otherwise specified.
   3. Surface: Stucco embossed; use only one type for entire Contract.
   4. Isolating or vapor barrier: Factory-applied on interior.
   5. Fittings: Formed 2-piece covers of 0.024 minimum gage smooth aluminum
   6. Ells, sweeps, and bends, of sizes for which above 2-piece formed jackets are not available shall be jacketed with factory-fabricated, field-assembled gore-type aluminum jackets consisting of interlocking segments which, when assembled, form smooth bend.

C. Banding:
   1. Over insulation surface less than 13" diameter: Stainless steel, 1/2" x 0.020'.
   2. Over insulation surfaces larger than 13", but less than 6'-0" in diameter: Stainless steel, 3/4" x 0.020".
   3. Over insulation surfaces larger than 6'-0" diameter: Stainless steel, 3/4" x 0.022".
   4. Maximum spacing: 12" oc.

PART 3 EXECUTION

3.01 PREPARATION

A. Do not apply insulation over damp or wet surfaces.

B. Testing on piping or equipment shall be completed prior to insulation installation.

3.02 INSTALLATION-GENERAL

A. Install insulating materials in strict accordance with manufacturer's recommendations and this Section.

B. Provide insulation and jackets on piping and equipment, including small diameter piping, low point drains, high point vents, and trim piping on equipment furnished and/or installed by this EPC Contract.

C. Longitudinal jacket laps on horizontal and sloped piping shall be on bottom of pipe.

D. Circumferential jacket laps on risers and sloped piping shall be made so upper section laps over lower section.

E. Verify insulation is continuous through inside walls. Pack around pipes and fireproof self-supporting insulation material, fully seal.

F. Finish insulation neatly at hangers, supports, and other protrusions.

G. Insulating materials shall be installed with necessary joints and terminations, to permit easy access and removal of equipment sections where inspection or frequent service or repair is required, and to allow for expansion.

H. Insulate thermometer wells, thermocouple wells, and test thermometer wells over entire external length. Taper insulation away from top of well neatly.

I. Provide heavy-gage metal insulation protection shields and saddles as required.

J. Provide closure at interface with existing insulation.

K. Anti-sweat insulation and vapor barrier shall be continuous through hangers and sleeves.

L. Install "burn protection" insulation on vent, drain, and similar piping where surface temperature of pipe exceeds 140°F when active and not otherwise insulated, or on piping or equipment where indicated.
   1. Burn protection insulation need not be continuous and may be limited to locations where pipe is accessible from floor, platform, stair, permanent ladder, adjacent to electrical cable trays, or other items susceptible to heat damage. Insulation shall extend 7' beyond access level.
   2. Use insulation thickness that will provide maximum exterior surface temperature of 140°F unless noted otherwise.
   3. Installation of burn protection insulation on branch lines from continuously insulated main lines shall include continuous insulation from main line to the outlet of the first isolating valve or to the steam trap, as applicable.

3.03 INSTALLATION - PIPING, VALVE, AND FITTING INSULATION

A. Insulate attachments with exposed metal surface temperatures above 140°F.

B. Insulation on piping 2-1/2" (64 mm) and larger with operating temperatures 500°F and above shall be installed in double layers with horizontal and vertical joints staggered. Each layer shall be 1/2 of total thickness to nearest 1/2" (13 mm).

C. Apply with tight seams and joints using wire loops or straps on 12" (300 mm) centers. Straps shall be used on insulation surfaces greater than 28" (711 mm) in diameter.

D. Embed wire loops flush with outer insulation surface. Cut off excess wire and embed twisted ends into insulation.

E. Apply anti-sweat insulation to piping with bonding adhesive, with butt joints and longitudinal seams closed tightly.

F. Flange covers:
   1. Construct in pieces to facilitate removal.
   2. Install after pipe has been brought up to operating temperature and bolts have been retightened.
   3. Construct fitting covers and special shapes of applicable pipe insulation; fill with insulating cement.
   4. Stop insulation a sufficient distance from flanges to permit bolt removal clearance.

G. Where thermal pipe shields are used at hanger locations, insulation shall extend through thermal shield. Where vapor barrier is required, Contractor shall be responsible for continuity of vapor barrier at thermal shield.

H. Where thermal pipe shields are not used at hangers for piping with vapor barrier, insulation shall be calcium silicate to eliminate compression.

I. Weld studs or clips to vertical runs of steel pipe to support insulation and to prevent displacement from expansion or contraction except following pipe lines which have clips furnished and installed by others

J. Insulation at anchors, pipe clamps, or other supports, secured directly to pipe surface, shall extend up anchor, clamp, or support for a distance of four times insulation thickness. Assure vapor seal at termination of vapor barrier.

K. Minimum thickness of fitting covers and special shapes: Same as straight pipe insulation, unless otherwise noted.

L. Laps on factory-applied jackets shall be 1-1/2" (38 mm) minimum width firmly cemented with lap adhesive, or be pressure sealing type lap.

M. Install factory-molded insulation for fittings as indicated for valve insulation.

N. Piping with "anti-sweat" requirements shall be continuous through pipe hangers.

O. Installation of cements and other castables shall be performed under ambient temperature conditions permitted by manufacturer. Provide supplemental closures and temporary heat to protect cast materials if required.

P. Work shall be water-resistant. Furnish and install adequate flashings, closures, joint covers, and any other covering required to keep insulation dry.

Q. Expansion joints:
   1. Expansion joints shall allow movement in direction of expansion or contraction. Cover metal expansion joints with insulating material and lag with metal matching description of flashing metal. Anchor one end of expansion joint cover, with other end free to slide in direction of expansion.
   2. Use double layer insulation at expansion joints regardless of insulation class or thickness.

R. Install heat barriers in vertical panel runs on maximum 8'-0" (2.4 m) centers.

S. Necessary provisions shall be provided for expansion and contraction of lagging so that it will lay flat and straight when equipment, piping, or ducts are either hot or cold. Insulation on equipment and ductwork shall have slip lap joints to prevent possibility of gaps when hot.

T. Trimming of pipe insulation around building steel, pipe, etc. will be required in some areas.

3.04 EQUIPMENT INSULATION INSTALLATION

A. Provide insulation clips where necessary. Field welding shall be performed by certified welders. No welding shall be performed on lined tanks and vessels.

B. Leave code stamps uncovered where possible. Provide nonferrous replica of nameplates, code stamps, etc., that will be covered by insulation. Field pack behind extended nameplates.

C. Reinforce insulation at corners and openings with metal beading.

D. Closed feedwater heaters:
   1. Construct insulation to allow cutting shell at cut line with minimum disturbance of insulation.
   2. Construct insulation to allow removal of channel access covers without disturbing shell insulation.
   3. Channel access cover insulation shall be attached to sectional sheet metal covers, to allow removal for access to channel access cover retaining bolts and replacement without damage.

E. Inspection ports, manholes, and access covers:
   1. Construct insulation to allow removal of covers without disturbing surrounding insulation.
   2. Access cover insulation shall be attached to sectional sheet metal covers or to access covers, to allow removal for access to access cover retaining bolts, and replacement without damage.
   3. Insulate hinges or any other protrusions extending beyond insulation surface.
   4. Rupture disk covers shall be uninsulated.

3.05 ALUMINUM JACKETING INSTALLATION

A. Field-applied aluminum jackets:
   1. Laps in piping insulation:
      a. Longitudinal: 1" (25 mm) minimum.
      b. Circumferential: 2" (25 mm) minimum.
   2. Laps in equipment insulation: 3" (75 mm) minimum longitudinal and circumferential.

B. Longitudinal laps on piping, screwed or riveted laps on equipment and piping accessories:
   1. Locate on side normally concealed from view.
   2. On outside piping, longitudinal laps shall be below center line, arranged to prevent entrance of water.
   3. Circumferential laps shall be tightly banded and calked with silicone rubber.
   4. All laps against weather

C. Longitudinal edges: Hemmed 1" (25 mm).

D. Fastening:
   1. Apply banding at lap, on maximum 8" (200 mm) centers and as required to securely hold jacket in place.
   2. Install binding head stainless steel sheet metal screws, No. 7 x 3/8" (10 mm), on 3" (75 mm) centers through laps on fittings, valves, etc., where banding cannot be used. Install screws between bands on longitudinal laps where required to prevent gapping in jacket.
   3. Use "Z" hooks at each circumferential lap on vertical runs, and inclined surfaces spaced as necessary to prevent slippage of jacket.

E. Fittings and irregular shapes:
   1. Use formed covers.
   2. Where formed covers not applicable, use neatly cut, lapped pieces, with exposed edges hemmed.
   3. Fasten in accordance with requirements for field-applied aluminum jackets.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Complete boiler including refractory for burner throats, roof and other penetration seals, observation and access doors, and sootblower openings and boxes.

B. Insulation and lagging on equipment and ductwork including fabric filter baghouse, air heater, ID fan, primary air fans, flues, and ducts.

C. Provide insulation and lagging on fans as required to meet noise limitations. Refer to Section 01 30 00 for requirements.

PART 2 PRODUCTS

2.01 DESIGN REQUIREMENTS

A. Hot and tempered primary air into mills requires thermal insulation. Main mill casings are not insulated, nor are coal pipes.

B. Insulation thickness shall be such that surface temperature does not exceed 140°F based on an ambient temperature of 90°F and an ambient wind speed of 1 mph, 1" minimum.

2.02 INSULATION

A. Materials:
1. New, dimensionally stable, dry, and noncorrosive. Select in accordance with maximum prevailing temperature; thickness as required to maintain specified outside surface temperature.
2. High-temperature block insulation (1,800ºF maximum): Asbestos-free mineral fiber block having density of not less than 20 lb/cu ft ASTM C612, Class 5.
3. Medium temperature block insulation:
   a. Asbestos-free mineral fiber block having a density of not less than 12 lb/cu ft, ASTM C612, Class 4, for use to 1,000ºF.
   b. Calcium silicate block, ASTM C533, Type 1, for use to 1,200ºF.
4. Mineral fiber blanket insulation (850ºF maximum): Asbestos-free mineral fiber felt having density of not less than 8 lb/cu ft, with stainless steel mesh on both sides, ASTM C592, Class 1.
5. Plastic insulation: Mineral wool thermal insulating cement, ASTM C195.
6. Packing for expansion joints, seals, etc.: Asbestos-free ceramic refractory fiber, packing density as required (3.0-12.0 lb/cu ft.
7. Low-temperature fiber board insulation (850ºF maximum):
   a. Type: Asbestos-free mineral fiber batt (fiberglass), density of not less than 3 lb/cu ft, ASTM C612, Class 5.
   b. Use: Restricted to particulate control equipment.
8. Medium-temperature preformed cylindrical pipe insulation (1,200ºF maximum):
   a. Type: Asbestos-free calcium silicate having density of not less than 15 lb/cu ft, ASTM C533, Type 1.
   b. Use: Piping except antisweat applications.
9. Low-temperature preformed cylindrical and sheet insulation (850ºF maximum):
   a. Type: Rigid fiberglass having density not less than 2.5 lb/cu ft; not less than 1/2" thickness.
   b. Use: Restricted to antisweat applications.
10. Medium-temperature preformed cylindrical pipe insulation (1,200ºF maximum):
    a. Type: Asbestos-free mineral fiber having density of not less than 12 lb/cu ft, ASTM C547.
    b. Use: Restricted to acoustical applications for noise abatement.
11. Mineral wool board (900°F maximum):
    a. Type: Asbestos-free mineral wool board having density of not less than 8 lb/cu ft.
    b. Use: Equipment and ductwork.

B. Piping: See Section 40 42 00.

C. Equipment and ductwork:
   1. Application:
      a. Boiler exit flue from economizer to SCR: Thermal
      b. Flue from Boiler to air heaters: Thermal.
      c. Air heaters: Thermal.
         Flue gas ductwork from air heaters to dry scrubber: Thermal.
      d. Flue from dry scrubber to baghouse: Thermal
      e. Flue gas ductwork from baghouse to ID fans: Thermal and acoustical.
      f. Flue gas ductwork from baghouse to ID fans: Thermal and acoustical.
      g. Flue gas ductwork from ID fans to stack: Thermal and acoustical.
      h. ID fans: Thermal and acoustical.
      i. Air ductwork from silencer to PA and FD fans: Acoustical.
      j. PA and FD fans: Acoustical, if required to meet noise limitations.
      k. Combustion air ductwork from PA and FD fans to air heaters: Acoustical, if required to meet noise limitations.
      l. Secondary combustion air ductwork from air heaters to burner windbox: Thermal.
      m. Burner windbox: Thermal.
      n. Primary air ductwork from air heater to pulverizers: Thermal.
      o. Tempering air ductwork: Acoustical; where required.
   2. Thermal insulation:
      a. Exterior metal cover:
         1) Over equipment and ductwork having regular surfaces: Box ribbed stucco embossed panel.
         2) Insulated irregular surfaces that cannot be neatly covered with box ribbed panels: Smooth aluminum sheet.
      b. Insulation thickness for equipment and ductwork, increase thickness as necessary to meet surface temperature requirements.
      c. Interior finish: 0.0025" of reflective aluminum foil covered with 16 USSWG soft-annealed wire.
      d. Flashing: Same material and finish as external lagging sheets.
      e. Use stainless steel screws. Exposed screws shall have sealing washers, pre-assembled to screws.
      f. Use aluminum washers over prongs or pins.
   3. Acoustical insulation:
      a. Exterior metal cover: Same as for thermal insulation.
      b. Insulation thickness: As required for noise abatement.
      c. Flashing: Same material and finish as external lagging sheets.
      d. Use stainless steel screws. Exposed screws on acoustical insulation shall have metal-backed neoprene washers, pre-assembled to screws. Exposed screws on acoustical thermal insulation shall have lead washers.
      e. Use aluminum washers over prongs or pins.

D. Baghouse:
   1. Preinsulated, prefabricated panel insulation or field-fabricated insulation and lagging, composed of materials specified, on exposed steel surfaces of baghouse, hot gas ductwork, access doors, hoppers, expansion joints, including baghouse walls forming access bay between compartments, except where building-type metal wall and roof panels will be installed.
   2. Preinsulated, prefabricated panel insulation in areas between top of baghouse end walls and roof.
   3. Provide auxiliary steel, flashings and accessories including those necessary for thermal movement and weathertightness of installation.
   4. Hopper heaters on baghouse shall be accessible by removable access panels. Panels shall be integral part of insulation and shall be either hinged or secured in place with sliding bolts.

E. Provide insulation blankets on maintenance items.

2.03 LAGGING

A. Box ribbed stucco embossed aluminum: 4", 1.0" deep, conforming to ASTM B209 Alclad 3003 or 3004, or equal, 0.040" minimum thickness on insulation over furnace and boiler gastight enclosure, breeching, ducts, and equipment having regular surfaces.

B. Smooth sheet aluminum: ASTM B209 Alclad 3003 or 3004, or equal, 0.050" minimum thickness on irregular surfaces that cannot be neatly covered with box ribbed aluminum. Sheet aluminum lagging shall also be used on headers, etc.

C. Pipe jacketing: See Section 40 42 00.

D. Banding: See Section 40 42 00.

2.04 METALS

A. Structural steel and miscellaneous shapes: As specified for boiler supporting steel; refer to Section 05 10 00.

B. Special castings, doors, hangers, supports: Cast iron (600ºF maximum) or iron-chromium-nickel alloys suitable for actual service temperatures encountered.

C. Wire mesh: Galvanized hexagonal wire mesh, 1" by No. 20 USSG, ASTM A390.

D. Expanded metal: Copper bearing diamond mesh metal lath weighing not less than 2.5 lb/sq yd.

E. Provide drum ends with metal enclosure with removable stainless steel cover plate for access to drum and manhole.

2.05 SETTING

A. Structure and supports:
1. Support setting materials from boiler pressure parts, in accordance with manufacturer's established standards.
2. Provide for thermal expansion but prohibit permanent displacement or sagging of setting materials.

B. Backpass and furnace walls:
1. Not less than 4" mineral fiber batt insulation applied directly to tubes.
2. Outer lagging securely supported, stiffened, and tied to prevent buckling or sagging.

C. Backpass and furnace roof inside penthouse: None.

D. Penthouse:
1. Internal insulation: High or medium temperature block or mineral fiber batt insulation, 4" minimum thickness.
2. Construction: Integral with boiler lagging.

E. Economizer hopper:
1. Not less than 4" mineral fiber batt insulation applied directly to hopper.
2. Securely support, stiffen, and tie outer lagging to prevent buckling or sagging.

F. Headers and circulators:
1. Insofar as practicable, enclose headers and circulators within exterior lagging.
2. Exposed headers and circulators shall be fully insulated; headers, circulators, and enclosed headers with fluid temperatures exceeding 900°F shall have molded or block-type insulation securely attached and supported. Insulation shall be calcium silicate-type low temperature or combination low and high temperature of thickness shown on Mechanical Standard M-1001 for prevailing maximum temperature or as required to meet surface temperature criteria.
3. Provide insulated removable panel covers, in sizes suitable for convenient handling, for access and inspection openings in headers. Where subject to internal gas pressure, covers shall be bolted and gasketed.
4. Insulation applied directly to header may be eliminated provided header enclosure and cover panel are provided with internal insulation of equivalent quality and insulating value.

G. Metering and instrument connections: Provide sleeved openings in setting and casing for metering connections as specified hereinafter:
   1. Unless specifically noted otherwise, sleeves shall be of 2" steel pipe welded in place.

H. Protruding elements:
   1. Setting and casing shall be carefully fitted around elements which protrude through walls or enclosure, including:
      a. Fuel burning equipment.
      b. Superheater and reheater tubes and headers.
      c. Water wall headers, tubes, and circulators.
      d. Blow-off and drain piping.
      e. Soot blowers.
      f. Boiler trim and accessories.
      g. Connections for control and metering apparatus.
      h. Gas sampling connections.
      i. Thermometers, thermocouples, and test wells.
   2. Provide flexible connections, seals, and any special construction necessary to provide airtight construction.

2.06 REFRACTORY

A. As required by manufacturer.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install steam generating unit setting materials in accordance with Manufacturer standard construction.

B. Install insulating materials in strict accordance with manufacturer's recommendations.

C. Installation of refractories, cements, and other castables shall be performed under ambient temperature conditions permitted by manufacturer. Provide supplemental closures and temporary heat to protect cast materials if required.

D. Work shall be water-resistant. Provide adequate flashings, closures, joint covers, and other covering required to keep insulation dry.

E. Top horizontal panels exposed to weather shall have minimum slope of 1/2" per foot as required for adequate drainage. Provide additional members required for proper drainage pitch.

F. Where horizontal side stiffeners exceed 6'-0" center-to-center, install additional members to provide satisfactory support for panels.

G. Weld structural steel members and stiffeners to duct surface to provide solid and safe connection.

H. On top surfaces, panel supports shall be on 3'-0" centers. Surface shall be designed for 250 lb/ft^2 walking load without suffering permanent deformation. Install flat sheet lagging over box ribbed lagging to provide uniform walking surface.

I. Structural steel members and stiffeners shall be of sufficient size, gage, and depth to provide adequate support and a smooth exterior surface.

J. Attach lagging to stiffeners and structural members with No. 14 stainless steel self-tapping screws on maximum 12" centers.

K. Expansion joints shall allow movement in direction of expansion or contraction. Cover metal expansion joints with insulating material and lag with metal matching description of flashing metal.

Anchor one end of expansion joint cover, with other end free to slide in direction of expansion. Install heat barriers in vertical panel runs on maximum 8'-0" centers.

L. Provide for expansion and contraction of lagging so it will lay flat and straight when equipment, piping, or ducts are either hot or cold. Insulation on equipment and ductwork shall have ship lap joints to prevent gaps when hot. Install removable access panels on access doors. Panels shall be integral part of insulation and shall be either hinged or secured in place with sliding bolts.

M. Construct insulation systems so as to facilitate easy removal of insulation around removable sections of fan casing and hopper heaters.

N. Insulation thicker than 2" shall be installed in double layers with horizontal and vertical joints staggered.

O. Provide antisweat insulation on cooling water and service water piping.

P. Attach insulation to exterior cover sheets by means of 20-gage split aluminum prongs or minimum 0.100" diameter aluminum pins. Spot-weld aluminum prongs or pins to exterior aluminum on maximum 18" centers longitudinally and laterally.

NO. M-1001 REV 3

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Provide supervision, labor, coordination, tools, material, equipment, and services required to perform commissioning and start-up of each respective item of equipment and systems furnished and/or installed as a part of this EPC Contract.

B. Provide supervision, labor, and assistance to manufacturer's field representative and technical directors of installation for equipment installed as a part of this EPC Contract. Follow specified procedures and instructions provided by these representatives. Representatives will not be present at all times. Owner or Owner's Representative will determine when representatives are required.

C. Provide construction labor required for commissioning process necessary to support schedule as determined by Owner, including initial total plant startup.
   1. Plant startup will proceed on a schedule determined by Owner and will likely entail 24-hour a day activity until startup is complete.
   2. Owner will provide operators for commissioning process. Owner will determine when startup has been completed.
   3. Startup refers not only to startup of total plant but also to individual systems requiring checkout prior to total plant startup.

D. Verify operation performance of system, equipment and associated accessories for compliance, as described in EPC Contract Documents.

E. Document test inspections.

F. Verify application of operation and maintenance manuals, record documents, spare parts listings, and other items as may be specified for supporting of piping systems and equipment.

1.02 QUALITY ASSURANCE

A. Assure participation and cooperation of specialty contractors under its jurisdiction as required for commissioning process.

B. Check-out each piece of equipment and each system with approved checklist to ensure EPC Contract Document conformance prior to start-up.

C. Keep track of commissioning activities with acceptance for operation checklist. Refer to mechanical and electrical technical specifications for specific requirements.

D. Develop detailed commissioning documents for Owner's approval.

E. Conform to Owner's plant operating procedures for commissioning and startup of equipment.
   1. Notify Owner, in writing, 1 day in advance of commissioning of equipment or systems.
   2. Notify Owner, in writing, 1 day in advance of startup of equipment or systems upon completion of commissioning process.
   3. Upon completion of start-up, equipment or systems shall be turned over to Owner and tagged as accepted. No additional work on or operation of equipment or systems shall be allowed by Contractor without written consent of Owner.

PART 2 PRODUCTS

2.01 MATERIALS

A. Piping system joint leak testing compound.

B. Anti-rust compound for packing gland threads and valve stems.

2.02 TEST EQUIPMENT

A. Provide test equipment required for commissioning and startup of equipment.

B. Provide and maintain tools and test equipment in first-class condition and quantities sufficient to assure timely, successful performance and completion of required Work.

C. Test equipment shall have recent calibration checks by equipment manufacturer or authorized facility to assure accuracy of commissioning process.

PART 3 EXECUTION

3.01 SITE VERIFICATION OF CONDITIONS

A. Installation verification:
1. Prior to system start-up, the Contractor and Owner shall conduct final installation verification audit. Contractor shall be responsible for completeness of work to Owner's satisfaction including change orders and punch list items. Audit shall include, but not be limited to, checking of:
   a. Electrical distribution system and equipment.
   b. Piping specialties including balancing, control, and isolation valves.
   c. Control sensor types and locations.
   d. Identification of piping, valves, equipment, controls, etc.
   e. Major equipment, fans, valves, starters, gages, thermometers, etc.
   f. Documentation of prestart-up tests performed, including manufacturer's factory tests.
2. If Work is found to be incomplete, incorrect, or nonfunctional, Contractor shall take corrective action before system start-up work proceeds. If during system start-up additional items are found, Contractor shall take corrective action before system start-up is completed.

B. Operation verification:
1. After system equipment, wiring, piping, and component installation has been verified, system start-up and calibration shall commence.
2. Contractor shall be responsible for operation and control of installed systems.
3. During system checkout, operation checklist shall be filled out to verify system operation.
4. Owner and/or Owner's Representative shall verify system operation with responsible Contractor.

3.02 ELECTRICAL DISTRIBUTION SYSTEM AND EQUIPMENT TESTING AND COMMISSIONING

A. Acceptance testing of electrical distribution system and equipment under scope of project shall conform to equipment manufacturer recommended testing and commissioning requirements and to ANSI/NETA Standard for Acceptance Testing Specifications for Electrical Power Equipment and Systems (ANSI/NETA ATS-2009).

B. Acceptance test shall include:
1. Visual and mechanical Inspection.
2. Electrical tests.
3. System functional tests.

C. Testing and commissioning of electrical distribution system and equipment shall cover following categories of equipment:
1. Large power transformers.
2. Medium and small transformers.
3. Medium-voltage switchgear.
4. Low-voltage switchgear and switchboards.
5. Medium-voltage and high-voltage circuit breakers.
6. Medium-voltage circuit breakers.
7. Medium-voltage and low-voltage variable frequency drives.
8. Medium-voltage and low-voltage starters.
9. Low-voltage circuit breakers.
10. Medium-voltage and high-voltage cables.

11. Low-voltage switches.
12. Medium-voltage and high-voltage switches.
13. Motor control centers.
14. Low-voltage cables.
15. Medium-voltage cables.
16. Bus ducts and bus ways
17. Rotating machinery: Motors and generators.
18. Protective relays and metering.
19. Instrumentations.
20. UPS, charger, rectifier, and battery system.
21. Specialty systems: Fire alarm, security, and communication.

3.03 EQUIPMENT COMMISSIONING

A. Bearings:
1. Inspect for cleanliness; clean and remove foreign materials.
2. Verify alignment.

B. Drives:
1. Inspect for cleanliness; clean and remove foreign materials before starting operation.
2. Adjust drives for all alignment of sheaves, V-belts, and couplings.
3. Adjust tension in V-belt drives, and adjust varipitch sheaves and drives for proper equipment speed.

C. Lubrication:
1. Lubricants for initial operation shall be furnished by Contractor.
2. Lubricants required for storage and flushing of equipment furnished shall be furnished by Contractor.
3. Lubricate bearings and fill oil reservoir prior to operation. Perform lubrication in accordance with manufacturer's recommendations.
4. After lubricating equipment, affix tag to equipment stating lubricant used, quantity, date lubricated, and name of person lubricating equipment.
5. Submit 2 volumes of lubrication requirements to Owner at site for each item of equipment furnished requiring lubrication.

D. Motors:
1. Check each motor for amperage comparison to nameplate value.
2. Correct conditions which produce excessive current flow, and which exist due to equipment malfunction.

E. Pumps:
1. Check mechanical seals and packing for cleanliness and adjustment before running pump.
2. Verify that pump and connecting piping are free of dirt, debris, and scale before circulating liquid through pump.
3. Check running clearances.

F. Inspect fan wheels for clearance and balance. Provide factory authorized personnel for adjustment when needed.

G. Remove any rust, scale, and foreign materials from equipment and renew defaced surfaces.

3.04 PIPING SYSTEMS COMMISSIONING

A. Check settings of pipe hangers.

B. Check piping for leaks at every joint, and at every screwed, flanged, or welded connection, using approved compound.
1. Examine flanged joints:
a. Tighten flanges after system has been placed in operation.

b. Replace flange gaskets that show any sign of leakage after tightening.
2. Inspect screwed joints:
a. Promptly remake each joint that appears to be faulty; do not wait for rust to form.
b. Clean threads on both parts, apply compound, and remake joints.

C. Vent gasses trapped in any part of liquid systems. Verify that liquids are drained from all parts of gas or air systems.

D. After system has been placed in operation:
1. Clean strainers, dirt pockets, orifices, valves seats, and headers in fluid systems, to assure they are free of foreign materials.
2. Open steam traps and air vents; remove operating elements. Clean thoroughly, reinstall internal parts and put back into operation.

E. Repair damaged insulation.

3.05 INSTRUMENT PIPING COMMISSIONING

A. Branch instrument air headers shall be blown down (drained) and leak tested prior to time air is admitted to any instrument. Purpose of blowing down header is to remove moisture, foreign particles, etc., to assure cleanliness of header. Larger outlets shall be blown first and ultimately each supply line shall be disconnected at instrument and blown.
1. In testing branch headers, pressurize header to 120 lb, close valves, and observe pressure loss during 30-minute period. A loss of greater than 2% will be considered excessive.
2. If leakage is excessive, perform bubble test to locate leaks in main header, and at joints in individual instrument supply lines.
3. Perform necessary repairs to air header and retest until satisfactory.

B. Pneumatic tubing circuits shall be blown down and tested for continuity, restrictions, tightness, and elimination of leaks.
1. Test for continuity, restrictions, and plugging shall consist of applying 35 psig air supply to input end of tubing under test, with tubing disconnected from instruments and open to atmosphere.
2. Reasonable flow of air shall be present at open end of tubing. If tubing leads to more than 1 unit or piece of equipment, same procedure shall be followed at each unit after reconnecting tubing to previous unit.
3. Test for tightness and elimination of leaks shall be that outlined in latest revision of ISA 7.0.01 "Quality Standard for Instrument Air."
4. Wherever possible, instrument or instruments at outlet end of tubing shall remain connected to tubing during test so that instrument may be tested simultaneously, provided instrument has suitable pressure rating.
5. Appropriate allowances shall be made in extending duration of length of test to offset additional volume of instrument. Where tubing terminates in large valve diaphragm housing or other large volume, tubing may be disconnected, plugged, and tested.
6. After tubing test has been completed, tubing shall be reconnected to various units involved, and broken connections shall be bubble-tested.
7. In testing diaphragm control valves or other large volumes for leaks, use small rotameter and 35 psig air supply. Rate of flow indicated by rotameter shall not exceed 5.0 std. cc/min. of air.
8. In event instrument air is not available during time that commissioning is required, supply instrument quality air from portable compressor or bottled dry air or nitrogen.

3.06 CONTROLS AND INSTRUMENTATION COMMISSIONING

A. Check out controls and instruments prior to start-up to assure in-situ performance in accordance with EPC Contract Documents under simulated operating conditions. Determine initial start-up conditions.

B. Prior to commissioning:
1. Remove shipping stops from instruments before starting with procedures specified.
2. Contractor shall have instruction manuals available.
3. Install miscellaneous components furnished separately.

4. Verify nameplate data with respect to conditions of range, operating temperature, specific gravity, and components as stated on unit specifications. Discrepancies shall be immediately called to attention of Owner and report of its condition confirmed in writing.

C. Commissioning responsibilities:
1. Verify instrument installation in conformance with manufacturer's recommendations.
2. Follow manufacturer's recommendations for calibrating control system components including instruments, switches, valves, etc.
   a. Calibrate instruments individually and where applicable, as system (i.e. transmitter, controller and control valve).
   b. Verify control system components calibration meets published accuracies over full operational range.
   c. Defective equipment: If any instrument cannot be properly adjusted or does not meet manufacturer's specifications, immediately call to attention of Owner and report of its condition confirmed in writing. Repair or replace equipment furnished as part of this contract.
   d. Calibration of supplementary supply and output pressure gages contained on instruments will not be required. Follow defective equipment guidelines if gage is found to be faulty.
3. Complete calibration report form for each instrument and control device.
4. Calibration Stickers: Upon successful calibration, affix calibration sticker to instrument or control component. Calibration sticker shall contain equipment identification number, calibrated range or switch set and reset conditions, date of calibration, due date for next calibration, and name of person performing calibration.
5. Check instrument and control wiring for proper operation.
   a. After energizing and prior to start-up, check control circuits and programs for proper sequence of operations and interlocking functions.
   b. Correct any wiring changes required as result of checks including properly changing terminal strip and/or wiring markers, and associated documentation including schematics and termination diagrams.

D. Test procedures:
1. Analog devices: Include 9-point span test (0%, 25% increasing, 50% increasing, 75% increasing, 100%, 75% decreasing, 50% decreasing, 25% decreasing, 0%) verifying linearity and hysteresis meets specified values.
2. Discrete devices: Use multiple state changes to verify set point, reset point, and deadband.

E. Acceptable calibration standards:
1. Vacuum or draft:
   a. 0" to 5" w.c.: Inclined water-filled manometer graduated in hundredths of inches of water.
   b. 5" to 25" Hg: Mercury manometer graduated in tenths of inches of mercury.
   c. 5" to 60" w.c.: Water manometer graduated in tenths of inches of water.
   d. Electronic: Digital manometer, ±0.25% full scale accuracy, 3.5-digit LCD display, ranges of 0 to 19.99" w.c. and 0 to 199.9" w.c., ±1 LSD.
2. Pressure:
   a. 0" to 5" w.c.: Inclined water-filled manometer graduated in hundredths of inches of water.
   b. 5" to 60" w.c.: Water manometer graduated in tenths of inches of water.
   c. 3 to 25 psig: Mercury manometer graduated in tenths of psi.
   d. 25 to 150 psig: Precision pressure gage, 0-160 psi, 1/4 of 1% accuracy, 8-1/2" dial minimum.
   e. 150 to 750 psig: Precision pressure gage, 0-800 psi, 1/2 of 1% accuracy, 8-1/2" dial minimum.
   f. 750 to 2,750 psig: Precision pressure gage, 0-3,000 psi, 1/2 of 1% accuracy, 8-1/2" dial minimum.
   g. Electronic: Digital manometer, ±0.1% full scale accuracy, 3.5-digit LCD display, ranges of 0 to 19.99 psig, 0 to 199.9 psig, and 0 to 1,999 psig, ±1 LSD.
3. Differential:
   a. 0" to 5" w.c.: Inclined water-filled manometer graduated in hundredths of inches of water.
   b. 5" to 300" w.c.: Mercury manometer graduated in tenths of inches of water.
   c. 5 to 25 psig: Mercury manometer graduated in tenths of psi.
   d. Above 25 psig: Use pressure gages specified.

e. Electronic: Digital differential manometer, ±0.1% full scale accuracy, 5-digit LCD display, ranges of 0 to 200" w.c. and 0 to 2,000" w.c., ±1 LSD.

4. Temperatures:
   a. -20 to 250ºF: Laboratory thermometers of suitable range.
   b. Other ranges: Use thermocouple and precision potentiometer.
   c. Electronic: Digital thermometer, ±0.1% of reading accuracy, 4-digit LCD display, ±1 LSD.
5. DC process signal calibrator: 2-wire transmitter simulator:
   a. 4-20 mA range: ±0.5% full scale accuracy, 4-digit LCD display, ±1 LSD.
   b. 10-50 mA range: ±0.06% full scale accuracy, 4.5-digit LED display, ±1 LSD.

3.07 PANEL MOUNTED INSTRUMENTS

A. Receiver instruments: Perform 9-point span test (0%, 25% increasing, 50% increasing, 75% increasing, 100%, 75% decreasing, 50% decreasing, 25% decreasing, 0%) verifying linearity and hysteresis by impressing measured signal into input or signal connections on instrument.

B. Controllers (panel or control room mounted):
   1. Check for proper operation and adjust in accordance with manufacturer's instructions. Vary process input signal and check output signal for direction.
   2. Set initial proportional band, reset rate, and rate time as recommended by manufacturer. It may be necessary to determine process dynamics in actual operation before settings can be made.
   3. Control loops shall be observed for operability and conformance to Specifications by impressing simulated input signal at primary element and checking response of final control element.

C. Integrators, ratio relays, etc.:
   1. Check in conformance to manufacturer's recommendations. Receiver integrators shall be calibrated for proper operation and multiplication factor by feeding maximum input signal for specified period of time with stopwatch.
   2. Check in conformance to manufacturer's recommendations. Ratio signals shall be simulated to check proper ratio settings and output.

D. Graphics panel: If possible, trip each alarm actuator (field device) in sequence and observe Graphics. Check "acknowledge" and "test" pushbuttons.

3.08 CONTROL VALVES

A. Prior to commissioning, inspect hand and automatic control valves.
   1. Verify control valve seat is free from foreign material and properly positioned for intended service.
   2. Clean bonnets and stems.
   3. Coat packing gland threads and valve stem with surface preparation of anti-rust compound after cleaning.
   4. Tighten packing glands to assure no leakage, but permit stems to operate without galling.

B. Test procedures:
   1. Perform 9-point span test (0%, 25% increasing, 50% increasing, 75% increasing, 100%, 75% decreasing, 50% decreasing, 25% decreasing, 0%) verifying linearity and hysteresis meets specified values.
   2. Check valve action and fail position for conformance to Specifications (i.e. open, close, or in-place on loss of power source).
   3. Valve positioner:
      a. Check for conformance to Specifications relative to spring action and input range (particularly for split range applications), valve action, and length of stroke.
      b. If valve positioner is fitted with standard characterized cam, check to see if proper cam is mounted.
      c. If specifications call for specially cut cam, refer this item in writing to Engineer for handling.
      d. Do not cut or modify standard cam.

C. After commissioning, replace packing on any valve which continues to leak.

3.09 ACCEPTANCE FOR OPERATION

A. Each piece of equipment installed by this contract shall carry "Acceptance for Operation Checklist." Each checklist shall be signed by the Contractor's Representative and Owner, or Owner's Representative. Each list shall have applicable blanks filled in and attached to items indicating that it is prepared for operation.

B. Owner will accept equipment and systems for operation when construction has been substantially completed by Contractor. "Acceptance for Operation" shall mean. From this point the O&M will be part of the O&M contract. "Acceptance for Operation" does not relieve Contractor from responsibilities related to defective materials and workmanship; neither does it constitute final acceptance of materials and equipment.

C. After Owner has accepted a system for operation, Contractor shall continue to perform following as requested and scheduled by Owner at no additional cost to Owner until final acceptance:
   1. Troubleshooting, adjustments, and repairs until system operation and performance is acceptable.
   2. Assist instrument and control personnel with instrument calibration.
   3. Craft labor as required.

D. After Owner has accepted a system for operation, Contractor shall continue to supply technical services when needed until final acceptance.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Impulse, instrument air supply, control, and signal piping including tubing, fittings, valves, and support materials.

B. Sun protection and instrument enclosures.

C. Instrument mounting stands.

D. Instruments and control equipment:
1. Pressure sensing devices.
2. Flow sensing devices.
3. Level sensing devices.
4. Temperature sensing devices.
5. Analytical devices.
6. Control valves.
7. Safety relief valves.

E. Installation of instrumentation and control equipment including field transmitters, sensing elements, control valves, analyzers, and miscellaneous devices.

1.02 QUALITY ASSURANCE

A. Provide instruments from same manufacturer and of same model series when multiple units of same item are required.

B. Instruments, control devices, and accessories shall be free of mercury and asbestos.

C. Use plant instrument air source pressure and furnish pressure regulator with filter and output gage.

D. Furnish insect-proof screens on vents.

E. Furnish new and unused instruments and control devices.

F. Provide linkages, mounting accessories, etc. necessary to place device into service.

PART 2 PRODUCTS

2.01 DESIGN REQUIREMENTS

A. Instrumentation, tubing, fittings, and valves shall comply with Power Piping Code ASME B31.1.

B. Flow meters:
1. Orifice plates: ISA SP3.
2. Turbine flow meters: ISA SP31.
3. Submit certified calculation sheets verifying meter selection for operating conditions at minimum and maximum flow rate.

C. Temperature measurement:
1. Thermocouples: ISA SP1.1.

2. RTDs: ISA SP1.3.
3. Temperature gages: ISA SP1.4 and SP1.6.
4. Thermowells:
   a. SAMA RC-17 application and dimensional standards.
   b. Verify stress analysis calculations in accordance with ANSI/ASME PTC-19.3, Part 3, for operating conditions to demonstrate thermowell shall not exceed material stress limitations.

D. Analytical measurement:
1. Combustible gas detectors: ISA SP12.13.
2. Hydrogen sulfide detectors: ISA SP92.01.
3. Carbon monoxide detectors: ISA SP92.02.
4. Ammonia detectors: ISA SP92.03.
5. Chlorine detectors: ISA SP92.06.

E. Control valves:
1. Furnish control valves and accessories as complete assembly with control tubing, fittings, and interconnection wiring.
2. Verify control valve sizing in accordance with ISA S75.01, as follows:
   a. Minimum flow: Greater than 10% valve travel.
   b. Normal flow: Approximately 50% to 70% valve travel.
   c. Maximum flow: Approximately 90% valve travel.
3. Verify predicted sound pressure level using ISA S75.17/IEC 534-8-3.
   a. Control valve body outlet velocity shall not exceed Mach 0.3.
   b. Predicted sound pressure shall not exceed specified level.
   c. Provide recommendations for mitigation of problem.

F. Verify pressure relieving device sizing for gas, liquid, and steam applications in accordance with ASME Boiler and Pressure Vessel Code, Section VIII – Rules for Construction of Pressure Vessels.

G. For all instrumentation and devices furnished under this Contract, Contractor shall select appropriate material and/or verify material compatibility for process fluid, pressure, and temperature as required for each application and installed environmental conditions.

H. Intent of this Section is to provide general guidance for selection of instrumentation and measuring devices. If not specifically indicated, Contractor shall provide suitable instrumentation and devices as required for each application subject to approval by Owner after award of contract.

2.02 IMPULSE TUBING

A. Tubing:
1. Process: Water, air, steam, gas below 300 psig and 1,200°F.
   a. Outside diameter: 0.5" (14 mm).
   b. Wall thickness: 0.049" (1.5 mm).
   c. Material: ASTM A213; Type 316H stainless steel.
   d. Construction: Seamless.
2. Process: Water, air, steam, gas at or above 300 psig, and below 2,500 psig and 1,200°F.
   a. Outside diameter: 0.5" (14 mm).
   b. Wall thickness: 0.083" (2.2 mm).
   c. Material: ASTM A213; Type 316H stainless steel.
   d. Construction: Seamless.
3. Process: Boiler feedwater and/or main steam above 2,500 psig.
   a. Outside diameter: 0.5" (14 mm).
   b. Wall thickness: 0.083" (2.2 mm).
   c. Material: ASTM A213; Type 316H stainless steel.
   d. Construction: Seamless.
4. Process: Water, air, steam, gas below 1,500 psig and 1,000°F.
   a. Outside diameter: 0.5" (14 mm).
   b. Wall thickness: 0.049" (1.5 mm).
   c. Material: ASTM A269, Type 316 stainless steel.

d. Construction: Seamless.
5. Process: Seawater below 300 psig and 200°F.
a. Outside diameter: 0.5" (14 mm).
b. Wall thickness: 0.049" (1.5 mm).
c. Material: Titanium.
d. Construction: Seamless.
6. Other processes:
a. Outside diameter: 0.5" (14 mm).
b. Wall thickness: 0.049" (1.5 mm).
c. Material: As required for application.
d. Construction: Seamless.

B. Fittings: Compression fittings shall match tubing material.

2.03 INSTRUMENT VALVES

A. Low-pressure water, air, gas, and steam below 300 psig and 500°F service:
1. Type: Ball.
2. Material: Type 316 stainless steel, ASTM A479.
3. Pressure rating: 1,500 psig at 100°F.
4. Internals: Type 316 stainless steel ball, teflon packing.

B. Seawater below 300 psig and 200°F service:
1. Type: Ball.
2. Material: Titanium.
3. Pressure rating: 1,500 psig at 100°F.
4. Internals: Titanium ball, teflon packing.

C. Steam at or above 300 psig and 500°F and boiler feedwater service:
1. Type: Ball.
2. Material: ASTM A479; Type 316 stainless steel.
3. Pressure class: ASME/ANSI B16.34 Class 2500.
4. Internals: Carbide ball seat and graphoil packing.
5. Orifice size: 0.375" (10 mm).

D. Other services: Type, materials, pressure class, and internals as required for application.

2.04 INSTRUMENT MANIFOLDS

A. Type: 2-valve for pressure applications and 3-valve for differential pressure applications.

B. Pressure class: ASME/ANSI B16.34 Class 2500.

C. Material:
1. Normal use: ASTM A479; Type 316 stainless steel.
2. Seawater: Titanium.
3. Other services: As required for application.

D. Internals: Carbide ball seat and graphoil packing, or as required for application.

2.05 CONTROL AND INSTRUMENT AIR SUPPLY TUBING

A. Application:
1. One line for 1 to 4 devices (not including pneumatic actuators).
2. One line to single pneumatic actuator.

B. Features:
1. Outside diameter: 3/8" (10 mm).
2. Wall thickness: 0.035" (1.0 mm).

3. Material:
   a. Indoor: ASTM A213 Type 316 stainless steel.
   b. Outdoor (subject to saliferious environments): Type 6 Mo (6% Molybdenum).
4. Construction: Seamless.

C. Fittings: Compression fittings shall match tube material.

D. Flexible tubing:
1. Use: Provide for applications between instrument/control valve/controller and stainless steel air supply tubing.
2. Construction: General purpose synthetic rubber tube, one textile braid reinforcement, with MSHA accepted synthetic rubber cover.
3. Size (I.D., in., mm): As required for application.
4. Color: Blue.
5. Fitting style: Barbed, as required for application.

2.06 CONDENSATE POTS

A. For steam service, provide condensate pots on flow transmitters and boiler drum level impulse tubing.

B. Construction:
1. Material: Type 316H stainless steel.
2. Rating:
   a. Design pressure: 9,000 psig.
   b. Design temperature: 1,200ºF (649ºC).
3. Length (from end cap to end cap): 14" (350 mm).
4. Port configuration:
   a. Vent: Centered on top cap.
   b. Drain: Centered on bottom cap.
   c. To process: Centerline on straight side of pipe 4" (100 mm) from end of vent cap.
   d. To instrument: On opposite side of process connection and 4" (100 mm) from end of drain cap with centerline on straight side of pipe.
5. Perform hydrostatic test at 1.5 times design pressure for 10 minutes.
6. Provide certification of hydrostatic test.

C. Materials, per pot:
1. One 4" (100 mm) Schedule XXH seamless pipe.
2. Two 4" (100 mm) Schedule XXH butt weld caps.
3. Four 1/2" (13 mm) 9,000 lb socket-weld weld half couplings.

2.07 SUN PROTECTION ENCLOSURE

A. Construction: Molded polyurethane or other chemical and ultraviolet light-resistant material.

B. Enclosure shall fully protect instrument from exposure to direct sunlight.

C. Mount directly to instrument or instrument mounting bracket.

2.08 INSTRUMENT ENCLOSURE

A. Construction: Molded polyurethane or other chemical, ultraviolet light- and fire-resistant material.

B. Enclosure shall fully enclose instrument and manifold.

C. Mount on same mounting bracket as instrument.

2.09 INSTRUMENTS AND CONTROL DEVICES

A. Instrument and control devices shall be rated according to applicable design process temperatures and pressures.

B. Pressure transmitters:
   1. Type: Absolute, differential, and/or gauge.
   2. Output: 4 – 20 mA with digital signal based on HART protocol.
   3. Minimum accuracy: 0.075 percent of calibrated span.
   4. Process flange type: Traditional.
   5. Materials:
      a. Flange and drain/vent:
         1) Standard: Type 316 stainless steel.
         2) Seawater: Titanium.
         3) Other: As required for application.
      b. Isolating diaphragm:
         1) Standard: Type 316L stainless steel.
         2) Seawater: Titanium.
         3) Other: As required for application.
   6. Housing material: Corrosion resistant.
   7. Mounting: Corrosion-resistant bracket for 2" (50 mm) pipe stand.
   8. Options:
      a. LCD display.
      b. Calibration data sheet.

C. Pressure switches:
   1. Type: Pressure and/or differential pressure.
   2. Enclosure: NEMA 4X.
   3. Element: Hermetically sealed, general purpose.
   4. Contacts: SPDT, rated at 11 amperes at 125/250 volts ac and 5 amperes at 30 volts dc.
   5. Actuator seal: As required for application.
   6. Pressure range: As required for application.
   7. Options:
      a. Stainless steel tagging.
      b. Factory adjusted setpoint.

D. Pressure gages:
   1. Type: Direct reading.
   2. Mounting: Local.
   3. Dial: 4-1/2" (114 mm).
   4. Color: Black on white.
   5. Case: Phenol.
   6. Ring: Screwed.
   7. Blowout protection: Pressure relieving back.
   8. Lens: Glass.
   9. Nominal accuracy: ±0.5%.
   10. Materials:
      a. Pressure element: Bourdon tube.
      b. Element and socket material:
         1) Standard: Type 316 stainless steel.
         2) Seawater: Titanium.
         3) Other: As required for application.
   11. Connection: 1/2" (13 mm) NPT lower.
   12. Movement: Standard.
   13. Plus performance (dampened movement).
   14. Stainless steel tag.

E. Differential pressure (DP) gages:
   1. Element: Diaphragm.
   2. Dial: 4-1/2" (114 mm).
   3. Color: Black on white.

4. Lens: Standard.
5. Nominal accuracy: ±2%.
6. Actuator: Convoluted diaphragm.
7. Movement: Standard.
8. Connection: 1/4" (6 mm) NPTF, In-line.
9. Blowout protection: None.
10. Materials: As required for application.

F. Flow indicators:
1. Type: Rotor.
   a. Body material and process connections: As required for application.
   b. Window: Tempered borosilicate.
   c. Seal gasket, for window: Neoprene gasket.
2. Type: Rotameter.
   a. Materials: As required for application.

G. Flow indicators (adjustable):
1. Type: Rotameter with valve.
2. Accuracy: 3% of full scale.
3. Process connections: Coordinate with mechanical requirements.
4. Flow range: As required for application.

H. Flow measurement (differential pressure):
1. Cone or wedge.
   a. Beveled ends.
   b. In-line.
   c. Turndown: 10:1 minimum.
2. Flow nozzle: Weld-end flanges.
3. Orifice.
   a. Plate edge thickness, bore and bevel: 1/8" (3 mm).
   b. Provide paddle type handle with following stamped on handle:
      1) Tag number.
      2) Line size.
      3) Flange rating.
      4) Orifice bore.
      5) Plate material.

I. Thermocouple assemblies, thermocouples:
1. Sensors:
   a. Thermocouple type:
      1) Normal use: Type E (Chromel-constantan).
      2) High temperature applications: Type K (Chromel-alumel).
   b. Cover style: Standard.
   c. Cover material: Standard.
   d. Sensor style: Spring loaded.
   e. Element: Dual, ungrounded.
   f. Element length: Sized to suit thermowell.
   g. Leads: 2-wire.
   h. Sheath diameter: 1/4" (6 mm).
   i. Sheath material: Type 316 stainless steel.
   j. Extension type: 4" (100 mm) nipple-union-nipple.
   k. Extension material: Corrosion-resistant steel.
   l. Connection: 1/2" (13 mm) NPT.
   m. Electrical connection: 3/4" (19 mm) NPT.
2. Thermowells:
   a. Material of construction: Type 316 stainless steel, unless specific application (i.e., seawater, high temperature systems, etc.) requires use of different material.
   b. Process connection: 1" NPT below 750 °F and 1-1/2" NPT above 750 °F.
   c. Insertion length "U": Not to exceed more than one-half of pipe diameter.

d. Lagging length: Thickness of insulation plus additional 1-3/4" (44 mm)).
e. Shank style: Tapered.
f. Bore: 0.260" (6.604 mm).
g. Internal thread: 1/2" (13 mm) NPT.

J. RTD assemblies:
1. Sensors:
a. RTD: 100 Ohm platinum, conforming to IEC 751 Class B.
b. Cover style: Standard.
c. Cover material: Standard.
d. Sensor style: Spring-loaded.
e. Element: Single.
f. Element length: Sized to suit thermowell.
g. Lead configuration: See Section 40 91 00-13.
h. Sheath diameter: 1/4" (6 mm).
i. Sheath material: Rated for high temperatures up to 1,070°F (577°C) or above.
j. Extension type: 4" (100 mm) nipple-union-nipple.
k. Extension material: Carbon steel.
l. Connection: 1/2" (13 mm) NPT.
m. Electrical connection: 3/4" NPT.
2. Thermowells:
a. Material of construction: Type 316 stainless steel, unless specific application (i.e., seawater, high temperature systems, etc.) requires use of different material.
b. Process connections: Coordinate with mechanical requirements.
c. Insertion length "U": Not to exceed more than one-half of pipe diameter.
d. Lagging: "F" length (lag extension "T" + 1-3/4" (44 mm)).
e. Shank style: Tapered.
f. Bore: 0.260" (6.604 mm).
g. Internal thread: 1/2" (13 mm) NPT.

K. Thermowells:
1. Material of construction: Type 316 stainless steel, unless specific application (i.e., seawater, high temperature systems, etc.) requires use of different material.
2. Process connection: 1" NPT below 750 °F and 1-1/2" NPT above 750 °F.
3. Insertion length "U": Not to exceed more than one-half of pipe diameter.
4. Lagging length: Thickness of insulation plus additional 1-3/4" (44 mm)).
5. Shank style: Tapered.
6. Bore: 0.260" (6.604 mm).
7. Internal thread: 1/2" (13 mm) NPT.
8. Stainless steel plug with captive chain.

L. Temperature gages with thermowells:
1. Gages:
a. Type: Bimetal, adjustable head.
b. Mounting: Adjustable angle (local).
c. Dial: 5" (125 mm).
d. Color: Black on white.
e. Case and stem material: Stainless steel.
f. Nominal accuracy: ±1%.
g. Stem connection: 1/2" (13 mm) NPT union.
h. Stem diameter: 1/4" (6 mm).
i. Options: Stainless steel tag.
j. Range: As required for application.
2. Thermowells:
a. Material of construction: Type 316 stainless steel, unless specific application (i.e., seawater, high temperature systems, etc.) requires use of different material.
b. Process connection: 1" NPT below 750 °F and 1-1/2" NPT above 750 °F.
c. Insertion length "U": Not to exceed more than one-half of pipe diameter.
d. Lagging length: Thickness of insulation plus additional 1-3/4" (44 mm)).

e. Shank style: Tapered.
f. Bore: 0.260" (6.604 mm).
g. Internal thread: 1/2" (13 mm) NPT.

M. Control valves:
1. Maximum allowable sound level shall not exceed 85 dBA.
2. Vacuum service: Valves shall have packing designed to minimize air leakage into valve with external pressures of 15 psia and full vacuum on valve interior.
3. Body materials, pressure ratings, and trim suitable for application.
4. ANSI Class seat tightness: V.
5. Actuators:
a. Type: Pneumatic spring diaphragm.
b. Size: As required for application.
c. Spring type: As required for application.
d. Air connections: 1/4" (6 mm) NPT standard.
6. Positioners:
a. Style: Advanced diagnostics.
b. Pneumatic train: Single acting.
c. Display: With display.
d. Gages: With tri-scale gages.
e. Communications: HART protocol.
7. Options:
a. Air set with output gages.
b. Factory installed and tested filter regulator assembly designed to meet requirements of complete valve assembly.
c. Swagelok stainless steel tubing and fittings.
d. Handwheel: Provide only for applications without a manual bypass.
e. Valve trains shall be delivered as completely tested and assembled products.
f. Provide limit switches as required for application.

N. Regulating valves:
1. Body materials, pressure ratings, and trim suitable for application.
2. ANSI Class seat tightness: V.

O. Relief valves: Body materials, pressure ratings, and trim suitable for application.

2.10 INSTRUMENT RACKS

A. Instrument racks for multiple instrument installations shall be floor-mount type. For single instrument installations, wall or column mounting of instruments is permitted.

2.11 INSTRUMENT IDENTIFICATION

A. Each instrument and control device shall have a tag permanently attached to case with following applicable information:
1. Tag number.
2. Manufacturer's name.
3. Model number.
4. Serial number.
5. Operating range.
6. Calibration setting/range.
7. Power rating.

B. Each control valve and actuator shall have stainless steel nameplate, permanently fastened to valve body or actuator with following as applicable:
1. Manufacturer's name, model number, and serial number.
2. Valve action on air failure.
3. Operating range and bench setting.

4. Body and trim size.
5. Body and trim materials.
6. Body and flange rating.
7. Type of packing and lubricant.
8. Flow arrow indicating direction of flow.
9. Tag number.

PART 3 EXECUTION

3.01 INSTALLATION - GENERAL

A. Install instrument and control devices in accordance with manufacturer's recommendations.

B. Mount instruments so they are rigidly supported, level and plumb, and in such a manner as to provide accessibility; protection from damage; isolation from heat, shock and vibration; and freedom from interference with other equipment, piping, and electrical work.

C. Do not install instruments until heavy construction work adjacent to instruments has been completed to extent that damage will be unlikely to installation by such construction work.

D. Manufacturer's recommendations referred to herein shall be as stated in manufacturer's installation manual and/or by manufacturer's service representative.

E. Install temperature elements sufficiently downstream of steam attemperators, with sufficient straight run downstream of attemperator per manufacturer's recommendations.

F. Installation shall conform to ASME B31.1 or Boiler and Pressure Vessel code requirements.

G. Perform welding in accordance with appropriate piping or structural welding specifications and procedures.

H. Provide minimum 10 straight pipe diameters upstream and 5 straight pipe diameters downstream of flow meters. Refer to manufacturer's recommendations for additional requirements.

3.02 INSTRUMENT EQUIPMENT MOUNTING

A. Mount instrumentation equipment to building steel, concrete floors, or walls using pipe mounting stands or field-fabricated mounting brackets.
   1. Secure instrumentation equipment mounting bracket to building steel by welding or bolting, and to concrete or masonry building structure by expansion-type anchors. Do not mount instrumentation equipment to exterior removable panels.
   2. Grout mounting brackets on concrete floors with nonmetallic, chloride-free gypsum material, ASTM C1107, Grade A; formulation suitable for application.
   3. If vibration-free location is not available for instrument mounting, appropriate vibration shock mounting shall be provided by use of rubber grommets or other vibration dampeners designed for vibration absorption subject to Owner's review. Mounting of process pressure and temperature gages or process pressure and temperature switches to process piping shall be allowable only if vibration is minimized.
   4. Install instrumentation mounted outdoors within sun protection enclosures. Enclosure opening shall face north or east, insofar as practicable.

B. Instrument accessibility: Following general rules shall be adhered to, unless limited by other requirements in design of system.
   1. Locate instrument process connections for maximum convenience in operation and servicing of instrument. Orient connections so instruments or piping will not obstruct aisles, platforms, or ladders.
   2. Install field-mounted instruments so they are accessible from grade, platform, or permanent ladder. Instruments requiring adjustment or inspection shall be accessible for servicing from grade, walkway, platform, or permanent ladder.

3. Locate remote instruments and control devices (devices not located in or on process lines) at nominal height of 4-1/2' (1.35 m) above finished floor, grade, or platform. Provide instrument racks for location in which 3 or more instruments or control devices are located within close proximity of each other.
4. Control valves shall be accessible from grade or platforms. Use manufacturer's recommended clearance distances.
5. Mount local indicators, recorders, and controllers so they are readable, controllable, and serviceable from grade or platforms.

3.03 TUBING INSTALLATION - GENERAL

A. Install instrument impulse piping parallel (except for slope) to building lines and other piping following instrument manufacturer's instructions.

B. Tubing shall be continuously supported with 12-gage aluminum angle and held in place with appropriate tubing clips and fasteners. Install tubing supports in such a manner to preclude fatigue failure of tubing due to vibration.

C. Only tool-made bends shall be acceptable.

D. Minimize number of unions used to join tubing lengths.

3.04 IMPULSE TUBING INSTALLATION

A. Instrument impulse piping work shall be from last block valve through, and including, blowdown piping to nearest equipment drain.

B. Install horizontal impulse piping with slope of 1" per foot (25 mm per 300 mm).
1. Slope impulse piping toward instrument for liquid and steam service.
2. Slope impulse piping away from instrument for gas service.

C. Blowdown and drain valves are required in impulse lines to all transmitters and instruments used on water, steam, and condensing vapor services.

D. Attach isolation valves to instruments so that it is possible to disconnect instrument from connecting pipe without having to drain pipe.

E. Install expansion loops in impulse piping installations where movement of last block valve and instrument is not in same plane or length of expansion varies.

F. Support pressure gages and other instruments connected to impulse piping independently of tubing. Provide ample expansion loops in tubing connections to instruments subject to vibrations to prevent failure due to metal fatigue.

G. Furnish and install accessories required for complete impulse piping system including instrument isolation valves, snubbers, siphons, and calibration and test connections at instrument.

3.05 CONTROL TUBING AND INSTRUMENT AIR SUPPLY TUBING INSTALLATION

A. Instrument tubing shall be routed an adequate distance from outside walls, doorways, and areas of extreme heat to minimize ambient effects on control lines.

B. Signal tubing termination at each instrument shall have gage tee with plug for calibration and service.

3.06 CLEANING

A. Before assembly or erection, thoroughly clean instruments of temporary protective coatings and foreign materials.

B. After erection of equipment, clean external surfaces of oil, grease, dirt, or other foreign material.

C. Blowout instrument air supply lines before final attachment to valve or instrument.

3.07 WIRE AND CABLE INSTALLATION

A. Maintain minimum of 1' (300 mm) separation between signals operating at voltages greater than 120-volts ac and instrumentation or communications signals. Group and route wire/cables as follows:
   1. Low-voltage/low current dc instrumentation signals (30-volts/50 mA or lower).
   2. High-voltage dc alarm signals (48-volts or greater).
   3. Low-voltage ac control signals (120-volts or lower).
   4. High-voltage ac power signals (greater than 120-volts).
   5. Communications signals.

B. Install continuous wire from terminal-to-terminal. Splices not acceptable.

C. Shielded signal cable:
   1. Connect shields to common ground at source of loop power.
   2. Shields of multiple cable runs shall be connected on separate terminal blocks, but not grounded.
   3. Cut and tape shield at destination end.

D. Identify both ends of wires and/or cables with permanent wire marker.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Design, furnish, test, and deliver one continuous emissions monitoring system (CEMS) per Unit, complete with data acquisition/historian system (DAHS) and CEMS enclosure.

1.02 QUALITY ASSURANCE

A. Manufacturer qualifications:
1. Significant history of supplying satisfactorily reliable systems in use for a period of at least 5 years at coal-fired power production facilities.
2. Regularly engaged in design and fabrication of type of building specified.
3. References shall show integration of specified equipment.
4. ISO 9001 certified.

B. Only services of Contractor's factory personnel shall be provided for start-up and commissioning activities. Third party independent subcontractors not permitted.

1.03 SITE CONDITIONS

A. Power supplies:
1. Analytical equipment: 120 volts ac, single-phase, 60 Hz, UPS.
2. CEMS shelter lighting, HVAC, receptacles, umbilical heater, etc.: 480 volts ac, 3-phase, 60 Hz.

B. Instrument air: 80 psig (minimum).

PART 2 PRODUCTS

2.01 DESIGN REQUIREMENTS

A. CEMS shall make measurements using fully extractive sampling technology for measurement of CO_2, SO_2, and NO_x (comprising of both NO and NO_2). CEMS shall also measure opacity and stack gas flow. CEMS shall consist of a complete system guaranteed to function as a unit including, but not limited to, following components:
1. Sample probe.
2. Sample umbilical line.
3. Sample conditioning system.
4. Monitoring equipment (analyzers).
5. Instrument panel.
6. Calibration gas system.
7. System controller.
8. DAHS.

B. Delivered system shall meet following requirements:
1. International Finance Corporation - World Bank Group – Environmental, Health, and Safety Guidelines for Thermal Power Plants.
2. Site air permit requirements.

2.02 PERFORMANCE GUARANTEES

A. Design to pass applicable initial compliance tests of following regulatory references:
1. International Finance Corporation - World Bank Group standards.
2. Dominican Republic State Minister of the Environment and Natural Resources.

B. If design fails to attain compliance, Contractor shall bear cost associated with modifying design as necessary to meet certification requirements and additional testing.

2.03 CONTINUOUS EMISSIONS MONITORING SYSTEM (CEMS)

A. Sample extraction probe:
1. Construct probe parts exposed to flue gas of corrosion-resistant and chemically inert materials designed to withstand process gases being sampled.
2. To ensure representative samples are obtained for analysis, probe shall extend into flue gas stream no less than 3' (900 mm) as measured from exhaust duct inside wall.
3. Equip probe with filtering element(s) to remove entrained particulate from sample. Porosity size of filters shall be engineered to maximize removal of particulate matter without restricting sample flow.
4. Filtering media integrated into sample probe shall be temperature-controlled and maintained at temperature that prevents condensation of moisture.
5. Design probe and associated filter assembly such that cleaning can be achieved by instrument air blow-back (purging) at programmed intervals or on-demand.
6. Design probe and associated filter assembly such that equipment may be easily and safely removed from gas stream for service.
7. Probe design shall provide for injection of calibration gases as close as practical to probe inlet. To maximum extent possible, calibration gases shall follow same path within system as flue gas follows during sampling mode.
8. Sample probe components mounted externally to stack shall be completely enclosed within NEMA 12 enclosure sized to facilitate maintenance and designed to prevent overheating of electrical elements.
9. Heated sample line shall connect to sample probe with standard tubing fittings, either compression type or quick-disconnect.

B. Heated sample line:
1. Provide pre-insulated and heat-traced sample line bundles connecting sample extraction probe to sample conditioning system.
2. Sample lines shall consist of proper material for application and shall be sized to provide required sample flow rate to analyzers and to minimize pressure loss.
3. Incorporate sample probe electrical and signal cable in single tube bundle.
4. Tubing and wiring within heated sample line shall be continuous.
5. Heated sample line shall conform to applicable NFPA and IEEE standards and shall have nonwicking fibrous glass insulation with outer jacket of heavy-wall, abrasion-resistant polyethylene meeting UL or FM flammability tests.
6. Valves and fittings in contact with sample gas either before or after any sample conditioner shall be compatible with sample line material.
7. Heat tracing shall incorporate heating element designed to accommodate climatic conditions specified herein. Heating shall be consistent with temperature limitations of sample line tube materials and shall be monitored and controlled by temperature controller.
8. Length of heated sample line: As required, but not to exceed 300' (91 m). Include length of heated sample line in base bid and provide unit pricing (per foot) for additional length, if needed.
9. Instrument panel end of heated sample line shall be marked: "INSTRUMENT PANEL END -- DO NOT CUT".

C. Sample conditioning system:
1. Sample conditioning system shall include necessary tubing, valves, pumps, coolers, drains, filters, etc., required to efficiently condition raw sample to state suitable for introduction into gas analyzers. Instrumentation and accessories shall be provided to appropriately adjust or control sample gases for following parameters:
   a. Pressure.
   b. Temperature.
   c. Sample flow rate.
   d. Particulate concentration.
   e. Moisture content.
   f. Removal of interfering components and acidic mist.
2. Fabricate system components from corrosion-resistant and chemically inert materials designed to withstand gases in sample stream.
3. Sample conditioning system shall provide easy access to components for ease of maintenance.

4. Sample dew points shall be lowered to temperature that adequately removes excess moisture, subsequently preventing carryover to analyzers. Provide high-moisture alarm indication and analyzer shutdown alarm.
5. Sample conditioning system shall have capability to condition and control calibration gases identical to manner in which sample gas is conditioned.
6. System shall include alarms that monitor system operation and provide warning whenever sample conditions exceed specified limits such as flow, temperature, pressure, or moisture content. Provide common alarm, normally energized contact for integration into Distributed Control System (DCS).
7. Sample condensate shall be drained into header for connection to drainage system.

D. Instrument panel:
1. Sample conditioning components and analyzers shall be housed in NEMA 12 enclosure.
2. Instrument panel shall provide complete access to components.
3. Design instrument panel to maintain environmental conditions consistent with environmental specifications of analyzers.
4. Analyzers and other instrumentation located in instrument panel shall be mounted on slide-out racks.

E. System controller:
1. System controller shall control CEMS functions including operation of probe, sample conditioning system, analyzers, calibration system, monitor system alarms and provide output signals to DAHS.
2. System control shall communicate with analyzers via Ethernet or serial communications for diagnostic information.
3. PLC, data logger, or Windows 7 embedded base system controllers acceptable.
4. Upon failure of DAHS, buffer minimum 7 days of monitoring and supporting quality assurance data. Upon recovery of DAHS, automatically log buffered data to DAHS.
5. Assign status (quality flag) to component data and resulting calculations (valid, invalid, zero check, span check, system malfunction, warning, out-of-control, not calibrated, maintenance, etc.).
6. Provide following output signals for integration into DCS:
   a. Analog outputs (4 to 20 mA):
      1) Raw O_2.
      2) NO_x emission rate.
      3) NO_x mass emission rate.
      4) CO_2 concentration (uncorrected).
      5) CO_2 concentration (corrected).
      6) CO_2 emission rate.
      7) CO_2 mass emission rate.
      8) Particulate Monitor (PM).
      9) SO_2 emission rate.
      10) SO_2 mass emission rate.
      11) Opacity (0-100%).
      12) Stack flow.
      13) Spares: 2.
   b. Digital outputs:
      1) CEMS trouble alarm.
      2) CEMS calibration.
      3) SO_2 trouble/Calibration.
      4) Main DAHS PC fault.
      5) Communication failure.
      6) International Finance Corporation - World Bank Group standards violation.
      7) Spares: 2.
7. System controller shall accept following inputs from DCS:
   a. Analog Inputs (4 to 20 mA):
      1) Coal feed rate.
      2) Fuel oil flow rate.
      3) Unit power (MW).
      4) Spares: 2.
   b. Digital inputs (each input proven by dry contact closure):

1) Unit on (generator breaker closed) status.
2) Unit in startup.
3) Unit in shutdown.
4) Unit fired.
5) Fired on oil.
6) Fired on coal.
7) Flue gas desulphurization (FGD) in service.
8) Spares: 2.

8. System controller shall incorporate an operator interface mounted on instrument panel.
9. Analyzer ranges, system control sequences such as timing for calibration and blowback shall be addressable and easily changed from front panel keys of system controller.

2.04 GAS ANALYZERS

A. Analyzer detectors shall be tolerant to interfering components. Twofold concentration change of any single or combination of interfering constituents in sample gas stream shall not affect analyzer reading and performance.
   1. Analyzer range shall be large enough to detect emissions greater than applicable air permit limits.
   2. Analog output signals from instrument panel shall be transmitted as isolated 4-20 mA, powered by CEMS for integration into DCS.

B. Analyzers supplied as part of CEMS shall employ known acceptable technologies meeting following requirements:
   1. NO_x analyzer:
      a. Non-dispersion infrared method (NDIR) or chemiluminescent method of sample analysis.
      b. Verify analyzer compatibility with method of sample analysis.
      c. Convert NO_2 to NO for measurement of NO_x.
   2. CO_2 analyzer:
      a. NDIR technology.
      b. Verify analyzer compatibility with method of sample analysis.
   3. SO_2 analyzer:
      a. Pulsed fluorescence technology.
      b. Verify analyzer compatibility with method of sample analysis.
   4. Flow monitor:
      a. Ultrasonic gas flow measurement.
      b. Zero and span adjustments.
      c. Automatic daily calibration verification as required by applicable regulatory agency procedures.
      d. Automatic daily interference test.
      e. Manually initiated automatic calibration verification.
      f. Isolated analog output for input to CEM data acquisition computer or controller.
   5. Opacity monitor:
      a. Provide across-the-stack, double pass transmissometers.
      b. Monitor shall have single lamp for measurements and calibrations.
      c. Design monitor to conform to requirements of applicable regulatory agencies.
   6. Particulate monitor:
      a. Scattered light technology.
      b. Design monitor to conform to requirements of applicable regulatory agencies.

2.05 CALIBRATION GAS SYSTEM

A. Provide equipment and supplies required to perform daily zero/span and quarterly linearity checks of CEMS.

B. Calibration gas system shall be capable of performing automatic zero and span checks at pre-selected timed intervals through DAHS. Manual override feature with alarming indication in DAHS shall be provided. Design system to complete calibration checks without loss of valid, hourly data.

C. Design calibration gas system to allow calibration gases to be introduced directly into analyzers for purposes of trouble shooting.

D. Provide compressed gas cylinders charged with appropriate calibration gases and quantities required for start-up, testing and certification of CEMS. Calibration gases shall meet following requirements:
   1. Manufacturer-certified to be within approximately 1.0% of concentration specified on cylinder label.
   2. Chemically inactive.
   3. Within expiration date identified on cylinders.

E. Perform pressure regulation of calibration gases from cylinders in dual stage via regulator or adjustable regulating valve. Provide armored flex stainless steel tubing connection between gas cylinders and pressure reducing station.

F. Compressed gas cylinder pressure regulators shall have stainless steel bodies and internals. Use of brass or copper bearing alloys not acceptable.

G. Regulators for daily calibration gas cylinders shall be provided with low-pressure switches.

H. Calibration gas tubing, fittings, and components shall be of required type and pressure rating for service conditions as required by typical industrial, local, and state requirements.

I. Compressed gas cylinder saddles, straps, chain or other retaining devices shall be installed to guarantee safe, secure storage of gas cylinders in accordance with OSHA requirements.

2.06 DATA ACQUISITION/HISTORIAN SYSTEM (DAHS)

A. DAHS shall consist of following equipment:
   1. Provide software platform and appropriate servers, clients, and data loggers for complete system.
   2. Personal computer:
      a. Quantity: 1.
      b. Operating system: Microsoft Windows 7.
      c. Processor: 1.86 gigahertz Intel Pentium 4, minimum.
      d. Hard drive:
         1) Quantity: 2.
         2) Each sized: 160 gigabyte, minimum.
         3) Disk mirroring: RAID 1 or 5 array.
      e. Memory: 1 gigabyte RAM.
      f. Internal drives:
         1) DVD-RW/CD-RW drive.
         2) Mass storage device capable of backing up entire contents of hard disk.
      g. Monitor: 19" flat panel, LCD.
      h. Keyboard and optical mouse.
      i. Communication card: 10/100 Base-T Ethernet.
      j. USB ports: 4, minimum.
   3. Printer:
      a. Quantity: 1.
      b. Type: Plain paper, laser.
      c. Print resolution: Up to 600 x 600 dpi.
      d. Print speed: 12 ppm.
   4. Other auxiliary equipment necessary to manage information output from monitors, store data, and produce required reports.

B. DAHS shall perform monitoring, system control, data acquisition, data storage, and regulatory reporting functions including, but not limited to:
   1. Read and record full range of gas concentrations in the stack, from zero through full scale.
   2. Produce instantaneous readout of required emissions and process data.
   3. Generate regulatory compliance reports from a menu driven format per regulatory references specified herein.

4. Generate graphical displays, trends, etc., for current and historical data as well as displaying CEMS status.
5. Compute and record monitor calibration error and calibration drift.
6. Automatically check measured values to determine if within allowable limits of normal operation flagging questionable and/or out-of-tolerance data for operator recognition.
7. Allow system alarms to be viewed and acknowledged by operators.
8. Allow for automatic or manual entry of required process data and information, including fuel analysis data such as heating values and fuel bound sulfur.
9. Be capable of distinguishing periods when boiler is off-line for reporting purposes.

C. DAHS software package:
1. Tailor package to operational needs of Owner; i.e., menu driven format for alarm list and reason code, real time and historical data of analyzer values, regulatory report generation including daily, monthly and quarterly reports.
2. Provide Ethernet communication capability to interface with DCS. Provide back-up compact disks containing system operating and applications programs. Instructions shall be provided to restore system in event of computer loss-of-memory.
3. Provide software program for purpose of scheduling automatic back-ups of hard drive using mass storage device.
4. Incorporate software program for remote control and file transfer purposes.

D. Calculations and recording:
1. Unless specified otherwise, DAHS calculations and conversions shall be consistent with applicable requirements in World Bank Standards.
2. CO_2 and NO_x emissions shall be measured in appropriate units of measure.
3. At minimum, DAHS shall be capable of recording 15-minute averages for following parameters and units:
   a. NO_x emission rate.
   b. NO_x mass emission rate.
   c. SO_2 mass emission rate.
   d. Monthly NO_x mass emission.
   e. Quarterly NO_x mass emission.
   f. Yearly NO_x emission.
   g. CO_2 concentration (uncorrected).
   h. CO_2 concentration (corrected).
   i. CO_2 mass emission rate.
   j. Monthly CO_2 mass emission.
   k. Quarterly CO_2 mass emission.
   l. Yearly CO_2 emission.
   m. Unit operating time.
   n. Fuel flow to unit.
   o. Heat input rate to unit.
   p. Btu totals per day.
   q. Btu totals per month.
   r. Parameters required by applicable regulations.

E. Reports:
1. Provide software and modifications to fulfill reporting requirements defined by regulatory references specified herein.
2. Accuracy and completeness of printed reports produced by DAHS shall be sufficient to eliminate requirement for manual database reduction.
3. Reports shall have capability of being saved as Excel and HTML files.

2.07 CEMS ENCLOSURE

A. Type: Walk-in, dusttight, modular building.

B. Size: 8' wide x 16' long x 8' high (2.4 m wide x 4.8 m long x 2.4 high) (ceiling height shall be minimum 8' [2.4 m]).

C. Location: Outdoor, near base of stack.

D. Function: Building shall house and contain required flue gas analyzers, associated sample collection equipment, control, backup data logging, signal conversion, data acquisition equipment, valves, condensers, sample pumps, instrumentation, pressure switches, and other equipment as required for complete and working system.

E. Construction:
1. Codes: In accordance with NFPA, NEC, national, and local Building Code R-009.
2. Building shall be designed such that cables (and their enclosing conduits), sample lines, and airlines can be supported from strut system attached to building.
3. Building shall be capable of withstanding shipping and construction loading.
4. Building shall be shipped to Site assembled with analyzer racks in place.
5. Roof penetrations or top of outdoor junction box conduit entrances shall not be allowed. Circumferences around penetrations shall be sealed with high grade silicone calking compound.
6. Instrument air piping, electrical wiring, and sample vent and drain piping shall be installed and tested at factory.
7. Provide fire detection system that shall consist of, at minimum, smoke detectors with provisions for remote alarms.
8. Building shall be sized so that analyzing equipment in cabinets/racks is completely accessible.
9. Provide 30" (750 mm) clearance between wall or other racks or portions of cabinet/rack requiring access.
10. Provide one entry door, minimum 36" wide x 78" high (1 m wide x 2 m high), with following:
    a. Fully gasketed with drip shield and closer.
    b. Door shall open from inside by means of crash bar.
    c. Provide deadbolt lock and two keys. Lock shall open from inside by activating crash bar.
    d. Door hardware shall be corrosion resistant.
    e. Provide 1' x 1' (300 mm x 300 mm) window constructed of safety glass.
11. Provide connections for piping to plant services or analyzers outside building.
12. Provide penetrations for sample tubing and calibration gas tubing.
13. Provide pre-piped vents, drains, and other piping.
14. Provide penetrations for heated sample line and instrument air. Bulkhead connectors or grommets shall be supplied, as needed.
15. Sample condensate shall be drained into header for connection to drainage system.
16. Interior features:
    a. Provide standard furnishings, fire extinguishers, and light fixtures.
    b. Provide 30" x 60" (760 mm x 1.5 m) workbench inside building. Workbench shall be furnished with two electrical outlets and shall be adequately lighted to perform work on equipment supplied. Workbench shall remain clear for maintenance purpose only. If space required for DAHS computer and printer, this space shall be in addition to workbench.
    c. Floor: Heavy-duty tile or aluminum checker plate.
    d. Walls: Interior walls shall be fire resistant. Exterior and interior skin of building shall be 1/16" pre-finished aluminum or painted steel construction.
17. Provide suitable exterior location on building allocated for calibration gas cylinder racks.

F. Mounting:
1. Skid-mounted suitable for attachment to slab foundation.
2. Provide elevated and insulated floor such that concrete slab foundation is not in direct contact with temperature-controlled space within building.
3. Building shall be attached to concrete slab foundation.
4. Provide metal tabs attached to building base or other suitable connection to attach building to sub-base.
5. Provide lifting lugs at four corners to facilitate hoisting of building onto concrete slab foundation.
6. Provide building anchor bolts.

G. Environmental requirements:
1. Building shall have R12 insulation on floor, walls, door, and roof, and shall have thermostatically controlled, industrial-grade air conditioning unit designed to maintain indoor temperature in range consistent with recommended operating range of CEMS equipment given site ambient conditions.
2. Space conditioning equipment:

a. Equipment redundancy: Required.
b. Air conditioning unit shall pressurize building between 0.1" and 0.2" w.g. with adjustable outside air damper.
c. Outside air and recirculated air shall be filtered through minimum 2" (50 mm) deep, pleated, disposable filter.
d. Air Minimum Efficiency Reporting Value (MERV): 9 (minimum).
e. Type: Air-cooled.
f. Rating: 11 SEER (minimum).
g. Humidity shall be controlled by room-mounted humidity controller and reheat, dehumidification cycle.
h. Evaporator and condenser coils shall be phenolic coated.

H. Electrical requirements:
1. Contractor shall supply single power feed described herein.
2. Provide external junction box for plant power.
3. Feed shall be connected to external junction box and distributed through distribution panel boards and transformers. Power source shall be used for equipment that does not require conditioned power, including monitoring location equipment, HVAC equipment, lighting, utility receptacles, and sample line heat trace, if required.
4. Provide equipment (including power supply wiring inside building) required to step down and distribute power to equipment.
5. Design building power distribution system capacity with 20% margin and additional 20% more space capacity.
6. Except for opacity monitors, any electrical utilities required by CEM equipment at sampling location shall be carried by contractor-supplied interconnecting tube bundle. Opacity monitors shall be powered from CEM building. Interconnecting power and signal wiring for opacity monitors shall be by Contractor.
7. Provide rack-mounted uninterruptible power source (UPS) to power equipment that requires conditioned power, including but not limited to microprocessor based systems (such as system controller, DAHS and analyzers), for 30 minutes and provide alarms to DCS.
8. Transformers shall be totally enclosed and rated for installed environment. Transformers shall be Class AA. Transformers shall have a minimum of four 2.5% taps: 2 FCAN and 2 FCBN. Winding insulation shall be rated for 302°F (150°C) temperature rise by resistance in °F (°C) above a 104°F (40°C) ambient. Transformers shall be located external to enclosure.
9. Provide circuit directory cardholder and card with clear plastic covering on inside of each power panelboard door. Directory card shall have space to identify each circuit in panelboard. Circuit identification for each breaker shall be typewritten on directory cards.
10. Power panel boards:
    a. Shall have rigid buses of copper or copper alloy shall be installed to provide consecutive phasing of branch circuit connections.
    b. Bolt-in branch circuit devices shall be installed to allow replacement of any device without disturbing operation or mounting of other devices in panelboard.
    c. Provide solid neutral bus in panel boards.
    d. Neutral bus shall have solderless connectors, numbered to agree with branch circuits.
    e. Bus shall be insulated from cabinet and have provisions for grounding.
    f. Provide equipment grounding bus with main lug and solderless connectors, numbered to agree with branch circuits.
    g. Provide protective overcurrent devices for branch circuits.
11. Power feeds into building shall be routed through conduit.
    a. Provide one disconnect switch and rigid steel conduit connection on outer building wall for connection to raceway system.
    b. Provide conduits from penetration to disconnect switch.
12. Provide fluorescent lighting (60 foot-candles average) and one light switch.
13. Interconnecting wiring outside of equipment cabinets/racks in the building shall be in covered raceways. Interconnecting wiring, including interconnection of equipment grounding, shall be installed and tested at factory.
14. Provide appropriate ground bus system with two separate 4/0 ground lugs at opposite ends of equipment for connection to exterior ground system.
15. Provide terminal box or boxes sized to NEC compliance (located on outside wall near power supply conduits) for instrument and control wiring to external cable connections.

2.08 SOURCE QUALITY CONTROL

A. Factory acceptance test:
   1. Provide facilities and technician support for factory functional checkout of system prior to shipment. Checkout shall be performed per written procedure, which shall be developed by contractor and submitted to Owner for review 30 days prior to test or earlier. Tests procedure shall include hardware and software inspection and proving.
   2. Furnish necessary support equipment, calibration gases, etc. needed for factory acceptance test.
   3. Owner shall be notified at least 10 days prior to time when equipment will be complete and ready for packaging and shipment. Owner shall have prerogative of witnessing and/or participating in functional testing of equipment prior to shipment.
   4. At conclusion of functional test, develop list of items (punch list) to be resolved. Items will be resolved to Owner's satisfaction before shipment of system.

PART 3 EXECUTION

3.01 FIELD QUALITY CONTROL

A. Perform certification testing for CEMS, including jobsite support activities for Relative Accuracy Test Audit (RATA). Owner shall contract services of qualified emissions testing firm to perform RATA.

B. Report summarizing results of certification testing shall be written by third-party certifier. Provide test results and additional information needed by third party certifier to produce report suitable for submittal to appropriate regulatory agencies.

C. Contractor's field engineer shall be present for RATA testing, including re-testing conducted due to inability of CEMS to pass initial test. Contractor's field engineer shall perform following activities:
   1. Assure proper operation of CEMS during testing.
   2. Make any necessary modifications or repairs in event that CEMS unable to pass RATA.

D. RATA attendance requires services of one field engineer for period of one day or as required to complete test.

E. Price for certification testing shall include on-site time as well as travel and expenses.

3.02 MANUFACTURER'S FIELD SERVICES

A. Furnish services of qualified field engineer to start up CEMS following field installation of equipment. Start-up support shall include following minimum requirements:
   1. Review installation checklist and perform walk-down to ensure equipment ready for activation.
   2. Energize system and perform thorough test of system functions per site-specific checklist.
   3. Monitor on-line operation and calibration drift over two-day period.
   4. Check DAHS software to ensure proper data reduction, calculations, display, and reporting functions.

B. Provide three 8-hour days for CEMS start-up support.

C. Provide one 9-hour day for DAHS start-up support.

D. Price for start-up support shall include on-site time as well as travel and expenses.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Vibration monitoring equipment.

B. Programming and configuration.

C. Installation.

D. Field services.

1.02 DELIVERY, STORAGE, AND HANDLING

A. Delivery, storage, and protection shall be in accordance with manufacturer's recommended procedures.

B. Accept products on site in factory containers and verify products free from damage.

C. Store products in clean, dry area. Maintain temperature in accordance with NEMA ICS 1.

D. Remove rack-mounted instruments, controllers, recorders, and indicators that could be damaged by shipment and package in original shipping cartons.

PART 2 PRODUCTS

2.01 VIBRATION MONITORING PANELS

A. Fabricate panel(s) in accordance with Section 40 95 13 requirements.

B. Style: Free-standing.

C. Dimensions: 78" H x 24" W x 41" D.

D. Rack units: 42U.

E. Doors: Front and rear access solid doors.

F. Color: Light gray.

G. Rating: NEMA 12.

2.02 PANEL-MOUNTED EQUIPMENT

A. System rack:
1. Size:
   a. Full-size rack.
   b. 19" EIA rack with 14 module slots.
2. Mounting: Rack mount.
3. Agency approvals: None.
4. Reserved: None.
5. European compliance: None.
6. Provide following accessories to accommodate installation shown on Drawings.
   a. Half-height module adapter complete with chassis, card guide, and screws to accept half-height modules where specified.
   b. Half-height blank monitor cover kit complete with front panel cover for each half-height slot labeled as "Spare."

c. Power supply blank cover kit complete with blank front panel, power supply input connector, and screws for each power supply slot labeled as "spare."
d. Full-height blank monitor cover kit complete with blank front panel, I/O module cover, and screws for each full-height rack slot labeled as "spare."

B. Power supply:
1. Input voltage: 120-volts ac.
2. Agency approvals: None.

C. Transient data interface module:
1. Type: Standard.
2. I/O module type: 10 Base-T/100 Base-TX Ethernet I/O module.
3. Agency approvals: None.

D. Enhanced key phasor module:
1. Number of channels: 2 half-height 2-channel key phasor cards.
2. I/O module type: Internal terminations.
3. Agency approvals: None.

E. Relay module:
1. Output module: 16-channel relay output module.
2. Agency approvals: None.

F. I/O module:
1. Type: Prox/Velom module with internal terminations.
2. Agency approvals: None.
3. Each module shall include latest version of firmware and software revisions required for vibration measurement application.

G. Tachometer module:
1. I/O module type: Internal terminations.
2. Agency approvals: None.
3. Each module shall include latest version of firmware and software revisions required for vibration measurement application.

H. Communication gateway module:
1. I/O module type: Ethernet/RS485 Modbus.
2. Memory type: Low memory.
3. Agency approvals: None.

I. Software: Provide latest version of rack configuration software.

2.03 FIELD-MOUNTED EQUIPMENT

A. Provide vibration sensors and enclosures for each equipment provision specified in Panel Schedule. Provide vibration sensor type (proximity, velocity, acceleration, etc.) as recommended by equipment manufacturer for measurement application.

B. Proximity measurement:
1. Measurement applications include but are not limited to X-Y radial bearing vibration (2-probes), thrust bearing vibration, shaft rotation (key phasor).
2. Probe:
a. Diameter: As required for application.
b. Mounting connection: threaded.
3. Sensor:
a. Mount style: DIN rail.
b. Calibration: Match length between probe and sensor.
4. Interconnection cable length: As required.
5. Agency approvals: None.

C. Velocity measurement:
   1. Measurement applications include but are not limited to bearing housing vibration, casing vibration, and structural vibration.
   2. Probe:
      a. Diameter: As required for application.
      b. Mounting connection: threaded.
   3. Interconnection cable length: As required.
   4. Agency approvals: None.

D. Acceleration measurement:
   1. Measurement application includes but is not limited to casing acceleration.
   2. Probe:
      a. Diameter: As required for application.
      b. Mounting connection: threaded.
   3. Interconnection cable length: As required.
   4. Agency approvals: None.

E. Enclosure:
   1. Quantity and size: As required to mount proximity sensors and terminal blocks for velocity and acceleration measurements associated with equipment.
   2. Enclosure shall be factory mounted to equipment.
   3. Rating: NEMA 4X.
   4. Material: Stainless Steel.
   5. Accessories:
      a. DIN rails to mount proximity sensors and terminal blocks.
      b. Three terminal blocks (minimum) for each velocity/acceleration probe interconnection cable.

2.04 PROGRAMMING AND CONFIGURATION

A. Programming and configuration of vibration monitoring systems shall be responsibility of Contractor. Work includes but is not limited to following:
   1. Verify system rack communication achieved.
   2. Customize system rack by configuring each module with available options required to interface with sensing devices and other auxiliary equipment.
   3. Adjust scale factors, zero positions, and manual key phasor thresholds as applicable for each module.
   4. Configure relay modules with specified set points.

B. Upon completion of configuration, provide both original and final copies of configuration software to Owner.

PART 3 EXECUTION

3.01 INSTALLATION - GENERAL

A. Install in accordance with manufacturer's recommendations.

B. Enclosure shall be positioned to allow doors to be fully opened for easy access to wiring and components.

C. Mount rigidly supported, level and plumb, and in such manner as to provide accessibility; protection from damage; isolation from heat, shock, and vibration; and freedom from interference with other equipment, piping, and electrical work. Equipment shall not be installed until adjacent heavy construction work has been completed to extent that damage will be unlikely to installation by such construction work.

D. Manufacturer's recommendations referred to herein shall be as stated in manufacturer's instruction books and/or by manufacturer's service representative.

3.02 MANUFACTURER'S FIELD SERVICES

A. Start-up support:
1. Furnish services of qualified field engineer to start up vibration monitoring systems following field installation of equipment. Start-up support shall include following minimum requirements:
   a. Review installation checklist and perform walk-down to ensure all equipment ready for activation.
   b. Energize system and perform thorough test of all system functions per site-specific checklist.
   c. Monitor on-line operation of each vibration monitoring system over one-day period.
   d. For each vibration monitoring system panel listed herein, provide following:
      1) Two days (8 hours per day) of monitoring and analysis during on-line operation.
      2) Two site visits to perform requisite monitoring.
2. Price for start-up support shall include on-site time as well as travel and expenses.

3.03 VIBRATION MONITORING PANEL SCHEDULE

Item No.	Description
1	Unit 1 FD/PA/ID Fan Vibration Monitoring Panel
2	Unit 2 FD/PA/ID Fan Vibration Monitoring Panel
3	Unit 1 Boiler Feedwater Pumps Vibration Monitoring Panel
4	Unit 2 Boiler Feedwater Pumps Vibration Monitoring Panel
5	Unit 1 Circulating Water Pumps Vibration Monitoring Panel
6	Unit 2 Circulating Water Pumps Vibration Monitoring Panel

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Distributed Control System (DCS) hardware including process controllers, power supplies, chassis, Input/Output (I/O) modules, communications interface modules, and associated hardware.

1.02 RELATED REQUIREMENTS

A. Section 40 05 00 – Common Work Results for Process Systems.

1.03 MAINTENANCE MATERIALS

A. One I/O card and relay for every 10 of each type provided, minimum of one.

B. One electronic card (controllers, memory, interface, communication, etc.) for every 10 of each type provided, minimum of one.

C. One cable for every 10 of each type provided, minimum of one.

D. One power supply or power supply assembly for every 10 of each type provided, minimum of one.

E. Peripheral spare parts for supporting hardware provided, as suggested by original manufacturers.

F. Guarantee continued availability, or identical functionality, of compatible substitute for major components and standard products supplied with system.

PART 2 PRODUCTS

2.01 PROCESS CONTROLLERS AND POWER SUPPLIES

A. Provide redundant process controllers.

B. Provide redundant power supplies.

2.02 INPUT/OUTPUT REQUIREMENTS

A. I/O components shall include I/O module, termination equipment, and interconnecting cables.

B. Process I/O cards and terminations shall be modular in construction and compact in design. Modules shall:
1. Consist of electronics module, compression-type terminal block and pluggable personality modules which include point fusing and signal conditioning.
2. Support hot swapping without upset to system or controls.
3. Allow replacement of I/O modules and personality modules without removing power or without tools.
4. Provide means for module identity, revision, and serial number to be obtained electronically via I/O bus.
5. Able to be assigned to selected slots on I/O bus, with bus cycle time of less than 32 microseconds and with bus error checking.
6. For all I/O cabinets provided and for each type of I/O module furnished, provide minimum 25% installed spare I/O capacity.

2.03 INPUT/OUTPUT PERFORMANCE REQUIREMENTS

A. I/O point cards shall comply with Surge Withstand Capability Standard ANSI/IEEE C37.90.

B. I/O point cards shall utilize optical or other isolation techniques to protect system against damage due to spikes.

C. I/O cards shall have common mode voltage rejection of 500 volts, except relay outputs which shall be 250 volts ac.

D. Analog inputs shall have a common-mode rejection ratio of 100 dB and differential rejection ration of 30 dB at line frequency and harmonics to ensure proper plant noise elimination.

E. Accuracy of analog I/O throughout entire system shall be not less than 0.1% of full scale.

2.04 REMOTE I/O

A. Provide remote I/O equipment including power supplies, communication modules, interconnecting cables, I/O modules, and associated hardware for redundant system (excluding I/O).

2.05 ANALOG SIGNALS

A. Characteristics:
1. Voltage: 24-volt dc.
2. Range: 4 to 20 mA.
3. Load impedance: 0 - 750 ohms, minimum.
4. Individually isolated and closed ended.

B. Analog inputs:
1. System shall directly interface with plant signals, including mA dc, mV dc, volt dc, thermocouples (Types B, E, J, K, R, S, T), and resistance temperature detectors (types 100 ohm, 3-wire platinum (preferred), 10 ohm copper.)
2. Signal conditioning shall be provided where necessary.
3. Dedicated solid-state A/D converters shall be provided for each input.
4. Separate isolated precision RTD power supplies shall be provided for each individual plant grounded RTD, when required.
5. Open thermocouple detection shall be provided on per scan basis, without need for batteries.

C. Analog outputs shall be two wire, single point, 4 to 20 mA, individually current limited points with minimum 700 ohm load limit.

2.06 DISCRETE SIGNALS

A. Voltage: 120-volt ac, 125-volt dc, 48-volt dc, or 24-volt dc.

B. Digital inputs:
1. System shall directly interface with plant devices, including standard dry contact closures, pulses, and sequence of events points.
2. Contact input cards shall contain filtering to eliminate contact bounce. Input status shall be rejected if signal level is not stable over 4 milliseconds.
3. Pulse input cards shall be capable of accepting up to 200 counts per second. Pulse counts shall be retained during any processor power failure.
4. Digital inputs shall be individually isolated from each other.
5. All digital inputs shall be capable of sequence of events (SOE) capture with time stamp accuracy of 1 ms.

C. Digital outputs:
1. All digital output cards shall have field replaceable Form C or Form X contacts.
2. System shall directly interface with plant devices including relays, metering, tap changers, circuit breakers, and like devices.

2.07 COMMUNICATION INTERFACE MODULES

A. Provide serial interface equipment to interface with auxiliary control systems:
   1. Capabilities for communicating to auxiliary systems:
      a. RS-232C, RS-422, and RS-485 with full and half-duplex operation, and following selectable baud rates: 19200, 38400, 57600, 115200.
      b. IEEE 802.3 "Ethernet" protocol at 10/100 MBPS, with TCP/IP.
      c. Configure Modbus in master-slave relationship, with automation system as master and auxiliary system as slave.
      d. Serial interface shall mount into any available slot in controller I/O rack. Controller shall auto-sense serial interface and present applicable configuration options. There shall be no need to set up dipswitches.
   2. OPC interface:
      a. Automation system shall be able to communicate bi-directionally with auxiliary systems using OPC.
      b. Configure OPC interface in client-server relationship with automation system as client and auxiliary system as server.
      c. Automation system shall be able to support up to 5 OPC servers.
      d. There shall be no need to write custom code to set up OPC interface. Configuring OPC shall be done using drag-and-drop functionality to link data source and target.
      e. At a minimum, OPC interface shall support scan rates of 500 ms and 1 second.

B. Remote I/O shall include capability to interface with foreign devices via serial interface modules; Ethernet, RS232, RS422, or RS485 compatible.

C. Local area networks: Control system shall support interfaces to administrative LAN network via TCP/IP.

D. Provide necessary interface hardware including:
   1. Modbus data interface.
   2. HART devices.
   3. Ethernet gateway.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install hardware in control panels per Section 40 95 13.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Furnish process control auxiliary devices including workstations, monitors, printers, OPC server, data historian server, time synchronization equipment, network components, and associated devices.

1.02 DEFINITIONS

A. Engineering workstation: Independent stand-alone unit with ability to configure system software including process controller changes, operator graphic screen changes, updating SOE logger and data historian.

B. Operating workstation: Independent stand-alone unit with ability to control system operations (setpoint adjustments, start/stop equipment, open/close valves, view/print reports).

PART 2 PRODUCTS

2.01 WORKSTATIONS

A. Quantity:
1. Per unit (minimum):
   a. Operator: 4.
   b. Engineering: 2.
   c. OPC server: 2.
2. Data historian server: 1.
3. Provide additional servers as required to fully implement redundant control system network.

B. Features:
1. Dual 120-volt ac power feeds.
2. Dual monitors.
   a. Type: Flat panel color LCD (two monitors per workstation).
   b. Size: 21" (525 mm), wide format.
3. Mouse or trackball.
4. Alphanumeric keyboard.
5. Hard drive: 300 GB (minimum).
6. RAM: 4 GB (minimum).
7. Drives: CD-RW and DVD.

2.02 ALARM MONITORS

A. Type: 42" (1067 mm) wide format, flat panel color LCD.

B. Warranty: 2-year extended warranty (4 years total).

2.03 PRINTERS

A. Quantity: 2 per unit.

B. Type: Laser.

C. Special features:
1. Ink colors: Black and white.
2. Paper size: Capable of accepting up to 11" x 17" paper.
3. Print speed: Up to 35 ppm.
4. Print quality: Up to 1200 x 1200 dpi.
5. Memory: 512 MB installed.

D. Warranty: 1-year on parts and labor.

E. Printers shall be networked together such that any operator workstation can access any printer.

2.04 TIME SYNCHRONIZATION EQUIPMENT

A. Provide GPS synchronization timing antenna/receiver to synchronize DCS system clock to within 0.001 second of received time signal.

B. System shall use an IRIG-B signal to synchronize DCS with coordinated Universal Time Code (UTC), Network Time Protocol (NTP), Simple Network Management Protocol (SNMP), or TCP/IP.

C. Provide and configure hardware, software, and cables to support fully functional time synchronization system.

2.05 NETWORK COMPONENTS

A. Provide network switches, hardware, and auxiliary devices as required to fully implement redundant control system network.

PART 3 EXECUTION

NOT USED

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Programmable controller system.

B. Local non-networked graphic operator interface.

C. Performance tests.

1.02 RELATED REQUIREMENTS

A. Section 40 05 00 – Common Work Results for Process Systems.

1.03 MAINTENANCE MATERIALS

A. Furnish 1 uninstalled spare for every 5 (or portion thereof) processors, power supplies, boards, modules, assemblies, and cables for each PLC system provided. Spare chassis is not required.

1.04 QUALITY ASSURANCE

A. Qualifications:
1. Manufacturer: Company manufacturing products specified within USA and specializing in manufacturing these products with minimum 5 years documented experience.

B. Design, construct, and test in conformance to NEMA ICS 1, ICS 2, and ICS 3.

1.05 DELIVERY, HANDLING, AND STORAGE

A. Delivery, storage, and protection shall be in accordance with manufacturer's recommended procedures.

B. Accept products on site in factory containers and verify damage.

C. Store products in clean, dry area. Maintain temperature in accordance with NEMA ICS 1.

1.06 WARRANTY

A. Manufacturer's warranty shall not begin until final acceptance of system by Owner.

PART 2 PRODUCTS

2.01 PERFORMANCE REQUIREMENTS

A. Functional performance: Configuration and base level programs shall conform to control strategies and graphic displays specified.

B. Reliability:
1. Equipment hardware and software shall have uptime operation meeting functional performance criteria in manner reasonably satisfactory to Owner.
2. Control equipment shall have no component whose failure shall cause system to be non-operative.

2.02 PROGRAMMABLE CONTROLLER SYSTEM

A. System shall provide following capabilities:

1. Field instrumentation wiring terminations, instrument signal input/output for system, monitor and control functions, operator interface via local graphic operator displays, and self-diagnostics.
2. Ability to expand control equipment, i.e. add controllers and local graphic interface panels. Control equipment shall be computer-compatible, but shall not require computer for data communication device expansion.
3. Capable of supporting copper of fiber-optic data communication for processor, work station, and remote I/O networking.
4. Multiple processors shall function as a network interfaced through data communication system with network programming capability. Processors shall support simultaneous on-line/remote programming and continuous data acquisition and control. Programming shall employ fill-in-the-blanks or interactive techniques.

B. Data communication system shall be capable of supporting copper or fiber-optic media for processor, work station, local graphic operator interfaces, and remote I/O networking.
   1. System hardware shall have sufficient data protection to prevent erroneous data communication during power-up or power-down.
   2. System shall recognize transmission format errors and either correct or request retransmission.
   3. Construct data communication of multipoint, multidrop configuration.
   4. Contractor shall be responsible for confirming final selection of components to support a fully complete and operable system.

C. Supply cabinets, consoles, power supplies, digital instrumentation, communications, interconnecting cables as required, and necessary voltage regulation or conditioning equipment for complete and operable system meeting performance and control description specifications.

D. Power supply: 120 volts ac, single-phase, 60 Hz.

E. Manufacturer shall have application training and customer assistance services available.

F. Major assemblies, subassemblies, circuit card, and devices shall be permanently marked with manufacturer's part or identification number.

G. Controller system shall be of modular design with plug-in processing unit, input/output frames or assemblies, and plug-in peripherals. Components shall be serviced and supported by same company.

H. Label I/O card strips with English descriptions.

I. Provide 10 spare CDs, DVDs, or other acceptable electronic media for use with programming panel.

2.03 SYSTEM COMPONENTS

A. Chassis capacity: As required for application.

B. Available input power source: 120-volt ac.

C. Controller:
   1. Controller shall be configured by system integrator.
   2. Controller tasks: 32 tasks, 100 programs/task.
   3. Built-in communication ports: One USB 2.0.
   4. Communication options: EtherNet/IP.
   5. User memory: 8 MB.
   6. Compact flash card with nonvolatile memory.
   7. I/O memory: 980 KB.
   8. Lithium battery.
   9. Configuration software requirements:
      a. Programming via IEC 61131-3 compliant configuration software. Configuration software shall support relay ladders, structured text, function block diagram and sequential function chart programming.

b. Program CPU on-line or off-line.

D. Local I/O modules:
1. Provide 20% spare installed I/O points of each type.
2. Discrete input:
a. Capacity: 16-point.
b. Voltage: 120-volt ac, sinked.
c. Grouping: 2 groups of 8 with common ground per group.
d. Removable terminal block: 20 position NEMA screw clamp block RTB.
3. Discrete output:
a. Capacity: 16-point.
b. Voltage: 120-volt ac, sinked.
c. Loading: 0.5 ampere maximum per point, 2 amperes maximum per group, 4 amperes maximum per module.
d. Grouping: 2 groups of 8 with common ground per group.
e. Removable terminal block: 20 position NEMA screw clamp block RTB.
4. Relay contact output:
a. Capacity: 16-point.
b. Voltage: Rated 120-volt ac or 24-volt dc.
c. Loading: 2 amperes maximum per point.
d. Grouping: Individually isolated.
e. Removable terminal block: 36 position NEMA screw clamp block RTB.
5. Analog input:
a. Capacity: 16-point single ended.
b. Voltage/current: 24-volt dc 4-20 mA across 249 ohm resistor, sinked.
c. Resolution: 16-bit.
d. Removable terminal block: 36 position screw clamp block RTB.
6. Analog output:
a. Capacity: 8-point.
b. Voltage/current: 24-volt dc 4-20 mA, sourced.
c. Loading: 0-750 ohm.
d. Resolution: 15-bit.
e. Removable terminal block: 20 position NEMA screw clamp block RTB.

E. Communication modules:
1. Copper EtherNet I/P (for cable distances 300' (91 m) or less):
a. Function: Interface PLC system with other network components via copper media.
b. Communication rate: 10/100 Mbps.
c. TCP/IP connections: 128.
d. Connection:
1) Single RJ-45 CAT 5 port.
2) Single USB 1.1.
e. Mounting position: Any slot in chassis.
2. Fiber EtherNet I/P (for cable distances exceeding 300' [91 m]):
a. Function: Interface PLC system with other network components via multimode fiber media.
b. Communication rate: 100 Mbps.
c. TCP/IP connections: 128.
d. Connection:
1) LC connectors.
2) Single USB 1.1.
e. Mounting position: Any slot in chassis.

2.04 PROGRAMMING DEVICE

A. Computer capable of interfacing with programmable controllers furnished by this contract. New laptop computer equipped with configuration and communication software shall be furnished to Owner. Programming device shall incorporate:
1. Alphanumeric keypad.

2. Function keys shall allow user to construct a relay ladder diagram on operator display screen, as well as complete programming instructions.

B. Programming controls shall permit user to enter, edit, and delete logic and to monitor registers in decimal, hexadecimal, binary or ASCII and obtain On/Off status of discrete I/O points.

2.05 PROGRAM DOCUMENTATION AND REPORT GENERATION SYSTEM

A. Programmable controller manufacturer shall provide a program documentation package to perform following tasks:
1. Ladder diagram reports complete with ladder rungs; English description for every contact, bit, or word; organized logic sections with comment lines to identify logic function; rung comments to facilitate maintenance; and element cross references.
2. Cross reference report: Sequential listing by element address of associated lines (or rungs).
3. Input/output configuration summary: Table of entire I/O address range, showing which addresses are used by programmable controller program, which addresses have descriptions, and which are hardwired I/O points.
4. Contact address listing: Lists I/O addresses and their associated symbolic definitions.
5. Record, load, and verification of program logic with program file on compatible electronic media, and program difference listings.

B. Provide software to allow "off-line" programming using a Windows compatible computer. Software shall document program as listed above. Provide required accessories to load program between programming computer and programmable controller.

2.06 LOCAL NON-NETWORKED GRAPHIC OPERATOR INTERFACE

A. Single graphics display capable of accessing information from programmable controller processor.

B. Interactive capability to allow operator to control I/O devices and acknowledge alarms from graphics display. Operator shall be able to change modes between manual and automatic control and change device states between on and off, enter control setpoints, timer and counter settings, process variables, and loop information by 1 or 2 keystroke actions.

C. Security levels shall be accessible by user-defined passwords. Levels shall include engineering configuration of graphic displays and setting system parameters, operator control functions only, and process monitoring only.

D. Mount graphic operator interface in console as specified in Section 40 95 13.

E. Processor:
1. Processors shall be capable of accessing field I/O points and registers available from programmable controller.
2. Failure of graphic operator interface processor shall in no way affect programmable controller functions.
3. Multiple tasks shall be executed allowing concurrent program modification and real-time monitoring and control. Processor operating system shall execute commands entered by operator at same time it reads and updates input from field devices.
4. Processor shall have sufficient memory for storage, display, and execution of graphic screens as specified in Section 40 96 45, with excess memory of 30% available for future programming needs.
5. Control program and display configuration shall be retained by hard disk or battery power to allow reloading after power failure.
6. Processor shall perform continuous diagnostic scans to detect data communication status and programmable controller status. System shall recognize transmission format errors and either correct or request retransmission.

F. Operator interface hardware:
1. Nominal screen size: 15" (425 mm).

2. Display type: Color TFT active matrix.
3. Resolution: 1024 x 768.
4. Operator interface: Touchscreen.
5. Power required: 120-volt ac.
6. Enclosure rating: NEMA 4X.

G. Communication interface: Provide Ethernet/IP communication protocol interfacing between graphics operator interface components and to programmable controller specified.

H. Accessories:
1. Supply system with necessary ventilating fans internal to console and cabinets.
2. Provide manufacturer's standard utilities and startup software.

I. Configuration software: Provide software to configure screens for dynamic monitoring and control of process variable data obtained from process controller.

2.07 PROGRAMMING

A. Configuration of control systems and their entry into microprocessor-based control system shall be responsibility of Contractor.

B. Entry and interaction of operator displays (overviews, summaries, loops, groups, graphics, etc.) with control units shall be responsibility of Contractor. Refer to Section 40 96 45 for graphics display requirements.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install in accordance with manufacturer's recommendations.

B. Enclosure shall be positioned to allow doors to be fully opened for easy access to wiring and components.

C. Mount rigidly supported, level and plumb, and in such manner as to provide accessibility; protection from damage; isolation from heat, shock, and vibration; and freedom from interference with other equipment, piping, and electrical work. Equipment shall not be installed until adjacent heavy construction work has been completed to extent that damage will be unlikely to installation by such construction work.

D. Manufacturer's recommendations referred to herein shall be as stated in manufacturer's instruction books and/or by manufacturer's service representative.

3.02 FIELD QUALITY CONTROL

A. Following field demonstration tests shall be conducted:
1. Visual check shall be performed to ensure correct equipment.
2. Latest revision of configuration and base level programs has been loaded.
3. Complete loop functional checks shall be performed.
4. Input signals shall be applied to each loop, and when applicable, outputs measured.
5. Input/output values shall be compared to graphic operator interface values.
6. Configuration displayed on graphic operator interface shall be verified.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Control panels and enclosures completely assembled with instruments and electrical controls mounted and wired for intended service.

B. Mount and wire control system and related hardware as specified in Section 40 94 43 or Section 40 94 23 in associated panels and enclosures.

1.02 WORK BY OTHERS

A. Master fuel trip (MFT) panel will be designed by boiler supplier. Scope of boiler supplier for MFT panel includes schematic design, panel layout, and bill of materials.

1.03 MAINTENANCE MATERIALS

A. Furnish separately packaged spare parts of following items:
1. Fuses: 100% of each rating furnished with control equipment and used internally within panel/enclosure for circuit protection including, but not limited to, miscellaneous fuses on controllers, recorders, and indicators. Minimum of one standard package.
2. Indicating lamps: 10% of each type furnished with control equipment. Minimum of one standard package.
3. Relays: 10% of each type furnished with panel/enclosure. Minimum of one.

1.04 DELIVERY, STORAGE, AND HANDLING

A. Ship control panels as recommended by control panel/enclosure manufacturer.

B. Provide removable eye bolt lifting lugs for large panels and suitable skids for safe handling.

C. Remove rack-mounted instruments, controllers, recorders, and indicators that could be damaged by shipment and package in original shipping cartons.

PART 2 PRODUCTS

2.01 FABRICATION

A. Size: Sufficient to house terminal blocks, wireways, power supplies, racks, chassis, and instruments required for each application. Provide 25% additional space for future expansion.

B. Oil-resistant gasket attached with oil-resistant adhesive.

C. Provide each panel/enclosure with industrial corrosion inhibitor emitters of sufficient size and quantity to protect contents of enclosure size selected. Emitters shall contain additional red metal inhibitors to protect brass and copper material in addition to ferrous metals.

D. Provide adequate cooling by means of air conditioners, pneumatic vortex coolers, blowers, exhaust fans, or sun shade, as necessary, for any panel in which internal cabinet operating temperature exceeds rating of any component mounted within enclosure. Thermostat shall be used to control internal temperature.

E. Provide "data pockets" for Drawing storage on inside face of panel.

F. Subpanels: Provide for full surface mounting of terminal blocks, wireways, power supplies, racks, chassis, and instruments.

G. Free-standing and floor-mount panels shall mount on 3" (75 mm) concrete pad provided by others.
   1. NEMA rating: Suitable for environment.
   2. Construct control panel in accordance with manufacturer's standard.
   3. Control panel shall be self-supporting with angle iron or plate framework as necessary to obtain proper stiffness and support.
   4. Fabricate control panel of 12-gage carbon steel plate with all-welded construction throughout. Welds shall be ground smooth, corners shall be rounded, and weld spatter cleaned. Corner construction shall be a minimum of 1/8" inside radius.
   5. Surface of control panel shall be free from mars and defects. Finished panel surfaces shall be flat within 1/16" in 6'-0" and be smooth with rounded edges. Instrument cutouts and drilling shall be straight and true.
   6. Provide 12-gage full height access doors. Access doors shall have triple-point latch, stainless steel handle and lock, full length stainless steel "piano" type hinge, and sponge rubber gaskets. Door shall be supplied with devices to hold door in 105° position when fully opened.
   7. Provide, full-width, full height, real rectangular subpanel for surface mounting of programmable controller, other surface-mounted instruments, wiring troughs, and terminals strips.
   8. Provide full-length, side-mounted subpanels for installation of terminal strips.
   9. Base of control panel shall be adequately reinforced to permit anchoring to concrete pad.
   10. Where required, purge control panel to protect instruments from corrosive vapors. Air purge rotameter and needle valve shall be furnished, installed and mounted on outside of panels. Purging devices shall be considered as part of control panel package. Provide other devices necessary for proper operation.
   11. Supply 4 identical master keys which will operate all locks of each control panel.

H. Surface-mounted panels:
   1. Provide with seam-sealed construction with no holes or knockouts and with stainless steel collar studs for mounting subpanels.
   2. Provide Type 316 stainless steel hasp for padlocking.
   3. Provide full size subpanel.
   4. Color:
      a. Exterior: White, outdoor; gray, indoor.
      b. Interior: White.

I. Outdoor-mounted panels:
   1. Provide panels with NEMA rating suitable for environment.
   2. Panel construction shall be suitable for protection from ultraviolet radiation.

2.02 SPECIALTY PANELS

A. Master fuel trip (MFT) panel:
   1. Construct as part of DCS burner management system (BMS) panels.
   2. Interconnect wiring between MFT and BMS panels shall be factory wired and tested prior to shipment to site.

2.03 PANEL-MOUNTED INSTRUMENTATION

A. As required for panel-mounting based on application.

B. Control relays:
   1. Function: General logic hardware interlocks.
      a. Type: Plug-in.
      b. Construction: Continuous duty.
      c. Coil voltage: As applicable.
      d. Switch configuration: 3-SPDT.
      e. Indication: Mechanical or LED to indicate energized relay.
      f. Switch rating: 10 amperes at coil voltage.
      g. Mounting: Socket for DIN-rail mounting.
   2. Function: Interposing relay for PLC output.
      a. Type: Plug-in.

b. Construction: Continuous duty.
c. Coil voltage: As applicable.
d. Switch configuration: 2-SPDT.
e. Indication: Mechanical or LED to indicate energized relay.
f. Switch rating: 5 amperes minimum at coil voltage.
g. Mounting: Socket for DIN-rail mounting

C. Selector switches:
1. Type: Non-illuminated.
2. Contact rating: 10 amperes at 120-volts ac, 60 Hz.
3. Legend plates: As required for application.

D. Pilot lights:
1. Type: Standard.
2. Input: Full voltage, 120-volt ac, 60 Hz.
3. Lamp type: LED.
4. Lens color:
a. Red: Danger, run, or open.
b. Amber: Shutdown, caution, pre-alarm, or abnormal.
c. Green: Stop, closed, or satisfactory.
d. White: Power available, ready.
e. Blue: Status.
5. Legend plates: As required for application.

E. Pushbuttons:
1. Type: Non-illuminated.
2. Configuration: Single-operator, number of poles as required for application.
3. Contact rating: 10 amperes at 120-volts ac, 60 Hz.
4. Operator:
a. Flush head: Start applications.
b. Extended head: Stop applications.
c. Mushroom head: Emergency stop applications.
5. Button color:
a. Red: Danger, run, or open.
b. Green: Stop, closed, or satisfactory.
c. White: Power on.
6. Legend plates: As required for application.

F. Digital display:
1. Display: 4 digit (-1999 to 9999) red LED, 0.56" high.
2. Decimal point: Up to 3 decimal places.
3. Update rate: 3.7 to 5 times per second.
4. Input signal: 4-20mA, externally powered.
5. Output signal: Not required.
6. Relay outputs: None required.
7. Enclosure: 1/8 DIN, high impact plastic.
8. Electrical classification: NEMA 4X, IP65 front.
9. Supply voltage: 24-volt dc.
10. Electrical connection: Screw terminal blocks.
11. Mounting: Control panel.

G. Signal splitter:
1. Input signal: 4-20 mA, externally powered.
2. Output signals: Dual, independent, 4-20 mA, internally powered.
3. Power requirements: 24-volt dc.
4. Mounting: DIN rail.

H. Signal convertor:
   1. Type: Universal.
   2. Inputs:
      a. Thermocouple.
      b. RTD.
      c. Resistor. 2-wire, < 8K ohm
      d. Potentiometer: 3-wire, < 8K ohm.
      e. Voltage: -20 mV to 2400 mV.
   3. Outputs:
      a. Current: 0-20 mA, 4-20 mA into 500 ohm load.
      b. Voltage: 0-5 volt, 0-10 volt, +/- 5 volt, =/- 10 volt, >10K ohm load.
   4. Power required: 18-30 volt dc.
   5. Mounting: DIN rail.
   6. Accessories: Configuration software and cable kit for interconnection.

I. Surge suppressor:
   1. Type: Pluggable surge suppression modules fitting into fixed base with hot swapping capability.
   2. Capacity:
      a. Current: Up to 10kA surge current handling.
      b. Peak clamping voltage: <= 41.6 volt dc
      c. Resistance: 2.2 ohm in-line.
   3. Analog signals:
      a. Circuits: 1 or 2 - 24 volt dc.
      b. Signals: Suitable for 4-20 mA current, thermocouple or mV.
   4. Discrete 24-volt dc signals:
      a. Circuits: 2 or 4.
      b. Signals: Suitable for 24-volt dc discrete circuits.
   5. Discrete 120-volt ac signals:
      a. Circuits: 2.
      b. Signals: Suitable for 120-volt ac discrete circuits.

J. Intrinsically safe barriers:
   1. Function: Isolate switches in hazardous areas.
   2. Type: Isolated switching.
   3. Hazardous area classifications: Class I, II, III; Division 1, Groups A through G.
   4. Power required: 120-volts ac, 60 Hz.
   5. Mounting: Nonhazardous area on DIN rail.
   6. Channels: 2.
   7. Inputs: One dry contact per channel.
   8. Outputs: SPDT relay contact per channel.

K. D ; power supply
   1. Provide 1 or more 24-volt dc power supplies, as necessary, within each panel to power field transmitters, I/O, and related equipment.
   2. Type: Redundant.
   3. Input voltage:
      a. One 120-volt ac from plant uninterruptable power supply.
      b. One 120-volt ac from plant essential service power supply.
   4. Rating: Amperage shall be 200% of required capacity.

2.04 FACTORY WIRING

A. Provide complete factory wiring of control cabinet and equipment mounted thereon.

B. Provide separate circuits from power distribution panel for:
   1. Instrumentation and control devices.
   2. Lighting and service outlets.

C. Install continuous wire from terminal to terminal. Splices not acceptable.

D. Wire and cable:
1. Analog signal cable:
   a. Configuration: Twisted pair, shielded, and jacketed.
   b. Insulation: 300-volt, 60ºC, PVC, color-coded to permit identification of each conductor.
   c. Conductors: Stranded copper, 18 AWG.
   d. Shield: Metallized foil or tinned copper braid providing 100% coverage against noise together with 20 AWG stranded tinned drain wire.
2. Power wire:
   a. Rating: 600-volt, 90ºC, PVC insulation/jacket, Type MTW.
   b. Conductors: Stranded copper, 12 AWG.
3. Discrete signal wire:
   a. Rating: 600-volt, 90ºC, PVC insulation/jacket, Type MTW.
   b. Conductors: Stranded copper, 18 AWG.
4. Power and discrete signal wire insulation color:
   a. BLK: Line voltage.
   b. BRN: Line voltage/fused.
   c. RED: 120-volt control ac.
   d. ORG: 24-volt control ac.
   e. YEL: Caution/may be live from remote power source.
   f. GRN: Ground.
   g. BLU: Dc negative.
   h. VIO: Dc positive.
   i. WHT: Neutral at GND potential.

E. Group and route wire and cables from terminal blocks to panel-mounted instruments in separate wireways as follows:
1. Low-voltage/low current dc analog signals (30-volts/50 mA or lower).
2. High-voltage dc alarm signals (48-volts or greater).
3. Low-voltage ac control signals (120-volts or lower).
4. High-voltage ac power signals (greater than 120-volts).

F. Wiring interfaces:
1. External connections:
   a. Install dedicated terminal strips for analog, discrete, and power signals.
   b. Provide manufacturer's standard connectors for communications, digital data, and multiplexed signals.
   c. Provide surge suppressor terminal blocks for analog and discrete signals that leave building structure:
      1) Analog signal blocks: Voltage rating 24-volt ac/dc.
      2) Discrete signal blocks: Voltage rating 120-volt ac/dc.
   d. Provide intrinsically safe barriers for applications where field instruments are not rated as explosionproof for use in hazardous classified areas.
2. Provide separate terminal strips and wireways for 120-volt ac and 24-volt dc circuits.
3. Terminal block requirements:
   a. Type: High-density.
   b. Voltage: 600-volt.
   c. Wire range: 30 AWG to 12 AWG.
   d. Termination: Screw clamp compression with pressure plate.
   e. Mounting: Rail-mounted with end anchors and barriers.
   f. Spare: Provide greater amount of 20% or 6 terminals per terminal strip
4. Terminate maximum of 2 wires on single connect point.
5. Wire network communication cables point-to-point rather than terminating on interposing terminal blocks.
6. Install power distribution blocks to parallel feed to power control devices. Parallel wiring from instrument to instrument not acceptable.
7. Provide plug-in strip for ac supply power to devices requiring ac power via power cord.

8. Circuit protection:
   a. Install individual circuit breakers for protection of control panel power supply circuits as identified above.
   b. Group circuit breakers on separate terminal strip away from low-voltage instrumentation circuitry.
   c. Provide fuses for protection of individual instrumentation circuits. Instrumentation circuits for field-mounted instruments may be combined in logical groupings of no more than 10 devices/signals.
9. Provide 8 AWG internal copper grounding bus for ground connections.

G. Wire tags:
   1. Type: Embossed, heat-shrink tubing. Fiber tape tagging not acceptable.
   2. Color: White.
   3. Identify both ends of wires and/or cables with permanent wire marker.

H. Service equipment:
   1. Fluorescent lighting fixtures of sufficient size and quantity to provide 30 to 50 foot-candles of illumination within panel. Wire to UL-approved switch mounted inside panel.
   2. Duplex, 120-volt ac, 3-wire grounded type convenience outlets. Provide 1 duplex receptacle per 12 sq ft of subpanel area. Service outlets shall be powered from separate voltage source than instrumentation and DCS/PLC equipment.

2.05 NAMEPLATES

A. Provide permanent nameplates for devices mounted on or within panels. Provide separate nameplates. Standard nameplates included with instruments not acceptable. Plastic tape labeling not acceptable.

B. Instrument nameplates shall be fabricated of laminated plastic, not less than 1/16" (2 mm) thick of white Bakelite engraving stock with black core.

C. Attach with sheet metal screws after painting is complete. Glue adhesive not acceptable.

2.06 PAINTING AND FINISHING

A. Surfaces shall be commercial blast cleaned in accordance with SSPC SP6.

B. After preparation of surfaces, pits or indentations shall be filled with a 100% solid catalyzed epoxy putty compound.

C. After hardening of putty filler, filled areas shall be sanded smooth. Entire exterior surface shall be smooth and uniform to receive paint.

D. Manufacturer's standard interior and exterior paint shall be acceptable as primer coat.

E. Prepare interior and exterior surfaces for finish coat of paint in accordance with manufacturer's instructions.

F. Color:
   1. Interior and subpanels: Slate gray.
   2. Exterior:
      a. Outdoor panels: White.
      b. Indoor panels: Slate gray.

G. Spray-apply paints to produce smooth, uniform coat, free of defects. SSPC PA-1 shall apply.

H. Each coat shall be properly cured according to manufacturer's instructions before application of succeeding coats.

2.07 SOURCE QUALITY CONTROL

A. Contractor shall be responsible for hardware provided and shall notify Engineer, in writing, when panel and enclosure control systems are considered complete, in good operating condition, and ready for performance testing.

B. Factory performance tests:
   1. Contractor shall perform testing and inspection prior to shipment of control equipment at Contractor's manufacturing facility.
   2. Contractor testing in preparation for inspection shall include, but not be limited to following:
      a. Confirm point-to-point wiring by continuity tests with written checklist indicating satisfactory results after final assembly and wiring.
      b. Energize control circuits, simulate analog and discrete signals.
      c. Verify hand switches, pushbuttons, and pilot light operations.
      d. Check control circuits for proper sequence of operation and interlocking functions.
      e. Test instruments over full operational range. Prove instruments to be within published specifications and accuracy. Instruments shall be tested individually and where applicable, as a system. Testing shall be by simulated field signals.
   3. If equipment or system fails to perform properly, Contractor shall make necessary corrections, including replacement, at no cost to Owner as follows:
      a. Correct wiring changes including changing terminal block and/or wire tags.
      b. Document all changes on Project Record Documents.
      c. Retest equipment verifying deficiencies are corrected.
   4. At completion of testing, Contractor shall notify Engineer of completion of testing and readiness for inspection.

C. Inspection:
   1. Notify Engineer, in writing, 10 days prior to completion of control panels and enclosures final testing. At their option, Owner and Engineer may witness final factory inspection.
   2. Coordinate between all concerned parties and establish schedule for inspection. Give minimum 10-day notice to all parties.
   3. Written test procedures shall be submitted prior to witness testing. Procedures shall be used for final testing.
   4. Upon satisfactory completion of testing, final inspection will be made by Engineer.
   5. If system fails to perform properly, Contractor shall make necessary changes and adjustments to equipment at no cost to Owner as specified above, and notify Engineer when ready for reinspection.
   6. Reinspection schedule shall be same as initial inspection procedures.
   7. If inspection is substantially correct but with minor defects, Contractor shall verify deficiencies are corrected in writing to Engineer without need for additional witness testing.

D. Testing costs:
   1. Costs of conducting tests, except for following, shall be borne by Contractor. Owner and Engineer's costs associated with factory performance test, not exceeding 1 round trip to Contractor's manufacturing facility and 5-days per person for total of 2 persons.
   2. Owner and Engineer will each render bill to be paid by Contractor covering costs incurred by retesting or supplemental testing exceeding limits noted herein.
   3. Billings to Contractor for Owner and Engineer's cost for retesting and supplemental testing exceeding limits specified shall be paid directly to Owner or Engineer, as appropriate, within 30 calendar days from receipt by Contractor. Contractor's failure to pay such billings shall be cause for withholding final payment in amount equal to such costs.
   4. Engineer's costs, when applicable, will be determined at Engineer's current per diem rates, plus direct expenses.

PART 3 EXECUTION

3.01 INSTALLATION

A. Mount rigidly supported, level and plumb, and in such manner as to provide accessibility; protection from damage; isolation from heat, shock, and vibration; and freedom from interference with other equipment, piping, and electrical work.

B. Do not install equipment until adjacent heavy construction work has been completed to extent that damage will be unlikely to installation by such construction work.

C. Install outdoor surface-mounted panels within sun protection enclosures. Panels shall face north or east, where possible.

D. Install in accordance with manufacturer's recommendations.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Sample panels including analytical instrumentation, data acquisition station, sample coolers, tubing, regulators, resin columns, valves, sensors and probes, sink, cabling, equipment supports, and associated connections.

PART 2 PRODUCTS

2.01 DESIGN REQUIREMENTS

A. Design water analysis equipment to operate accurately, reliably and safely under operating conditions described herein, without undue heating, vibration, wear, corrosion, or other operational conditions.

B. Design and arrangement of equipment shall be subject to approval by Owner's Representative. Arrangement of equipment and sub-assemblies shall afford maximum accessibility and maintainability of parts. Arrange piping, tubing and fittings so instruments or devices may be removed and/or serviced without disturbing piping or tubing runs. Do not route pipe or tube across face or rear of instrument, junction box or other device in such a manner as to prevent opening of covers or to obstruct access to leads, terminals or instruments for servicing. Parts subject to wear, corrosion or other deterioration, or requiring adjustment, inspection or periodic maintenance shall be made accessible and capable of convenient removal when required.

C. Sample system shall be completely assembled, piped, and wired at factory and ready for installation when received at site. Equipment shall be mounted with properly designed supports and complete factory-installed internal piping, tubing and electrical wiring for all devices. Internal piping, tubing, wiring and connections shall be securely fastened, compactly arranged and readily accessible. Suitably brace to prevent distortion and damage during shipping and handling.

D. Incoming and exiting piping and tubing connections shall be clearly identified by engraved nameplates with sample line number and appropriate text. Nameplates shall be made of 1/16" (2 mm) laminated plastic and shall be fastened to panel with fasteners or stainless steel screws. Nameplates shall be black text engraved on white background.

E. Sample panel tubing:
1. Tubing includes bulkhead fittings and rack isolation valves at inlet of conditioning rack.
2. Tubing size: 1/4" OD x 0.049" wall and/or 3/8" OD x 0.065" wall, as needed for proper sample conditioning.
3. Tubing material: ASTM A213/A269, Grade 316.
4. Fitting connections internal to rack shall comply with ASME/ANSI B31.1. Instruments, piping, tubing, valves and fittings shall be securely mounted. Fittings shall be as required by sample conditions and pipe specifications. Supports shall provide complete freedom from strain on equipment. Arrange runs so connections can be broken without distortion of tubing.

F. Materials:
1. Piping, tubing, and system components wetted by sample stream shall be Type 316 stainless steel. Type 304 stainless steel is acceptable for other components.
2. Parts subject to high pressure or temperatures or other severe duty shall be of materials suitable for service.

G. Analyzer requirements:
1. Furnish to meet anticipated sample conditions per design.
2. Each analyzer shall have self-contained readout meter.
3. Each analyzer cell shall include valved flow indicator to enable adjustment of sample flow through cell.

4. Instrument shall be of proven design. Solid-state measuring and alarm circuitry shall have suitable electrical filters so instrument will not be sensitive to power spikes, either induced or in supply line.
5. Analyzer shall have 4-20 mA dc isolated (ungrounded) outputs. Analyzer shall meet accuracies required for proper power plant operating and maintenance and shall exhibit a constant repeatability with less than 1% error full scale after initial calibration.

H. Mounting:
1. Mount instruments, valves, and accessories within dimensional confine of rack/panel.
2. Mount required pressure, temperature and flow indicators, and sample isolation valves to permit viewing or manipulation from front of panel.
3. Mount all analyzer cells and resin columns on panel front to facilitate maintenance over sink.

I. Surface preparation and painting:
1. Surfaces of noncorrosion-resistant materials shall be properly cleaned, shop blasted, and painted with enamel type paint as specified below. Prior to painting, welded joints, drilled holes, etc. shall be properly cleaned and ground to assure smooth appearance.
2. Sharp welds and sharp corners shall be ground smooth and blended into base material. Interior surfaces of shells and nozzles shall be cleaned of all mill scale, cuttings, weld spatter, and other foreign matter. Exterior ferrous metal surfaces shall be cleaned and painted in accordance with manufacturer's standard practice for shop primer.
3. Machined faces and fittings, parts to be embedded in concrete, nonferrous parts, nameplates, and instruction plates shall not be painted. Suitable means, such as coating with grease or preservative shall be employed to provide protection of ferrous surfaces during shipment and storage.
4. Cleaning and painting procedures shall be submitted to Owner for acceptance before they are implemented.

J. Structural welding.
1. Perform by qualified welders in accordance with applicable procedures. Procedures qualification and welder performance qualification shall be in accordance with ASME Section IX, as applicable.
2. Structural welding shall be performed by qualified welders in accordance with AWS D1.1 or ASME Section IX.
3. Welded joints in piping and equipment pressure parts shall be inspected in accordance with ASME/ANSI B31.1. Procedures employed for inspection shall be approved by Owner.

K. Electrical:
1. Distribution of power shall be centralized from panel of circuit breakers located together in dry panel section. AC and DC circuits shall have circuit breakers in live leg. Circuit identifying nameplates shall be readily accessible for inspection and maintenance.
2. Where more than one device uses same measurement or control signal, transmitter or other components shall be fully equipped to provide all signal requirements. Arrange system so failure of any recorder, indicator, control component, etc., shall not open signal loop nor cause loss or malfunction of signal to other devices using same basic signal.
3. Power supply: 120 volts ac, 60 Hz.

2.02 SYSTEM DESIGN REQUIREMENTS

A. Construction:
1. Provide components indicated herein as required for each sample panel. Not all sample panels will contain the same components due to the nature of sample streams.
2. Sample panel shall be freestanding panel into which equipment is mounted.
3. Connect samples to panel at top. From connection point, sample shall flow through tubing and control instruments to condition its pressure, temperature, and flow rate.
4. Wire all analyzer high/low alarms and thermal shutoff valve closed alarms on each process sample line in series so that any alarm condition in a particular sample line will result in a common alarm for that sample line.

B. Panel flow requirements:
   1. Under all sampling conditions, cell or analyzers not requiring minimum required sample flow rate shall be designed with flow rate of approximately 150 cc/min.
   2. If analytical equipment requires different flow rates, then analyzer minimum flow shall be design basis.
   3. Total sample line flow shall be as close as practical to 6 feet/second to ensure contemporary sample.
   4. Each sample shall flow continuously to ensure representative samples.
   5. When sampling is transferred, incorporate so analyzer flow is undisturbed by grab sampling or analyzer maintenance.

C. Manual isolation valve:
   1. Valve located immediately downstream of interface point shall allow operator to isolate sample line for maintenance and repair.
   2. Valve shall be selected for appropriate temperature and pressure requirements that will allow proper sample flow and provide for operator safety.

D. Sample coolers:
   1. Furnish coolers as integral part of sample panel.
   2. Arrangement: Side by side in panel. Connect to inlet and outlet cooling water header.
   3. Locate for easy access to throttling valves and for maintenance and replacement, as necessary.
   4. Cooling water piping shall not disturb sample piping.
   5. Sample piping shall not interfere with removal and replacement of cooler coils and/or shells.
   6. Equip with 3-way inlet valves for cooling water isolation.
   7. Provide outlet globe valves for throttling cooling water flow.
   8. For maintenance, coolers shall have removable shells.
   9. Coil-in-shell design with counterflow of sample and cooling water. Coolers shall have single flange and gasket shell design.
   10. Primary sample cooler: Water sample temperature shall be reduced by using full counter-flow sample coolers to achieve temperature within 5°F of temperature of primary cooling water; steam samples to achieve temperature within 10°F of temperature of primary cooling water.
   11. Secondary sample cooler: Use in conjunction with closed temperature control unit (TCU) to achieve controlled temperature of 77± 1°F.
   12. Provide relief valves for primary and secondary cooling headers.

E. Blowdown valve for boiler drum water samples:
   1. Two blowdown connections:
      a. Downstream of pressure reducing valve to assure complete flushing of upstream sample line.
      b. Upstream of primary cooler to allow for high pressure flushing of large particulates during start-up.
   2. 3-way ball valve design to eliminate dead-legs in sample line.
   3. Route reduced pressure blowdown to sample sink for visual inspection.

F. Thermal shut-off valve:
   1. Provide on each sample line to protect downstream analyzers from cooling water failure by isolation of sample line at temperatures exceeding 120°F. Design for multiple events and require manual reset by operator.
   2. Provide contact to provide alarm upon actuation of valve.
   3. Locate valve downstream of sample cooler and blowdown valve.

G. Pressure reducing valve
   1. Manual adjustment to reduce sample inlet pressure to required sampling outlet pressure.
   2. Provide VREL type or suitable high pressure reducing valves for boiler blowdown, economizer inlet, main steam, and saturated steam samples for pressures greater than 500 psi.

H. Backflow pressure regulator/relief valve:
   1. Type: Mechanical, requiring no electrical energy to operate.
   2. Provide on each sample line to allow for precise flow control.

3. Valve shall provide pressure relief capability to protect associated analyzers from overpressure in accordance with pressure limitations imposed by analyzer manufacturer.
4. Discharge of valve shall be used to allow grab sample collection without affecting flow to analyzers.
5. Pipe discharge to sample sink.
6. Regulated pressure: Nonadjusting, factory set at 20 psig under normal operating conditions.
7. Connections: 1/4" (6 mm) NPT female.
8. Ambient temperature: -40°F to +165°F.
9. Wetted materials: Type 316 stainless steel and Viton.
10. Relieving capacity: 2 gpm at 10 psi buildup over set pressure.
11. Provide separate sample line relief valve, as required to assist in pressure control.

I. Instrumentation:
1. Flow meters:
   a. Provide proper range for analyzer being serviced.
   b. Provide integral control valve to adjust flow rate.
   c. Panel-mounted such that flow tubes can be easily removed for cleaning from panel front.
2. Thermometers, gages, and indicators shall be clearly visible to operating personnel.
3. Install thermowells in each sample line at locations that will provide accurate representation of each grab sample process condition.

J. Wet analyzer rack:
1. Attach to sample-conditioning panel. Rack shall house in-line type analyzers on front faceplates.
2. Analyzer cells shall include valved flow indicator to enable adjustment of sample flow through cell.
3. Design unit so wet analyzers can be easily accessible from front of rack, with all drains, electrical and other connections located in rear.
4. Analyzers on wet analyzer rack shall be wired to control and monitoring section of panel to terminate all signals from cells, analyzers, and power supply.
5. Electrical enclosure and electronics enclosure of each analyzer shall have NEMA Type 12 rating as a minimum.

K. Control and monitoring enclosure (dry section):
1. Integrate control and monitoring of each instrument and its components into sampling panel.
2. Include data acquisition station for local indication, trending, and data transmission to DCS.
3. Enclosure: NEMA 12.
4. Structure shall include appropriate cutouts for instruments and analyzers specified and/or shown.
5. Internals of enclosure shall include appropriate electrical connections for power and signals and include interior lights with on/off switch and a minimum of one utility outlet for operator use.
6. Process signals:
   a. Provide individual discrete signals for each sample stream wired to common terminal block including but not limited to following:
      1) Sample high temperature alarm.
      2) Individual analyzer alarm.
   b. At common terminal block, signals shall be wired in series to provide "common" trouble alarm for each sample stream.
   c. Provide 4 to 20 mA analog signals from each analyzer wired to common terminal block.
   d. Provide external connection at common terminal block for closed cycle cooling water low flow switch dry contract input.
   e. From common terminal block, all signals shall then be wired to Data Acquisition Station.
7. Enclosure shall include but not be limited to following:
   a. Power distribution breakers.
   b. Terminal blocks for outgoing signals and incoming power supply and distribution.
   c. Operation switches (On/Off/Auto) for manual control of chiller unit.
   d. Internal factory wiring, terminal blocks, and wireways as specified in Section 40 95 13.

L. Resin column:
1. Use: Cation conductivity measurement.
2. Design to allow for easy resin replacement.
3. Design shall provide optimum fluid velocity with increased resin efficiency.

4. Materials of construction shall prevent leaching of chlorides or plasticizers into sample.
5. Supply with initial charge of resin, corrosion proof, quick-disconnect mounting bracket and barbed quick disconnects, with auto-shutoff feature.

M. Sample sink:
1. Provide grab sample collection facility consisting of Type 304 stainless steel sink and individual flexible tubing connected to backpressure relief valve outlet.
2. Sink shall be large enough to accommodate 1-liter bottles.
3. Size: Minimum of 7-3/4" (197 mm) wide x 8-1/2" (216 mm) deep with 12" (300 mm) back splash. Slope to one side for drainage.
4. Mount within and support by panel frame.
5. Grab sample will flow continuously into sink and will be gravity drained from sink to waste.
6. Sink shall have 4" (100 mm) minimum working surface with 1" (25 mm) drip lip.

N. Temperature control unit (TCU):
1. Type: Packaged, redundant chilled water cooling and control system, skid-mounted with necessary accessories included within confines of skid.
2. Full-capacity circulation pump for cooling water, full capacity hermetically sealed compressor, and necessary piping, valves and controls.
3. Safety factor: Minimum of 20%. Apply to estimated heat load when calculating design tonnage of TCU.
4. TCU shall provide heating capability by means of hot gas bypass design in event of sub-cooled sample temperatures from primary coolers.
5. Equip TCU with gages and isolation valves to simplify maintenance and troubleshooting.

2.03 BOILER PROCESS SAMPLE POINTS

A. Boiler drum water (blowdown):
1. Source: Continuous blowdown line from steam drum.
2. Supply pressure and temperature: Per design.
3. Measured parameters:
   a. Specific conductivity.
   b. pH.
   c. SiO_2.
   d. PO_4.

B. Condensate pump discharge:
1. Supply pressure and temperature: Per design.
2. Measured parameters:
   a. Specific conductivity.
   b. Cation conductivity.
   c. pH.
   d. Dissolved oxygen.

C. Economizer inlet:
1. Source: After final feedwater heater .
2. Supply pressure and temperature: Per design.
3. Measured parameters:
   a. Specific conductivity.
   b. pH.
   c. Dissolved oxygen.
   d. Cation conductivity.

D. Condensate polisher effluent:
1. Supply pressure and temperature: Per design.
2. Measured parameters:
   a. Specific conductivity.
   b. Cation conductivity.

E. Main steam:
   1. Source: main steam line.
   2. Supply pressure and temperature: Per design.
   3. Measured parameters: a.
      Cation conductivity. b.
      Specific conductivity. c.
         Na.
      d. SiO_2.

F. Deaerator storage tank outlet:
   1. Source: Deaerator storage tank
   2. Supply pressure and temperature: Per design.
   3. Measured parameters:
      a. pH.
      b. Dissolved oxygen.
      c. Specific conductivity.

G. Saturated steam:
   1. Source: Steam drum.
   2. Supply pressure and temperature: Per design.
   3. Measured parameters:
      a. Specific conductivity.
      b. Cation conductivity.

H. Reheat steam:
   1. Source: Reheat steam header.
   2. Supply pressure and temperature: Per design.
   3. Measured parameters:
      a. Specific conductivity.
      b. Cation conductivity.
      c. Na.

I. Primary cooler cooling water:
   1. Source: Closed cycle cooling water system.
   2. Supply pressure, temperature, and flow rate: Per design.

J. Temperature control unit cooling water:
   1. Source: Closed cycle cooling water system.
   2. Supply pressure, temperature, and flow rate: Per design.

2.04 SEAWATER INTAKE PROCESS SAMPLE POINTS

A. Sample downstream of chlorination: Free chlorine residual.

2.05 WATER PRODUCTION PLANT SAMPLING SYSTEM PROCESS SAMPLE POINTS

A. Mixed media filter influent:
   1. Free chlorine residual.
   2. Specific conductance.

B. Mixed media filter effluent (combined flow or each filter individually): Turbidity.

C. Seawater reverse osmosis (SWRO) influent: Oxidation / reduction potential (ORP).

D. SWRO permeates (each skid): Specific conductance.

E. SWRO rejects: Specific conductance.

F. Remineralization filters effluent line downstream of NaOCl injection: Free chlorine residual.

G. Brackish water reverse osmosis (BWRO) influent: pH.

H. BWRO skids permeates: Specific conductance (for each skid).

I. BWRO skids rejects: Specific conductance (for each skid).

J. Electrodeionization (EDI) skid effluents: Specific conductance (for each skid).

K. EDI rejects: Specific conductance (for each skid).

L. Demineralized water tank pump discharge:
   1. Specific conductance.
   2. Silica.
   3. Sodium.

2.06 WASTEWATER TREATMENT PROCESS SAMPLING POINTS

A. Wastewater treatment sampling systems (as required for compliance with all applicable environmental rules, regulations, and effluent discharge permit conditions).
   1. SWRO reject wastewaters.
   2. Package sanitary sewage treatment plant effluent.
   3. Oil/water separator wastewater effluent.
   4. Wastewater pond effluent.

2.07 DATA ACQUISITION STATION

A. Features and accessories:
   1. Display unit: 10.4" TFT color LCD (640 x 480 pixels).
   2. Power supply: 120-volts ac, 60 Hz.
   3. Channels: 48.
   4. Display language: English.
   5. Memory: 200 MB (large memory).
   6. Provide application software for Windows XP operating system.
   7. Shunt resistors (screw input terminal) for 4-20 mA inputs.

B. Options:
   1. Alarm outputs: 12 points.
   2. Serial communications interface: Modbus Ethernet network communication for output of measurement data.
   3. 24 volt-dc transmitter power supply: 8 loops.

2.08 SAMPLE COOLER

A. Type: Helical coil.

B. Tube material: Type 316 stainless steel.

C. Shell material: Type 304 stainless steel.

2.09 THERMAL SHUT-OFF VALVE

A. Pressure rating: 3,000 – 6,000 psi.

B. Downstream pressure rating: 25 psi.

C. Temperature rating: 250°F.

D. Trip temperature setpoint range: 115-125 °F.

E. Wetted materials: Type 316 stainless steel, Viton, PEEK.

F. ConnectioShut-off time: Less than 5 seconds after temperature reaches setpoint.

G. Reset time: Temperature must drop 2-3°F below setpoint.

H. Position indicating dry contact:
1. Configuration: One SPDT (Form C).
2. Enclosure: NEMA 4.
3. Terminations: Screw-type.
4. Contact rating: 5-ampere, 125 volts ac, 250 volts ac.

2.10 RESIN COLUMN

A. Operating temperature: 180°F maximum.

B. Operating pressure: 100 psig at 100°F.

C. Cation capacity: 1,000 grains as $CaCO_3$.

D. Resin volume: 0.020 ft^3.

E. Resin: Cation resin with color indicating dye.

F. Connections: Manufacturer's standard.

2.11 SENSOR PROBES

A. Measurement: Cation conductivity, Specific conductivity, pH, ORP, and others as required for each process sample stream.

B. Cell constant: As required for application.

C. Type of installation: Suitable for insertion.

2.12 INSTRUMENTATION

A. Pressure:
1. Range: 0 – 60 psig or as required for application.
2. Construction: Type 316 stainless steel.
3. Size: 2-1/2" minimum dial.

B. Temperature:
1. Range: 30 – 130°F.
2. Type: Bi-metal.
3. Size: 3" minimum dial.

C. Flow indicators:
1. Type: Rotameter.
2. Flow range: 0 - 560 cc/min or as required for application.
3. Flow control: Integral control valve to adjust sample flow rate.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install system components in accordance with manufacturer's current installation instructions.

3.02 PANEL SCHEDULE

Item No.	Description
1	Unit 1 Boiler Sample Panel
2	Unit 2 Boiler Sample Panel
3	Wastewater Treatment Sample Panel
4	Water Production Plant Sample Panel
5	Seawater Intake Sample Panel

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Multimode fiber optic cable for outdoor and indoor nonplenum use.

B. Conduit, panels and panel-mounted equipment.

C. Accessories, testing, and commissioning.

1.02 QUALITY ASSURANCE

A. Qualifications: List of 5 similar projects of fiber optic construction including project name, location, date of completion, and name and telephone number of contact person for verification of references.

B. Regulatory requirements: Work shall be in accordance with latest editions of EIA Standard RS-455, ANSI C2, NFPA 70; and shall comply with EPA regulations.

C. Cable shall be from same manufacturer, of same type, and of same size.

1.03 DELIVERY, STORAGE AND HANDLING

A. Preparation: Ship cable on reel. Radius of reel drum shall be greater than minimum bend radius of fiber.

B. Wind cable on reel so unwinding can be done without kinking cable. 2 meters of cable at both ends of cable shall be accessible for testing.

C. Attach permanent label on each reel showing length, cable identification number, cable size, cable type, attenuation, bandwidth, date of manufacture, and identifying spool number.

D. Provide water-resistant label and indelible writing on labels.

E. Fiber shall be packaged under sufficient low tension to avoid degradation of fiber strength due to static fatigue.

F. Ship control panels as recommended by control panel and enclosure manufacturer.

G. Remove rack-mounted instruments, controllers, recorders, and indicators that could be damaged by shipment and package in original shipping cartons.

1.04 ENVIRONMENTAL REQUIREMENTS

A. Provide equipment and cable rated for continuous operation under ambient environmental operating conditions of -30ºF to 175ºF and humidity up to 100% condensing or as normally encountered for installed locations.

B. Overhead cabling shall be resistant to ultraviolet (UV) degradation.

PART 2 PRODUCTS

2.01 FIBER OPTIC CABLE

A. Use: All-dielectric, loose tube indoor and outdoor cable.

B. Type:
   1. Loose tube, containing multimode fiber optic conductors. Individual fiber conductors shall be color-coded.
   2. All-glass, graded index, dual window, multimode fiber optic wave guides.
   3. Fiber shall have nominal core diameter of 62.5 microns.
   4. Fiber shall be coated with cladding material, which is concentric with the core.
   5. Fiber cladding diameter shall nominally be 125 microns. Protect fiber with protective tube, jacketed nonmetallic strength member, and exterior jacket.
   6. Cable shall have transmission window centered at 850 and 1300 nanometer wavelengths.
   7. Attenuation of multimode fiber cable shall be not greater than 4.0 dB/km at 850 nm and not greater than 1.5 dB/km at 1300 nm.

C. Construction: Cable components shall withstand environment where cable is installed for minimum of 20 years.
   1. Mechanical stress: Mechanical stress present in cable shall not be transmitted to optical fibers. Fiber optic cable shall be all-dielectric, loose tube construction. In loose tube construction optical fibers shall be surrounded by tube buffer, be contained in channel, or otherwise loosely packaged to provide clearance between fibers and inside of container to allow for thermal expansion without constraining fiber. Protective container shall be extruded from material having coefficient of friction sufficiently low to allow fiber free movement.
   2. Protective covering: Provide continuous covering on single length cable with same material, and shall be free from holes, splits, blisters, and other imperfections. Covering shall be flame-retardant (where installed in lengths over 50' in length indoors), moisture-resistant, nonnutrient to fungus, ultraviolet light resistant, nontoxic, and electrically nonconductive.
   3. Strength members: Nonmetallic strength members shall be integral part of cable construction. Combined strength of members shall be sufficient to support stress of installation and protect cable in service. Minimum proof test level shall be 50,000 psi.
   4. Cable outer jacket: Provide polyvinyl chloride cable jacket. Jacket shall be continuous, smooth, and free from holes, splits, blisters, and other imperfections. Jacket shall be flame-retardant, moisture-resistant, nonnutrient to fungus, ultraviolet light resistant, nontoxic, and electrically nonconductive.
   5. Impact and crush resistance: EIA TIA 455-25A, Table 2 for minimum impact energy for specified cable diameter. Minimum crush resistance of 220 Newtons per square centimeter, tested in accordance with EIA 455-41.
   6. Storage temperature range: -40ºC minimum and 70ºC maximum.
   7. Rating: Indoor/outdoor riser and tray.

D. Cables:
   1. Minimum strands: 12 fiber strands, multimode.
   2. Typical: 48 fiber strands, multimode.

2.02 PATCH CORDS

A. Pre-assembled end connections: ST to ST.

B. Fiber type: Multimode.

C. Fiber count: 2.

D. Cable construction: Interconnect.

E. Quantity: As required.

F. Length: As required.

2.03 BUFFER TUBE FAN-OUT KIT

A. Function: Provide protection for fibers when terminating cables.

B. Length of tubing: 25" (635 mm).

C. Environment: Indoor or outdoor, as required for application.

D. Quantity of fibers per buffer tube:
1. 12-fiber cable: 6.
2. 48-fiber cable: 12.

E. Accessories:
1. Buffer tube fan-out kit assembly tool kit.
2. Buffer tube fan-out kit assembly consumables kit.

2.04 MECHANICAL TERMINATIONS

A. Connector type: ST.

B. Fiber: 62.5 micron, multimode.

C. Insertion loss: 0.1 dB typical, 0.5 dB maximum.

2.05 TERMINATION HOUSINGS

A. Use: Enclosure for termination of fiber optic cable(s).

B. Size: Accommodate fiber optic cable terminations.

C. Number of fibers: 12 to 48.

D. Location: As indicated on Drawings.

E. Housing style: As required for application.

F. Provide closet connector housings (CCH) with Type ST connectors for fibers.

G. Provide breakout kits and other accessories as required for complete installation.

H. Wall-mount interconnect center (WIC):
1. CCH connector panels: Four 12-fiber ST connector.
2. Construction: Black metal housing.
3. Dimensions: 13" H x 8.5" W x 2.6" D (330 mm H x 216 mm W x 66 mm D).
4. Accessories:
a. Jumper protection door.
b. Field-installable lock.
c. Blank panels.
d. Cable strain relief kit.

I. Single-panel housing (SPH):
1. CCH connector panels: One 12-fiber ST connector.
2. Construction: Black metal housing.
3. Dimensions: 6.3" H x 5.5" W x 2" D (160 mm H x 140 mm W x 50 mm D).
4. Accessories: Ledge-mount bracket.

J. Industrial connector housing (ICH):
1. CCH Connector Panels: Two 12-fiber ST connector.
2. Construction: Aluminum, baked-on black powder-coat finish, NEMA 3S rated, IEC IP64 tested.
3. Dimensions: 10.5" H x 13" W x 5.5" D (267 mm H x 330 mm W x 140 D).
4. Accessories:
a. Field-installable lock.
b. Two NEMA 4 rated conduit fittings for 2" (50 mm) conduit.

2.06 FIBER OPTIC PATCH PANEL

A. Use: Interconnection of fiber optics.

B. Location: As indicated in fiber optic patch panel schedule.

C. Fibers within panel shall be terminated. Refer to fiber optic patch panel schedule for fiber count details.

D. Style: As required for application.
1. Free standing style:
   a. Dimensions: 78" H x 24" W x 41" D (1981 mm H x 600 mm W x 1041 mm D).
   b. Rack units: 42U.
   c. Doors: Front and rear access solid doors, door hinges shall be on same side of panel with doors opening towards wall.
   d. Color: Light gray.
2. Wall mounted style:
   a. Dimensions: 48" H x 24" W x 24" D (1219 mm H x 600 mm W x 600 mm D).
   b. Rack units: 26U.
   c. Doors: Front access solid doors.
   d. Color: Light gray.

E. Fabricate panel(s) in accordance with Section 40 95 13 requirements.

F. Rating:
1. Indoor: NEMA 12.
2. Outdoor: NEMA 4X.

2.07 PANEL-MOUNTED EQUIPMENT

A. Closet connector housings (CCH):
1. Quantity: To accommodate fiber optic cable terminations with minimum of 20% additional spare capacity for each fiber optic patch panel.
2. Provide connection panels with Type ST connectors.
3. Provide panels, covers, side panels, brackets, grounding kits, buffer tube fan-out kits, and labels, as required, for complete installation.

B. Jumper management panel:
1. Use: Organize patch cord routing within fiber optic patch panel.
2. Size:
   a. 1U rack unit when jumper management panel dedicated to one CCH.
   b. 2U rack unit when jumper management panel installed between 2 CCHs.

C. Media converters:
1. RS-232/422/485 to multimode fiber:
   a. Fiber connector: Type ST.
   b. Power: 24 volts dc.
   c. Size: 2.638" W x 3.937" D x 0.866" H (67 mm W x 100 mm D x 22 mm H).
   d. Baud rate: Auto detection.
   e. Options: DIN-rail mounting kit (35 mm).
2. EIA-232 fiber-optic transceiver (IRIG-B receiver):
   a. Fiber connector: Type ST.
   b. Power: None.
   c. Serial port: DB-9 male.
   d. Provide 1 V-pin latch kit for each fiber optic transceiver.
3. EIA-232 fiber-optic transceiver (IRIG-B transmitter):
   a. Fiber connector: Type ST.
   b. Power: None.
   c. Serial port: DB-9 male.

d. Provide 1 V-pin latch kit for each fiber optic transceiver.
e. Provide internal Category 5e cabling and 9-pin D-connectors (both ends), between each multifunction relay and each media converter.

4. Copper-to-multimode fiber switch:
   a. Type: Hardened.
   b. 100-Mbps multimode fiber port: 1, Type ST.
   c. 100-Mbps copper ports: 5, Type RJ-45.
   d. Power: 120 volts ac.
   e. DIN-rail mounting kit.

D. Power supplies
1. Output voltage: 24-volts dc:
2. Input voltage: 120 volts ac.
3. Current output (maximum): 1.5 amperes.
4. Size: 3.898" H x 1.378" W x 4.035" D (99 mm H x 35 mm W x 102.5 mm D).

2.08 SOURCE QUALITY CONTROL

A. Certify fiber optic cable conforms to requirements of this specification and applicable EIA Standard RS-455 testing procedures.

B. Fiber optic cable reel test: Test 100% of fibers with OTDR prior to shipment. Calibrate OTDR to show anomalies of 0.2 dB as minimum.

PART 3 EXECUTION

3.01 INSTALLATION - PANELS AND ENCLOSURES

A. Mount rigidly supported, level and plumb, and in such manner as to provide accessibility; protection from damage; isolation from heat, shock, and vibration; and freedom from interference with other equipment, piping, and electrical work.

B. Do not install equipment until adjacent heavy construction work has been completed to extent that damage will be unlikely to installation by such construction work.

C. Install outdoor surface-mounted panels within sun protection enclosures. Panels shall face north or east, where possible.

D. Install jumper management panels directly above and below each CCH unit. One common jumper management panel may be used in applications where jumper management panel located between 2 CCHs.

E. Install in accordance with manufacturer's recommendations.

3.02 FIELD WIRING

A. Supports in vertical runs: As required by NFPA 70, Article 800.

B. Cable pulling:
1. Reels: Mount firmly on portable stand and secure against displacement.
2. Lubrication: Use an approved cable pulling lubricant with maximum coefficient of friction of 0.15.

C. Remove fiber coating material by mechanical means only.

D. Cable bending radius:
1. "No load" condition: 15 times cable diameter, or 6" (150 mm), whichever is greater, minimum.
2. "Under load" (greater than 30% of full load): 20 times cable diameter, or 12" (300 mm), whichever is greater, minimum.

E. Install fiber optic cables in dedicated conduit.

F. Fiber optic patch cords routed between panels shall be installed in dedicated conduit.

3.03 SPLICES

A. Fusion splices allowed only with fiber optic pigtails.

3.04 CONNECTIONS

A. Fibers at each end of cable shall have jumpers or pigtails installed of not less than 3' (1 m) in length. Fibers at both ends of cable shall have connectors installed on jumpers. Mated pair loss, without rotational optimization, shall not exceed 1 dB. Pull strength between connector and attached fiber shall not be less than 20 lb (9 kg).

B. Identification and labeling:
   1. Identification tags or labels shall be provided for each cable.
   2. Markers, tags, and labels shall use indelible ink or etching which will not fade in sunlight, or in buried or underground applications.
   3. Markers, tags, and labels shall not become brittle or deteriorate for period of 20 years.
   4. Labeling format shall be identified and complete record shall be provided to Owner with final documentation.
   5. Each cable shall be identified with type of signal being carried and termination points.

3.05 CONDUIT INSTALLATION

A. Provide 1" (25 mm) rigid galvanized steel conduit for indoor installation of fiber optic cable to WIC.

B. New conduit installation shall comply with NFPA 70.

C. Openings in walls:
   1. Provide openings for passage of conduits through walls and floors.
   2. Sleeves:
      a. Provide for passage of conduits through walls or partitions.
      b. Material: Schedule 40 PVC conduit or pipe securely fastened in position.
   3. Openings made in existing walls and floors shall be patched and finished to match original material in composition and appearance.
   4. Openings made in fire-resistant rated walls shall be sealed after conduit installation to provide equivalent fire rating of wall.

D. Bends:
   1. Not more than equivalent of four 90º bends between pulling points.
   2. Use large radius (sweeps) for conduit bends wherever possible.

3.06 FIELD QUALITY CONTROL

A. Test each fiber on reel, after placing on cable reel, using an OTDR. Cables with anomalies greater with 1 dB shall not be delivered.

B. Test each fiber after installation with power attenuation test.

C. Testing shall be done by personnel qualified in fiber optic cable testing.

D. Test each fiber and fiber optic cable assembly in accordance with applicable test requirements of EIA Standard RS-455.

E. OTDR tests:
   1. Perform using test procedures of EIA 455-59.

2. OTDR shall be calibrated to show anomalies of 0.2 dB as minimum. Photographs of traces shall be furnished to Owner.

F. Power attenuation test:
1. Perform at light wavelengths of 850 and 1300 nm.
2. Measure flux at receiver end and compare to flux injected at transmitter end. Provide jumpers at each end of circuit under test to validate end connector losses.
3. Rotational optimization of connectors not permitted.
4. Calculate optical loss budget as follows:
   a. Use product specific attenuation and loss values as shown on Product Data.
   b. Cable attenuation: Maximum cable attenuation (dB/km) X length (km).
   c. Total connector attenuation: Maximum insertion loss per connector X number of connectors.
   d. Optical loss budget: Cable attenuation plus total connector attenuation.
   e. Example:
      1) Using 200 meter run of Corning Freedm cable with total of 6 UniCam connectors.
      2) Cable attenuation: at 850 nm, 3.5 dB/km x 200 m = 0.7 dB; at 1300 nm, 1.0 dB/km x 200 m = 0.2 dB.
      3) Total connector attenuation: 0.5 dB x 6 = 3 dB.
      4) Optical loss budget: at 850 nm, 0.7 dB + 3 dB = 3.7 dB; at 1300 nm, 0.2 dB + 3 dB = 3.2 dB.
5. If circuit loss exceeds optical loss budget by more than 2 dB, circuit is unsatisfactory and shall be examined to determine problem. Owner shall be notified of problem and what procedures Contractor proposes to eliminate problem.

G. Submit typewritten report for each test to Owner.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Product Data: Requirements for DCS software, programming and configuration.

PART 2 PRODUCTS

2.01 SOFTWARE REQUIREMENTS

A. System software shall be fully integrated into one software package for both process control and operator interface.

B. Software shall require only one database for tag and point reference to be modified for hard I/O or soft I/O changes to system. Information in central database shall be automatically accessed or downloaded to various controllers or operator workstations.

C. Changes to database shall be automatically tracked and software shall be self-documenting.

D. Software, exclusive of application software, shall be most recent revision applicable to system hardware at time of software freeze date as defined in EPC Contract Documents.

E. Provide auto-tune function with features including but not limited to:
1. Suitable for processes with slow and fast dynamics.
2. Compatible with self-regulating and integrating processes.
3. Immune to noise and process load disturbances.
4. Permit tuning of PID control blocks whether blocks reside in process controller or Fieldbus device.
5. Provide easy-to-use graphical interface.

F. System software, including that supplied by third parties, shall be furnished to Owner with licensing agreement allowing use of program on supplied equipment and copying for archive or training purposes. Licensing shall be supplied with DCS to allow I/O expansion up to I/O count provided (including 25% spare I/O) plus 10%.

G. Software shall provide standard trending features.

H. Operating system: Latest version of Microsoft Windows platform on which DCS is certified to operate.

I. Office suite: Microsoft Office 2010 Professional, or latest version.

J. Control system software: Provide control system manufacturer's operator interface software and functionality from each control system workstation for:
1. Human Machine Interface.
2. Interfaces to third party systems.

K. Provide complete set of system software including gateway drivers including but not limited to following:
1. Modbus data interface.
2. HART devices.
3. Ethernet gateway.
4. AS-I Bus.

L. Data historian:
1. Software platform: PI System (latest version).
2. Point license: Minimum 20,000 points.

3. Install software on dedicated historian server.

M. Provide OPC software and server software.

N. Provide field device asset management system.

O. Provide software license for Sequence of Events (SOE) for site (2000 points).

2.02 PROGRAMMING AND CONFIGURATION

A. Process control shall not be carried out in PC-based operator workstations. Perform execution of configuration software and operation of I/O in dedicated redundant process controllers.

B. Provide application software configuration of system. System configuration shall include database development, control strategy implementation and debugging.

C. I/O partitioning, programming, configuration, graphic screens, control, indication, trending, alarming, status, sequence of events, reporting, archiving, testing, commissioning, and startup assistance shall be responsibility of Contractor.

PART 3 EXECUTION

NOT USED

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Requirements for graphic screens.

B. Configuration.

PART 2 PRODUCTS

2.01 GRAPHIC SCREEN REQUIREMENTS

A. Graphic screens shall include but not be limited to following:
1. Typical power plant overviews.
2. Trend and alarm screens.
3. Equipment status screens with indication of equipment run hours, totalized flows, etc.
4. Plant systems based on P&IDs and electrical one-line diagrams.
5. Other miscellaneous screens as required.

B. Graphics, documents, and alarms shall be in Spanish.

2.02 CONFIGURATION

A. Graphic screen configuration and development shall be responsibility of Contractor.

PART 3 EXECUTION

NOT USED

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Requirements for alarms.

B. Configuration.

1.02 QUALITY ASSURANCE

A. Regulatory requirements: Work shall be in accordance with applicable requirements of following codes and standards.
   1. International Society of Automation ANSI/ISA-18.2 – Management of Alarm Systems for the Process Industries (Article 11 – HMI Design for Alarm Systems)
   2. Engineering Equipment and Material Users' Association EEMUA 191 – Alarm Systems - A Guide to Design, Management, and Procurement

PART 2 PRODUCTS

2.01 ALARM REQUIREMENTS

A. Three alarm priority designations to be assigned as follows:
   1. Low.
   2. Medium.
   3. High (critical).

2.02 CONFIGURATION

A. Alarm configuration and development shall be responsibility of Contractor.

PART 3 EXECUTION

NOT USED

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Furnish and install equipment and accessories necessary for coal conveying system including, but not limited to:
1. Belt conveyors.
2. Tripper.
3. Skirtboards.
4. Feeder enclosures.
5. Chutes and hoppers.
6. Belt enclosure hoods.
7. Magnetic separators.
8. Screw conveyor.
9. Motors.
10. Water collecting valves.
11. Flop diversion gates.
12. Feeders.
13. Slide gates.
14. Belt alignment switches.
15. Coal sampler.
16. Electromagnetic vibrators.
17. Dust curtains.
18. Equipment supports.
19. Tramp iron containers.
20. Reclaim feeder.

1.02 QUALITY ASSURANCE

A. Contractor's professional engineer shall have not less than 5 years of related professional design experience.

B. Contractor shall have not less than 10 years' experience in design, fabrication and installation of coal handling systems.

C. Design shall conform to OSHA standards and other applicable standards.

PART 2 PRODUCTS

2.01 DESIGN CRITERIA

A. Design for conditions of:
1. Normal coal flow.
2. Abnormal condition of chutes plugged resulting in all chutes full of coal.
3. Anticipated excursions above normal coal flow.

B. Provide expansion joints to isolate equipment loads as indicated and required.

C. Equipment structural component:
1. Design in accordance with applicable provisions of AISC "Specification for Structural Steel Buildings - Allowable Stress Design and Plastic Design."
2. Analysis shall be based upon established, accepted, published design procedures.

D. System design/capabilities:
1. Belt conveyors: Refer to System Description.
2. Feeders: Capacity to match belts.

E. Service:

1. Continuous operation service factor.
2. Heavy-duty design with plant life of 30 years.
3. Across-the-line motor starting with belts fully loaded.
4. Belt conveyor pulley bearings: L-10 life approximately 90,000 hours.

F. Service factors: Gear reducers and drive mechanisms: 1.5 minimum, greater where driven equipment and operating conditions dictate; based on calculated motor horsepower.

G. Arrangements of equipment shown on Drawings are intended only to show general requirements. Final arrangements shall be responsibility of Contractor.

H. Similar components shall be furnished by one manufacturer insofar as practicable.

2.02 BELT CONVEYORS

A. Comply with "Belt Conveyors for Bulk Materials" prepared by Conveyor Equipment Manufacturers Association (CEMA), and these specifications, whichever is more stringent.

B. Belts:
1. Belts and pulleys in accordance with CEMA Standards for:
   a. Grade 2 belting or better.
   b. Maximum top cover wear; abrasion-, cut-, and gouge-resistant.
   c. DIN abrasive rating 90 or better.
   d. Cover temperature range: 40F to 200°F.
   e. Tension.
   f. Troughability.
   g. Longitudinal flexibility.
   h. Minimum plies for load support.
   i. Impact resistance.
   j. Minimum tensile rating: 2,500 psi
   k. Hardness: 60 Durometer Shore A.
2. Cover materials:
   a. Suitable for coal of various sulfur ratings.
   b. Compatible with commercially available dust-suppression products.
   c. Top cover minimum thickness: 3/16".
   d. Bottom cover minimum thickness: 1/16".
   e. Cover ratio to resist cupping.
3. Carcass: Conventional ply construction.
4. Edges: Bonded and protected to resist edge abrasion.
5. Elongation: Guaranteed not to exceed 2% during expected belt service life.
6. Design for across-the-line starting with belt conveyors fully loaded.
7. Splices: Hot vulcanized field splices in accordance with recommendation of belt manufacturer before splicing is performed.

C. Pulleys and shafts:
1. Comply with requirements of CEMA for minimum requirements. Custom design for belt tensions greater than those covered in codes.
2. Design for 150% of continuous running load belt tension or maximum acceleration load, whichever is greater.
3. Construction: Welded steel, heavy-duty, self-aligning, antifriction roller bearings with grease seals.
4. Tapered or curved ends are acceptable.
5. Provide bearing brackets with screw adjustment and locking device for aligning on both sides of each bearing bracket.
6. Shaft keys: Provide for drive and head pulleys in accordance with ANSI B17.1.
7. Lagging: Provide on lead pulleys as recommended by belt manufacturer for belting used.
8. Final minimum drive, tail, and take-up pulley diameters as recommended by belt manufacturer for belting used, greater than or equal to CEMA minimums.
9. Pulley total indicated run-out tolerances:

a. 12" and under diameter: ±0.063".
b. Over 12" diameter: ±0.125".
10. Provide pulley manufacturer with complete information required to check pulley and shaft design.

D. Drive machinery:
1. Type: Electric motor-driven gear reducer, direct-coupled to head pulley shaft.
2. Gear reducer:
a. Totally enclosed oil bath type with helical or equal gears and antifriction bearings
b. Gears and bearings mounted in oil and dust tight split steel or split cast iron housing; split seals.
3. Drive motor: Direct connected to the gear reducer by means of a fluid coupling; drive, coupling, and reducer shop-mounted and aligned on a common steel baseplate.
4. Fluid coupling: Adequate for service intended to provide soft-start.
5. Provide removable coupling guards.
6. Provide 2 jacking bolts at each of 4 corners of motor.
7. Provide 2 jacking bolts at each of 4 corners of gear reducer.

E. Belt cleaners: Provide for each belt conveyor. Locate for easy maintenance access.
1. Head pulley access doors: Sizes as required to service new pre-cleaner and secondary cleaner.
2. Head pulley pre-cleaner and mounting hardware:
a. Blade material: Polyurethane.
b. Slide-in/slide-out blades.
3. Head pulley secondary cleaner and mounting hardware:
a. Arms: Polyurethane, slide-in/slide-out multiarms.
b. Blades: Stainless steel snap-in/snap-out swivel blades.
4. Tail pulley V-plow:
a. Torsion arm system.
b. Blades: Urethane blades.

F. Back-stop:
1. To prevent backward movement of inclined conveyors.
2. Minimum size: 1.5 times drive motor horsepower.
3. Provide additional equipment, if required, to prevent coal pile-ups due to coasting of belt after tripping off downstream conveyor, when operating at fully loaded condition.

G. Belt take-ups:
1. Type: Vertical automatic gravity take-up whenever feasible.
2. Provide tail pulley screwed take-ups with hydraulic assist only when gravity take-up is not feasible.
3. Design for belt tension to control belt sag between idlers to 2% maximum.
4. Location: As recommended for belt tensions, maintenance, and available space.
5. Provide necessary pulleys, counterweights, guides, cables, and other equipment required for complete installation.
6. Take-up travel: Conform to minimum CEMA requirements plus 2' and as recommended by belt manufacturer.
7. Provide means to confine counterweight in event of belt failure; provide means of resisting impact loads due to free fall of take-up.
8. Counterweight steel boxes shall have capacity of at least 130% of required weight. Boxes shall have bolted removable cover and drain holes in bottom.
9. Counterweights for vertical take-up assemblies shall be located as close as possible to grade or elevated platform, as applicable.
10. Extend lubrication points to access platforms.

H. Idlers:
1. Carrying idlers:
a. Type: 3 equal-length rolls with 35° side roller angle; reduce angle at approaches to terminal pulleys.
b. Size: 5" diameter rollers minimum, CEMA Series D minimum.
2. Return idlers:
a. Type: Full-length single rollers.

b. Size: Diameter and CEMA series to match carrying idlers.
c. Use steel return idlers between head pulley and take-up pulley.
3. Impact idlers: Support each loading point with at least 6 special impact type carriers.
4. Idler spacing:
a. Carrying:
1) Not more than 4'-0".
2) Under skirtboards: Not more than 2'-0".
b. Return: Not more than 10'-0".
c. Impact: Not more than 1'-0".
5. Rollers:
a. Seamless steel tubing with rounded ends.
b. Antifriction roller bearings enclosed in dust tight and moisture tight housings with grease seals.
6. Self-aligning training idlers:
a. Same type as carrying and return idlers, with pivot mounted side guide rollers.
b. Install maximum 15 belt-widths from each terminal or closer as recommended by belt manufacturer and at spaces not exceeding 100'-0" on both carrying and return runs.
7. Installation: Laser align idlers to following tolerances.
a. No more than 1/16" misalignment in any direction between adjacent idlers.
b. No more than 1/8" misalignment between any idlers over entire length of conveyor.

I. Lubrication:
1. External means for lubricating bearings.
2. Gear trains, etc., arranged for enclosed oil bath lubrication; oil sight gage and train valve with plug on enclosure.
3. Grease fittings:
a. Location: Extend to allow servicing from access platforms or walkways; plastic extension piping is not acceptable; install for all fittings including training idler rollers.
b. Hollow shaft idlers with one fitting serving all bearings are acceptable.

J. Deck plate:
1. Not lighter than 14-gage galvanized steel; provide entire length for conveyors.
2. Overlap 6" and position to prevent material buildup on belt return run.

K. Removable safety shield:
1. Galvanized chain link fence, framed for mounting.
2. Install at following locations:
a. Tail pulley enclosure.
b. Gravity take-up bend pulleys along walkways.
c. Other locations as determined by Contractor's design engineer.
3. Design to prevent coal build-up.

2.03 TRIPPER

A. Location: Above silos.

B. Type: Movable. Design for belt capacity. Provide direct drive gear reducer electric motor drive system to move tripper.

C. Provide discharge chute arranged to allow diversion of coal into silos below.

D. Chutes: Not lighter than 1/4" thick ASTM A36 steel with ceramic lining.

E. Pulleys: As specified in paragraph 2.01.C.

F. Grease fittings: High pressure. Extend to allow servicing from tripper floor. Plastic extension piping is not acceptable.

G. Festoon cable system with cable for power and control circuits suitable for use in areas classified by NEC as Class II, Division I, Group F.

H. Steel wheels and track.

I. Flat belt seal system for discharge grates. Provide necessary greasable idlers or live shafts with grease fittings to direct belt seal over tripper components and back to discharge grate. Overlapping belts with discharge chute plow arrangement not acceptable.

J. Provide discharge grate and frame for entire length of tripper travel.

K. Enclose tripper for dust control.

2.04 SKIRTBOARDS

A. Provide as required for proper operation of material handling equipment.

B. Arrangement: To be determined by Contractor and as shown on Drawings.

C. Design requirements:
1. Construct of not less than 1/4" ASTM A36 steel plate or better.
2. Skirtboards, adjustable seal strips, dust curtains, shaft seals, gaskets, calking, packing, and other accessories required for maximum dusttightness; include dusttight inspection doors where shown and recommended.
3. Locate skirtboards to allow for vertical offset of impact idlers, due to uneven loading.
4. Loading point: Self-adjusting one piece "ribbed" dual skirtboard sealing system for use on belts with 35° idlers.
   a. One-piece seal.
   b. Material: Nitrile Rubber, 60 Durometer.
   c. Free belt area: 2.5" on both sides of exterior chute wall.
   d. Service temperature range: -20º to 160ºF.
   e. Length: 12' minimum.
5. Loading point skirtboard liners:
   a. Configuration: Straight.
   b. Material: Type 304 stainless steel.
   c. Mounting holes: 24" intervals.
6. Cover plate:
   a. Material: 10 gage galvanized steel.
   b. Use spring clip closures at 1' spacing.
   c. Calk joints with clear silicone calking.

2.05 FEEDER ENCLOSURES

A. Feed chute, stationary skirt, and discharge chute with flexible seals to feeder.

B. Dusttight inspection doors located where recommended and indicated.

C. Regulating gate in feed chute to control material to feeder. Construct of minimum 1/4" abrasion-resistant plate.

D. Other accessories as required for maximum dusttightness.

E. Provide connections on all feeder enclosures and on all conveyor discharge and loading enclosures for dust collection system pick-up dust hoods, and at locations required for dust return.

2.06 CHUTES AND HOPPERS

A. Arrangement: As determined by Contractor.

B. Size chutes for specified capacity.

C. Design for most direct connection from point to point.

D. Provide round chutes when drop distance greater than 12'.

E. Avoid "dog legs" and fast tapers.

F. Materials:
   1. Chutes and hopper shells: 1/4" minimum thickness ASTM A312 Type 304 stainless steel.
   2. Liners:
      a. Hoppers at sloping surfaces subject to wear: 5/8" minimum thickness ASTM A312 Type 304 stainless steel.
      b. Abrasion-resistant ceramic wear tile liner for all chutes, except portion under belt cleaners:
         1) Hardness: 400-450 Brinell, minimum.
         2) Chemical composition for corrosion resistance: Minimum 90% alumina ceramic.
         3) Material thickness: 1/2" minimum.
      c. UHMW polyethylene lining for use under belt cleaners:
         1) Density (Test Method ASTM D792): 0.96 g/cc.
         2) IZOD impact, ft-lb/inch notch at 23ºC (Test Method ASTM D256A): 28 to 30.
         3) Tensile strength (Test Method ASTM D638):
            a) Yield: Minimum 3,200 psi.
            b) Ultimate: Minimum 5,600 psi.
         4) Coefficient of friction (Test Method ASTM D1894): Maximum 0.11.
         5) Material thickness: 1/2".
         6) Mounting: Stainless steel welding washers spaced at 12" maximum any direction and at 12" center to center 2" from edge of sheet with UHMW polyethylene plugs to provide smooth lining surface.
   3. Wear plates:
      a. Average Brinell hardness: 400-450 minimum.
      b. Chemical composition for corrosion resistance.
      c. Butt joints: Continuously welded; side joints tack welded.
      d. Use: Impact areas.
      e. Material thickness: 1/2" minimum.
   4. Provide head chutes with liners as specified above up to centerline of discharge pulley on front and sides or 6" higher than material impact point, whichever is greater.

G. Provide exterior stiffeners and bracing to prevent excessive vibration and deflection during operation and when plugged.

H. Access doors:
   1. Gasketed, dusttight.
   2. Size: Minimum 24" x 24" inside dimensions.
   3. Quick-opening type with hinges and latches.
   4. Type: Handle style lift and turn latch.
   5. Latch to apply compression to pull enclosure tight against frame.
   6. Install deflector angles to protect door seals.
   7. Provide access doors as shown and as required for access to all moving parts, critical wear areas, belt cleaners, and equipment inside chutes and hoppers.
   8. Provide adjustable baffle plate at discharge from each conveyor head pulley designed for material impingement, with adjusting bar operable from outside of discharge chute. Construct of minimum 1/4" wear liner plate. See "Wear Plates" above.
   9. Provide access doors approximately 4' above skirt board in loading chute and at 15' intervals.

I. Chute at diversion/flop gates:
   1. Symmetrical about centerline.
   2. Design to eliminate material pocket below shaft.
   3. Design to recess top of gate in chute when gate is in operating position.

J. Minimum valley angle: 60° to horizontal.

K. Loading chutes: Arrange to enable belts to carry maximum load, avoid spillage, and reduce abrasion. Arrange loading chutes with V-shaped or rounded bottoms designed to deposit fines on belt before larger lumps.

L. Provide chutes in welded segments. Limit segment length for easy removal during maintenance. Bolt segments together and use gaskets to provide connections dusttight.

M. Hopper and chute side walls shall be as nearly vertical as possible.

N. Liners welded in place shall have welds accessible for cutting and rewelding for maintenance purposes. Liner sections shall not exceed 150 lb to allow for ease of replacement.

O. Incorporate means for collection of dribble from belt cleaners with delivery to conveyor discharge hoppers.

P. Tramp iron chute:
   1. From magnetic separator to 3'-0" above ground floor.
   2. Construct of not less than 1/4" stainless steel plate.

Q. Provide stainless steel silo chute inlet grate 5/8" minimum thickness.

2.07 BELT ENCLOSURE HOODS

A. Provide for conveyors exposed to weather.

B. Hoods:
   1. Hinged half-circle top section and leg on side opposite walkway.
   2. Hinged leg on walkway side; size for access to carrying and return idlers.
   3. Extend legs to bottom of return idlers.
   4. Minimum 18-gage galvanized corrugated steel.
   5. Cover length: Standard based on idler spacing, except at interface with loading skirts, head chutes and buildings. Use 4' nominal length segments.

C. Support bands:
   1. Install at center points between carrying idlers.
   2. Minimum 14-gage galvanized corrugated steel or 1/4" galvanized steel plate.

D. Accessories:
   1. Handle and latch: Galvanized or stainless steel.
   2. Hinges: Stainless steel.
   3. Fasteners: Galvanized or stainless steel with weathertight head same color as hood.
   4. Latch shall be easily operated by hand. Wrenches shall not be required to open hoods.
   5. Weathertight closures: Corrugated rubber or neoprene.

E. Finish of corrugated galvanized steel hood enclosures:
   1. Phosphatize galvanized sheet materials for primer coat of paint.
   2. Primer coat: 0.2-mil (127-micron) minimum dry film thickness.
   3. Finish coat: Polyvinylidene fluoride coating with minimum of 70% resins. Provide dry film thickness of 0.8 mil (510 microns) minimum.
   4. Apply coatings to steel in strict accordance with established coating manufacturer's standards.

2.08 MAGNETIC SEPARATOR

A. Type:
1. Self-cleaning, rectangular electromagnet.
2. Air-cooled.
3. In-line or cross feed.

B. Capacity: As required to remove tramp iron from conveyors.

C. Magnet belt width, minimum: Conveyor belt width minus 6".

D. Rectifying equipment rating: 460 volt, 60 Hz, 3-phase power supply; equipment case to meet hazards classification.

E. Drive mechanism: As specified for belt conveyors.

F. Provide chutework and tramp iron containers at discharge of each magnet provided.

2.09 SCREW CONVEYOR

A. Screw diameter: 9" mimimum.

B. Speed: 45 rpm maximum.

C. Standard pitch flight.

D. Construction:
1. Casing:
   a. Split with flanged removable covers to allow for shaft and flight removal. Arrangement requiring shaft and flight installation and removal through ends not acceptable.
   b. All connections flanged.
   c. 1/8" steel minimum
2. Flighting: 1/8" minimum steel.
3. Shaft: Segmented pipe, 2" standard weight, minimum.
4. Bearings: Anti-friction ball or roller bearing with grease fittings.
5. Inspection door: 4" x 4" with quick opening door and permanent screen to prevent entrance of objects 1/2" and larger into conveyor.

E. Drive:
1. Shaft-mounted gear reducer.
2. V-belt from gear reducer to motor.
3. Adjustable motor mount.
4. Provide shear pin in drive shaft at connection to screw to protect screw and drive in event of stalled screw.

2.10 MOTORS

A. See electrical specifications also.

B. Type: TEFC, suitable for use in areas classified by NEC as Class II, Division 1, Group F.

2.11 WATER COLLECTING GATE VALVE

A. Motor-operated; dust-tight, enclosed double rack-and-pinion; Type 410 stainless steel lining, slide plate and eater collecting hopper; antifriction bearing rollers; heavy-duty.

B. Lining plate thickness: Minimum 1/4".

C. Water collecting hopper drain connection: 4".

D. Size: As required.

E. Provide handwheel with chain for operation from floor below. Hand operating equipment shall not move when motor operator is running. Provide chain operation of clutch from floor below.

F. Motor operator and limit switches: See other Sections.

G. Design to close with chute full.

H. Provide 2-1/2" relief space between gate body and front of gate in closed position.

I. Provide gasket to seal gate against hopper outlet to prevent eater leakage.

2.12 FLOP DIVERSION GATES

A. Construction:
1. Electric operator: Motor operator or electric cylinder operator, see Section48 05 23; include chain wheel operator if greater than 6' off floor or platform.
2. Design to withstand stall torque of motor.
3. Provide local position indicator.
4. Gate Material: 1/4" Type 304 stainless steel minimum with 3/8" minimum wear plate as specified for chutes.
5. Position adjustment capability: 2-position.

B. Gate slope in operating position: 65° to horizontal minimum.

C. Design components to withstand material impingement in all gate positions and permit changing position while material is flowing.

D. Access panels: Bolted and gasketed, as required for access to moving parts and other equipment inside chutes and hoppers.

E. Bearings:
1. Pillow block, ball, or roller type; self-aligning.
2. Dust-sealed.
3. Support from chute plate with stiffeners to prevent buckling or warping of plates or misalignment of bearings when operated.
4. Equipped with lubricating fittings as specified for belt conveyors.

F. Shafts: Dust-sealed where passing through material chute plate.

G. Wear plates: As specified above.

2.13 FEEDERS

A. Positive displacement rotating spool feeder:
1. Feeder output shall be proportional to speed of rotation and material shall be fed at a constant rate.
2. Drive system: Variable speed drive and electric motor for a continuously controllable feed rate.
3. Materials of construction: Housing shall be of ASTM A36 or better, creating stationary support for rotating elements and drive system.

B. Belt: Feeder.
1. Furnish complete with motors, drives, and other accessories necessary for proper installation and operation.
2. Service: Continuous duty at initial and future capacity.
3. Capable of accepting dry, wet or frozen material.
4. Controls:
   a. Variable speed control utilizing a variable frequency drive.

b. Suitable for manual or automatic adjustment, remote electric operated feed rate control.
c. Include 4-20 milliampere d-c signal for remote feed rate indication (remote indication by others). Submit complete feedback signal information.

5. Design for support on concrete base.
6. Furnish with lubrication fittings external to housings and frames.
7. Equip with adjustable gate for manual control of maternal flex.

C. Drag-chain reclaim feeder:
1. Surface fixed mounted.
2. Capacity and material characteristics: Per system requirements.
3. Loading devices:
a. Bulldozer.
b. Dump trucks.
c. Scrapers.
4. Loading device discharge: End, left and right of reclaim feeder.
5. Coordinate discharge height with belts fed.
6. Coordinate wing wall dimensions to provide 3' clearance with other equipment in the area.
7. Hydraulic direct drive.

2.14 SLIDE GATES

A. Double rack-and-pinion or screw rolling slide gates, manually operated with Type 304 stainless steel lining and slide plate.

B. Provide electric operator sized to operate slide gate through both moving material flow and static material to height of enclosure.

C. Locate rollers out of material flow.

D. Sealed, antifriction-type roller bearings.

E. Dusttight construction with rubber gasketed access door and removable dusttight covers.

2.15 ELECTROMAGNETIC VIBRATORS

A. Type: ac-operated electromagnetic.

B. Size: As recommended.

C. Cases: Totally enclosed, suitable for use in areas classified by NEC as Class II, Division 1, Group F.

D. Power supply: 480 volt, single-phase, 60 Hz.

E. Mounting brackets attached to sides of hoppers at locations recommended for maximum effectiveness during unloading. Install safety chain between vibrator and mounting bracket.

F. Mounting arrangement and location as recommended by vibrator manufacturer.

2.16 DUST SUPPRESSION

A. Design for coal with high percentage of fines and low moisture content.

B. Design system for minimum 99% fugitive dust control efficiency.

C. Chemical supply lines:
   1. Minimum of 1" stainless steel tubing.
   2. Chemical supply line shall be laid out using minimum number of pipe bends or ells.

D. Incorporate into existing controls.

2.17 DUST CURTAINS

A. Use to isolate dust suppression and dust collection installations.

B. Location:
   1. Install upstream of dust collection hoods.
   2. Install at entry and exit points of dust suppression spray manifolds.

C. Material:
   1. Flexible, 60 to 70 Durometer elastomer, 0.25" thick.
   2. Shaped as necessary to material load on belt.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install equipment in conformance to manufacturer's installation instructions and as shown on Drawings.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Coal crusher with drive.

1.02 MAINTENANCE MATERIALS

A. Provide special tools required to maintain equipment furnished. Provide metal toolbox for special tools furnished.

PART 2 PRODUCTS

2.01 COAL CRUSHERS

A. Type: Hammermill, single roll or double roll mill.

B. Quantity: as necessary to meet transfer requirements.

C. Capacity: as necessary to meet transfer requirements.

D. Crusher speed: Not greater than 900 rpm.

E. Construction:
1. Frame and housing: Commercially dusttight, welded, heavy-gage, rolled steel plate. Frame liners of carbon manganese steel in areas subject to wear.
2. Provide bypass chute of 1 piece steel fabrication with stiffeners and AR400 steel liners. Chute is bolted to frame in lieu of front access panel.
3. Adjustable breaker plate assembly to compensate for wear, adjustable from outside of crusher housing. Provide grease fittings for pivot shaft bearings.
   a. Breaker plate support:
      1) Fabricated steel.
      2) Adjustment by synchronized worm gear jacks outside of frame.
      3) Shims not allowed.
   b. Breaker blocks:
      1) Removable; AR400 or equivalent steel, minimum.
      2) 2 beads of tungsten carbide hard facing at peak of each block.
   c. Breaker plates: Renewable AR400 or equivalent steel.
4. Rotor: Balanced statically and dynamically.
   a. Shaft: Forged alloy steel, sealed dusttight at frame opening.
   b. Rotor breaker plates: Renewable AR400 or equivalent steel
5. Hammers, if used:
   a. Forged steel. Heads hardened to 500 BHN, minimum. Tungsten carbide hard facing, 1 bead each leading edge and 1 bead each working face or,
   b. Bimetallic:
      1) Crushing end: High-chrome, wear-resistant cast-iron with chrome content 15-22%; hardness minimum 60 HRC.
      2) Eye: Heat treated low alloy steel.
6. Bearings:
   a. Anti-friction, self-aligning, dustproof, grease-lubricated.
   b. Equip each bearing with 3-wire RTD detectors rated 100 ohm at 0°C. Wire and terminate RTD leads on terminal blocks in externally mounted junction box. Route bearing RTD signals back to motor protection relay. Terminate signals on protective relay on PRT Terminals No. 9 and 10.
   c. Provide provisions in motor and crusher rotor bearings for future installation of vibration monitoring system; 2 axis each bearing.

7. Access door: Hinged frame, sized and arranged to expose entire rotor assembly, breaker plates, and liners; dusttight.

F. Drive: Motor-driven through gear-type flexible coupling.

G. Provide suitable coupling guard.

H. Provide support attachments for crushers and motors on concrete foundation.

I. Seal crusher outlet to discharge chute work in accordance with manufacturer's instructions.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install equipment in conformance to manufacturer's installation instructions.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Pulverizers.

B. Pulverizer seal air system.

C. Pulverizer inerting system.

D. Coal feeder equipment.

E. Burners, flame monitoring, and ignition system.

F. Burner controls.

G. Accessory piping, valves, ducts and dampers.

1.02 QUALITY ASSURANCE

A. Design and construct equipment in compliance with applicable laws, ordinances, and regulations of ASME Boiler Code Section I, ASME B31.1, NFPA 85, and OSHA.

B. Manufacturer qualifications: Manufacturer shall present evidence of reliability and performance on Design coal for at least 5 years for pulverizers of size used.

C. Provide completely dusttight pulverized fuel system in accordance with NFPA 85.

PART 2 PRODUCTS

2.01 SYSTEM DESCRIPTION

A. Type: Direct feed, pressurized.

B. Air source: Cold, ambient.

2.02 AREA CLASSIFICATION

A. Fuel oil ignition system:
1. Potential leak sources include igniter double block and vent valve assemblies, main fuel oil igniter trip valve assemble, and header vent valves.
2. Electrical devices and enclosures shall be rated in accordance with NEC Class I, Division 2, Group D.
3. Fuel oil igniter double block and vent valve assemblies shall be located at a distance so boiler burner fronts are unclassified.

B. Low load fuel oil firing system:
1. Potential leak sources include burner double block and vent valve assemblies, main fuel oil burner trip valve assemble, and header vent valves.
2. Electrical devices and enclosures shall be rated in accordance with NEC Class I, Division 2, Group D.
3. Burner double block and vent valve assemblies shall be located at distance so boiler burner fronts are unclassified.

2.03 PULVERIZERS

A. Capacity:
   1. Attain MCR of boiler when firing Performance Coal with any one pulverizer out of service.
   2. Attain MCR with worn pulverizers when firing Design Coal with all pulverizers in service. Worn pulverizers are defined as having 90% of pulverizing capacity of a new pulverizer, unless manufacturer can demonstrate conclusively that pulverizer capacity does not decrease between pulverizer overhauls.
   3. Turndown: Pulverizers shall be capable of maintaining performance at a minimum turndown ratio of 2:1 without requiring support fuel.
   4. Coal-air temperature: Maintain minimum of 120°F throughout load range while firing Design Coal.
   5. Fuel distribution: Maintain conduit to conduit fuel distribution inequality so unit will operate stably and meet emission requirements throughout its load range while firing Design Coal.

B. Operation:
   1. Respond as required to meet unit load change ramp rate.
   2. Stable between specified minimum and maximum capacities.
   3. Mills shall be provided with automatic loading system to adjust the roller pressure online.

C. Construction:
   1. Pressurized.
   2. Fixed rolls.
   3. Design drive train components for torque required to start pulverizer with full load coal inventory following full load trip.
   4. Classifiers: Dynamic
   5. Inspection and access doors: As required for inspection and maintenance.
   6. Enclosure: Dusttight.
   7. Bearings: Self-lubricated, dusttight; with convenient removal for repair.
   8. Couplings: Between motor, reducer, and pulverizer so each item can be removed separately.
   9. Gear reducers:
      a. Totally enclosed, planetary type reduction gearing with valves and plugged drain connection with accessibility.
         1) Oil-bath lubricated or;
         2) External tank with oil circulation pumps.
      b. Removable without pulverizer disassembly.
   10. Lubricating system: As required by pulverizer design. Include electric motor-driven oil pumps, electric motors, motor starters, reservoir heaters, water-cooled heat exchangers, Pall duplex disposable filters, gear box vent and fill systems, thermometers, pressure gages, temperature and pressure switches for alarm and control, piping, and other accessories.
   11. Cooling system:
      a. Heat sink: Closed cycle cooling water system.
      b. Heat exchangers: Copper tubes and copper tube sheets.
      c. Thermometers, pressure gages, temperature and pressure switches for alarm and control, piping, and other accessories.
   12. Tramp iron separator: Manufacturer's standard.
   13. Provide soleplates and sub-soleplates.
   14. Pyrites hoppers and chutes: Manufacturers' standard.
      a. Elevation of pyrites outlet shall be suitable for pyrites hopper installation above floor.
      b. Piping and accessories for transfer of pyrites and coal following mill trip to upper trough of bottom ash drag chain conveyor.
   15. Provide connections for steam inerting system.
   16. Provide manufacturer standard surface preparation and epoxy primer.

D. Drives, pulverizer motors: One electric motor per pulverizer, capable of starting mills in fully loaded condition. Refer to Section 26 05 09 for additional motor requirements.

E. Maintenance air drives: Creeper drives and linkage if required for recommended maintenance procedures. Hoists: Provide monorail and electric hoist as required to service pulverizers without disconnecting hoist from rail.

2.04 PULVERIZER SEAL AIR SYSTEM

A. Piping system shall supply seal air for pulverizers coal feeders and other items subject to primary air fan discharge pressure.

B. Provide dampers with air cylinder operator and solenoid air control valve (for header system) for automatic remote control.

C. Provide seal air pressure control dampers and drives. Provide connections for seal air to pulverizer differential pressure monitoring for each pulverizer.

2.05 PULVERIZER INERTING SYSTEM

A. Media: Steam.

B. Flow and pressure: In accordance with manufacturer's requirements.

C. Operation: Manual local and remote.

D. Provide piping, valves, and controls for each individual pulverizer.

2.06 COAL FEEDER EQUIPMENT

A. Type: Electronic gravimetric belt.

B. Capacity: Not less than maximum capacity of pulverizer served.

C. Design:
1. Design to withstand internal explosion pressures in accordance with latest requirements of NFPA.
2. Portions of feeders in contact with fuel, except belt, shall be Type 304 stainless steel.
3. Equip with drag-type cleanout conveyor to remove dust accumulation from feeder body.
   a. Provide with separate motor and gear reducer drive.
   b. Provide with torque limiter coupling or shear pin.
4. Locate grease fittings externally for accessibility.
5. Other construction features such as seals and feeder housing shall be suitable for service encountered.
6. Exact lengths of feeders: As determined by fuel burning equipment arrangement.

D. Motors: 460-volt, 3-phase, 60 Hz, TEFC.

E. Feeder controls and instrumentation:
1. Feed rate control integrated into DCS.
2. Accept 4-20 mA dc combustion control signal corresponding to feed rate in pounds per hour from Owner's DCS.
3. Integral local control panel with operator interface shall be provided on each feeder.
4. Electronic speed and weight sensing devices furnished with each feeder.
   a. Sensors provide outputs to feeder speed control and to a local indicator mounted on control cabinet.
   b. Sensor output signal shall be linear with coal flow calibrated in weight per hour of coal fed.
5. Two separate linear outputs of 4-20 mA dc for feed rate range, with maximum 0.5% error, furnished for each feeder for feedback to DCS. Two outputs drive shall be to minimum value (4 mA) when there is no coal on feeder belt.
6. Total coal flow integrator:
   a. Indicate weight of coal fed, furnished for each feeder.
   b. Mount in feeder local control enclosure.

7. Coal stoppage switches furnished with each feeder:
   a. Outputs to feeder and pulverizer logic in BMS when no coal is detected on belt, when pluggage occurs at feeder outlet, or when belt stoppage occurs.
   b. Detects belt stoppage made independently of motor stoppage.
8. Provide calibration equipment and tools for each feeder.

F. Silo to coal feeder accessories:
1. Coal valves.
2. Slip joints.
3. Connecting chutes.
4. Flush-mounted acoustic or RF sensor.
5. Other items as necessary.
6. Silo outlet coal valves:
   a. 150 lb minimum, flanged connection chain wheel operated from operating floor level.
   b. Dusttight and watertight, stainless steel lined gate.
   c. Body plates in contact with active coal: 1/4" Type 304 stainless steel.

G. Feeder outlet shutoff valve:
1. Type: Motor-operated, dusttight, stainless steel lined gate. Body plates in contact with active coal shall be 1/4" Type 304 stainless steel.
2. Motor: 460-volt, 3-phase, 60 Hz, TEFC.
3. Provide position and torque adjustable setting limit switches.

2.07 COAL PIPING

A. Piping between silo and feeder and piping between feeder and pulverizer:
1. Material: Type 304 stainless steel, seamless or welded, if welded, internal weld shall be ground smooth.
2. Flanges: ANSI B16.5 Class 150.
3. Wall thickness: 1/4".
4. Provide coupling on each feeder inlet to permit expansion and movement between feeder and silo. Inner ring shall be Type 304 stainless steel.

B. Pulverized coal piping from pulverizers to burners:
1. Material: Steel, seamless or welded, if welded, internal weld shall be ground smooth.
2. Flanges: ANSI B16.5 Class 150.
3. Wall thickness: 1/2".
4. Ceramic lined at pulverizer outlet and bends to burners:
   a. Flanged with smooth transitions to prevent edges.
   b. Provide minimum of 5' length of ceramic lined straight pipe downstream of each lined elbow.
   c. Provide minimum of 5' length of ceramic-lined straight pipe downstream of each coal distribution control device.
5. Ceramic lining: 85% alumina tile or equivalent.
6. Locate coal distribution control devices no higher than 8' above finished floor or provide platform/ladders for operations and maintenance access.
7. Sample connections:
   a. Provide 2 connections minimum spaced 90° in vertical run.
   b. Full port ball valves: Minimum size 1-1/2".
   c. Locations: Best available location consistent with ASME test methods and requirements.
8. Provide barrier and/or dust tight valves in accordance with NFPA. Electric operators shall be designed for control and operation from BMS.

C. Coal sampling equipment:
1. Provide connection on each coal pipe in accordance with ASME Performance Test Code 4.2 "Coal Pulverizers."
2. Locate accessible from established floor level or platform.
3. Provide one set of sampling equipment.

2.08 BURNERS

A. Burner capacity: Cumulative coal burning capacity of burners connected to each pulverizer shall be not less than maximum capacity of each pulverizer.

B. Fuel: Coal and Fuel Oil No. 2.

C. Load range: Each burner shall have turndown range of at least 2:1 without requiring change of burner parts and without evidence of flame instability or other combustion difficulties.

D. Type: Low NO_x; manufacturer's standard.

E. Burner registers and/or secondary air vanes or dampers:
   1. Air register and air vanes or dampers as required for each burner.
   2. Provide electric motor actuators for vanes or dampers required for automatic control.
   3. Provide local instrumentation and connections for burner balancing and tuning.

F. Throat refractory: In accordance with manufacturer's standard.

2.09 FLAME MONITORING EQUIPMENT

A. Provide flame scanning system for main flame, ignitors and warm-up guns.
   1. Sense flame intensity or radiation directly; indirect measurement for determining presence and adequacy of flame being scanned not acceptable. Use of fiber optics for signal transfer to a remote sensor acceptable.
   2. Provide main flame detection and discrimination over entire steam generator and burner operating range.
   3. Provide logics necessary to determine status and performance level of each flame detector.
   4. Provide outputs for use by BMS and DCS.
   5. If required, provide inputs to flame scanner from BMS to switch scanner sensitivity to provide discrimination between startup and main fuel flames.
   6. Equip for periodic automatic functional testing.

B. Provide equipment required for cooling air and sealing air to flame scanners over entire steam generator operating range.
   1. System will prevent damage to flame scanners due to excessive heat during all operating periods, normal shutdowns and unit trips, and conditions of fluctuating pressure and temperature.
   2. Provide fans or blowers with inlet air filtering and plugged filter indication.
   3. Two 100% capacity fans or blowers with automatic start of standby unit upon failure of running unit.

2.10 BURNER IGNITION SYSTEM

A. Pilot torch for each burner; suitable for ignition fuel oil No. 2, as specified. For burners requiring retractable ignitors, furnish pneumatic cylinder propulsion mechanism for each ignitor and ignition electrodes.

B. Provide for air atomization of fuel oil.

C. Provide fuel oil No. 2 and instrument air piping arranged for single connection for each system.

D. Ignitor type shall be Class 1 as defined by NFPA 85.

E. Locate connections at operating floor level.

F. Furnish ignitor maintenance racks.

G. Arrangement:
   1. Burners served by one pulverizer shall have simultaneous ignitor operation.
   2. Provide limit switches for position indication and control as required.

H. Accessories:
1. Pilot fuel shutoff valve: Automatic double block safety valves, automatic bleed valve, and manual shutoff valve in accordance with NFPA 85 at each ignitor.
2. Solenoid fuel control valve: 125 volts ac or dc for each ignitor or group of ignitors controlled as a group.
3. Air scavenging system, with operation interlocked with ignitor control system.
4. Flexible spiral metal tubing for ignitor fuel in accordance with NFPA 85 and air supply piping.
5. One scanner per igniter complete with mounting hardware and sight tube
6. Accumulator(s): As required by system design.

I. Automatic electric ignition system:
1. Electrical supply: 120 volt ac.
2. Equipment required: Electrodes, high-tension cable, transformers, relays, controls, mounting brackets and accessories necessary.
3. Control: Automatic; by limit switches on ignitor torch.
4. Interlocks: In accordance with NFPA 85.

J. Wiring:
1. Provide electrical wiring to interconnect limit switches, panels, and valves. Terminate wiring on burner fronts in terminal boxes located on burner platforms.
2. Conductors:
   a. ICEA S-19-81.
   b. Materials: Soft annealed coated copper, ASTM B33 or ASTM B189.
   c. Insulation and covering: Heat- and moisture-resistant rubber insulation, 600-volt, 75 °C copper temperature with overall neoprene jacket.
   d. Size: No. 12 AWG, stranded.
3. Rigid metallic conduit:
   a. Use for all circuits except where otherwise specified.
   b. Type: Rigid galvanized steel conduit, mild steel ANSI C80.1, hot-dip galvanized or electrogalvanized with enamel coating.
4. Flexible liquidtight conduit:
   a. Use between equipment on boiler and rigid conduit or where approved by Owner.
   b. Type: Steel, galvanized with outer liquidtight jacket.
5. Fittings: Standard type, treaded
6. Sizes: As required by NEC, except use 3/4" minimum.

2.11 BURNER CONTROLS

A. Arrange fuel burning equipment to permit remote light-off and shutdown of ignitors.

B. Coal line valves, burner registers, burner impellers and other components requiring manipulation for light-off or shutdown shall be equipped with actuators, including external position indication, suitable for position monitoring and remote control by burner management system.

C. Provide mounting facilities including sight tubes and mounting flanges for burner management system flame scanners; one main flame and one pilot scanner per burner minimum.

2.12 ACCESSORY PIPING, VALVES, DUCTS, AND DAMPERS

A. Ducts: In accordance with Section 40 05 16.

B. Air flow measurement: Provide air flow measurement devices and transmitters at each pulverizer.

C. CO measurement: Provide CO monitioring and integrate with mill fire prevention.

D. Control dampers:
1. Air flow control damper:
   a. At primary air inlet of each pulverizer.

b. Drives shall be suitable for intended service and compatible with combustion control equipment.

2. Tempering air and hot air dampers: Arrange to permit automatic control of outlet temperature from each pulverizer. Drives shall be suitable for intended service and compatible with combustion control equipment.

E. Primary air shutoff :
1. Provide positive shutoff of primary air flow to each pulverizer.
2. Double-gate arrangement with seal air between gates or low leakage guillotine damper in accordance with Section 40 05 16.
3. Gate drives included:
4. Integrate into and interface with burner management system.

PART 3 EXECUTION

NOT USED

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Furnish and install equipment and accessories for linear bucket wheel stacker reclaimer referred to as stacker reclaimer.

1.02 QUALITY ASSURANCE

A. Comply with ISO 5049-1 International Standards Organization, "Mobile Equipment for Continuous Handling of Bulk Materials."

PART 2 PRODUCTS

2.01 DESIGN REQUIREMENTS

A. Stacker reclaimer shall be rail-mounted, with rotating bucket wheel, risible boom, single counterbalance, slewing and luffing capability.

B. Stacker reclaimer shall have connected traversing structure and elevating conveyor and be capable of both automatic and manual stacking and reclaiming as required for the coal handling system operation.

C. Stacker reclaimer shall traverse the length of the storage piles to stack out and reclaim on both sides.

D. Design for general and discipline specific criteria listed in other sections, criteria specified here and code requirements, whatever is most limiting. Design and construct equipment in compliance with all applicable laws, ordinances, and regulations of principality having jurisdiction of plant site.

E. The system shall be designed for the operator cab to be manned at all modes of stacker reclaimer operation for safety reasons and to minimize the possibility of equipment damage.

F. Structural design of the stacker reclaimer and the conveyor belts shall be considered loaded "to spilling".

2.02 LINEAR BUCKET WHEEL STACKER RECLAIMER

A. Furnish and install equipment and accessories necessary for stacker reclaimer including, but not limited to:
   1. Belt conveyors.
   2. Traversing structure and associated rails.
   3. Storm tie-downs and boom tie-down cradle. The location of the tie-down shall be at the end-of-travel.
   4. End travel stops including fabricated brackets and bumpers located on the stacker reclaimer and size.
   5. Electrical house mounted on stacker reclaimer structure to house supplier-furnished electrical and control equipment. Includes complete HVAC system to maintain conditions of supplier electrical and control equipment.

6. Complete dust suppression system shall be provided for dust control during both stacking and reclaiming operations with both dust control at the transfer points and stacker reclaimer pile dust control.
7. Belt scale shall be provided on the boom conveyor with an accuracy of +/- 0.5 %.
8. Area equipment lighting and local area flood lighting located on the stacker reclaimer.
9. PLC control system.
10. Plant public address and telephone communication equipment located on stacker reclaimer with handsets located in operator cab and electrical house.

B. Design wind speed, operational, normal: 45 mph.

C. Wind speed for travel drive and brake holding: 55 mph.

D. Wind speed for storm tie-downs: 145 mph.

E. Slewing travel speed (minimum), ft/min: Manufacturer's standard.

F. Boom luffing speed at boom tip (minimum), ft/min: Manufacturer's standard.

G. Slewing arc, stacking/reclaim: 90/105 degrees (from travel centerline).

H. Boom luffing angle: +/- 16 degrees.

I. Moving parts of all equipment shall be readily accessible for inspection, lubrication, and repair and, where necessary, shall be protected from the flow of conveyed material. However, moving parts of equipment shall also be guarded as required to protect personnel during operation.

J. Provide walkways, access platforms, hand rail and guard rails and stairs to access all mechanical, electrical and control equipment mounted on the stacker reclaimer for operator and maintenance access.

K. Traversing structure shall be supported by a minimum of eight (8) wheels.

L. Traversing structure shall include an elevating conveyor; trailer structure, traversing system including non-driven wheels; electrical/control and machinery rooms, transformer house and receptacles.

M. Trailer system shall be permanently attached to the stacker/reclaimer structure. Tripper structure platform shall also support the single electrical/control cable reels and dust-suppression water hose reel.

N. Gantry or substructure shall consist of a rigid gantry supported by equalizer beams with rail wheel assemblies including drives running on rails. Slew bearing shall be supported by fixed gantry.

O. Gantry shall be a true 3-point, 4-corner support structure.

P. Truck wheels:
1. Forged steel of heavy-duty, double flanged type, shaft mounted in anti-friction roller type bearings in accordance with ASTM. A 504, Class CR.
2. Tread hardness: 320 Brinell minimum.
3. At least one-half of the fixed gantry track wheels shall be driven.

Q. Bucket wheel:
1. Rotating variable speed using direct mounted hydraulic drive unit.
2. Negative fail safe brake which shall engage automatically in case of electric power failure and to prevent the wheel from rotating during its maintenance (temporary removal of buckets).

R. Buckets:
1. ASTM A514-RGB or equivalent wear resistant steel.

2. Formed and welded construction.
3. Bucket lips shall be hard surfaced for abrasion resistance.
4. Abrasion-resistant removable liners shall be provided on wearing surfaces of the wheel, retainer plate and chute.

S. Boom luffing assembly: Hydraulic or steel cable with necessary hold safety features.

T. Travel drive assemblies shall consist of rigid flange coupling mounted reversible gear motor(s) with torque arm(s).

U. Slewing drives shall be variable speed. Boom shall be slewed by means of two (2) variable-speed (VFD) AC gear motors, mounted on the rotating gantry.

V. Slew bearing shall be lubricated by a two independent timed, automatic, grease-lubrication system.

W. Slewing speed shall be automatic (PLC) or manually controlled by operator. Slew speed shall be varied continually to suit the different pile cross-sections in automatic operation.

X. Rail clamps and storm tie-downs:
1. Automatically engage in winds in excess of the operating wind
2. Bypass switch, connected to the anemometer, shall disengage the rail clamps and permit emergency travel in a wind that is 15-mph higher than the operating wind.
3. Spring set, hydraulic release.
4. Fail-safe and automatically set on loss of power.
5. Spud locks, in conjunction with rail clamps, shall assure structural stability in winds up to the design storm wind.

Y. Rails: Design and provide to meet structural and machine requirements.

Z. Cable reel:
1. Single power/control cable and cable reel with fiber optic control cable and a separate communication cable used for operator communication via telephone and public address handset units.
2. Reel size and cable length shall be based on a total machine travel distance from the midpoint junction box.
3. The reel shall be complete with magnetic coupling and a maximum travel cam limit switch.

AA. Electrical house:
1. Electrical house and the power winding reels shall be mounted on the gantry frame.
2. Rigidly-supported, sealed, insulated.
3. Air-conditioned to maintain positive pressure and temperature control, utilize outside air filters.
4. Equip with two 10-lb capacity, portable, wall mounted, dry-chemical fire extinguishers.
5. House MCC, unit substation, travel and slew drive control panels, isolation transformer, lighting and low voltage distribution transformers, auxiliary (PLC) control panel, and miscellaneous equipment such as control transformers and distribution panels.
6. For electrical equipment requirements refer to specific technical sections.

BB. Operator control cab:
1. Provide to allow clear lines of sight during all operations and for all hours of the day and night.
2. Heavy-gage sheet metal construction, weather proof, insulated and pressurized with thermostatically controlled air conditioning system complete with an adequately sized filter.
3. Air-tight door with a suitable lock shall be fitted. The windows shall be sealed, tinted safety glass, provided with sunblind, motorized windshield wipers and washers.
4. Self-leveling cab shall be suspended on a damped pendulum mount. The sound level shall not exceed 65 dB(A) in the cab. A retractable emergency escape ladder shall be provided at the cab.

CC. Controls and communications:

1. Mount manufacturer's standard stacker reclaimer Human/Machine or HMI display in operator cab to monitor and control operation of the stacker reclaimer.
2. Coal handling system HMI also mounted in operator cab.
3. Provide control interlocks either hardwired or logic based for protection of all either on stacker reclaimer and other equipment in the overall coal handling system.
4. Modes of control:
   a. Manual mode: Stacking or reclaiming shall be completed by the cab operator with boom luffing, slewing and travel controls in manual.
   b. Semi-automatic mode: Stacking and reclaiming shall be initiated by the operator at the beginning and ending of each pass (stacker reclaimer traveling full length of the pile) with automatic control of boom luffing speed and position, boom slewing speed and position, bucket wheel rotational speed and stacker reclaimer travel.
   c. Automatic mode: Stacking and reclaiming automatically after initiation by the cab operator. Manual start up and shut down is required by the cab operator. Fully automatic control includes automatic stop and start after each pass of the stacker reclaimer with multiple passes, after automatic control is initiated by the operator with same automatic control capability as indicated above.
   d. Stacker reclaimer luffing, slewing and travel shall be controlled via a standard program for stacking and standard program for reclaiming for both bench and modular routines. The programs will include operator selectable stackout methods via chevron, cone shell and windrow storage pile stacking patterns.

DD. Instrumentation:

1. Conveyor instrumentation shall include, but not limited to, zero speed switches, belt misalignment switches, pull chord switches, warning horns, emergency stop switches, jog buttons at conveyor drives, and plugged chute detectors.
2. Pile sensing switches: Minimum of 2.
3. Anticollision devices: As necessary to prevent equipment damage through inadvertent bucket wheel plowing into the storage pile or boom and pile contact or covered storage structures.
4. Rail travel limit switches and position:
   a. Redundant lever operated.
   b. Normal, over travel and emergency limit switches shall be provided on both ends of the railway.
   c. Proximity/limit switch actuators for traverse encoder automatic recalibration at runway center point.
5. Slewing limit switches and position:
   a. Redundant lever operated.
   b. Guard against over travel of the stacker boom horizontal angle.
   c. Encoder type position or proximity switches shall be furnished to control the boom horizontal position.
6. Luffing limit switches and position:
   a. Redundant lever operated.
   b. Guard against over travel of the stacker boom horizontal angle.
   c. Encoder type position or proximity switches shall be furnished to control the boom vertical position
7. Warning devices:
   a. Equip with audible and visual warning devices.
   b. Audible warning devices shall automatically sound for a preset time before a belt, luffing, or slewing drive is energized, whether the start command is initiated locally or remotely and equipped with audible and visual warning devices.
   c. Audible warning devices shall automatically sound for a preset time before a belt, luffing, or slewing drive is energized, whether the start command is initiated locally or remotely.
8. Anemometer shall provide wind speed indication and limit operation during high wind conditions.

PART 3 EXECUTION

NOT USED

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Bottom ash conveying system.

B. Bottom ash submerged drag chain conveyor.

C. Dry drag chain conveyor.

D. Pulverizer rejects conveying system.

PART 2 PRODUCTS

2.01 SYSTEM DESCRIPTION

A. Bottom ash conveying system: Bottom ash conveying system consists of submerged drag chain conveyor designed to interface with a fixed boiler seal skirt to receive ash from boiler and transfer it to truck for disposal.

B. Bottom ash submerged drag chain conveyor: Bottom ash submerged drag conveyor consists of a drag flight chain conveyor submerged in a water-filled upper trough. Chain conveyor flights shall move bottom ash out of water-filled trough onto a dewatering slope. Submerged scrapper conveyor (SSC) will able to directly load trucks that have been parked in the bunker area.

C. Pulverizer rejects conveying system: Pulverizer rejects conveying system transfers rejects from each coal pulverizer mill to bottom ash conveying system. The pulverizer rejects will be sluiced with water to upper trough of submerged drag conveyor.

D. Economizer ash conveying system: System shall convey ash collected in hoppers below boiler economizer. Economizer ash shall be handled by dry drag flight or en masse conveyor(s) to bottom ash system.

2.02 DESIGN REQUIREMENTS

A. Operation of submerged drag conveyor will normally be continuous, but may be periodically shutdown for switching of ash haul trucks or maintenance without need for a boiler shutdown or load reduction.

B. Capable of temporarily accumulating and storing ash deposited therein at peak ash production and worst fuel for 4 hours.

C. Design pulverizer rejects system for evacuating mill following mill trip.

D. Design water overflow to minimize solids carryover.

E. Complete submerged drag chain conveyor trough assembly shall be self-supported assembly mounted on roll-out wheel assemblies.

F. Provide ash water cooling system to maintain appropriate water temperature and water level in upper trough of conveyor.
   1. Two 100% recirculating pumps shall be installed to circulate surge tank water through two 100% plant cooling water heat exchangers and back to surge tank.
   2. Two 100% sludge return pumps shall circulate sludge from surge tank to SSC.

G. Provide pyrite rejects conveying system.

H. Provide instrumentation, motors, and other electrical equipment necessary.

I. System controls will be implemented in PLC control system.

2.03 BOTTOM ASH CONVEYING SYSTEM

A. Bottom ash conveying system shall include equipment, materials, and accessories necessary for a complete system to receive ash from boiler and transfer it to destination specified.

B. Submerged drag chain shall discharge to dump trucks.

2.04 SUBMERGED DRAG CHAIN CONVEYOR

A. Submerged drag chain conveyor system shall include mechanical submerged flight chain conveyor, access provisions, continuous chain wash, and all necessary valves, piping, controls, and instruments.

B. Transition chute shall extend from furnace throat to penetrate water level in upper trough.
   1. Materials: Type 316 L stainless steel.
   2. Material thickness: 3/8" minimum. Material thickness and external stiffening shall be sufficient to withstand direct impact of furnace slag and meet furnace pressure design criteria.
   3. Inside shall be free of structural members or other obstructions capable of causing bridging.
   4. Breaker bars across inside of transition chute not permitted.

C. Upper trough: Water filled upper section of submerged drag chain conveyor where bottom ash is collected and removed by drag chain flight conveyor.
   1. Housing material: ASTM A36.
   2. Material thickness: 3/8" minimum. Material thickness and external stiffening shall be sufficient to withstand direct impact of furnace slag. Inside free of structural members or other obstructions capable of causing bridging.
   3. Capable of storing up to minimum storage amounts of bottom ash, economizer ash and pulverizer rejects indicated in Design Requirements without exceeding normal water level.
   4. Upper trough bottom and dewatering slope:
      a. Liner material, minimum thickness and minimum hardness:
         1) ASTM AR 400 plate, 1", 360 Bhn or
         2) Cast basalt tile, 1", 360 Bhn.
      b. Bias wear surfaces to ensure smooth passage of flights from one section to next.
      c. Welds ground smooth to prevent flight hang up.
   5. Upper trough side inner surface exposed to bottom ash: Replaceable liner material, minimum thickness and minimum hardness; ASTM AR 400 plate, 1/4", 360 Bhn.
   6. Provisions shall be made to protect chain entire length of trough from falling ash and slag.
   7. Design one side of conveyor upper trough assembly to:
      a. Unbolt and detach quickly from a self-supporting side panel section or
      b. Unbolt and lower segmented hinged side panel sections.
      c. Positive watertight seal at side panel/conveyor trough interface.
      d. Permit rolling conveyor to one side of boiler transition chute and thus allow full access to furnace through boiler seal skirt and boiler throat.
   8. Able to clear boiler seal skirt (plates) while boiler is in hot position.

D. Lower trough: Lower, dry section of submerged drag chain conveyor which is required for return of conveyor flights:
   1. Housing material: ASTM A36.
   2. Allow for visual inspection of entire length of return chain and flights through expanded metal guard access panels, extending length of lower trough.
   3. Height shall allow individual flight removal without interfering with another flight, bottom of upper trough or equipment or structure in between.
   4. Provide for draining accumulated water through single drain connection.
   5. Material thickness: 1/4" minimum with structural stiffeners as appropriate.
   6. Lower trough bottom and dewatering slope:
      a. Replaceable liner material, minimum thickness and minimum hardness:
         1) Full width, ASTM AR 400 plate, 1", 360 Bhn or
         2) Full width, cast basalt tile, 1", 360 Bhn Flight return guide rails:

a) ASTM AR 400 plate, 1", 360 Bhn.
b) Minimum width: 3".
c) Configure to evenly distribute wear over entire surface of flight liner.

b. Bias wear surfaces to ensure smooth passage of flights from one section to next.
c. Welds ground smooth to prevent flight hang up.

E. Supports and wheel assemblies:
1. Complete submerged drag chain conveyor trough assembly shall be self-supported assembly mounted on roll-out wheel assemblies.
2. Wheels:
a. Flanged railroad-type mounted in structural steel carriage ways and furnished with bearings.
b. Material: High alloy steel forged and machined, induction hardened.
c. 16" (450 mm) minimum tread diameter 18" diameter flange.
d. Types:
1) Double flanged wheels or
2) Rollout configuration:
a) 2 double-flanged wheel assemblies and flat roller assemblies for remainder or
b) 1 double-flanged wheel assembly and single-flanged wheel assemblies for remainder.

F. Towing lugs shall be fitted along conveyor assembly for moving conveyor into maintenance position.

G. Flights and chain attachments:
1. Drag chain flights:
a. ASTM A36 with replaceable, abrasion-resistant steel wear plates or strips.
b. Wear plates or strips:
1) Full contacting surface of flights; upper and lower.
2) Minimum 3/4" thickness.
3) 215 to 255 BHN minimum.
2. Operate under design conditions without permanent deformation.
3. Fit with chain attachments:
a. Same materials as chain, hardened.
b. Easily removed from chain.
c. Not fail due to loosening or fatigue.
d. Provide nonrigid connection of flight to chain.
e. No bending moment shall be introduced into chain.
f. Allow for proper meshing of chain links into sprockets and idlers.
4. Size flight connectors to withstand stresses imposed by maximum load on flights.
5. Design flights so chain does not drag along bottom of trough, but is held in suspension by flight connectors.

H. Flight chains:
1. Double strand, matched, abrasion-resistant.
2. Materials, drag chains: case hardened, nickel-chrome steel alloy
3. Base chain size on chain pull.
4. Allowable chain pull at peak operating conditions shall not exceed 1/7 of chain breaking strength as rated by manufacturer. Allowable chain pull at storage pullout shall not exceed chain manufacturer's recommendations for maximum chain pull allowable on an infrequent basis.
5. Furnish in matched pairs with connecting links.
6. Deviations in length of each chain in a pair shall not exceed 0.05% of length.
7. Chain link connectors shall be hardened and shall be of same metallurgy as chain.
8. Chain link connectors shall be furnished by same manufacturer as chain.
9. Provide piping and spray nozzles for water to clean chains before contact with drive sprockets.

I. Sprockets and idlers:
1. Sprocket drive teeth:
a. Bolted in position for easy removal and replacement.
b. Material: Same as chain.
2. Idler surfaces in contact with chain shall be smooth and free of pockets that could accumulate ash and cause wear.

3. Idler contact surfaces shall be hardened to a minimum Brinell of 500.
4. Provide idlers at locations where chain changes direction.
5. Idler assemblies submerged in upper trough shall be independent cantilevered type mounted to externally removable support plate.
6. Antifriction, self-aligning bearings, internally mounted to idler, shall be protected against water intrusion by double row lip seals, and be externally greaseable to provide both a seal and lubrication.
7. Equip sprocket and submerged idler bearings with mounted external lube fittings.
8. Equip submerged idler assemblies located in ash path with idler groove cleaners protected, from impact of material falling from combustion chamber of boiler.
9. Protect rotating bearing closure plates, seal enclosures, idler wheel retainer plates, idler wheel grooves, etc., from being immersed in abrasive ash being conveyed through trough. Partial shroud over top of idler assemblies shall not be considered sufficient to meet this requirement.

J. Chain tensioning device:
1. Provide automatic hydraulic operated chain tensioning device for each chain and located at tension end.
2. Device shall allow vertical travel and shall be equipped with limit switches to alarm on insufficient and excessive chain tensions. Linear position transmitter also acceptable instead of limit switches.
3. Each chain shall be independently adjustable, allowing for individual take up adjustment for each chain.
4. Provide zero speed switch on each chain tensioner idler wheel.

K. Shafts and bearing:
1. Bearings on drive and other continuous or through-shafts shall be rolling element, self-aligning, extra heavy-duty type.
2. Provide externally mounted, heavy-duty spherical roller-type bearings in pillow blocks.
3. Provide regreaseable lubrication with drain plugs and seals with lubrication
4. Design seals to prevent foreign material from entering bearing area and grease from leaving bearing area.
5. Lubrication fittings shall be located so that they are easily accessible for greasing operations.
6. Water flushed bearings not acceptable.
7. Shafts shall be solid alloy steel.
8. Bearing and sprocket mount areas: Machined. Provide shoulders for positive positioning of sprockets.
9. Idler and sprocket hubs: Shrink fit or supplied with compression hubs to prevent "walking" along shaft

L. Submerged drag chain conveyor drive and motor:
1. Hydraulic drive and gear reducer shall be coupled to conveyor head shaft through direct-coupled assembly.
2. Forward output speed: Infinitely variable throughout required speed range.
3. Provide for inching or jogging in both forward and reverse direction.
4. Size to allow for continuous operation with resultant normal operating torques and intermittent operation, startup, and pullout, with torque resulting from specified storage condition.
5. Manual drive direction and forward speed selection: Performed at local control station in vicinity of submerged drag chain conveyor.
6. Provide hydraulic pressure relief to limit torque beyond ash storage limit for protection of conveyor and drive system components.
7. Provide return filtration with electric differential pressure indication.
8. Include air-to-oil heat exchanger with cold start bypass, reservoir heater (as required), reservoir oil level, and temperature switches; pressure, level, and temperature gages; and electrical enclosure with terminal strips for shop wiring of supplied power and instrumentation.
9. Provide reservoir with access manway cover filtered fill connection, valved drain connection, and breather.
10. Locate power unit in close proximity to head shaft.
11. Locate gear reducer at head end of each conveyor. Mount on adjustable steel baseplate and permanently attach to inclined section of conveyor.

12. Provide necessary safety guards.

M. Access:
1. Provide easy access to equipment and instrumentation. Support access platforms from submerged drag chain conveyor.
2. Provide platforms, stairs, ladders, handrails and other items as required for access to applicable equipment and auxiliaries during normal day-to-day inspections and during periodic maintenance.

2.05 DRY DRAG CHAIN CONVEYOR

A. Casing:
1. Dusttight.
2. Top: Provide for easy removal to facilitate unit inspection and maintenance.
3. Inspection doors:
   a. Hinged and dusttight.
   b. Locations: Drive section, tail section, and after each material inlet.
   c. Diameter: 9" minimum.
   d. Rugged quick release opening mechanism.
   e. Reuseable gaskets appropriate for temperature, pressure and service conditions encountered.
4. Side walls: ASTM A36, 1/4" minimum thickness.

B. Replaceable liners: ASTM AR 400.
1. Material thickness:
   a. Side walls: 3/8" minimum at 400 Bhn.
   b. Lower compartment bottom: 1/2" minimum at 400 Bhn.
2. Attach such that fasteners, matching points or other obstructions do not protrude into material flow.

C. Sections: Head, tail and main body.
1. Shop assembled.
2. Flanges square with run of casing: 8" maximum bolt spacing.

D. Provide for visual inspection and replacement of entire length of chain and flights through bolted panels.

E. Provide dusttight seals for shaft penetrations through casing.

F. Support conveyor from floor with provisions to accommodate thermal movements of conveyor due to elevated ash temperatures.

G. Flights and chain attachments:
1. Drag chain connectors: case hardened, manganese-chrome steel alloy
2. Drag chain flights: ASTM AR400; minimum 3/8" thick.
3. Design to withstand full load startup conditions.
4. Size flight connectors to withstand stresses imposed by maximum load on flights.
5. Design flights so chain does not drag along bottom of trough, but is held in suspension by flight connectors.

H. Flight chains:
1. Materials: Case hardened, manganese-chrome steel alloy.
2. Single-strand or dual-strand chain design.
3. Forged alloy steel conveying chain shall have core hardness of 300-400 Bhn and minimum case hardness of 550 Bhn (to minimum depth of 0.025"). Connecting pins or bolts (if applicable) shall be constructed in same manner.
4. Base pitch selection and ultimate design strength of chain components on severe service conditions and design full load startup conditions.
5. Selected chain ultimate chain strength rating shall be no less than 5 times maximum calculated chain pull.

I. Shafts and sprockets:
   1. Conveyor head section will contain drive sprocket.
   2. Drag flight conveyor sprockets: Split, segmented or solid hub type with replaceable teeth.
   3. Surfaces in contact with chain shall be smooth and free of pockets that could accumulate ash and cause wear.
   4. Sprocket teeth surfaces in contact with chain shall be hardened to approximately 550 Bhn.
   5. Shaft material: AISI 4140; finished to dimensional requirements of bearing manufacturer at bearing surfaces.
   6. Provide gland-type shaft dust seals at casing penetrations.

J. Chain tensioners/automatic chain take-up:
   1. Provide compression-spring operated chain tensioning device for each chain.
   2. Locate at tension end of each drag chain conveyor.
   3. Minimum of 7" of travel.
   4. Equip with appropriate tension indicating devices.

K. Shaft bearings:
   1. Drive and tension bearings: Rolling element, self-aligning, extra heavy-duty type.
   2. Dusttight seals of regreaseable lubrication type with drain plugs and seals with standard grease gun lubrication fittings.
   3. Design to prevent foreign material from entering bearing area and grease from leaving bearing area.
   4. Locate lubrication fittings so that they are easily accessible for regreasing operations.

L. Dry drag flight conveyor drive and motor:
   1. Variable speed drive (VFD) system consisting of electric motor, coupling, and drive unit including gear reducer.
   2. Motor shall be suitable for use with VFD at low speed.
   3. Capable of starting conveyor at maximum expected storage limit of conveyor trough.
   4. Provide operation of drive in both forward and reverse (jog only) directions.
   5. Locate at head end of each conveyor. Mount on adjustable steel bedplate and permanently attach to conveyor.
   6. Provide necessary safety guards.

M. Accessories: Zero-speed switch fitted to conveyor shaft to indicate status of conveyor operation.

N. Provide easy access to sprockets, equipment, and instrumentation.

2.06 PULVERIZER REJECTS CONVEYING SYSTEM

A. Provide equipment, materials, and accessories as necessary to route pyrites, other rejects, and coal (following a mill trip) from coal pulverizer mills and ash from economizer and other boiler and ductwork hoppers to bottom ash system.

B. Jet pumps:
   1. Design to allow inspection, repair, and replacement of nozzle and throat without disturbing remainder of sluice piping.
   2. Construct replaceable throat portion of cast alloy with minimum 550 Bhn. Fabricate nozzle from tungsten carbide.
   3. Select pump so specified design capacity is achieved after throat has been worn minimum of 1/2" (13 mm) in excess of original dimension.

C. Sluice system transport piping and valves:
   1. Sluice piping and fittings for pulverizer rejects, economizer ash, and duct hopper ash shall be of chromium alloy cast iron or induction hardened steel expressly designed for service.
   2. Piping shall be not less than 300 Bhn hardness.
   3. Fittings shall have reinforced wear backs and shall be not less than 450 Bhn.
   4. Furnish necessary expansion joints and couplings.

5. Piping expansion joints shall be of axial slip type. Line interior of expansion joint in contact with ash with abrasion-resistant material.
6. Couplings shall not be considered expansion joints.
7. Discharge piping from individual jet pumps shall include hand hole fittings, drain tees, and, as required for service, transition fittings.
8. Design valves in ash conveying service so valve blade is completely removed from conveying path while valve is open.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install in accordance with manufacturer's instructions.

B. Install accessory equipment specified.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Fly ash system.

B. Exhausters.

C. Conveying ash pipe and fittings.

D. Ash silo conditioning system.

E. Ash silo unloading system.

F. Shop cleaning.

G. Performance testing.

1.02 QUALITY ASSURANCE

A. Conveying system supplier qualifications: Designed and supplied successful systems of equal or greater capacity than that specified for use on boilers and AQCS systems.

B. Materials and equipment shall be new, free of defects or damage.

C. Materials of construction shall be those proven by service in similar system designs and for similar operating conditions.

D. Parts subject to wear, corrosion, deterioration, or requiring adjustment, inspection or repair shall be accessible and capable of reasonably convenient removal, replacement, and repair.

E. Products containing asbestos are prohibited including, but not limited to, items such as packing or gaskets; even though item encapsulated or asbestos fibers impregnated with binder material.

F. Materials shall be identified by ASTM Specification Number, AISI type number, or other industry recognized means of identifying composition and properties of material.

G. Properly select parts of system to ensure compatibility of fluid and environment

1.03 MAINTENANCE MATERIALS

A. Provide special tools, jigs, fixtures, and lifting tackle which are necessary for assembly, erection, operation, maintenance, and repair of equipment. Special tools shall become property of Owner.

B. Provide special tools and devices of design, purpose, and use peculiar to equipment furnished and not available from normal wholesale or retail outlets. Exclude standard general purpose tools.

PART 2 PRODUCTS

2.01 SYSTEM DESCRIPTION

A. Removal systems: pneumatic conveyor system conveys ash from fly ash collecting hoppers to either fly ash silo. The fly ash conveying systems for each boiler will normally be running independently.

B. Fly ash storage silos receive ash from conveying systems.

C. Unloading systems: Fly ash unloading equipment mixes, conditions, and transfers fly ash from storage silo into Owner transport trucks for landfill disposal. The unloading system consists of two wet unloaders and a single dry unloader with vent fan.

2.02 DESIGN REQUIREMENTS - GENERAL

A. Type: Pneumatic dilute phase. System can be either a pressure system or a vacuum system.

B. Equipment location:
1. Exhausters: Indoors, unheated.
2. Fly ash silo: Outdoors.
3. Mixer/unloader: Indoors, on unloader floor under silo.

C. Service: System shall meet duty and service conditions specified.

D. Locate silo associated equipment in pre-engineered building next to silo.

E. Equipment and structures shall meet structural design criteria stated in Section 01 32 13. Arrangement of equipment is for most direct route.

F. System shall be capable of operating continuously over full operating range without overheating, excessive noise, vibration, surging, or instability.

G. Transport rate:
1. Minimum: two times the generation rate based on maximum fuel ash.
2. Transport rate is defined as average ash conveying rate over time measured to empty ash from all hoppers, including indexing and purge times, and convey ash to silo.
3. Transport rate shall be determined with system operating in "Normal" automatic mode.

H. Load out system silo unloading rate: four times maximum silo fill rate.

I. Vent filters and any other discrete emission points: guaranteed emission rate of 0.01 gr/dcf max.

J. Noise level for equipment, in combination, shall not exceed sound pressure level as indicated in Section 01 30 00. Provide enclosures as necessary.

K. Provide lifting lugs or points on equipment and motors to facilitate installation and maintenance.

L. Bag filters: Provide with access to bags, by means of walk-in, clean air plenums.

M. Provide stairways and ladders to equipment platforms, silo roof and for dust collector access.

N. Mixer/unloader water source: Service water.

O. Provide unit specific PLC system for control of fly ash system and ash silo equipment with communication to DCS for remote monitoring and supervisory control.

2.03 FLY ASH SYSTEM

A. Two 100% or three 50% capacity exhausters or blowers, each complete with:
1. Motor.
2. Drive belt or coupling.
3. Inlet filter, if required.
4. Inlet silencer, if required.
5. Discharge silencer.
6. Discharge check valve.
7. Isolation and selection valves.
8. Vacuum breaker.

9. Vacuum switch and vacuum gage. Vacuum switch shall annunciate control panel alarm in event of high vacuum.
10. Inlet and discharge expansion joints.
11. Common base plate for exhauster, drive, and accessories.

B. Conveying piping, fittings, and hardened pipe wear sections, terminating at silo inlets.

C. Clean air piping.

D. Material intake:
1. Provide flanged airtight and dusttight valves for connecting to ash pickup.
2. Provide Manual maintenance gates at ash inlets to system, and as otherwise required by Contractor's design.

E. Air intake:
1. Furnish as required at terminus of each branch transport line.
2. Cast iron.
3. Bell-mouth inlet.
4. Internal adjustable spring check valve.
5. Blowers and heaters necessary to maintain material with proper transport properties.

F. Segregating rotary swing gates:
1. Furnish machined rotary swing gate shut off valves with spring-compensated sealing rings in each branch transport line at pickup points indicated on Drawings and where determined necessary by ash conveying system manufacturer.
2. Equip swing gates with double-acting air cylinder operators and solenoid valve.

G. Vent valves.

H. Vent piping.

I. Air control valves.

J. Required conveying system instrumentation.

K. Branch line valves.

L. Target boxes or blind tees.

M. Interconnecting chutes.

N. Expansion joints for system and at terminal points.

O. Exhaust system:
1. Primary and secondary separators:
a. Hard alloy cast iron.
b. Minimum hardness: 550 Brinell.
c. Furnish for installation on ash silo roof.
d. Provide double swing gate air lock arrangement on outlet.
2. Automatic bag filter:
a. Automatic, self-cleaning unit suitable for application and for installation on ash silo roof.
b. Filter media shall be in accordance with manufacturer's recommendation meeting ash and temperature requirements.
c. Assembly shall include main housing, bag filters, cages, bag cleaning system, control panel, and other items necessary.
d. Design working vacuum: As required for overall system design. Air-to-cloth ratio (cfm per sq. ft.): 2.5, based on acfm.
e. Design working temperature of air and dust: 250°F.
f. Bag weight: 16 oz minimum.

g. Maximum bag length: 12'.
h. Bag design shall include 3" wear cuff at bottom of bag.
i. Emission rate: 0.01 gr/dscf.
j. Provide double swing gate air lock arrangement on outlet.

3. Ash and dust discharge mechanism and housing:
   a. Provide primary separator and bag filter with manufacturer recommended ash discharge gates to meet operating conditions.
   b. Provide replaceable seal ring to provide positive airtight seal between gate body and gate.
   c. Housing: 3/8" minimum thickness carbon steel.
   d. Location: Roof or loading platform.
4. Air piping.
5. Exhausters.

2.04 EXHAUSTERS

A. Exhausters:
   1. Type: Belt-driven, positive displacement.
   2. Casing: Cast iron.
   3. Shafts: Forged alloy steel.
   4. Rotor/impeller:
      a. Cast iron, cast steel or ductile iron.
      b. Static and dynamically balanced.
   5. Bearings: Renewable antifriction.
   6. Lubrication for gears and bearings:
      a. Provide bearing housings with fill and drain plugs
      b. Provide oil reservoirs with visible oil level gages.
      c. Provide air-cooled radiator, as necessary.
   7. Seals: Labyrinth.

B. Baseplate:
   1. Mount on common baseplate with motor drive.
   2. Mount motor on adjustable base.
   3. Fabricate baseplate, motor stand, support, and fasteners required for assembly from corrosion-resistant materials.
   4. Metal facing and load carrying surfaces shall be machined. Provide baseplates of welded steel construction. Include following features:
      a. Raised rim for retaining drips.
      b. Extended under parts of equipment mounted thereon.
      c. Sloped to tapped drain connection at one or both ends.
      d. Anchor bolt and grout holes.
   5. Exhauster and motor mounting base shall be continuous. Design baseplate to withstand mechanical forces, such as those due to external thrusts, possibly causing misalignment of equipment.
   6. Include sufficient holes in baseplate furnished to allow for grout filling and air venting, providing sound foundation. Baseplate stiffness shall be incorporated in lateral and torsional analysis of rotating elements. Analysis shall take into account form of support and stiffness. Provisions for adding concrete to baseplate for high inertia characteristics are required.
   7. Pipe housing drains to edge of baseplate with minimum of 2" drain pipe with ASME Schedule 40 pipe.

C. Gears: Forged steel, wide face spur manufactured to AGMA standards.

D. Drive:
   1. Belt with OSHA guard.
   2. Belt(s) minimum rating: 1.5 times bhp of exhauster.

E. Motors: Refer to Section 26 05 03.

F. Use of cooling water or injection of water to increase capacity not allowed. Systems shall be completely dry.

G. Accessories, one per exhauster:
1. Inlet, cooling air, and discharge silencer sized to suppress objectionable noise.
   a. Provide silencer support legs and brackets.
   b. Provide inlet filter at cooling air inlet.
2. Spring-loaded relief valve and other accessories as required.
3. Temperature safety switch to automatically shut down blower in event of high temperature condition.
4. Expansion joints: Flanged, bellows type, reinforced rubber inlet and outlet expansion joints suitable for pressure, vacuum, and temperature anticipated.
5. Provide nonreturn valve in discharge line of each exhauster.
6. Fit inlet filter combined with absorptive or reactive-type silencer to exhauster intake.
7. Inlet screens.

H. Inlet screens on exhausters: Heavy-mesh, double-crimp wire with outside frame for bolted attachment.

I. Exhausters shall avoid critical speed excitation or resonance.
1. Design discharge head/motor stand design to exclude primary excitation frequencies of 0.5X, 1X and 2X of fans' operating speed.
2. Correction of resonance problems shall be completed prior to shipment and installation.

2.05 CONVEYING ASH PIPE AND FITTINGS

A. Pipe:
1. Match internal diameters.
2. Within a minimum of 3' or 5 pipe diameters whichever is greater, downstream of material transport elbows or flow direction changes:
   a. Chrome alloy cast iron.
   b. Minimum hardness: 240 Brinell.
   c. Design fittings to provide airtight joint.
3. Downstream of wear sections and for clean air applications: seamless carbon steel.

B. Line fittings:
1. Replaceable, heavy-duty, wear-resistant.
2. Minimum hardness: 350 Brinell.
3. Flanges: ANSI compatible.

C. Mechanical joints:
1. Flanged connections for carbon steel piping.
2. Slip type coupling, or equal.
3. Design pipe joints for operating vacuum and pressures equal to or greater than twice available exhauster pressure.

D. Pneumatic system expansion joints:
1. Type: Sleeve; sliding surface fabricated from 280 minimum Brinell hardness chrome alloy cast iron. Joints shall include stops to limit movement.
2. Provide in necessary locations to accommodate expansions and to eliminate offsets in piping due to thermal pipe movement. Movements cannot be taken in pipe or fitting couplings.
3. Design for temperatures in accordance with material conveyed.
4. Interior of expansion joint in contact with ash shall be lined with abrasion-resistant material.
5. Indicate on conveyor layout drawings expected thermal movement of each pipe run and extent of movement to be taken in each expansion joint.

E. Design to offer maximum resistance to wear.

2.06 ASH SILO CONDITIONING AND UNLOADING SYSTEM

A. Capacity: Four times maximum silo fill rate.

B. Type: Paddle or pin rotary ash mixer conditioner:
1. Mixer paddles: AR400 plate, w/ TIVAR, or equal.
2. Mixer internal liner: Ultra-high molecular weight (UHMW) polyethylene, TIVAR, or equal.

2.07 DRY ASH SILO UNLOADING SYSTEM

A. Provide motor-operated telescoping dry unloading chute including necessary instrumentation and control components for dry discharge from silo.

B. Unloading capacity minimum: Four times maximum silo fill rate.

2.08 INSULATION, LAGGING, AND STANDOFFS

A. Provide for personnel protection to maintain maximum surface temperature of 140°F.

2.09 INSTRUMENTATION AND CONTROLS

A. Instrumentation and controls furnished shall be shop-installed to maximum extent practicable.

2.10 IDENTIFICATION AND TAGGING

A. Each part of complete assembly shall be permanently marked in accessible locations.

B. Provide large, visible nameplates identifying:
1. Equipment model and type.
2. Service conditions: Capacity, TDH, temperature, rotational speed, BHP.
3. Year built.
4. Serial numbers and shop order numbers.

C. Provide separate stainless steel nameplate with equipment.

2.11 SOURCE QUALITY CONTROL

A. Statically and dynamically balance rotating parts.

B. Exhausters with motors: Completely assembled in shop and test run for pressure test, volume test, alignment, vibration, and noise. Provide certificate stating results within 2 weeks of successful completion of balance testing.

2.12 SHOP CLEANING

A. Clean surfaces not to be painted or coated in accordance with manufacturer's best recommended practice. Conduct cleaning operations so stainless steel and nickel alloys are not contaminated with lead, copper, mercury, and/or other low melting point metals; chlorides, sulfur, halogens, and ferritic steel materials.

B. Machined or mating surfaces, including pipe and components for lube oil systems, shall be free of rust. Clean internal surfaces of particulate contaminates such as sand, metal chips, weld slag, etc. Surfaces shall be free of organic contaminates such as oil, paint, and preservatives as determined by visual examination.

C. External metallic surfaces of exhausters and motors shall be primed and finished in accordance with manufacturer's standards. Flush and clean assemblies prior to packaging. Stainless steel and similar corrosion-resistant materials shall not be treated or painted with rust preventative. Materials shall be

provided with high-grade primer and top-coat over a blast clean and smooth surface prior to packaging for shipment.

D. After complete cleaning and drying of internal and external surfaces, exposed openings shall be covered or blocked with rigid covers. Use desiccants to avoid condensation.

PART 3 EXECUTION

NOT USED

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Coal silo.

B. Fly ash silos.

C. Lime silo.

PART 2 PRODUCTS

2.01 DESIGN REQUIREMENTS

A. Cylindrical and vertical.

B. Mass flow, externally stiffened if required.

C. Suitable for continuous charging while conveyor is running.

D. Free of horizontal dust accumulation surfaces.

E. Watertight and dusttight.

F. Exit cone slope 60° minimum.

G. Design basis density: per structural design criteria.

H. Structural design requirements: Refer to Section 01 32 13.

I. Coal silo:
1. Capacity: Attain MCR of boiler when firing coal with any one pulverizer out of service for both of the following time frames:
   a. Minimum 12 hours on Performance Coal.
   b. Minimum 10 hours on Design Coal.
2. Carbon steel barrel section with stainless steel cone bottom.
3. Provide welded construction, except where bolted connections for openings and penetrations.
4. Openings and penetrations:
   a. Coordinate openings with Engineer during detailed design.
   b. 24" by 24" opening for man access.
   c. Fire suppression penetrations in accordance with NFPA.

J. Fly ash silo
1. Ground supported by columns or integrated skirt. Silo shall allow for support of unloading devices at a separate integral unloading level below silo.
2. Capacity: Minimum active storage volume: 72 hours at full load.
3. Configuration: All necessary penetrations and accessories for fly ash transport and unloading systems and equipment.
4. General arrangement requirements:
   a. Loading floor access: 2 egress points from exterior of unloading floor; 1 by stair tower, 1 by OSHA-approved ladder and platform system.
   b. Silo roof: Single OSHA approved spiral stairs.
   c. Unloading floor equipment maintenance access:
      1) Provide removable hoistway access opening in unloading floor for mixer/unloaders or largest piece of equipment on unloading floor if different or,
      2) Provide access opening through silo skirt on unloading floor for mixer/unloader or largest piece of equipment on unloading floor if different.

5. Exit cone slope 60° minimum with fluidizing troughs or flat bottom with fluidizing air system. Provide fluidizing air system components and associated heaters or fluidizing fed from instrument air system.
6. Design for truck load out utilizing off-road dump trucks 40-ton capacity.

K. Lime storage silo:
1. Type: Watertight and dusttight, hopper truncated to receive vibrating bin discharger, as specified herein. Silo support columns shall have girts attached to provide weatherproof area below silo.
2. Capacity: Silo shall be sized to contain a minimum 7 day supply of design lime at maximum SDA requirements for design coals at MCR.
3. Material: ASTM A283, Grade C, or ASTM A36, 5/16" minimum thickness steel plates; ASTM A36 structural elements. Stiffeners shall be provided on tank exterior as necessary; no internal stiffeners or bracing which may affect flow of material will be allowed.
4. Provide pressure-vacuum relief valves to ensure pressure differentials detrimental to silo and contents cannot be generated.
5. Joints: Smooth to eliminate lime accumulation.
6. Flanges: Provide as necessary for dust collector, manhole, and other connections.
7. Equip silo with minimum of four 4" pipe nipples fitted with pipe caps to permit emergency rodding. Attach caps to nipples with chain.
8. Supports: Provide supports as necessary to meet structural design criteria.
9. Ladder, platform, stairs, and handrails: Provide as necessary for access to roof from grade with intermediate platforms as required by OSHA, and as necessary to permit access to dust collector, manhole, and connection flanges. See personnel access requirements in Section 48 11 13.
10. Silo manhole: Provide on silo roof complete with locking bar suitable for padlock (by others), handrails, and "Danger" warning sign.

2.02 MATERIALS

A. Structural steel: ASTM A36, A1011 or A992.

B. High-strength bolts: ASTM A325 or ASTM A490.

C. Stainless steel: ASTM A240 Type 304.

D. Refer to Section 05 10 00 for additional materials.

2.03 INSTRUMENTATION

A. Coal silo continuous level indication system: Provide load cell level indication system for each silo. Outputs to coal handling control system and Unit DCS.

B. Fly ash silo level detection: Level transmitters with associated control units shall be installed to provide 4-20 mA analog indication of level in silo. Locate probes so that indication of level at center of each silo can be obtained.

C. Fly ash silo hi-level and hi-hi level detection: Contact probes shall be furnished, along with respective control units for high level and high-high level indication on silo.

D. Lime silo level detection: Level transmitters with associated control units shall be installed to provide 4 to 20 mA analog indication of level in the silo. Locate probes so that indication of level at center of each silo can be obtained.

E. Lime silo hi-level and silo hi-hi level detection: Contact probes shall be furnished, along with respective control units for high level and high-high level indication on silo.

2.04 FABRICATION

A. Refer to Section 05 10 00.

PART 3 EXECUTION

3.01 ERECTION

A. Fill junctions at exterior of intersecting bunker plate corners with weld and grind smooth.

B. Use bolted connections except for joints in wall and bottom plates which are to be welded.

C. Connect wall plate to columns with 3/4" (19 mm) minimum diameter high-strength bolts.

D. Refer to Section 05 10 00.

3.02 PAINTING

A. Apply field touch-up coat in accordance with Section 09 90 00.

3.03 NONDESTRUCTIVE TESTING OF FIELD WELDS

A. Retain services of qualified independent testing company to perform nondestructive testing of field welds. Selection of testing company shall be subject to review of Owner.

B. Test field welds of bunker plates by one test for each 20 linear feet (6 linear meters) of weld.

C. Nondestructive testing shall be by ultrasonic method conforming to AWS D1.1.

D. Welds shown by testing to have discontinuities shall be repaired in accordance with AWS D1.1 at no cost to Owner.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Air heater.

B. Cold end temperature control steam coils.

1.02 QUALITY ASSURANCE

A. Regulatory requirements:
1. Design and construct equipment in compliance with all applicable laws, ordinances, and regulations of principality having jurisdiction of plant site.
2. ASME Boiler Code Section 1, ASME B31.1, NFPA 85, and OSHA.

PART 2 PRODUCTS

2.01 DESIGN REQUIREMENTS

A. Provide instruments, control panels, motors and other electrical components required for a complete system. Refer to Section 40 95 13 for control panel requirements.

B. Provide interconnection wiring and raceway from air heater instruments and packaged skids to associated control panels provided under this Contract. Wiring and raceway shall be installed in accordance with Section 26 05 00 and 26 05 33.

2.02 AI ℜ HEATER

A. Type: Trisector, regenerative suitable for outdoor service.

B. Quantity: 1.

C. Heat recovery:
1. Provide secondary air temperature as required for burner performance and stability.
2. Provide primary air temperature required for drying coal and maintaining mill outlet temperature.

D. Air heater design:
1. Final average flue gas temperature at air heater outlet (excluding effect of air heater leakage): In accordance with Contractor recommendation.
2. No preheat shall be required above 55°F ambient temperature at maximum continuous rating.
3. Preheated combustion air temperature:
   a. Provide secondary air temperature in accordance with steam generator design requirements throughout design load range.
   b. Provide primary air temperature in accordance with pulverizer system design requirements throughout design load range.
4. Maximum air-to-gas side leakage: 8% of rated inlet gas flow.
5. Arrangement:
   a. Vertical shaft.
   b. Counterflow of air and gas.
   c. Arrange to permit water washing (out of service) of elements on gas side.
6. Construction:
   a. Shell: Steel plate not lighter than 1/4".
   b. Removable heating elements of following materials:
      1) Hot end: Manufacturer's standard.
      2) Cold end: Corrosion resistant weathering steel.
   c. Cold end heating elements shall be closed channel configuration that can be maintained in clean condition with regular on-line sootblowing.

d. Cold end shall be of sufficient depth to contain temperature range of expected ammonium bisulfate condensation.
e. Support bearing. Anti-friction, roller type.

7. Bearing lubrication:
   a. Quantity: 1 complete unit lubricating system for guide bearing and 1 complete lubricating system for support bearing. Guide bearing and support bearing lube systems may be combined.
   b. Type: Oil.
   c. Each lubricating unit assembled on individual base shall include:
      1) Oil reservoir.
      2) One full capacity oil-to-air heat exchanger, if cooling is required.
      3) Two full capacity oil pumps with individual isolation valves.
      4) Full capacity oil filter, duplex disc type with valving and manual cleaning device or 2 full capacity replaceable cartridge-type with valving.
      5) Accessories: As required.
      6) Piping, valves, fittings: Type 304 stainless steel.
   d. Provide temperature switch for each lubrication system.
   e. Temperature indication: Provide Type E thermocouple in support bearing.
8. Rotor drive:
   a. Motor suitable speed reducer.
   b. Provide auxiliary air motor drive.
      1) Connect to separate input shaft on speed reducer.
      2) Include muffler, solenoid valve, and lubricator.
      3) Shall be suitable for maintenance purposes and for emergency operation of air heater.
9. Washing devices:
   a. Water washing:
10. Observation windows:
   a. Provide minimum of 2 windows to allow inspection of cold end elements. Minimum size 8".
   b. Provide internal illumination, 120-volt ac.
   c. Provide means of changing lamp and means for cleaning observation windows while unit is operating.
11. Deluge protection:
   a. Water supply pressure: Approximately Service water.
   b. Controls: Manual activation.
   c. Provide piping to common single connection at each air heater.
12. Provide access doors for inspection and maintenance.
13. Painting: Refer to Section 09 90 00.
14. Provide air heater fire detection system.
15. Provide rotor motion detector.
16. Provide with Sootblowers.
17. Provide monorails necessary for changing heating elements.

2.03 COLD END TEMPERATURE CONTROL (STEAM COIL) AIR HEATER

A. Provide combustion air heating coils as necessary to maintain minimum average cold end temperature at specified minimum capacity; not less than 155°F.

B. Quantity: 1 set.

C. Duct steam coil air preheater:
   1. Type: Vertical finned tubes designed to prevent freezing of condensate.
   2. Welded carbon steel ASTM A515 supply and return headers.
   3. Tubes: Steel tube with embedded aluminum fins.
   4. Install in air duct before air heater.
   5. Design to raise temperature of outdoor air from minimum outdoor ambient design conditions at fan inlet duct inlet to temperature required for cold end temperature protection. Provide 10% excess surface.
   6. Design to operate at extreme minimum outdoor ambient design conditions.
   7. Heating medium: Per Contractor's design.

8. Arrangement:
   a. Bolted connections to ductwork shall allow removal of heating coils without disturbing ductwork.
   b. Coil shall have 2 rows of tubes each, minimum.
   c. Provide access doors on both sides of heating coils for maintenance access. If more than one coil is required for each PA/FD fan duct, provide 3'-0" minimum length duct with access door between coils.
   d. Location: Forced draft and primary air fan discharges. Not required on primary air fan discharge when used with a trisector air heater.
   e. Instrumentation: By Contractor.
   f. Control valves, isolation valving, and controls: By Contractor.
   g. Supply piping: By Contractor.

D. Painting: Refer to Section 09 90 00.

E. Vent high points.

F. Drains: Provide steam trap with bypass at low points.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install in accordance with manufacturer's instructions.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Induced draft (ID) fan, primary air (PA) fan, forced draft (FD) fan, and auxiliaries for boiler. Unless otherwise noted, provide each fan with following auxiliaries:
   1. Outlet evasé and duct for attachment to duct.
   2. Inlet silencer (FD fan and PA fan only).
   3. Shutoff dampers:
      a. ID fan inlet or outlet.
      b. FD fan outlet.
   4. Inlet and outlet expansion joint(s) as required for fan isolation from duct.
   5. FD and ID fans will be controlled by variable frequency drives.
   6. Electric motor.
   7. Hydraulic bearing/oil lubrication system for ID, FD, and PA fans.
   8. Weather enclosure for hydraulic bearing/oil lubrication system.
   9. Damper actuator and linkage.
   10. Bearing vibration taps and probes for ID, FD, and PA fans.
   11. Variable frequency drives and fan dampers will be controlled by DCS.

1.02 QUALITY ASSURANCE

A. Materials shall be new, free of defects or damage.

B. Products that contain asbestos not allowed. This includes items such as packing or gaskets even if item is encapsulated or asbestos fibers are impregnated with binder material.

C. Materials shall be identified by ASTM Specification Number, AISI type number, or other industry recognized means of identifying composition and properties of material.

D. Provide certified material test reports (CMTRs) for Class III and Class IV fan impellers and shafts.

E. Properly select parts of fan assembly to ensure compatibility of fluid and environment. Alternate materials may be offered for consideration.

F. Materials of construction shall be those proven by service in similar fan designs and for similar operating conditions.

G. Furnish austenitic stainless steel in solution annealed, unsensitized condition.

H. Materials of construction shall be piece-marked to reflect installation drawings.

1.03 MAINTENANCE MATERIALS

A. Provide special tools, jigs, fixtures, and lifting tackle which are necessary for assembly, erection, operation, maintenance, and repair of equipment. Special tools shall become property of Owner.

B. Special tools and devices are of design, purpose, and use of which are peculiar to equipment furnished and which are not available from normal wholesale or retail outlets. Standard general purpose tools are not included in this requirement.

C. Spare parts: Provide one lot of commissioning spares in accordance with manufacturer's specific recommendations.

PART 2 PRODUCTS

2.01 DESIGN REQUIREMENTS

A. Fans shall be suited for power plant requirements of fans in pulverized coal boiler applications. Temperature expansions and wear plate for dust laden applications will be included. Fans shall meet ambient conditions in Section 01 30 00.

B. Service: Fan shall meet duty and service condition as required for selected boiler and described on Data Sheets.
   1. Capacity design: 110% of boiler and component requirements.
   2. Static design: 120% of boiler and component requirements.
   3. Allowances for fan losses shall be included in boiler and component requirements.

C. ID fan shall be able to operate in peak temperatures not less than 400°F.

D. Arrangements and ratings of fans shall be in accordance with AMCA standard.

E. Provide fans and associated equipment suitable for continuous operation with no cyclic or dynamic limitations at design conditions or any other load between minimum continuous safe flow of 20% and 110% of design capacity.

F. Fans shall be capable of operating continuously over their full operating range without over-heating, cavitating, excessive noise or vibration, surging or instability when operating. Design fans to avoid pressure pulsations greater than ±1" w.g. between 30 – 100 Hz over operating range of 20 to 100% flow.

G. Operating point shall be at or near Best Efficiency Point (BEP) for fans. Operating point for fan shall be not less than 50% of BEP flow.

H. If temperature or noise abatement indicates, provide insulation pins and clips. Dampers, bearings seals, etc. shall have provisions for insulation.

I. Prior to assembly for shipment, pre-pipe skid-mounted equipment.

J. PA fan and FD fan inlet screens shall be grating, designed for bolted attachment.

K. Avoid critical speed excitation or resonance for each service. Design discharge head/motor stand to exclude primary excitation frequencies of 0.5X, 1X, and 2X of fan operating speed. Correct resonance problems prior to shipment.

L. Protect complete fan assembly of fan, seals, bearings and motor from damage from reverse rotation.

M. Noise level for motor and fan, as individual components, shall not exceed 85 dBA at 3'.

N. Provide lifting lugs or points on fan housing and motor to facilitate installation and maintenance.

O. FD and ID Fans controlled with a variable frequency drive.

P. PA fan, FD fan, and ignition air fan, if required, inlet air temperature:
   1. MCR design: 80°F.
   2. Test Block: 105°F.
   3. Minimum: Refer to Section 01 30 00 for extreme minimum design temperature.

2.02 INLET BOX, FAN CASING, AND FAN OUTLET

A. Construction: Welded steel plate.

B. Minimum thickness: 0.25".

C. Materials: ASTM A36, AISI 1012, AISI 1015, or ASTM A242 (high-strength, low-alloy steel).

D. Provide sufficient bracing and reinforcement to withstand imposed pressures without excessive vibration or distortion.

E. Fit fan casing and inlet box(es) with drains at least 2" in diameter with threaded end caps; locate at low points. Minimum drain size:
   1. ID fan: 6".
   2. PA and FD fans: 2".

F. Split and add flange to fan casing and inlet box(es) for access and removal of rotor without disconnecting ductwork.

G. Inspection doors: Bolted design; set out from casings where insulation of casing is needed.

2.03 SHAFT AND ROTOR

A. Shaft: Forged steel.

B. Wheel:
   1. All-welded construction.
   2. Materials: ASTM A36, ASTM A242, ASTM A283 Grade D, ASTM A441, ASTM A514, ASTM A517, ASTM A542 Class 2, or ASTM A588.
   3. Fasten to shaft and attach securly against axial and radial movement.

C. Rotor:
   1. Center plates, not less than 0.75" thick MWT for wheel diameters in excess of 80".
   2. Suitable for service at all speeds and withstand abrupt speed changes without excessive vibration.

D. Design rotor assembly so installed resonant speed is not less than 1.20 times maximum operating speed. Installed resonant speed is defined as speed which corresponds to natural frequency of combined spring-mass system of rotating element, oil-film, bearing housing, bearing supports and includes effect of foundation stiffness.

E. After final machining operation, statically and dynamically balance rotor assembly in shop.

F. During rotation, run out of similar points on rotor structure shall not exceed deviation from median path of 3/8 of 1% of wheel diameter axially and 3/16 of 1% of wheel diameter radially.

G. Use backward curved air foil blades to give nonoverloading power characteristics.

2.04 SEALS

A. Provide shaft seals as required.

B. Type: Carbon ring type or aluminum disk type shaft seals.

C. If seal purge gas is necessary, provide data on kind of purge gas required with what pressure and how much. Typical purge gas is instrument air, nitrogen, steam or media gas.

D. Seal components shall be suitable for maximum specified gas temperature, regardless of seal flush temperature.

E. Mechanical seal shall be compatible with service fluid for pH and corrosion resistance.

F. Single mechanical seals:
   1. Bellows or single-spring type; design to permit operation to maximum continuous speed without resulting in unwinding or off-center operation. Seals shall be cartridge-type design.
   2. Unless otherwise specified, mating seal ring(s) shall be of one-piece design manufactured from tungsten carbide or silicon carbide.

2.05 BEARINGS

A. Type:
   1. Sleeved, self-aligning, oil-cooled for ID, FD, and PA fans.
   2. Antifriction for other fans.

B. Locate fixed bearing on drive side.

C. Minimum B_{10} life of 80,000 hours for antifriction bearings.

D. Bearing system shall not allow axial or radial loads to be transmitted to fan drive motor.

E. Oil seal and integral dirt and water seal at each end of reservoir.

F. Provide positive oil indication with external oil reservoir for oil-lubricated bearings.

G. Provide babbited thrust collars for each thrust bearing.

H. Bearing housings:
   1. Fill and drain plug.
   2. Provide with labyrinth-type positive sealing for protection of lubricant and bearings.

I. Each bearing shall have one 10-ohm copper RTD for input to DCS.

J. Design bearings for coast-down without damage in event of a station power failure.

K. Thrust loads, momentary and continuous, shall be accommodated by thrust bearing in fan; 1.5 minimum service factor.

L. Design fans to withstand thrust imbalance resulting from shutoff of 1 inlet of double inlet fan while other inlet is open.

M. Arrangement of fan housing and bearing housing shall allow for rotor removal and bearing maintenance without disturbing alignment of motor, fan, and/or coupling.

N. Provide bearing pedestals independent of fan housing. Fabricate from heavy steel plate or cast iron. Provide soleplates for proper location of bearing pedestals.

O. Vibration displacement of installed fans at bearings, at full speed, with a clean rotor shall not exceed vibration severity chart in "Very Good" range.

2.06 SHAFT COUPLINGS

A. Type:
   1. Variable speed fans:
      a. Flexible, limited end float, resilient-type.
      b. Shop-mount coupling and motor half. Ship motor half of fan coupling to motor manufacturer for mounting on motor shaft.
   2. Constant speed fans: Flexible, all-steel, limited end float, gear-type.

B. Step key and shrink fit to both fan and motor shafts.

C. Capable of transmitting maximum power developed by driver.

2.07 COUPLING GUARD

A. OSHA-approved enclosures over entire coupling.

2.08 SHUTOFF DAMPERS

A. Provide dampers to control draft during maintenance periods.

B. See Section 40 05 16 for requirements for shutoff dampers.

2.09 INLET SILENCERS

A. Provide inlet silencers for PA and FD fans.

B. Type: Self-supporting from inlet box(es) for loads such as dead, wind, and seismic. Provide flex joints between silencers and inlet boxes.

C. Integral inlet silencer mounted on inlet box and supported through inlet box shall include air measuring device, inlet screen, and connecting ductwork to fan.

D. Maximum normal operating air pressure drop through silencer: 1.50" w.g.

2.10 AIR FLOW AND STATIC MEASUREMENT

A. Provide for each fan.

B. Type:
1. Multipoint, self-averaging pitot-type transverse station.
2. Integral air straightener-equalizer honeycomb cell.

C. Location: Mounting in accordance with manufacturer's recommendations.

D. Static pressure shall be measured at pressure taps provided with fan near inlet and outlet flanges. Extend taps through insulation.

2.11 BASEPLATE AND PEDESTAL

A. Fabricate baseplate, pedestal, motor stand/support and fasteners required for assembly from materials of carbon steel.

B. Metal facing and load carrying surfaces shall be machined. Baseplates and pedestals shall be of welded steel construction.
1. Provide with raised rim for retaining drips.
2. Extend under all parts of equipment..
3. Slope to tapped drain connection at one or both ends.
4. Provide with anchor bolt holes and grout holes.

C. Design to withstand system forces that could cause misalignment of equipment.

D. Provide sufficient holes in baseplate and pedestals to allow for grout filling and air venting, providing sound foundation. Incorporate baseplate stiffness in lateral and torsional analysis of rotating elements. Analysis shall take into account form of support and its stiffness. Provisions for adding concrete to baseplate and soleplates for high inertia characteristics are required.

E. Pipe housing shall drain to edge of baseplate with minimum of 2" ASME Schedule 40 drain pipe.

2.12 ACCESS DOORS

A. Type: Hinged, gastight.

B. Provide for entry into fan inlet, casing, and outlet.

2.13 HYDRAULIC BEARING AND OIL LUBRICATION SYSTEMS

A. Each fan shall have common hydraulic bearing for motor and fan consisting of following:
   1. Two hydraulic pump and motor sets.
   2. Provide one "Hand-Off-Auto" (HOA) switch for each motor and tank heater provided on skid. Owner will use switches in hardwired control scheme. Provide a minimum of 2 contacts for each switch position. Mount "HOA" switches and indicating lights on control termination box.
   3. Welded construction, stainless steel oil reservoir with filtered breather cap, clean out hatch on side of tank, 1 oil level sight glass, 1 local temperature indicator, and drain plug(s).
   4. Provide one 10-ohm copper RTD with thermowell mounted in reservoir for input to DCS.
   5. One oil-to-air heat exchanger with redundant cooling fans with manual changeover.
   6. Duplex oil filter with differential pressure transmitter with integral local indicator for input to DCS.
   7. Triple redundant oil pressure transmitters with integral local indicator for input to DCS.
   8. Two pressure regulator valves to direct appropriate oil flow to both motor and fan bearings. Factory set to match manufacturer requirements.
   9. Pressure relief valve.
   10. Two nonreturn valves.
   11. Interconnecting piping between hydraulic unit and fan and motor housing including flexible hoses required. Lube oil piping shall be stainless steel.
   12. Provide 2 local electrical enclosure/termination boxes, 1 dedicated for electrical and 1 dedicated for controls.
      a. Box ratings: NEMA 4X stainless steel.
      b. Wiring: Refer to Section 26 05 00.
      c. Electrical box size: As required to accommodate control power transformer, power external wiring terminal blocks, motor power leads, tank heater contactor and HOA switch, and termination point for supplied power.
      d. Controls box size: As required to accommodate low level control wiring terminal blocks including, but not limited to, pressure transmitter, differential transmitter wiring, thermocouple wiring, pressure switches, HOAswitches and other control related control devices.
      e. Labeling: Devices, terminal blocks and components shall be labeled and labels shall correspond to manufacturer drawings.
      f. Indicating lights: Provide one white indicating light for tank heater. Mount indicating lights on control terminal box cover. Use cluster type LED lamps. Incandescent not acceptable.
      g. Provide plastic wire way with covers internal to control termination box for organization of internal and field installed wiring. Wireway shall be provided on both sides of all terminal blocks.
   13. Local thermostat, contactor and control as depicted in schematic bound herein for coil-rod tank heater. Heating element shall be totally encapsulated in stainless steel pipe to prevent ingress of materials in event of heater failure.
   14. Two local thermostats and contactors for fans.
   15. Other switches for alarms and operation as required.
   16. Material contacting oil: Stainless steel.
   17. Tank oil heater logic.
   18. Raceway: Use UV-rated liquid flexible conduit with anchoring points no more than every 2'. Conduit penetrations into all boxes shall be preformed using raintight hubs. Lock nuts not acceptable. Wire ties shall be UV-rated. Provide weather tight cord grips where required at end of conduits. Cords shall not be installed on skid without conduit for more than 1 ft.
   19. Skid: Rated for outdoor installation regardless of enclosure specified.

B. Enclosure building:
   1. Provide weather protection enclosure over oil systems.
   2. Removable.

3. Provide with switched 120-volt, 2-bulb industrial florescent light fixture and no less than 3 weathertight, duplex convenience receptacles all wired to 1 customer termination point.
4. Provide no less than 3' of free space on all sides of lube oil skid.
5. No less than 7' in free clearance.
6. Provide ventilation system consisting of propeller wall fan(s) and wall louver(s). Ventilation rate shall maintain space at design outdoor temperature plus 10°F. Heat gains include lube oil pumps and heat rejected from lube oil radiator.

2.14 INSTRUMENTATION AND CONTROLS

A. Factory-install instrumentation and controls for skid-mounted equipment. Adhere to following when installing and selecting instruments and controls:
   1. Instrumentation and controls with direct readout shall be easily readable from aisle adjacent to fan.
   2. Accessible for visual inspection, maintenance, and replacement.
   3. Inspection, repair, or replacement of other fan components shall require minimum removal of instrumentation and controls.
   4. Do not use mercury in instruments and controls.
   5. RTDs: 10 ohm copper, 3-wire; ungrounded, terminating in aluminum head.

B. One instrument tap for inlet pressure measurement shall be installed after silencer; 2" connection.

C. Switches for alarms and operational interlocks as required.

D. Vibration monitoring:
   1. Each radial sleeve bearing shall have 2 proximity probes mounted in an X-Y configuration, 90° apart for measuring radial vibration.
   2. Provide key phasor for measurement of shaft speed.
   3. Refer to Section 40 91 23-56 for vibration monitoring panel requirements.

E. If maximum head capability of forced or induced draft fans, with ambient air, exceeds design pressure of these systems, provide field instruments and logic to implement a furnace pressure control system in accordance with NFPA 85 in DCS.

2.15 INDUCED DRAFT FAN

A. Location: Outdoors.

B. Type: Double-width, double inlet.

C. Maximum rotational speed: 1,200 rpm.

2.16 PRIMARY AIR AND FORCED DRAFT FANS

A. Location: Outdoors.

B. Type: Double-width, double inlet.

C. Maximum duct velocities entering fan and leaving evasé: 2,500 feet per minute.

D. Maximum rotational speed: 1,800 rpm.

2.17 IDENTIFICATION AND TAGGING

A. Permanently mark in accessible locations each part of complete assembly. Provide large, visible nameplates identifying:
   1. Equipment model and type.
   2. Service conditions: Capacity, TDH, temperature, rotational speed, BHP.
   3. AMCA certified rating seal.

4. Wheel diameter and type.
5. Year built.
6. Serial numbers and shop order numbers.

2.18 SHOP CLEANING

A. Perform cleaning of surfaces, which are not to be painted or coated, in accordance with manufacturer's best recommended practice.

B. Conduct cleaning operations such that stainless steel and nickel alloys are not contaminated with lead, copper, mercury, and/or other low melting point metals; chlorides, sulfur, halogens, as well as ferritic steel materials.

C. Machined or mating surfaces, as well as pipe and components for lube oil systems, shall be free of rust. Clean internal surfaces of particulate contaminates such as sand, metal chips, weld slag, etc. Surface shall be free of organic contaminates such as oil, paint, and preservatives as determined by visual examination.

D. Prime and finish external, noncorrosion-resistant metallic surfaces of fans and motors in accordance with manufacturer's standards.

E. Flush and clean assemblies prior to packaging. Stainless steel and similar corrosion-resistant materials shall not be treated or painted with rust preventative. Provide noncorrosion-resistant materials with high-grade primer and top-coat over blast clean and smooth surface prior to packaging for shipment. Refer to Section 09 90 00.

F. After complete cleaning and drying of internal and external surfaces, exposed openings shall be covered or blocked with rigid covers. Provide desiccants to avoid condensation.

2.19 SOURCE QUALITY CONTROL

A. After final machining operation, statically and dynamically balance rotor assembly and rotating parts in shop.

B. Notify Owner minimum 10 days in advance. Owner may elect to witness:
1. Rotor balance test.
2. Packaging and shipping inspection.
3. Performance and cleanliness.

C. Shop balance criteria: ANSI S2.19.

D. Performance tests shall be made on fans in accordance with guidelines of AMCA. If fan cannot be assembled and shipped from shop, performance test will be done in field.

E. Perform testing in manner that duplicates actual in-service conditions. Develop job-specific test procedure and submit to Owner for approval prior to testing.

F. Provide minimum of 8 test points from shutoff head to 110% design capacity. In addition to measurements of capacity, head, and power, vibration measurements shall be taken at top motor bearing and shall not exceed acceptable values as defined by AMCA.

G. Subject fans to uncoupled motor run test to measure and record motor vibration levels in 2 planes.

H. In consideration of fan tolerances, fan being offered shall meet flow, pressure, and noise requirements.

I. Submit certified copies of performance test results in graphical and tabular form. Graphical form shall show total head in inches, brake horsepower in hp, and fan efficiency plotted as ordinate, against fan flow in cfm as abscissa.

PART 3 EXECUTION

NOT USED

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Condenser vacuum pump units including pumps, motors, separators, heat exchangers, piping, wiring, controls, silencers, and accessories.

1.02 QUALITY ASSURANCE

A. Materials furnished shall be new, free of defects or damage.

B. Pressure vessels shall be ASME-code stamped.

C. Statically and dynamically balance rotating parts.

PART 2 PRODUCTS

2.01 CONDENSER VACUUM PUMPS

A. Performance shall be in accordance with HEI 2854 – Performance Standards for Liquid Ring Vacuum Pumps.

B. Vacuum pump water piping shall terminate with 1 connection each for water supply and drain for pump cylinders and 1 connection each for cooling water supply and return.

C. Vacuum pump air piping shall terminate with 1 connection each for control air, air inlet from condenser header and air discharge from exhaust silencer.

D. Vacuum pump control wiring shall terminate in control panel with connections for remote control.

E. Construction shall permit complete servicing without breaking piping or motor connections.

F. Service: Evacuation and normal high-vacuum operation for steam surface condenser.

G. Type:
1. Package unit.
2. Fully automatic.
3. Each unit shall be provided on single baseplate.

H. Pumps:
1. Type: 2-stage liquid ring design.
2. Speed: 500 rpm or less.
3. Shaft: Steel.
4. Rotors: Shrouded ductile iron.
5. Unit shall require no internal lubrication and shall not be damaged by water vapor, entrained droplets or slugs of water.

I. Coupling: Flexible with coupling guard.

J. Motors: See Section 26 05 03.

K. Heat exchangers:
1. Type: Plate and frame.
2. Plates:
   a. Plate gap: Size to pass spherical particles 0.12" in diameter.
   b. Material: Compatible will cooling water.

L. Cooling water source: By Contractor.

M. Water seal system: Provide with necessary equipment, including but not limited to:
1. Separator:
   a. Gage glass.
   b. Level switch.
   c. Overflow line with check valve.
   d. Rotameter with isolation and drain valve.
   e. Discharge check valve with handle.
2. Centrifugal seal line circulating pump.
3. Valves and piping required for automatic operation.

N. Controls:
1. NEMA 4 control panel.
2. Power supply: 120-volts ac from external source (MCC control power circuit). Provide local light indication of "control power available."
3. Provide capability for remote operation from distributed control system (DCS) for each skid as follows:
   a. Remote RUN command (dry contact by others) shall start/stop vacuum pump.
   b. Remote STANDBY command (dry contact by others) shall enable standby operation of vacuum pump.
4. Provide contact in local control panel to complete circuit and energize vacuum pump motor contactor located at MCC.
5. Skid shall also accept dry contact from motor contactor for seal-in function of standby operation.
6. Provide individual relay circuits (1 Form C) with dry contacts to monitor remote status indication of following:
   a. Vacuum pump On/Off.
   b. Vacuum pump "Standby On/Off."
   c. Auto make-up On/Off.
7. Provide minimum 1 terminal block with 4 terminals in local control panel for customer use (seal water pump run status).
8. Local operation: None.

O. Accessories:
1. Interconnecting piping and valves necessary.
2. Silencers on pump discharge.

P. Paint: Manufacturer's standard.

2.02 IDENTIFICATION

A. Permanently mark each part of complete assembly in accessible locations. Large, visible nameplates shall identify:
1. Equipment model and type.
2. Service conditions.
3. Year built.
4. Serial numbers.
5. Purchaser's tag numbers.

2.03 SOURCE QUALITY CONTROL

A. Major individual items and entire assembled system furnished shall be given industry standard tests at factory during or at completion of manufacture.

B. Test completely assembled units to assure equipment and controls function properly.

C. Perform running test on pumps. Operate at rated capacity and pressure; record capacity, inlet and outlet pressures and temperature, motor horsepower and vibrations.

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Process pumps.

1.02 QUALITY ASSURANCE

A. Equipment furnished shall be new and of proven capability and not prototype design. Design qualification of complete pump set and motor shall be based on operating experience with similarly sized units operating under equivalent conditions of service.

B. Each pump assembly shall include, but not limited to, complete pumping assembly with mechanical shaft sealing and flush piping, couplings, pump bearings, baseplate, and driver. Other components or accessories needed to provide utility service and any other material required to install equipment for intended service requirements shall be provided by Contractor.

C. Materials furnished shall be new, free of defects or damage.

D. Fabricate and assemble to ensure concentric and true mechanical fits and to provide alignment during installation.

E. Products which contain asbestos are prohibited, including items such as packings or gaskets even though item is encapsulated or asbestos fibers are impregnated with binder material.

F. Identify materials by ASTM Specification Number, AISI-type number, or other industry-recognized means of identifying composition and properties of material.

G. Materials of construction shall be those proven by service in similar pump designs and for similar operating conditions.

H. Furnish austenitic stainless steel in solution annealed, unsensitized condition.

I. Equipment supplied shall be free of mercury.

PART 2 PRODUCTS

2.01 DESIGN REQUIREMENTS

A. Statically and dynamically balance rotating parts.

B. Construction shall permit complete servicing without breaking piping or motor connections.

C. Pump connections, unless otherwise noted:
1. 3/4"-2": Threaded or flanged.
2. 2-1/2" or larger: Flanged.

D. Baseplate:
1. Provide separate machined-surface steel baseplate to provide support and alignment.
2. Motor support: Flanged connection.
3. Head and motor stand design shall employ stiffening ribs for strength and rigidity.
4. Provide jacking screws at top of motor stand to facilitate alignment to pump shaft. Provide centering fixture for stuffing box.
5. Provide lifting lugs on pump head and motor to facilitate installation and maintenance.

E. Equipment furnished shall be high quality and suitable for purpose described. Contractor shall guarantee pump performance from suction to discharge flange. Internal losses are to be accounted for within pump and motor rating.

F. Pump design and associated equipment shall be utility grade, suitable for continuous operation with no cyclic or hydraulic limitations at design conditions or any other load between minimum continuous safe flow and one pump runout.

G. Pumps shall be capable of operating continuously over their full operating range without over heating, cavitating, excessive noise or vibration, surging or instability when operating in single or in parallel with other pump.

H. Best efficiency point (BEP) shall be selected at or near design flow for pumps. Power required at motor terminals at near design point values shall be guaranteed and demonstrated during shop testing.

I. Like pumps shall be "identical" as defined by HI standards.

J. As minimum, guidelines of ASME VIII, Division 1 shall be addressed in design of pressure retaining parts of assembly to ensure long-term operability.

K. Size to allow increase of rated head by at least 10% by replacement of impeller.

L. Pumps shall have continuously rising head characteristic as flow is decreased.

M. Motors: See Sections 26 05 01, 26 05 03, and 26 05 09.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install in strict accordance with manufacturer's recommendations.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Self-cleaning, low-pressure, high-volume, pulse-jet fabric filter dust collectors with exhaust fans. Complete package unit; pre-wired bag cleaning system, and all-welded body assembly.

PART 2 PRODUCTS

2.01 DESIGN REQUIREMENTS

A. Locations: boiler building, crusher building and other locations as required to meet environmental requirements.

B. Minimum capacity requirements: per system design.

C. Material to be collected: Dust generated from handling of coal.

D. Dust particle size: 2 to 5 microns.

E. Dust bulk density: 80 lb/cu ft.

F. Dust temperature: Ambient.

G. Air to cloth ratio: 5 cfm/sq ft maximum.

H. Maximum outlet loading: 0.01 gr/dscf.

I. Service: Continuous, uninterrupted.

J. Fire protection: In accordance with NFPA requirements.

2.02 DUST COLLECTORS

A. Maximum fabric filter operating pressure drop: 5" w.g.

B. Filter housing:
1. Construction: All-welded, round.
2. Material: 12-gage steel, minimum, panel construction designed to withstand up to 20" (508 mm) minimum w.g. negative pressure.
3. Explosion venting in accordance with NFPA 68 for collectors for coal handling equipment.
4. Top bag removal with walk-in plenum.
5. Safety handrails, platforms, and ladders for units with walk-in plenums. Coordinate with location and general arrangements.

C. Hoppers:
1. Construction: All-welded, round conical shape.
2. Material: 12-gage steel minimum, panel construction designed to withstand up to 20" (508 mm) minimum w.g. negative pressure.
3. 60° slope minimum.
4. Provide with manufacturer's standard size hinged access doors, minimum 18" (457 mm) square.

D. Bags:
1. Material: fine denier polyester.
2. Weight: Minimum 16 oz/sq yard.
3. Provide grounding in accordance with NFPA 77.

4. Length: 12' (4 m) maximum.
5. Bag cleaning: Compressed air pulse jet.
6. Provide same length and diameter bags for all collectors.

E. Rotary locks:
1. Quantity: 1 for each dust collector hopper outlet.
2. Type: Deep pocket drop-through; capable of discharging collected dust while maintaining negative pressure within collector and storage hopper during operation.
3. Size: Minimum 12" (305 mm).
4. Heavy-duty gear motor.
5. Valve rotor: Replaceable vanes.
6. Maximum speed: 22 rpm.

F. Controls:
1. Locate unit-mounted electronic controls for easy access.
2. Control system shall provide options to initiate cleaning cycle based on high differential pressure and adjustable timer and allow for continuous cleaning.
3. Solid-state electronic timer with duration and interval adjustments.
4. Differential pressure indicating switch:
   a. Provide 1 differential indicating transmitter per dust collector for local indication, high differential pressure control, and high-high differential pressure alarm to monitoring system.
   b. Provide additional solenoid and connect solenoid output line to each impulse line to be used to keep impulse lines free of any dust particulate build-up. Additional solenoid shall pulse line clean during baghouse pulsing.
5. Provide broken bag detector.
6. Controls power supply by others: 120 volts ac.
7. Electrical and instrumentation enclosures: In accordance with NEC requirements for installed location.

G. Shop finish paint:
1. Interior of dust collector shall be painted.
2. Collector shall arrive at jobsite finish-painted.
3. Field touchup of all surface areas damaged during shipment and installation.

H. Accessories:
1. Access platform:
   a. Provide access to controls and access doors, and for inspection and maintenance.
   b. Conform to OSHA requirements.
   c. Size for convenient removal and replacement of bags and cages.
2. Diaphragm valves, pulse pipes, solenoid pilot valves, and compressed air header.
3. Air line filter: Provide regulator and flow control valve for plant air.
4. For walk-in plenum, provide upper access door in clean air plenum.
   a. Size: Minimum 24" (610 mm) wide by 60" (2 m) high; hinged.
   b. Arrange to allow maintenance and change out of bags.
5. External caged ladder and catwalk shall be provided complete with grating, kickplates, and handrails.
6. Support legs for hopper bottom units.

2.03 EXHAUST FANS

A. Design air flow as necessary per system design.

B. Size: Air flow rating shall match dust collector air flow at 13" w.g.

C. Construction:
1. Housing: Welded steel; flanged inlet and outlet connections.
2. Wheel and shaft: Dynamically balanced to comply with median value of Quality Grade G6.3 of ISO 1940 (ANSI S2.19).

3. Provide quick-opening access doors.
4. Manual outlet damper.
5. Provide casing drain and plug.

D. Drive: direct drive.

E. Guards:
1. Conform to OSHA requirements.
2. Belt guard:
   a. Material: Wire mesh.
   b. Size: Minimum 10-gage.
   c. Frame: Angle iron.
3. Shaft guard.

F. Bearings: Grease-lubricated, ball or roller.

2.04 DUCTWORK

A. Ductwork fabrication and installation shall be in accordance with latest edition of SMACNA Round Industrial Duct Construction Standards and NFPA 91 standards.

B. Minimum duct air velocity: 3,500 fpm.

C. Ductwork arrangements shall provide adequate clearances for maintenance.

D. Materials: Galvanized steel conforming to ASTM 526.

E. Fabrication:
1. Ductwork: 16-gage steel minimum thickness in 15' sections (maximum) using welded construction with gasketed and flanged connections.
2. Elbows: 12-gage steel minimum thickness with centerline radius of 2 times duct diameter.
3. Branch entries: 12-gage steel minimum thickness.
4. Hoods: 10-gage steel minimum thickness. Included angle shall be 90º and face area minimum of 2 times duct area. Hoods may be either bolted or welded in place.
5. Clean out doors: 12-gage steel minimum thickness; locate on top or sides of ductwork. Doors hinged and held with snap locks or clamps. Space in accordance with NFPA 91.
6. Blast gates: 12-gage steel minimum thickness; locate in accordance with NFPA 91. Slides shall be locked, or drilled and bolted in place after final adjustment.

F. Permanent test fittings may be installed in ductwork. Cover test holes drilled in ductwork with welded patches.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install equipment in conformance to manufacturer's installation instructions and as shown on Drawings.

3.02 MANUFACTURER'S FIELD SERVICES

A. Provide services of service engineer.

B. Service engineer shall inspect, check, and approve installation, startup, adjustment, and operation of equipment.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Pulse-jet fabric filter baghouse including accessories and supports to control particulate emissions.

1.02 BAG LIFE WARRANTY

A. Fabric filter bags shall be warranted against failure for minimum of 3 years from date of Substantial Completion or 4 years from first gas admission whichever occurs first.

B. For purposes of this bag life warranty, a bag will be deemed to have failed if it has a defect such as a visible hole or tear in the fabric, missing stitching or similar.

C. Replacement bags for bags failing during warranted period shall be furnished and delivered at no cost to Owner. Owner will provide labor for changing bags.

D. If, during guarantee period, more than 10% of bags in any one module fail due to manufacturing defects or installation damage, all modules shall be re-bagged with new bags. Costs for furnishing and delivering bags, removal of old bags, and installation of replacement bags will be at Contractor's expense.

1.03 MAINTENANCE MATERIALS

A. Extra materials:
1. Provide one spare gasket for each access door and one for each manhole.
2. Provide 10% spare bags. Number of bags required = number of bags per module x number of modules x 0.10.
3. Provide 1% spare cages. Number of cages required = number of cages per module x number of modules x 0.01.

PART 2 PRODUCTS

2.01 SYSTEM DESCRIPTION

A. Fabric filter baghouse will receive fly ash-laden flue gas from pulverized coal boiler.

B. Location: Between scrubber and ID fan.

C. Provide flue gas bypass.

D. System operation:
1. Fabric filter system is comprised of individual modules (compartments), internal and other ductwork, necessary operating dampers, process instrumentation and controls, access provisions, and other necessary accessories.
2. Flue gas enters single-point manifold connection where it is distributed to individual modules. At each module, gas passes through inlet isolation damper and enters compartment.
3. Distribution devices evenly distribute gas to bags which are suspended from tube sheet located at top of housing.
4. Flue gas passes through bag fabric from outside of tubular bag to inside. Collected particulate is retained on outer surface of bag and cleaned flue gas exits inside of bag at top, through tube sheet.
5. Rigid wire cage, installed inside bag, prevents its collapse.
6. Exhaust from bags is combined in clean air plenum above tube sheet where it exits through outlet damper into clean air manifold.
7. Discharge from modules is ducted to single point outlet for connection to ID fan.
8. Build-up of particulate on outside surface of bag causes increase in resistance to gas flow, or increase in pressure drop. Build-up of particulate is removed periodically by bag cleaning system.

9. Cleaning is initiated either automatically by reaching preset differential pressure set point or by overriding timer, or manually initiated by operator. Module can also be taken off-line manually for maintenance.
10. When cleaning cycle is initiated, bag cleaning is accomplished by on- or off-line bag pulsing technique.
11. Cleaning is accomplished on line when each row of bags is pulsed one at a time through solenoid-piloted diaphragm valve and piping system. Each bag is pulsed individually through a venturi. Off line cleaning is accomplished by compartments sequentially isolated by closing of outlet damper, and, while module is off-line, pulsing each row of bags same as on-line cleaning process,
12. Following cleaning of bags in off-line mode, each compartment is held off-line for brief period of time to allow settling of dust into hopper before compartment is brought back on-line, and next compartment cleaned.
13. Baghouse bypass will operate automatically during certain upset conditions.

2.02 DESIGN REQUIREMENTS

A. Number of modules: To be determined by Contractor. Baghouse shall be capable of 100% MCR operation while firing Performance Coal with 1 module out of service.

B. Bag cleaning: On-line, pulse jet.

C. Air-to-cloth ratio: 2.7:1, net maximum at MCR while firing Performance Coal. "Net" means one module off-line for cleaning or maintenance.

D. Gas temperature: Normal range of gas temperature as controlled temperature leaving air heater.

E. Gas volume: To be determined by Contractor at high end of normal gas temperature.

F. Design pressure of baghouse and duct: Refer to Section 40 05 16.

G. Dust loading to inlet of fabric filter: To be determined by Contractor grains/acf.

H. Provide instruments, motors, and other electrical components required for complete, operational system for control through DCS.

I. Provide bag leak detection system that provides relative or absolute particulate matter loadings and is capable of detecting particulate matter emissions at concentrations of 10 milligrams per actual cubic meter or less.

J. Emissions guarantees shall be based on baghouse operating in “net” condition with any one compartment out of service up to maximum air to cloth ratio.

2.03 FABRIC FILTER BAGHOUSE

A. Application: Filter fly ash from flue gas generated by pulverized coal boiler.

B. Filter media:
1. Filter media shall be in accordance with manufacturer’s recommendation meeting flue gas and temperature requirements.
2. Bag weight: 16 oz/sq yd, minimum.
3. Bag design shall include minimum 3" wear cuff at bottom of bag.
4. Maximum bag length: 26.5'.
5. No pleated bags.

C. Bag cages:
1. Material: Welded stainless steel wire.
2. Minimum gage: 9.
3. 12 vertical wires with 6" maximum spacing between horizontal wires.
4. Cages shall be rolled so that horizontal wires are inside.

5. Include solid stainless steel cap at bottom of cage.
6. Cages shall be free of burrs or other imperfections which would contribute to bag wear.

D. Venturis: Aluminum or cast iron.

E. Bag, bag cage, and venturi assembly shall attach to tube sheet without tools.

F. Bag layout will be designed to minimize bags touching other bags or structure during operation.

G. Tube sheet:
1. Design for individual top bag and cage removal.
2. Reinforce as required. Design for 50 psf live or 1,000 lb concentrated in addition to bag and waste material loadings.

H. Housing:
1. ASTM A36 3/16" minimum thickness carbon steel, welded construction.
2. Access doors:
   a. Quantity: Minimum of 2 per module.
   b. Minimum opening size: 20" x 48".
   c. Include gastight seals for each access door.
   d. Permanent platforms required to all access doors.

I. Hoppers:
1. Quantity: 1 per module.
2. Configuration: Pyramid or trough with fluidization.
3. Minimum valley angle: 55° from horizontal.
4. Capacity: Minimum of 12 hours of Design Coal and design load.
5. Structural design:
   a. Design shall be adequate to support entire hopper full of fly ash.
   b. Design hoppers to support and provide anchorage for suspended ash handling system.
   c. Material and construction: Same material as baghouse housing; not less than 3/16" thick.
6. Rodding openings: Two 2" NPT male connections at each hopper outlet, with screwed pipe caps secured by a chain.
7. Provide each hopper with two 6" square strike plates extending through insulation.
8. Design shall prevent ash bridging and sticking to hopper walls. Provide fluidization or electromagnetic vibrating unit.
9. Access doors:
   a. Provide separate, interior, inward opening, top-hinged door as well as gastight, exterior, shop-insulated, outer-hinged door.
   b. Minimum opening size: 24" in diameter.
   c. Latch:
      1) Exterior door: Bolted latching mechanism capable of maintaining positive seal after repetitive use.
      2) Interior door: Normal latch.
   d. In addition to latching mechanism, exterior access doors shall be equipped with safety catch. Safety catch shall allow door to open partially, but must be released before door opens fully.
10. External electric heaters:
   a. Provide heaters on all four sides of each hopper, hopper throat, and poke holes: 480 volts, 3-phase.
   b. Type: Modular or cal-rod; self-contained insulated heaters arranged for bolting to hoppers.
   c. Heaters shall be of adequate size to prevent hopper plugging due to moisture condensation.
   d. Heaters shall be thermostatically controlled to provide minimum inside wall temperature of 50°F above sulfur dew point or steady-state flue gas temperature, whichever is greater.
   e. No mineral insulated (MI) cable style heaters allowed.
   f. Thermostat: Adjustable temperature controller with 3-pole contactor, and 480 to 120-volt primary fused control power transformer in NEMA 4X enclosure for each hopper. Temperature readout required. Thermostat and contactor operating coil rated for 120 volts.
11. Insulation and lagging: See Section 40 42 23.

J. Manifolds:
   1. Inlet:
      a. ASTM A36, 3/16" minimum thickness carbon steel construction.
      b. Tapered for constant gas velocity along its length.
      c. Access doors:
         1) Quantity: 1 minimum.
         2) Minimum opening size: 24" diameter.
         3) Hinged, shop insulated, with latching mechanism.
         4) Gastight seals.
      d. Maximum velocity: 3,200 fpm.
      e. Minimum flow must keep particulate in suspension and to prevent drifting in manifold.
      f. Full hopper to be below inlet to keep from having fly ash re-entrainment.
   2. Design for inlet manifold with 1 ft depth of fly ash.
   3. Outlet:
      a. ASTM A36, 3/16" minimum thickness carbon steel construction, designed for -110% maximum ID fan or ±35" wc, whichever is greater.
      b. Access doors:
         1) Quantity: 1 minimum.
         2) Minimum opening size: 24" diameter.
         3) Hinged, shop insulated, with latching mechanism.
         4) Gastight seals.
      c. Maximum velocity: 3,200 fpm.
   4. Guide vanes: Refer to Section 40 05 16.

K. Bypass duct or partition:
   1. ASTM A36 3/16" minimum thickness carbon steel construction, design criteria.
   2. Size bypass duct to pass 100% of flue gas, at design load, with pressure drop similar to that of baghouse.
   3. Application: Bypass will be used only for startup, emergency conditions, excessive flue gas temperature, high pressure drop plus others as recommended by baghouse manufacturer.

L. Dampers and valves:
   1. Provide inlet, outlet, and bypass dampers and valves including linkage, solenoid valves, and pneumatic actuators, except as noted otherwise herein.
      a. Use vertical-shaft poppet-type dampers only, except as noted otherwise herein.
      b. Bypass damper shall be flap-type or poppet style.
      c. Module inlet dampers shall be butterfly dampers or poppet style.
      d. Actuators: Cylinder type operators with speed checks, exhaust silencers, and PRVs.
   2. Each module shall have following dampers:
      a. Inlet isolation damper.
      b. Outlet primary damper.
   3. Parts subjected to wear shall be replaceable.
   4. Valves and dampers shall "fail-safe" upon loss of signal or loss of power. Valves, dampers, and operators shall be easily accessible by means of ladders or platforms.
   5. Remotely operated valves and dampers shall be provided with limit switches in both full-open and full-closed positions.
   6. Solenoid valves for pneumatically-operated dampers shall be supplied with 120-volt high temperature ac coils and manual operators. Solenoid valves shall be located between 3' and 5' above floor or platform.
   7. Controls and actuators shall be located sufficiently far from heat radiating surfaces and in ventilated areas to allow access by maintenance personnel.
   8. Damper shafts and bearings shall be provided with lubrication fittings suitable for high temperature service accessible from platforms. Bearings shall be external to gas flow and accessible during operation.
   9. Dampers shall be of heavy-duty construction, capable of nearly tight shut-off and mounted in separate welded frames with predrilled flanges. Leakage shall be less than 1%, except bypass damper shall have less than 0.5% leakage.
   10. Dampers and valves shall have metal-to-metal seats; tightness shall be adjustable.
   11. Valves, dampers, and actuators shall be factory assembled.
   12. Poppet dampers: Type 316 stainless steel sealing elements.

M. Expansion joints: Refer to Section 40 05 16.

N. Air storage tank:
1. Quantity: 1.
2. Size: As required to limit peaks in compressed air usage and also to complete 1 baghouse cleaning cycle.
3. Type: Vertical or horizontal as required to fit general arrangement, cylindrical, welded steel construction.
4. ASME stamp and certify in accordance with Section VIII, Division 1 of ASME Boiler and Pressure Vessel Code.
5. Accessories:
   a. One pressure gage:
      1) Accurate to within 1% of span.
      2) Pressure element: Bourdon tube or bellows, manufactured from materials suitable for service application.
      3) Dial: Direct reading, minimum 4" diameter. Scale shall be selected so that normal operating range is between 33% and 67% of span.
      4) Connection: 1/2" threaded.
      5) Solid front and back blow-out protection.
   b. One pressure relief valve (PSV):
      1) Relief (safety) valve: Use for pressure-relieving services as required by ASME Boiler and Pressure Vessel Code.
      2) Relief valves shall be modulating pressure-relieving devices that start to open at 100% of set pressure and are fully open at 110% of set pressure.
      3) Valve bodies and trim: Manufacturer's standard for specified service unless specifications require bodies and/or trim of other construction.
         a) Relief valves: Conventional- or balanced-type, closed bonnet.
         b) Valves shall have screwed connections for inlet sizes to 2" unless mating connection is flanged.
         c) Lifting levers shall be furnished for relief valves.
   c. Drain valve: Provide with manual and automatic drain.
   d. One pressure transmitter. Refer to Section 40 91 00 for requirements.

O. Bag pulse cleaning assembly consisting of air supply header, solenoid and diaphragm valves, blowpipes, venturis, and accessories shall be of manufacturer's standard design.

P. Provide for horizontal movement of baghouse on supports due to thermal expansion and contraction. Provide teflon-coated slide plates on sliding supports.

Q. Structural metal framing: Refer to Section 05 10 00.

R. Field-mounted instruments: Refer to Section 40 91 00.

2.04 ENCLOSURE

A. Enclose baghouse penthouse.

2.05 SHOP PAINTING

A. Provide shop prime painting on interior and exterior structural steel framing, high- and low-temperature pipe, miscellaneous structural steel, and miscellaneous metals in accordance with Section 09 90 00.

B. Shop prime painting not required on surfaces to be covered with insulation and lagging.

PART 3 EXECUTION

3.01 MAINTENANCE

A. Each compartment of baghouse shall be capable of being isolated for maintenance while balance of baghouse is still on line. Provide OSHA required lockouts.

3.02 FIELD QUALITY CONTROL

A. Perform tests as necessary to verify equipment meets emissions requirements for Design Coal specified. Performance other than emissions will be based on Performance Coal.

B. Refer to Section 01 45 16 for description of tests performed to assure equipment meets design conditions and guarantees.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Circulating fluid bed (CFB) absorber.

B. Gas humidification system.

C. By-product recirculation and removal system.

D. Hydrated lime storage and supply system.

E. Performance acceptance tests.

PART 2 PRODUCTS

2.01 CFB SCRUBBER SYSTEM DESCRIPTION

A. Flue gas enters bottom of CFB absorber and travels vertically upward.

B. Dry hydrated lime reagent and recirculated by-product shall be introduced into flue gas stream so the mixture is evenly dispersed in CFB absorber.

C. Cooling water shall be introduced to control surface humidity conditions of solids and enhance SO_2 removal and lime utilization.

D. By-product exiting CFB absorber is collected in downstream fabric filters.

E. By-product material shall be metered from fabric filter collection hoppers onto airslides. A portion of material is recirculated to CFB absorber. Excess material shall be diverted by gravity to product storage bin for removal.

2.02 LIME SYSTEM DESCRIPTION

A. Hydrated lime shall be metered from silo to de-aeration bin used to prevent surging of hydrated lime. Hydrated lime shall leave deaeration bin through a speed rotary valve for feed rate control to CFB absorber. Metered hydrated lime shall feed through a rotary valve and onto a reagent airslide feeding CFB absorber. A second variable speed rotary valve shall be included to allow contents from hydrated lime silo to be fed directly to reagent airslide.

2.03 DESIGN REQUIREMENTS

A. CFB scrubber system shall meet emission guarantees specified while handling 100% of gas flow while burning Design Coal specified. CFB scrubber system shall meet reagent usage guaranteed while handling 100% of gas flow while burning Performance Coal specified.

B. CFB scrubber capable of complying with emission limits down to 35% MCR.

C. Service Water shall be used for cooling water source.

D. Lime system shall be capable of supplying sufficient lime for boiler design conditions operating at full load burning highest sulfur Design Coal.

E. Design each system to handle upset condition resulting from failure of air heater.

F. Provide access openings at strategic locations to provide for inspection, cleaning, and maintenance. Access doors shall be gastight and of quick-opening type. Elevate absorber to permit 10' access

under lowest point which would collect particulates. Locate access door at lowest point to permit removal of accumulated particulate. Design door to open with accumulation of material above door.

G. Design absorber module to facilitate easy and rapid access to cooling water injection nozzles.

H. Design equipment for ease of repair.

I. Provide instruments, motors, and other electrical components required for complete, operational system for control through DCS.

J. Provide shop prime painting on interior and exterior structural steel framing, high- and low-temperature pipe, miscellaneous structural steel, and miscellaneous metals in accordance with Section 09 90 00. Shop prime painting not required on surfaces to be covered with insulation and lagging or inside of ductwork or piping.

2.04 CFB ABSORBER

A. Quantity: 1.

B. Capacity: Treat 100% of flue gas while operating at MCR.

C. Material:
1. Vessel wall areas.
   a. Diverging section and first course: 1/4" thick minimum ASTM A514.
   b. Second course to fabric filter inlet: 1/4" thick minimum ASTM A36.
2. Venturis: 1/4" thick minimum abrasion-resistant steel.

D. Construction:
1. Space external stiffening ribs as necessary to provide support for vessel skins. Design joints to be assembled airtight and watertight.
2. Refer to Section 40 05 16 for design pressure.
3. Absorber shall withstand internal and external pressure with not more than L/240" deflection in panel or reinforcing member during normal operation, where L is center to center spacing of stiffeners. Large deflection theory with deflection not exceeding 2x plate thickness may be used instead of L/240" criteria.
4. Access doors and hatch covers:
   a. Use: Access to interior of absorber module for maintenance purposes.
   b. Access doors shall have separate, interior, gastight hinged door and exterior shop-insulated outer hinged door.
   c. Minimum opening size: 20" x 48".
   d. Latching device:
      1) Interior door: Bolted latching mechanism capable of maintaining positive seal without use of gaskets.
      2) Exterior door: Normal latch.
      3) Equip access doors with safety catch to allow door to open partially, but shall be released before door opens fully.
   e. Provide access doors and hatch covers with means to facilitate padlocking in open position to prevent accidental closing while maintenance personnel are inside.
   f. Provide module lock out stations at each door.
5. Maintenance and access platforms: Provide at intermediate levels.
6. Provide gas inlet with internal deflector plates designed to prevent distribution, short circuiting, and localized abrasive impingement of fly ash on absorber internals.
7. Design absorber vessel, ductwork and associated support steel to support mass of absorber vessel filled with fly ash to 2' depth minimum.
8. Equipment which has been idled shall be capable of being restarted without damage caused by settled solids or other process problems.

2.05 GAS HUMIDIFICATION SYSTEM

A. Humidification water storage tank:
1. Quantity: 1.
2. Capacity: Minimum 1 hour storage while operating at MCR.
3. Type: Vertical, cylindrical, closed-top tank with flat bottom.
4. Location: Adjacent to CFB absorber, inside enclosure.
5. Material: ASTM A283, Grade C, or ASTM A36, 3/16" minimum thickness steel plate; ASTM A36 structural elements. Provide stiffeners on tank exterior as necessary. Provide internal epoxy lining.
6. Provide nozzles, connections, drain valves, baffles, and accessories.
7. Ladder, platform, and handrails: Provide as necessary for access to top of tank from operating floor meeting requirements specified.
8. Construction: Full penetration butt welded. Grind inside surfaces smooth; remove burrs and weld flush on external surfaces.

B. Humidification water injection pumps:
1. Quantity: 2.
2. Capacity: Each capable of supplying 100% water requirements while operating at MCR.
3. Type: Horizontal, centrifugal, multi-stage.
4. Location: Adjacent to humidification water storage tank.
5. Design requirements:
   a. Design pumps for ease of dismantling for inspection and maintenance without having to remove piping.
   b. Size pumps with adequate margins on head and capacity to ensure scrubber modules can achieve specified ratings.
   c. Pumps shall be suitable for 24 hours per day operation.
   d. Construct pumps of corrosion- and erosion-resistant materials specially suited for long life in intended service.

C. CFB absorber water spray injection nozzles:
1. Material: Stainless steel.
2. Quantity: As required, plus one spare per unit.
3. Provide with quick disconnects.

2.06 HYDRATED LIME STORAGE AND SUPPLY SYSTEM

A. Hydrated lime silo:
1. Quantity: 1.
2. Capacity: 3 days storage operating at MCR.
3. Accessories:
   a. Fill pipe and target box.
   b. Bin vent filter with fan.
   c. Bin bottom aeration.
   d. Double discharge:
      1) Normal feed to deaeration bin:
         a) Manual slide gate.
         b) Pneumatic slide gate.
         c) Rotary valve.
      2) Emergency feed to lime air slide:
         a) Manual slide gate.
         b) Rotary valve.
   e. Deaeration bin with air operated single outlet slide gate valve.
   f. Air slide to CFB absorber.

B. Lime silo fluidization equipment:
1. Hopper bottom aeration.
2. Hopper fluidizing air blowers.
   a. Quantity: 2.

b. Capacity: Each capable of supplying 100% air requirements while operating at MCR.
3. Hopper fluidizing air heaters: Number of heater banks shall be 2 operating, 1 for startup, 1 spare; 4 total.

C. Brine storage and injection equipment, if required:
1. Brine storage tank.
a. Quantity: 1.
b. Capacity: Minimum 4 hours storage while operating at MCR.
c. Material: FRP.
2. Brine transfer pump:
a. Quantity: 2.
b. Capacity: Each capable of supplying 100% brine water requirements while operating at MCR.

2.07 BY-PRODUCT RECIRCULATION AND REMOVAL SYSTEM

A. Components:
1. Hopper bottom aeration.
2. Hopper fluidizing air blowers.
a. Quantity: 2.
b. Capacity: Each capable of supplying 100% air requirements while operating at MCR.
3. Hopper fluidizing air heaters: Number of heater banks shall be 2 operating, 1 for startup, 1 spare; 4 total.
4. Manual knife gate valves.
5. Dosing valve: 1 per trough hopper.
6. Overflow discharge pipes: As required.
7. Expansion boots and chutes.
8. Hopper level detectors: 4 per fabric filter hopper.
9. Airslide conveyors: As required.
10. Airslide fluidizing air fans.
a. Quantity: 2.
b. Capacity: Each capable of supplying 100% air requirements while operating at MCR.
11. Airslide fluidizing air heaters: Number of heater banks shall be 2 operating, 1 for startup, 1 spare; 4 total.
12. Airslide fluidizing air piping, valves fittings and supports.
13. Ash by-product storage bin.
a. Quantity: 2.
b. Capacity: Each sized for minimum 4 hours storage at MCR.

2.08 ACCESS, PLATFORMS, GALLERIES.

A. Design and supply of access platforms, galleries, stairs and/or ladders shall be provided for equipment requiring routine maintenance.

PART 3 EXECUTION

NOT USED

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Water treatment chemical applications requirements for storage, feed, and control equipment and facilities.

1.02 QUALITY ASSURANCE

A. Contractor shall be responsible for integrity of components and materials of construction.

1.03 DELIVERY, STORAGE, AND HANDLING

A. Gasket surfaces, threaded connections, and flange faces shall be thoroughly cleaned and protected for shipment and storage.

B. Crates, boxes, bags or items shipped loose or skidded shall be marked or tagged.

PART 2 PRODUCTS

2.01 DESIGN REQUIREMENTS

A. Provide separate chemical feed system for each unit and for common systems.

B. Equipment furnished shall be fabricated from materials compatible with fluids coming in contact with equipment.

C. Chemical storage system design for each product application shall consider:
1. Chemical product calculated use rate.
2. Product shelf life and required storage conditions (e.g. time, temperature, UV exposure, etc.).
3. Product delivery method, quantity and logistics.
4. Containment of spills or leaks.
5. Indoor vs. outdoor chemical storage impact on compliance with building and fire codes.

D. Each chemical feed system shall be prefabricated and shipped as single, complete, nonleaking, skid-mounted unit with tanks (if required), suction piping, low-level switches and accessories in place, except where otherwise noted in this Specification.

E. Where possible chemical feed systems shall be designed to feed undiluted chemical products. Dilution mix tanks shall be used only as needed to assure system designs are capable of proper chemical feed control across the full range of all operating conditions.

F. Pumps:
1. Where possible, pumps shall be of same basic model; differing only in materials, capacity, pressure rating, motor size and dimensions.
2. Unless specified differently, chemical metering pumps shall be diaphragm, positive displacement, metering type with provisions for changing stroke length from 0 to 100% by means of micrometer adjuster while pumps are operating. Packed-piston pumps shall be used only where pumping conditions dictate this option.
3. Chemical metering pumps shall have guaranteed repetitive accuracy of ±1% of full range. Pumps shall have highest practical turndown ratio for neat-feed applications.
4. Unless specified otherwise, pumps shall be furnished with adjustable internal or external pressure relief valves. Relief valves shall be set by manufacturer at specified relief pressure.
5. Chemical metering pump skids for cooling tower make-up water and circulating water chemical feeds shall have back-pressure check valves.

6. Mount pumps furnished as part of packaged system on structural steel skid protected with chemically resistant coating.
7. Chemical metering pumps speed shall not be greater than 130 strokes per minute.
8. Chemical metering pumps shall be capable of pumping to at least 20 psig above backpressure check valve setting.
9. Wetted portions/components of pumps, piping, valves, fittings and accessories shall be chemically compatible with materials being pumped. Type 316 stainless steel is preferred; use wherever suitable.
10. Sulfuric acid pumps, piping, valves, fittings and accessories shall be manufactured of Alloy 20 stainless steel.

G. Calibration columns: Provide for draw-down chemical feed rate measurement consistent with pump capacity. Plumb to suction of pump with appropriate isolation valving for draw-down procedures.

H. Strainers: Each metering pump shall be furnished with Y-type strainer made from chemically compatible materials, Type 316 stainless steel where possible, installed on suction side of each pump. Pulsation dampeners shall be provided between metering pumps and back-pressure check valves.

I. Chemical injection quills:
1. Injection quills shall be provided constructed of chemically compatible materials of construction to assure proper chemical mixing and prevent localized corrosion potential.
2. Retractable injectors or corporation stop fittings shall be provided for applications injecting chemicals into systems under pressure requiring periodic cleaning for on-line maintenance, particularly sodium hypochlorite injections into pressurized water lines.

J. Design chemical containments and provide around chemical storage areas, tanks, and chemical feed systems to prevent uncontrolled spills or leaks and facilitate safe removal and clean-up of chemical spills or leaks. Suitable chemically resistant coatings and materials of construction shall be used to assure containment integrity.

K. Packaged system interconnections:
1. Interconnection piping, fittings, and valves between pumps and tanks shall be furnished and installed with each system. Design for 100 psig minimum working pressure.
2. Fabricate valve and fitting materials of 1/2" (13 mm) minimum from chemically compatible materials, Type 316 stainless steel where possible.
3. Where required to provide proper metering under specified conditions, Provide 1 backpressure valve for each pump. Valves shall be furnished installed in pump discharge piping.
4. Provide valved pressure gages with diaphragm seal in discharge line of each metering pump.

L. Low-level switches: Provide on solution day tanks. Switches shall operate when liquid level in tanks is 6" (150 mm) above pump suction connection. Each level switch shall have at least 2 DPDT switches.

M. Skid mountings:
1. Structural skids: Carbon steel. Brace to provide rigid support of mounted components during shipping and handling and after equipment is placed in service.
2. Support structures: Welded construction. Pumps and tanks shall be rigidly fastened or bolted to skid.
3. Furnish skids with lifting lugs.
4. Structural steel skids finish: Use chemically resistant coatings suitable to service. Apply exactly in accordance with manufacturer's instructions.

N. Control panels:
1. Each skid shall have pre-wired control panel for skid-mounted components.
2. Provide "Start-Stop" or "On-Off-Auto" switch as required for each pump and each agitator.
3. Provide wiring terminal point for each skid-mounted component including level switches, etc.

4. Enclosure: NEMA 4X.
5. Motor controller shall be furnished and installed in control panel for each pump.
6. Provide single point 480-volt power supply termination with integral disconnect means for each skid. Provide integral control power transformers as required to service lower voltage components.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install in accordance with manufacturer's requirements.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Valve identification and accessories.

1.02 DESIGN REQUIREMENTS

A. Provide high-point vent valves and low-point drain valves. High-point vent valves shall be 1" globe valves and low-point drain valves shall be 1" gate valves unless noted otherwise. High-point vents and low-point drain lines shall be double valved when piping system is ASME Class 600 and above.

B. Valves located in boiler code piping shall be constructed in accordance with ASME Boiler and Pressure Vessel Code.

C. Parts in contact with feedwater, condensate, or steam associated with turbine cycle shall be copper-free.

D. Valve end preparations shall comply with following:
   1. Butt weld ends:
      a. Nominal pipe wall thickness 0.375" and less shall conform to ASME B16.25
      b. Nominal pipe wall thickness greater than 0.375" shall conform to ASME B16.25
   2. Threaded joints shall conform to ASME B1.20.1.
   3. Grooved ends shall conform to AWWA C606.
   4. Solder joints shall conform to ASME B16.18.
   5. Flanged ends: ASME B16.1, ASME B16.5, ASME B16.47 or AWWA C207 as applicable.

E. Valves shall be suitable for operator mounting (handwheel, bevel gear, motor operator, air actuator) with valve in any position without external support.

F. Check valves:
   1. Suitable for operation in horizontal and vertical flow up piping arrangements.
   2. Manufacturer shall check size to assure proper operation when operating conditions are provided in Valve Schedule.

1.03 QUALITY ASSURANCE

A. Design and construct ferrous valves in accordance with ASME B16.10 and ASME B16.34.

B. Valves in potable water service shall be in compliance with NSF 61.

C. Valves shall be stamped with 100ºF rating that meets or exceeds specified hydrostatic shell and closure test pressures.

D. Valves associated with fire protection system shall be UL-listed and FM-approved.

PART 2 PRODUCTS

2.01 ACCESSORIES

A. Hand wheels and levers:
   1. Valves shall be provided with hand wheels or levers unless noted otherwise.
   2. Valves installed in areas inaccessible to platforms shall be provided with chain wheels. Provide chain wheel operators for manual valves with hand wheel operators in horizontal plane located more than 6'-6" above floor, unless noted otherwise. Provide sufficient chain to bring operation down to 6'-6" above floor.

B. Gear operators:
1. Gates, globes, plug, and angle valves: Bevel gear manual operators shall be provided on following valves.

Valve Pressure Class	Valve Size
300 and lower	6" and larger
600	4" and larger
900 and above	2-1/2" and larger

2. Quarter turn valves: Worm gear or screw operator shall be provided on valve sizes 10" and larger.
3. Maximum operator force required to stroke valve against maximum differential pressure: 75 lb.
4. Valve operators shall be designed to withstand hydrostatic test without damage.

C. Mctor operators:
1. Motors shall be designed and constructed to applicable requirements of NEMA, ANSI, AFBMA, and IEEE standards.
2. Select and apply for equipment duty service in accordance with requirements of NEMA MG-1 and MG-2 standards and NEC.
3. Differential and static pressures: Operator shall be sized to open or close against maximum differential pressure equivalent to design pressure of pipe, unless noted otherwise.
4. Design and construction:
   a. Design for high-torque, reversing service in a 50°C ambient temperature.
   b. Class F nonhygroscopic insulation sealed with minimum of 2 dips and bakes of epoxy varnish.
   c. Temperature rise shall not exceed 70°C rise by resistance in 50°C ambient for time rating furnished.
   d. Gear trains: All-metal.
   e. Enclosures:
      1) Cast iron or steel, NEMA 4, totally enclosed, nonventilated, weatherproof, dusttight; suitable for outdoor service.
      2) Enclosures located in coal handling areas shall be Class II, Division 1, Group F.
   f. Antifriction bearings: Double-shielded, grease pre-lubricated, regreaseable. AFBMA minimum L-10 rating life of not less than 15,000 hours.
   g. Design for installation in any position without lubricant leakage or other operating difficulties.
   h. Motor leads shall be terminated in limit switch compartment.
5. Rating:
   a. AC motors: 460 volts, 3-phase, 60 Hz, unless noted otherwise.
   b. Motor starting torque: Not less than 500% of rated full load torque.
   c. Motor time rating for normal opening and closing service shall exceed largest of following:
      1) As required for three successive open-close operations.
      2) As specified elsewhere.
      3) As required for service.
      4) 15 minutes.
   d. Where specified or necessary for service, valves designed for modulating service shall have motors rated for continuous duty and for frequent starting (12 starts/stops an hour) and stopping service.
   e. Sufficient torque shall be provided to open or close valve against maximum differential pressure and static pressure at 90% nominal voltage for ac motors.
6. Accessories: Motor operators shall be supplied with following:
   a. Conduit ports: Provide separate conduit ports for controls and power connections.
   b. Hand wheel and position indicator:
      1) Provisions shall be made for manual engagement of hand wheel at any time except when motor is energized.
      2) Hand wheel shall automatically disengage when motor is energized.
   c. Rotary drum limit switches:
      1) Provide when P&ID indicates requirement for limit switches.
      2) Capable of being set to trip at any point between fully open and fully closed positions.
      3) Quantity: 4.

4) 2 normally open and 2 normally closed contacts.
d. Double-torque limit switches shall be provided to limit opening and closing thrust.
e. Reversing starters: Integral.

D. Air operators:
1. Type: Pneumatic, spring return.
2. Equip actuator with combination filter regulator with pressure gage, if required, set to limit air pressure to maximum allowable air pressure for each actuator.
3. Enclosures:
a. Cast iron or steel, NEMA 4, totally enclosed, nonventilated, weatherproof, dusttight; suitable for outdoor service.
b. Enclosures located in coal handling areas shall be Class II, Division 1, Group F.
4. Solenoid valve for control:
a. Provide with each actuator.
b. 120-volt ac.
c. 3-way type with threaded conduit connections.
5. Limit switches for control:
a. Provide with each actuator.
b. DPDT contacts.
6. Provide stainless steel tubing with stainless steel fittings for control tubing interconnection of pneumatic accessories.

E. Bypass and drains:
1. Provide in accordance with MSS SP-45.
2. Bypasses shall contain globe valves capable of sealing in both directions.
3. Bypass valves and piping shall have pressure-temperature ratings meeting or exceeding main valve.
4. When main valve body material is 9% chrome, materials for bypass and drain piping and valves may be 2.25% chrome.
5. Minimum piping schedule: 80.

F. Bonnet vents:
1. 3/4" tapped vent hole equipped with shop-installed pressure relieving sentinel valve.
2. Sentinel valve set pressure: Equal to valve rating at specified design temperature.
3. Install in vertical position.
4. Instead of sentinel relief valve, Contractor may provide equalizing piping between bonnet, upstream, and downstream side of main valve. Equalizing piping shall contain valves to enable main valve to seal in both directions. Materials for piping and valves shall be equivalent or superior to main valve. When main valve body material is 9% chrome, materials for piping and valves may be 2.25% chrome.

G. Vacuum service: When valves are subject to a vacuum, valves shall have packing designed to minimize air leakage into valve with external pressures of 15 psia and full vacuum on valve interior.

2.02 SOURCE QUALITY CONTROL

A. Hydrostatic tests: Valve shall be subjected to hydrostatic shell and seat leakage tests in accordance with ANSI B16.34 and MSS SP-61. Maximum seat leakage during closure tests shall not exceed:

PART 3 EXECUTION

3.01 INSTALLATION

A. Install valves in accordance with manufacturer's recommendations and Section 40 05 13.

3.02 FIELD QUALITY CONTROL

A. Hydrostatic tests: Valve shall be suitable for field hydrostatic pressure tests, in closed position of 1.5 times design pressure of system.

B. Radiographic examination: As required by code. Special class and intermediate class valves shall be radiographically tested in accordance with ANSI B16.34.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Medium-voltage, generator class, isolated-phase bus (IPB) system.

1.02 CLOSEOUT SUBMITTALS

A. Operation and maintenance manuals. Provide at a minimum:
1. General description and technical data.
2. Receiving, storage, installation, and testing instructions.
3. Detailed welding instructions.
4. Operating and maintenance procedures.
5. Complete set of reviewed drawings that require no further action.
6. Complete documentation of inspections and tests performed, including any logs, curves, and certificates. Documentation shall note any replacement of equipment or components that failed during testing.
7. List of recommended spare parts.

1.03 ENVIRONMENTAL REQUIREMENTS

A. Design of IPB system and supporting structures shall be suitable for the service conditions.

B. See Section 01 30 00 for environmental design conditions.

1.04 MAINTENANCE MATERIALS

A. Provide complete set of special tools as necessary for installation for each piece of equipment. Tools and intended use shall be identified in assembly instructions.

1.05 QUALITY ASSURANCE

A. Manufacturer's qualifications:
1. Manufacturer shall be manufacturer of major components within assembly and shall be ISO certified.
2. Manufacturer shall have produced similar equipment for a minimum period of 5 years.

B. Regulatory requirements: System shall be in accordance with applicable requirements of ANSI/IEEE C29, C37.23, C37.24-1971, IEEE Std. 4, NEMA CC1, and AWS D1.2.

PART 2 PRODUCTS

2.01 SYSTEM DESCRIPTION

A. IPB system includes, but is not limited to:
1. Hardware and components for:
   a. Connection to generator compartment and generator terminal equipment.
   b. Transformer connections.
   c. Generator breaker, if applicable.
2. Bellows.
3. Flexible links.
4. Expansion joints.
5. T-taps.
6. Elbows.
7. Seal off and wall seal assemblies.
8. Indoor and outdoor support structures.
9. Accessories.

2.02 CONDUCTOR

A. Construct from aluminum alloy, either extruded circular tubing or rolled from sheet to form circular tube with welded longitudinal seams.

B. Paint conductor exterior flat black to increase heat dissipation.

C. Provisions shall be made at connections to equipment for use of flexible braided, laminated, or rope-lay copper connectors. Coordinate with other equipment suppliers and provide flex connectors, hardware, and insulating material for making connections.

D. Bolting hardware shall be compatible with conductor materials and resistant to corrosion.

E. Bus parts for installation by others shall be properly identified and segments shall be match-marked for field assembly.

F. One meter of extra conductor shall be provided per phase, per type of bus for field makeup purposes.

2.03 PHASE ENCLOSURES

A. Design shall be electrically continuous with cross connection bonding plates welded at each end of runs with taps joining enclosures of each phase.
   1. Bonding plates shall provide low-resistance path between phase enclosures to safely carry circulating currents without exceeding allowable temperature rise.
   2. Provide ground pads for connection of bonding plates to station ground grid.

B. Fabricate bus enclosures from high-conductivity aluminum sheets, rolled and formed into circular shape with fully welded longitudinal seams.

C. Enclosures located indoors and outdoors shall be weatherproof, designed for outdoor service.

D. Design of enclosures shall allow for thermal expansion, contraction, and equipment vibration isolation to prevent overstress on any part of bus assembly or supports.

E. Provide access panels for equipment requiring access including disconnecting links and termination enclosures. Access panels shall be permanently match-marked for easy installation and shall use stainless steel, captive fastening hardware.

F. Exterior bus enclosure temperature shall not exceed 80°C at any point, taking into account solar heat gain.

G. Interior of enclosures shall be finished flat black to aid in heat dissipation.

H. Prime paint exterior and provide final paint finish with manufacturer standard color.

I. Use Type 304 stainless steel hardware for fasteners used on duct interior and conductor joints. Use stainless steel conical washers on bolted joints.

J. Enclosure shall be rated to carry 100% of conductor rated current.

K. Fit enclosure with factory-welded castings for bolt-in installation and removal of each insulator assembly. Casting shall be gasketed for positive sealing of enclosure.

L. Bus parts for installation by others shall be properly identified and segments shall be match-marked for field assembly.

M. One meter of extra phase enclosure shall be provided per phase, per type of bus for field make up purposes.

2.04 SPLICES

A. Design conductor and enclosure segments to minimize shipping splits and reduce field welding.

B. Weld conductor runs assembled in factory for shipment as a unit. Fit factory-welded conductor sections with backing rings and beveled ends for 100% weld penetration and reinforcement.

C. Enclosure and bus conductor splices that require field welding shall be prepared at factory.

D. Enclosure covers shall be split design requiring both radial and longitudinal welding of seams to provide weathertight and dusttight seal, and maintain structural integrity.

E. Horizontal and vertical elbows shall be designed and shop-welded at factory.

2.05 INSULATORS

A. Isolate conductor from enclosure using wet-process, porcelain-type insulators.
   1. Rigidly fasten to aluminum casting welded to bus enclosure.
   2. Exterior mechanical fasteners shall be Type 316 stainless steel.

B. Insulator compressive, cantilever, and tensile strength properties shall be based on specified momentary ratings.

C. Furnish conductor support insulators at each location in quantities as determined by size and weight of conductor, short circuit levels, and BIL requirements.

D. Mount insulators such that they are externally removable from enclosure for replacement when bus is de-energized.
   1. Disassembly of bus enclosure or temporary support of bus conductor shall not be required.
   2. Insulator mounting plates shall be electrically bonded to adjacent enclosure.

E. Spring-loaded, self-centering conductor support saddles on insulators shall hold bus conductor in place during faults, but allow conductor movement for expansion. Do not rigidly fasten insulators to conductor.

2.06 EXPANSION JOINTS

A. Manufacturer shall determine location and quantity to compensate for effects of bus thermal expansion due to continuous current at rated ambient versus de-energized bus at minimum ambient conditions. As a minimum, provide expansion joint in each single-phase run of main bus.

B. Expansion joints shall provide for simultaneous conductor and enclosure movement. Joints shall be manufacturer's standard proven design.

2.07 TERMINATIONS

A. Isolated-phase bus connections at generator shall establish main bus horizontal elevations and center-to-center phase spacing.

B. Provide mounting plate fabricated to interface with generator terminal enclosure without field modification.
   1. Make provisions for connection of bus enclosures to mounting plate.
   2. Provide removable access plates adequately sized to allow room for standard terminations to be made. Access plates shall have bonding connections.

C. Enclosure connections between mounting plate and bus enclosures shall incorporate insulated flexible bellows to maintain isolation between equipment and bus enclosures and to prevent vibration from being transmitted from terminal enclosure to bus enclosures.

1. Removal of bellows assembly shall be capable without disassembly of any bus conductor or enclosure.
2. When bellows assemblies are removed, there shall be unobstructed space for installation of flexible link connectors.

D. Include sufficient quantity of spade lugs welded to plate for termination of flex connectors.

E. Contact areas of spade lugs and flex connector lugs shall be tin- or silver-plated depending on surface area or temperature rise design. Coordinate configuration of welded spade arrangement with generator line side bus arrangement configuration.

F. Provide seal -off assembly for each enclosure for generator line terminal enclosure. Seal-off bushings shall be capable of preventing migration of hydrogen into bus enclosure in event of leakage at generator bushing.

G. Coordinate details of terminal connections and mounting arrangements at generator and generator breaker with suppliers. Transformers shall be furnished with circular raised flanges at each bushing for connection of IPB to transformer.
1. Furnish bus with flange plate to match transformer raised flange plate and bolt hole spacing for each bushing.
2. Design bushing enclosure to maintain electrical clearances within enclosure for maximum rated voltage of bushings. Bushing enclosure shall have removable access plate with bonding connections to allow access for bushing terminations.
3. Main bus enclosure connections to bushing enclosures shall incorporate insulated flexible bellows to maintain isolation between bus enclosures and transformer to prevent vibration from being transmitted to bus enclosure.
4. Design flexible bellows that removal of bellows assembly can be done without disassembly of any bus conductor or enclosure.
5. Bellows assembly shall also allow unobstructed space for installation of flexible link connectors and insulating boots or tape.
6. Flexible links and bellows shall provide transition means for physically disconnecting transformer from IPB and enclosure without having to cut bus enclosure or conductor.
7. Cap conductor ends at terminations with aluminum plates with sufficient number of spade lugs welded to plate to allow termination of flex connectors. Contact areas of spade lugs and flex connector lugs shall be tin- or silver-plated depending on surface area and temperature rise design. Coordinate configuration of welded spade arrangement with transformer bushing.
8. Provide enclosure seal off assembly for each enclosure at transformer bushing enclosure. Coordinate details of transformer bushings and mounting arrangements at transformers with transformer suppliers.

H. If in-line generator breaker is used, weld into isolated phase bus enclosure and bolt onto phase conductor. Manufacturer shall provide connection hardware and accessories.

I. Flexible links shall be such that when removed, electrical clearance between link terminals will allow energization and use of equipment continuously on both sides.

2.08 WALL SEAL UNIT

A. Furnish for locations where bus duct passes through building walls.

B. Provide aluminum wall plate and frame with porcelain bushings surrounding bus resulting in airtight installation.

C. Provide mounting bolts for fastening wall plate to building wall.

D. Wall seal plates shall sustain maximum wind load under site conditions with a deflection less than or equal to L/240.

E. Wall seal plates shall have fire rating to match fire rating of the penetrating wall.

2.09 SUPPORT STRUCTURES

A. Design, fabricate, and ship required bus support structures, base plates, and miscellaneous hardware necessary to support indoor and outdoor IPB assembly.

B. Design support structures to accommodate for project wind, snow load, and seismic conditions. Supports shall take into consideration full static and dynamic forces imposed by bus system under short circuit conditions.

C. Provide supports at each 90º horizontal bend for each main bus run.

D. Provide steel work and support of bus duct at generator. Support shall be independent of generator frame, bushings, and generator pedestal. No weight shall be exerted on generator bushings.

E. Coordinate supports with equipment and foundations located below bus assembly.

F. Provide loading information for IPB foundation design. Foundation design will be by others.

G. Structural supports, base plates, anchor bolts, miscellaneous hardware, and welding shall be manufacturer's standard unless specified in otherwise.

2.10 POSITIVE PRESSURE AIR SYSTEM

A. Furnish tap connection in each single-phase bus run near generator for connection of plant dry instrument air system. Connection shall be suitable for copper or stainless steel air piping.

B. Provide pressure relief and manual purge valve for each single-phase bus run.

C. Seal-off assemblies shall prevent air leakage from bus enclosure.

D. System shall maintain bus enclosures under positive pressure.

2.11 NAMEPLATES

A. Provide stainless steel nameplates with engraved and enamel filled lettering.

B. Mount nameplates using stainless steel hardware.
   1. Provide nameplate on each single-phase section of main bus run on lower section quadrant.
   2. Placement shall be at each termination on each phase.

C. Minimum information required on nameplate:
   1. Rated nominal voltage.
   2. Rated maximum voltage.
   3. Rated frequency.
   4. Rated insulation level.
   5. Rated continuous current.
   6. Rated 1/2-cycle asymmetrical momentary current.
   7. Rated conductor temperature rise above ambient.

2.12 GROUNDING

A. Design bus enclosure as continuous ground conductor path capable of safely carrying same withstand short circuit current as maximum rated bus conductor.

B. Provide NEMA 2-hole ground pads for ground connections. At a minimum, grounding connections shall be provided at each bus termination enclosure including transformers and generators.

2.13 TERMINATION ENCLOSURES

A. Provide enclosures and components designed for site location requirements. Enclosure design shall be suitable for site location requirements.

B. Provide hinged doors that open a minimum of 105° for access and removal of equipment. Equip doors with single latch handles that incorporate keyed locks.

C. Cubicles shall be capable of welding to floor leveling channels.
   1. Bus work shall be rigid copper or aluminum.
   2. Voltage and insulation rating shall be equal to, or greater than bus duct assembly.
   3. Provide separate ground bus internal to enclosure.
   4. Provide single-phase voltage transformers (VTs) factory wired and in quantities as required.
      a. VTs shall be draw-out type with current limiting fuses on high voltage side.
      b. Movable carriage shall be automatically disconnected and grounded when removed.
      c. Provide DIN rail mounted miniature circuit breakers (MCB) on low-voltage side of each VT circuit.
         1) Factory wire line side of MCBs and wire load side to terminal blocks.
         2) Each MCB shall have contact that closes on circuit breaker trip condition. Each contact shall be wired to terminal block for customer use.
         3) Access for visual inspection and testing of VT circuits shall not require shutdown of equipment.
         4) Provide means for external conduit connection.

D. Include disconnecting links for isolation of surge protection equipment. Removal of links shall not require dismantling or disconnection of other components.

2.14 SOURCE QUALITY CONTROL

A. If bus design is similar to a previous design with same voltage, current, interrupting ratings, bus and enclosure design, insulator support configuration, and phase spacing, complete test data for previous similar design will be accepted instead of actual testing. New potential tests shall be required for each section of bus furnished.

B. Following test data, as a minimum, is required.
   1. Rated frequency withstand test.
   2. Impulse withstand test (BIL).
   3. Short circuit current test.
   4. Temperature rise test.

C. If furnished bus system is of design not previously fabricated, perform above-referenced tests.

D. Perform standard production tests and quality control checks normally conducted as part of manufacturing and fabrication process.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install in accordance with manufacturer's recommendations.

B. During installation, plant instrument air system may not be available due to sequence of construction. Provide external air supply until plant instrument air is available.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Design, manufacture, test, deliver, and install two (one per unit) steam turbine generator (STG) control and instrumentation system with steam turbine, generator and auxiliary equipment specified.

1.02 ENVIRONMENTAL REQUIREMENTS

A. STG control system cabinets will be located in an environmentally controlled space where temperature is maintained between 60 and 100°F with humidity between 10 to 90%, noncondensing. Refer to Section 01 30 00 for specific temperature, humidity and seismic design conditions.

1.03 MAINTENANCE MATERIALS

A. Spare parts: Recommended spare parts list including pricing and date through which prices are valid. When spare parts order is placed, Contractor shall identify to Owner any spare parts that deviate from codes/standards requirements referenced in original purchase specification. Contractor shall ensure that use of a spare part will not degrade original equipment.

PART 2 PRODUCTS

2.01 SYSTEM DESCRIPTION

A. STG control system shall be manufacturer's standard package as currently provided with its STG equipment. It is anticipated that the standard control system package is of current distributed processor architecture with fault-tolerant features to include redundant processors, system data highway and power supplies.

B. Intent of this specification is to provide Contractor with definition of hardware, operator interfaces and methods required for implementing this project.

2.02 SYSTEM HARDWARE

A. Automation system architecture shall be composed of standards based technology open architecture function blocks and field devices, "off the shelf" computing platforms, Windows 7 operating system, OLE/OPC for interconnectivity to distributed control system (DCS), compact packaging with DIN rail mounting, Class 1, Division 2 field mountable control and I/O subsystem.

B. Enclosed cabinetry shall be UL listed.

C. STG control system shall include:
1. PC-based engineering/maintenance HMI station to include 1 operator display/keyboard unit and interface electronics. Engineering/maintenance HMI station shall be located in electronics room.
2. PC based OPC server with interface to DCS and interface to other users. PC shall be supplied meeting same hardware requirements as engineering/maintenance HMI workstation. STG will be operated and monitored through DCS operator interface workstations.
3. Two laser-type operations printers with printer stand for alarm, action log and reports, complete with a paper tray capable of holding up to 1 ream of paper for both 8-1/2" x 11" and 11" x 17" sizes. One printer will be located with engineering/ maintenance HMI workstation; other will be located in main control room.
4. Redundant data highway cables and other peripheral equipment cables as necessary. Supply of all communications cable and termination hardware shall be by Contractor.
5. I/O hardware, processors, memory boards, communication interfaces, interposing relays, interconnecting and preassembled cables with plug/pin connectors, etc. to meet functional intent of this specification.
6. Internal power supplies, power supply conditioning and protection equipment.

7. Interface equipment (hardware and software) to provide means of maintaining system configuration, modifying system programs, and performing diagnostic tests without Manufacturer's assistance.
8. Accessories and appurtenances, necessary hardware, cabling and software, system logic, documentation, and power supplies to provide totally integrated system of monitoring and control.
9. One complete set of special tools, test equipment, and/or software required for installation, operation, and maintenance of purchased equipment not commonly available in an industrial plant. Special tools, test equipment, and/or software supplied shall become Owner's property.
10. Complete sets of system software including gateway drivers for all hardware supplied
11. Full and complete documentation for all installed equipment.

D. System software:
1. STG control system shall provide equipment control, monitoring and alarming. Control system shall incorporate state-of-the-art industry DCS functional capabilities in order to provide fully integrated and satisfactory process control and safety interlocking capability. Operator interfaces to STG control system will be through plant DCS LCD-based "soft" control stations for modulating and binary control. Manufacturer shall provide graphic operational screens to Contractor for inclusion in DCS graphic screens configuration. All sequence of events (SOE) data points shall be hard-wired to DCS SOE I/O.
2. Provide STG control system operating, driver, diagnostic and programming software. Develop equipment-specific configuration software.
3. Provide necessary interface hardware and drivers including:
   a. Redundant Ethernet/IP communications interface to DCS suited for HMI service.
   b. OPC server software that has a status of "tested" with the OPC Foundation.

2.03 CONTROL SYSTEM FUNCTIONS

A. STG control system shall provide speed governing configured for steam turbine provided under this Contract.

B. STG control system shall perform as a digital electro-hydraulic control system with following system functions:
1. Provide complete "automatic turbine start-up" package to take unit from turning gear to synchronous speed with manually or automatically established rate of acceleration and hold periods. Automatic turbine start-up package shall provide for lockout of critical speeds.
2. Provide loading rate limit adjustment.
3. Provisions for complete manual control of preceding features providing operator with full manual control throughout start-up and operating sequence. Transfer between manual and automatic shall be completely bumpless and balanceless in both directions.
4. STG control outputs shall be designed to fail "status-quo" as is. Provide control failure monitoring devices to detect and indicate control system failure.

C. Load control functions:
1. Stop valve position.
2. Intercept valve position.
3. Control valve position.
4. Load limit.
5. Main steam pressure limit remotely adjustable.

D. STG control system shall provide speed control plus overspeed protective control.

E. Control system shall provide frequency limits control for meeting grid requirements.

F. Interface provisions:
1. DCS and STG control system shall be primary operator interfaces for STG. Interfaces between plant DCS and STG control system shall be comprised of hard-wired control signals supplemented by Ethernet data link.
2. Automatic load dispatch/load frequency control (4-20 mA signal) through DCS.
3. Unit DCS coordinated control between STG and boiler.

4. Steam turbine start-up monitoring.
5. Control generator breaker for synchronizing and unit operation.

G. Control system redundancy:
1. Design system based on the principle that no single failure shall cause loss of steam turbine-generator unit.
2. System shall have sufficient redundancy such that, based on reported mean time between failure (MTBF) and mean time to repair (MTTR) data, minimum expected time between failures which would cause a complete shutdown of a major portion of system or a complete loss of operator interface shall be at least 100 years.
3. When redundant hardware is provided, design such that failures of primary equipment will be automatically detected and switchover to backup equipment will occur without loss or interruption of any system control function or data. When such failures occur, system alarm shall be generated and diagnostic information as to fault location shall be available to operator.
4. System shall provide for on-line capability for configuration changes. Redundant hardware shall be capable of being removed for repair or replacement while system is on line without any loss of control functions or data.

H. System external interfaces:
1. Auxiliary control systems shall be hard wired.
2. OPC interface: Automation system shall be able to communicate with auxiliary systems using OPC. OPC products shall be of the latest OPC revision and have a "tested" status with OPC Foundation. Standard OPC protocol interface shall be provided for interfacing with plant DCS historian.

I. Engineering/maintenance HMI workstation:
1. One independent, interactive LCD/keyboard operator station. Equip station with keyboard and mouse or trackball.
2. Engineering/maintenance HMI workstation shall be capable of performing all of operator interface functions of system and shall have access to total system database.
3. LCD monitor shall be minimum of 20" screen size and shall be capable of displaying high resolution (SVGA), 1024 x 768 pixels minimum, 24 bit color, 75 Hz refresh rate at maximum resolution, minimum. LCD shall have nonglare surface.
4. LCD and keyboard mounting positions shall provide adjustable viewing and comfortable keyboard interaction for a seated operator. Control adjustments for brightness, contrast, etc. shall be easily accessible. Keyboard for the HMI workstation shall be a protected, heavy-duty keyboard to prevent dirt and grime from damaging it. Pointer control device shall be either a mouse or a heavy-duty, industrial grade trackball.
5. Each keyboard, mouse, or trackball shall be replaceable without system reboot.

J. Printers:
1. Two high-quality laser type graphic printers. One printer will be located with HMI workstation; the other printer will be located in main control room and tasked with printing STG alarms.
2. Printers shall be capable of accepting 11"x17" paper and have capacity to hold one ream of paper.
3. Printers shall have sufficient buffer memory to allow associated HMI interfaces to be returned to other functions while printing continues. Paper jams, printer left "Off-Line," and paper change outs shall not result in loss of any printed information.
4. Printers shall be standard "off the shelf" units.

K. System logs and reports: Provide with configurable and nonconfigurable STG logs and reports. At a minimum, control system shall be provided with alarm, operator action, and system logs and reporting utility.

L. Data highway:
1. Communication system shall be based on a redundant industrial grade digital communication link, utilizing coaxial, twin axial, or fiber optic cable and providing high speed data transfer between process controller's, engineering/maintenance HMI station, DCS interface, and other highway connected devices.

2. Two data highway structures shall be provided. Process control data highway shall redundantly connect all process controllers and HMI workstation. Second data highway shall be for supervisory monitoring, external systems interface and printer functions. Supervisory data highway is not required to meet redundancy requirements.
3. Both highway protocols shall be TCP/IP Ethernet and open architecture. Supervisory data highway shall be OPC server direct-compatible.
4. Communication throughput shall be such that HMI workstation screens are updated at 1-second intervals (maximum) to reflect process parameters and status changes. Operator keyboard instructions/commands shall be implemented within 1 second.
5. Data highways shall be totally redundant including connected communications devices. Failure of any piece of communications hardware at any highway-connected device shall not disable communications between remaining equipment on highway. Process controllers shall be provided with at least 2 data highway connections, one to each of two highways.
6. Automatic error checking procedures shall be incorporated for detection of data transmission errors. When an error is detected, a number of retries shall be attempted before automatically switching to redundant channel. Failure alarms shall be generated and location of fault shall be indicated on engineering/maintenance HMI workstation. A history of transmission errors shall be maintained in order to allow preventative maintenance of degraded equipment before a failure occurs. Integrity checks shall continue on backup communications channel even when primary channel is functioning properly.
7. Data highway communications protocol shall be transparent to user. Application software configuration shall not require knowledge of communications protocol.

M. Software requirements:
1. System software shall be fully integrated into one software package for both process control and operator interface. Software shall require only one database for tag and point reference to be modified for any and all hard I/O or soft I/O changes to system. Information in central database shall be automatically accessed or downloaded to various controllers or operator workstations. Changes to database shall be automatically tracked and software shall be self-documenting.
2. Software shall be designed for both modulating and sequence logic control functions. Configuration tools shall be IEC61131 compliant. Each node shall be fully capable of both modulating (analog) and binary (digital) logic. Processing subsystems shall generate nonlinear functions such as square roots and thermocouple conversions, provide nonlinear characterizations for flow relationships to valve or damper position, as well as perform complex logic in digital manner. It is anticipated that calculations required for control will be accomplished within nodes dedicated for control and not by monitoring nodes. However, results of calculations shall be available to monitoring system for alarming and logging.
3. Application software shall not require modifications in order to be able to run under new releases of system operating software. Any new release of system software shall be backward compatible with files created using previous software releases.

N. Diagnostic requirements:
1. Self-diagnostic programs shall be provided to identify system component degradation, failure and faults. This shall include, as minimum, I/O cards, communications network interface cards, node processors and memory, operator display processors and memory, and other cards containing logic devices or other solid state components. Control system shall include extensive self-checking to detect malfunction of input/output equipment, memory parity errors, lost or spurious interrupts, program hang-ups (control and data acquisition) and other feasibility checks that indicate erroneous operation. When such checks show problem from which system can recover without intervention by plant personnel, or interruption of control system operation, system error shall be alarmed to Operator Interface and operation shall continue. If check reveals nonrecoverable error, an orderly shutdown shall be performed, leaving in memory whenever possible such information as will enable plant personnel to readily locate and correct problem.
2. On-line and off-line diagnostics shall be provided to assist in system maintenance and troubleshooting. Diagnostics shall be provided for every major system component and peripheral. This shall include segment as well as device diagnostics and firmware diagnostics in devices. If diagnostics do not exist for particular peripheral devices (for example printers and terminals,) system must detect and provide an error indication for failure of these devices.

O. System cabinet(s) physical/electrical requirements:
   1. Engineering/maintenance HMI workstation and printer hardware will be located in environmentally controlled areas. Cabinet(s) for processors, interface equipment and I/O shall be designed to protect equipment from environment in which they are located. Cabinets and enclosures shall be UL listed.
   2. If forced air ventilation is required, air intakes shall be filtered using replaceable filters. In addition, over temperature alarm switches shall be located in cabinet(s). Switches shall be wired to discrete input points to alarm on ventilation fan failure.
   3. Cabinet(s) for system equipment located in a controlled environment shall be NEMA 1 minimum, or Owner's approved equal, rugged, self-supporting structures. Cabinet(s) shall have front access doors with lift-off hinges, key lock, and handles. Cabinet(s) and stiffening members shall be of steel construction. Rust-resisting bolts and hardware shall be used. Each enclosure shall have 120 volts ac convenience outlet.
   4. Cabinet(s) shall be mounted on and tack welded to sills embedded in floor or attached to floor by means of concrete expansion bolts.
   5. Cabinet(s) shall have a laminated nameplate with Owner's identification number engraved, 3/16" (5 mm) black lettering on a white background. Nameplates shall have beveled edges and be secured with two stainless steel screws. Internal cards, devices, etc. shall be identified with tags corresponding to Manufacturer's schematic and arrangement drawings.

P. Power supply:
   1. Two feeds shall be provided to STG control system cabinet(s), one fed from UPS (primary source) and other from an essential service ac line source (backup). Each of two feeds shall pass through a line noise filter and feed two power busses within cabinet(s), one for UPS and other for line. Each of controller power supplies or rack I/O power supplies shall be fed from both of these busses through individually fused feeds. Power supplies shall be dual feed or redundant, automatically selecting UPS feed as preferred source.
   2. Each power supply shall only feed controllers, I/O cards and other accessories associated with one particular node. Power feeds shall be segregated, including I/O loop power.
   3. Provide power distribution equipment required to meet requirements of power distribution system for STG control system, including distribution panels, circuit breakers, fuses, etc.
   4. Supply whatever power supplies are necessary to operate his system. Equip each control module cabinet and other Manufacturer-furnished equipment with internal power supplies with at least 2N redundancy. If each processor is supplied with own power supply, only one (N) power supply is required per processor.
   5. Should one power supply fail, system shall automatically initiate a bumpless switchover to standby power supply. Power supply failure shall generate an alarm indication at operator's interface. System shall monitor status of both primary and backup power supplies and provide indication at operator's interface of status of both power supplies. Local indicator (LED or flag) at component level shall be provided to indicate status of power supply.
   6. Provide necessary fusing for internal power distribution, field devices, etc.
   7. Manufacturer shall be responsible for fuse/circuit breaker coordination to preclude propagation of faults inside or outside of Manufacturer's equipment.

Q. Cabling and terminations:
   1. Signal cabling shall be multiconductor type with an overall shield and shields for individual pairs, and shall be used for analog, thermocouple, and RTD input and output cables.
   2. Cabling for discrete contact inputs and outputs shall be 16 AWG, multiconductor, unshielded cable. Contractor's contact interrogation voltage and input noise immunity shall be sufficient to preclude any false indications due to electromagnetically coupled voltages induced.
   3. Terminal strip for 120-volt ac power supply circuits shall be separate from control and other wiring terminal strips and shall be capable of accepting No. 10 AWG maximum wire size.
   4. Prewire internal connections between terminal strips and I/O modules. No more than two (2) conductors shall be connected to one terminal point, including Manufacturer's internal wiring.
   5. Prefabricated cables with plug/pin connectors shall be furnished by Contractor for connection between system cabinet(s) and engineering/maintenance HMI workstation and between cabinet(s) and system peripheral equipment. The cables shall be of sufficient length and shall be flexible and manageable for ease of routing and final installation. Both ends shall be clearly

marked along with associated connectors with identification numbers corresponding to those shown on Manufacturer's drawings.

R. Grounding: Single-point grounding system (designated "Control System Ground") shall be designed and implemented for STG control system ground. Separate "Safety Ground" for hardware, cabinets, etc. shall also be required.

S. Surge protection: Plant electrical environment will experience high-voltage, high frequency surges caused by rotating machinery, energy coupled between conductors by capacitance, and mutual inductance. Transient voltage suppression shall be provided on incoming power feeds and all inputs and outputs shall meet requirements of ANSI/IEEE C37.90.1 within testing limits established by guide.

T. Noise immunity: Equipment in system shall be capable of functioning with cabinet doors open even when exposed to a 5-watt handheld 2-way radio with a frequency range of 400-900 MHz, with no false operation. Analog outputs shall not vary by more than 0.5% of span and analog inputs shall not vary by more than 0.25% of span under these conditions. Testing methods shall be in accordance with IEEE trial standard C37.90.2.

U. Maintenance: Design system for ease of maintenance. Provide, with system design, criteria assist in system maintenance. Supply special tools, test equipment, and software not commonly available in power plant. Program backup shall be able to be performed on line without causing loss of control and monitoring functions.

2.04 STEAM TURBINE GENERATOR ASSOCIATED INSTRUMENTATION

A. STG supervisory equipment including detectors, transmitters, indicators and recorders for following functions:
1. Rotor eccentricity.
2. Rotor vibration.
3. Casing expansion.
4. Casing and rotor differential expansion.
5. Speed indication.
6. Control valve position.
7. Steam and turbine metal temperatures.

2.05 VIBRATION MONITORING

A. Provide integrated vibration monitoring system for steam turbine generator and steam turbine.

B. Provide complete vibration monitoring package including, but not limited to, following components:
1. Proximity probes installed 90 degrees apart (X, Y) at same longitudinal location along shaft for each bearing.
2. Axial position probes.
3. Key phaser probe.
4. Proximiters with calibrated cable and connector for each probe.
5. Racks with power supplies.
6. System integrated PC touch screen display.
7. Sufficient rack modules to interface with external equipment (vibration, temperature, key phaser, etc.).
8. Vibration monitors interfacing probes with vibration monitoring rack.
9. Ethernet interface modules with Modbus protocol.
10. Complete software for programming, analysis, and communication including perpetual corporate license.

C. Vibration monitoring system shall interface to plant Distributed Control System (DCS).

2.06 STEAM TURBINE GENERATOR AND AUXILIARIES INSTRUMENTATION

A. Thermocouples, dual element, Type E or K, ungrounded with thermowells, as required for:

1. Turbine metal temperatures.
2. Thrust bearing and journal bearing metal temperatures. Provide one thermocouple in each of two shoes on both faces of thrust bearing.
3. Generator and exciter journal bearings.
4. Thrust bearing and journal bearing oil drain temperatures.
5. Oil cooler, oil inlet and oil outlet temperatures.
6. Common oil cooler outlet temperature for DCS.
7. High-pressure fluid cooler common outlet oil temperature for DCS.
8. Seal oil cooler (if required by design) common outlet oil temperature for DCS.
9. Stator slot temperatures.
10. Hydrogen gas stream.

B. Thermometers, bi-metallic type, 5" (125 mm) dial with service legend, for following services:
1. Bearing drain oil temperatures.
2. Oil cooler, oil inlet and oil outlet temperatures.
3. High pressure fluid cooler, fluid inlet and fluid outlet temperature.
4. Exhaust hood temperature.

C. Pressure gages, 4.5" (114 mm) dial with service legend, for following services:
1. Bearing oil system.
2. Hydraulic fluid system.
3. Gland steam system.
4. Exhaust casing spray water system.

D. Pressure transmitters:
1. Main steam pressure.
2. Steam chest pressure.
3. Seal steam pressure.
4. Bearing oil pressure.
5. High pressure hydraulic fluid pressure.
6. Generator hydrogen gas pressure.
7. Turbine first stage pressure, plus any other interstage pressure monitoring recommended by Manufacturer.

E. Temperature detectors, 3-wire copper, nickel or 100 ohm Platinum (alpha = 0.00385) RTDs.
1. Hydrogen cooler outlet gas temperatures.
2. Hydrogen cooler inlet gas temperatures.
3. Stator winding temperatures.

F. Pressure switches.

G. Specific generator temperature detector requirements:
1. Machines with direct cooling of stator winding, temperature of cooling medium at outlet of winding shall be measured with at least three temperature detectors.
2. Detectors for indication of inlet and outlet temperature to each hydrogen cooler shall be provided for hydrogen cooled generators.
3. Inlet and outlet temperatures to collector ring and exciter housing shall be provided.
4. Detector leads shall be brought out and terminated in a single terminal box.
5. Drawings shall indicate location of terminal box.
6. Leads and terminals shall be legibly labeled.
7. Field temperature indicator/transmitter shall be provided to transmit main generator field temperatures to main control room for display.

2.07 SOURCE QUALITY CONTROL

A. Notify Owner in writing to witness comprehensive STG control system test program.

B. System components shall be subject to Manufacturer's standard testing and burn-in requirements.

C. Factory acceptance testing shall be performed with system fully assembled and connected using only equipment supplied for this order and any necessary test or simulation equipment provided by Manufacturer.

D. Any exceptions to this shall be noted prior to test.

PART 3 EXECUTION

3.01 FIELD QUALITY CONTROL

A. When system arrives at plant site, it will be assembled in DCS/Electrical Room. Extensive testing shall be carried out on system in this location before configuration software is loaded. Initial testing will include most of steps usually carried out during a factory acceptance test except for configuration testing.

B. After initial testing, configuration software will be loaded and tested loop-by-loop by Contractor. Demonstrations of guaranteed or specified performance will be carried out for each communication interface device and its associated software all network gateways and output devices, such as printers.
   1. Long-term sustained performance must be demonstrated. After sustained performance is demonstrated to satisfaction of Owner, Owner will formally confirm acceptance to Contractor in writing. Criteria for sustained performance testing final approval shall be mutually conceived and approved by both Owner and Contractor. Reliability test shall include: Confirmation that system performs as specified including testing of all configuration, interlocking logic, sequencing, and field I/O interfacing, instrument inputs, Modbus gateways, Powernet gateways, OPC functionality and equipment control.
   2. Confirmation that engineering/maintenance HMI workstation is fully configured including review of all screens, displays, trends and reports.

3.02 MANUFACTURER'S FIELD SERVICES

A. Field service personnel shall be capable of independently accomplishing tasks listed below. Each and every one of Manufacturer's service personnel shall possess these capabilities. Should Manufacturer require multiple personnel to accomplish tasks listed, Manufacturer shall coordinate these individuals.
   1. Hardware utilization and troubleshooting:
   2. Software initialization, modification and troubleshooting:
   3. Process control strategy: Tuning of modulating control loops including analysis and recommendation of field device modifications to meet performance requirements.
   4. Field service shall include, but not be limited to:
      a. Placing system into initial operation.
      b. Testing system for proper operation.
      c. Performing site acceptance test.

B. Field startup support:
   1. Manufacturer shall furnish qualified and competent field startup engineer (technical assistant) familiar with control system configuration for this project and capable of providing technical direction and startup assistance to Contractor and Owner's field personnel.
   2. Duration of such assistance shall be through initial start-up and demonstrated satisfactory control per performance guarantees and reliability tests at Owner's discretion.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Burner Management System (BMS).

1.02 DELIVERY, STORAGE AND HANDLING

A. BMS components shall be properly covered, skidded, and crafted to facilitate handling and to withstand normal shipping shocks and vibration.

B. Local panels shall be protected from elements during shipping.

PART 2 PRODUCTS

2.01 SYSTEM DESCRIPTION

A. BMS package for boiler shall include local panels, junction boxes, input/output (I/O) lists, functional logic diagrams and descriptions, which will be used later for integration into DCS.

B. Contractor shall be responsible for ensuring BMS performance during unit start-up, shutdown, and all safety-related functions of the fuel burning equipment.

C. Coordinate with mechanical equipment supplier(s) to ensure necessary instruments, controls, and other required appurtenances and interfaces are furnished for complete system meeting required national codes and standards and requirements from local authority having jurisdiction over this Project.

2.02 PERFORMANCE REQUIREMENTS

A. BMS shall meet all requirements of NFPA 85, latest version.

B. BMS shall maintain boiler in safe operating condition at all times, and shall permit remote safe light off and shutdown of coal and fuel oil fuel firing equipment from operator control workstations located in the Unit control room.

C. Boiler combustion controls and BMS will be operated via plant DCS operator interfaces. BMS shall perform the following functions, but not limited to, automatic burner sequencing, flame supervision, status indication, and self-diagnostics. Flame supervision shall be by a combination UV/IR detector.

D. BMS shall provide following capabilities: Field instrumentation wiring terminations, instrument signal input/output for system, monitoring and control functions, any required local operator interfaces, and self-diagnostics.

E. Manufacturer shall review and approve Contractor's implementation of functional logic diagrams supplied under this Contract.

2.03 BMS IMPLEMENTATION REQUIREMENTS

A. BMS functional logic diagrams will be implemented on a partitioned section of DCS.

B. Limits shall provide hard-wired shutdown. System shall be designed to fail in a safe condition.

C. Fuel valve circuits shall utilize triple redundancy through energization of a burner control relay, master fuel trip relay, and the individual fuel relay.

D. Provide BMS I/O requirements and functional logic.

E. BMS inputs from process monitoring instrument and control devices shall be hard-wired inputs.

2.04 BMS MASTER FUEL TRIP (MFT) PANEL REQUIREMENTS

A. Provide MFT panel layout and design, including but not limited to schematic diagrams and bill of materials for construction by Contractor. MFT panel shall be physically connected to BMS panels with all interconnect wiring between MFT and BMS panels installed and tested at DCS manufacturing facility prior to shipment to site.

B. Power supply: 125 volt dc.

C. Trip philosophy: De-energize to trip.

D. Features:
1. Electrical classification: NEMA 12.
2. MFT panel shall be located in DCS/Electrical Room.

2.05 BMS LOCAL PANELS AND CONTROLS

A. Flame safeguard panels and burner panels shall be in accordance with rating for area. Local devices may be provided on panels, depending on manufacturer's standard BMS package.

B. Use junction boxes to facilitate wiring to DCS.

C. Wiring methods: See Section 26 05 00.

PART 3 EXECUTION

3.01 INSTALLATION

A. BMS field components and sub-assemblies shall be in an operational status when installed and interfaced with DCS.

3.02 MANUFACTURER'S FIELD SERVICES

A. After installation is complete, provide services of an authorized factory service representative to perform commissioning, start-up and operation demonstration services.

3.03 START-UP

A. Perform services in accordance with manufacturer's written start-up instructions. Test system controls and demonstrate compliance with requirements. Replace damaged or malfunctioning equipment and oversee software configuration issues.

3.04 DEMONSTRATION

A. Demonstrate all phases of operation including start-up and shutdown.

3.05 TRAINING

A. As a part of maintenance and operating instructions, review data in operating and maintenance manual, including preventative maintenance schedule and procedures, and procedures for obtaining repair parts and technical assistance.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Design, manufacture, testing, shipment, delivery, installation, site testing and performance of 3-phase, cylindrical-rotor, synchronous alternating-current generators.

1.02 RELATED REQUIREMENTS

A. Section 00 43 23 - Proposal Technical Data Form: Contractor shall provide data for Synchronous Cylindrical-Rotor Generator.

1.03 CLOSEOUT SUBMITTALS

A. Operation and maintenance manuals for each piece of equipment furnished. Provide, at a minimum:
1. Detailed description and technical data.
2. Receiving, storage, installation, and testing instructions.
3. Operating and maintenance procedures.
4. Complete set of final submittal certified shop drawings and data.
5. Complete documentation of inspections and tests performed, including logs, curves, and certificates. Documentation shall note any replacement of equipment or components that failed during testing.
6. Spare parts lists.
7. Installation field reports.

1.04 QUALITY ASSURANCE

A. Manufacturer's qualifications:
1. ISO 9001:2000 certified.
2. Produced similar electrical equipment for a minimum period of 20 years.
3. Service requirements: Service on-site presence including service engineers with a maximum response time of 24 hours.
4. Minimum of 25 units of similar type and design operating.
5. When requested by Owner, provide acceptable list of similar equipment installations complying with requirements of specification.

B. Regulatory requirements: Design, manufacture, and test equipment in accordance with requirements of following documents and entities. In event of a perceived or apparent conflict between these documents and requirements contained in this Section, Contractor shall submit conflict in writing to Owner for resolution.
1. National Electrical Code (NEC/NFPA 70).
2. ANSI C50.13,Cylindrical-Rotor 50 Hz and 60 Hz Synchronous Generators Rated 10MVA and Above
3. ANSI C68.1, Measurements of Voltage in Dielectric Tests.
4. IEEE 32, Neutral Grounding Devices.
5. IEEE 43, Recommended Practice for Testing Insulation Resistance of Rotating Machinery.
6. IEEE 95, Recommended Practice for Insulation Testing of AC Electric Machinery (2300V and Above) With High Direct Voltage.
7. IEEE 115, Test Procedures for Synchronous Machines
8. IEEE 118, Standard Test Code for Resistance Measurement
9. IEEE 421.1, Standard Definitions for Excitation Systems for Synchronous Machines
10. IEEE 421.2, Guide for Identification, Testing, and Evaluation of Dynamic Performance of Excitation Control Systems
11. IEEE 421.3, Standard for High-Potential Test Requirements for Excitation Systems for Synchronous Machines
12. IEEE 421.5, Recommended Practice for Excitation System Models for Power System Stability Studies
13. IEEE C57.13, Standard Requirements for Instrument Transformers

14. National Electricity Reliability Council (NERC)
15. Applicable regional NERC council and interconnection entities, including off-frequency capability requirements.
16. Standards of other organizations shall not be used without written approval from Owner.

PART 2 PRODUCTS

2.01 SYSTEM DESCRIPTION

A. Generator package shall include, but not limited to:
1. Generator.
2. Excitation system and related equipment including power potential transformer.
3. Cooling equipment.
4. Neutral grounding equipment.
5. Lube oil system and equipment.
6. Seal oil system and equipment (hydrogen-cooled only).
7. Generator CTs and VTs.
8. Metering and protection equipment.
9. Surge arresters and capacitors.
10. Cubicle for surge arrester, surge capacitor, and voltage transformers.
11. Generator terminal enclosure.
12. Power system stabilizer.
13. Complete wiring systems between equipment.
14. Packaging, enclosures, and compartments.

B. Equipment furnished shall be capable of serving maximum rated output of turbine at rated power factors, under all ambient and cooling conditions, with minimum additional 5% capability while remaining within limits of its reactive capability curve.

C. Design and select equipment for continuous duty service.

D. Minimum design life of generator shall be 30 years.

2.02 DESIGN REQUIREMENTS

A. Design generator to withstand bolted 3-phase fault at generator terminals for 10 seconds without damage while operating within rated operating frequency range with an excitation value equivalent to maximum rated terminal voltage at rated lagging power factor.

B. Generator shall be capable of withstanding any other short circuit at terminals for 10 seconds without damage, provided integrated product of negative phase sequence current and time does not exceed values required by standards and maximum phase current is limited by external means to value that does not exceed maximum phase current obtained from 3-phase short-circuit.

C. Generator shall be capable of operating at varying loads and be capable of enduring sudden load changes between zero and maximum generator capability limit without damage.

D. Load rejection:
1. Generator system shall be capable of full load rejection to island operation.
2. Sudden opening of external circuit shall not result in damage to generator.

E. Generator shall be capable of synchronizing with system and loading at a rate compatible with loading rate of prime mover.

F. Generator shall be capable of withstanding overspeed without mechanical degradation as required by standards.

G. Temperature rise:
   1. Rise shall not exceed limit for insulation system when loaded to maximum rating for ambient temperature, cooling medium temperature, and insulation class specified.
   2. Calculated hot spot temperature shall not exceed that allowed by standards.

H. Design combined core, inner frame, end turns, and end turn supports to have natural frequencies outside range of those for combined prime mover and generator operations.

2.03 GUARANTEED EFFICIENCY AND LOSSES

A. Efficiency shall be determined at rated output voltage, speed, frequency, and power factor and at balanced load conditions in accordance with ANSI/IEEE 115.

B. Efficiency shall be computed from input shaft power and shall include entire generator and generator systems including, but not limited to:
   1. Losses of any types.
   2. Exciter systems.
   3. Generator auxiliaries.
   4. Lubrication systems.
   5. Cooling and ventilating systems.

C. Efficiency shall be at least 98.5%.

2.04 STATOR

A. Core:
   1. Materials: Laminated, nonaging, high-quality silicon alloyed steel sheets with each side coated and having uniform thickness throughout entire surface, with high permeability.
   2. Core laminations: Free of burrs and damage to sheet coating prior to stacking.
   3. Stator support:
      a. Core support system shall ensure constant and uniform pressure upon core iron laminations.
      b. If insulated through bolt design is used, include low loss nonmagnetic press plates and press fingers.
      c. Design generator such that core clamping system can be retightened after stator coil installation is complete.
      d. Core testing:
         1) Perform stator core iron induction test performed by manufacturer for verification of absence of hot spots in core iron stacking.
         2) Perform test after completion of stacking of stator core.

B. Windings:
   1. Insulation of armature windings, field windings, and collectors: Class F.
   2. Calculated hottest spot temperature shall not exceed 155°C on machine manufactured to ANSI standards.
   3. Stator coil insulation:
      a. Manufacturer's standard system.
      b. Capable of withstanding temperatures during high-voltage tests specified by ANSI C50.13.
   4. Stator winding support structure:
      a. Design to resist resultant forces from maximum possible short-circuit torque that could occur, and other forces imposed during normal and abnormal operation.
      b. Design to absorb thermal expansion of stator winding bars without undue stress to any part.
      c. Generators rated 100 MVA and larger, consolidation of stator coil end winding structures shall include, but not be limited to:
         1) Installation of fiberglass ring located perpendicular to top coil sides, and fiberglass ring located perpendicular to bottom coil sides at each end of each generator.
         2) Top and bottom coil side rings shall be connected together by multiple fiberglass bolts, nuts, and washers that can be re-tightened.
   5. Connections and terminals:

a. Stator winding shall be star-connected.
b. 6 terminals shall be brought out of machine and shall be available for external connections.
c. Design one end of windings as neutral connection or for use as main generator power leads.

C. Design combined core and inner frame to have 4 nodal natural frequency well removed from 100 Hz or 120 Hz.

D. Design and manufacture core and coil assembly to prevent insulation fretting or "dusting" during operation. Such occurrence shall be immediately addressed at manufacturer's expense.

2.05 ROTOR

A. Rotor and shaft shall be machined from steel forging free from flaws and defects.

B. Brace coils to prevent movement or damage under any condition encountered during normal and over-speed operation.

C. Construct rotor to withstand, without mechanical injury, overspeed condition of magnitude specified on Data Sheet.
1. Critical speeds of combined turbine-generator rotor shall be well below and above normal operating speed range of combined turbine-generator unit and well outside required off-frequency capability.
2. Coordinate critical speeds with turbine manufacturer.

D. Design unit for easy access for repairs and for removal of rotor.

E. Rotor and field windings shall meet thermal and mechanical requirements of standards.

F. Design generator rotor for connection with turbine shaft coupling.

G. Design rotor to withstand no less than 3,000 starts during its lifetime.

2.06 FRAME

A. Generator shall have totally enclosed design.

B. Collector rings shall be enclosed, when used.

C. Design housing to allow dismantling generator for inspection and repairs.

D. Design stator frame so that natural period of vibration will not produce resonance.

E. Provide removable covers in stator frame to permit external viewing of stator end turns.

F. Provide lifting lugs on generator frame.

G. Machine junction boxes and generator mounted equipment supports into frame.

H. Frame penetrations into controlled cooling spaces shall be sealed as required to maintain integrity of cooling system and not cause cooling medium losses and pressure changes.

I. Frame shall be complete with sole plates, grout plates, and/or leveling frames and accessories complete for installation.

2.07 BEARINGS

A. Bearings shall be pressure oil lubricated.

B. Lubrication system:
   1. Generator and turbine shall share common bearing lubrication system.
   2. Coordinate lube oil system requirements with turbine manufacturer.
   3. Provide generator with lubricating oil piping as required to directly connect with piping provided with turbine bearing lubrication system.

C. Closed running shaft seals shall prevent oil leakage and prevent entrance of foreign materials such as water and dirt in bearing area.

D. Shaft Insulation:
   1. Generator collector end bearing shall be insulated.
   2. Use shaft ground brushes or equivalent system to prevent shaft current and resulting bearing damage.

2.08 FRAME GROUNDING

A. Provide stator frame with four grounding pads each with four threaded holes and associated bolts for attachment of station grounding conductors.

B. Shop Drawings shall indicate locations of grounding pads, proposed size and quantity of conductors, and method of connection to pads based on specific project applications.

2.09 PARTIAL DISCHARGE MONITOR

A. Monitor and control system complete with corporate license software.

B. Sensors:
   1. Slot couplers, if specified:
      a. Six slot couplers installed in stator winding slots, minimum.
      b. Wire slot couplers to single junction box conveniently located on generator frame in location coordinated with Owner.
      c. Provide BNC terminations for each slot monitor on terminal board mounted in junction box.
      d. Provide wire isolation and penetration seals for exit from controlled cooling environment.
   2. Bus couplers:
      a. One per phase.
      b. Mount in generator terminal cabinet.
      c. Wire bus couplers to single junction box conveniently located on generator frame in location coordinated with Owner.
      d. Provide BNC terminations for each coupler on terminal board mounted in junction box.

C. Provide initial partial discharge signatures and plots as part of final field test reports.

2.10 GENERATOR CONDITION MONITOR

A. Monitor shall include system employing ion chamber capable of sensitive, reliable, and rapid detection of local core overheating before extensive damage results.

B. System shall be capable of initiating alarm signals as required for proper operator response.
   1. Pyrolysis products, generated by decomposition of organic material such as insulation and polymers, shall be collected by an absorbent such as silica gel for analysis.
   2. Selective coating within generator shall be used where available, such that temperature and area of local overheating may be determined through pyrolysis product analysis.

C. Monitor system analyzer shall be suitable for local installation adjacent to generator. Equip with accessories required for operation including:
   1. Sample system accessories.
   2. Calibration accessories and devices

D. Provide indicator on generator control panel.

E. Analyzer shall provide both alarm contacts and 4-20 mA loop-powered dc signal outputs for external use.

F. Software shall be complete with operational, maintenance, and analytical software. Provide with perpetual corporate license.

2.11 GENERATOR TERMINAL EQUIPMENT AND ENCLOSURE(S)

A. Terminals:
1. Withstand maximum fault forces and torques without damage to bushings.
2. Provide maximum possible forces that can be applied in X, Y, and Z directions.
3. Either set of terminals shall be suitable for use as either phase or neutral terminals.
4. Furnish spade-type terminals capable of connection to generator terminal conductor system.
   a. Coordinate terminal details with manufacturer of generator terminal conductor system.
   b. Provide required quantities of flexible braids in appropriate sizes to ensure satisfactory generator connection to generator terminal conductor system.
   c. Design connection to generator terminal conductor system such that flexible braids can be disconnected to form point of isolation.

B. Bushings:
1. Equip generator with 6 dry-type generator bushings for transition from controlled cooling environment to air.
2. Mechanical ratings shall exceed those required to sustain maximum fault forces.

C. Enclosure(s):
1. Generator terminal enclosure(s):
   a. Provide sheet-steel enclosure(s) to completely enclose generator terminals and neutral interconnections.
   b. If phase and neutral terminals are provided at different locations, provide multiple enclosures.
   c. Provide CTs in generator terminal enclosure. Wire to shorting-type terminals in common terminal box.
2. Surge/VT cubicle:
   a. Provide sheet-steel enclosure to completely enclose VTs and surge protection devices.
   b. Wire equipment auxiliary power and control wiring to terminal blocks.
3. Provide flanges and provisions required for attaching generator terminal conductor system to terminal enclosure and surge/VT cubicle.

D. Current transformers (CTs):
1. Provide generator bushing-mounted CTs, suitable for both relaying and metering service.
2. Refer to Section 00 43 23 for types, accuracy requirements, burden requirements, and quantities.
3. Manufacture in accordance with requirements of IEEE C57.13.
4. Provide CTs within generator terminal enclosure(s). Wire CT to shorting-type terminals in common terminal box.
5. Mount common terminal box as close as physically possible to CT to limit CT lead length.

E. Voltage transformers (VTs)
1. Provide primary fuses for all VTs.
2. Provide multiple secondary fuses or breakers as required for the design requirements.
3. Manufacture in accordance with requirements of IEEE C57.13.

F. Surge protection devices:
1. Provide surge capacitor and surge arresters.
2. Ratings shall be provided by manufacturer. Ratings shall be suitable for application.

2.12 NEUTRAL GROUNDING

A. Drawings shall indicate preferred location for mounting assembly.

B. Provide a complete set of materials and accessories required to electrically connect generator neutral at generator neutral bushings.
   1. Conductors between neutral bushings shall be copper bar, fully rated and sized as required to carry maximum current of generator.
   2. Suitable bolted-type cable connectors with standard 2-hole NEMA pads, terminal kits, and raceway fittings shall be provided for connecting neutral buswork and neutral enclosure to neutral grounding equipment.
   3. Rated for location and temperature of installed equipment.

C. Provide high-impedance grounding as follows:
   1. Both transformer kVA rating and resistor rating shall be adequate to maintain phase-to-ground primary current for specified fault duration without damage.
   2. Resistor rating shall be properly sized to supply normal capacitive charging current to all equipment electrically connected to generator terminals.
   3. Resistor and transformer sizing calculations shall be submitted for review and approval by Owner.
   4. Where ratings need to be revised, this shall be done at no cost to Owner.
   5. Neutral grounding transformer:
      a. Dry, self-cooled distribution type, with a line-line voltage class and BIL rating suitable for operation on generator rated nameplate voltage class.
      b. Rating shall be preferred rating as listed in IEEE/ANSI C57.12.01 with a low voltage terminal rating of 240 volts.
      c. Transformer shall have sufficient overvoltage capability to prevent saturating on phase-to-ground faults with generator operating at maximum generator terminal voltage.
   6. Phase-to-ground primary current range shall be limited to between 5 to 10 amperes.

2.13 TEMPERATURE DETECTORS

A. Provide minimum of 1 active and 1 spare embedded 3-wire, 100-ohm platinum resistance temperature detectors (RTD) 0.00385 alpha in each winding for determining generator stator winding operating temperatures.

B. Machines with direct cooling of stator winding, temperature of cooling medium at outlet of winding shall be measured with at least 3 temperature detectors.

C. Detectors for indication of inlet and outlet temperature to each hydrogen cooler shall be provided for hydrogen cooled generators.

D. Provide inlet and outlet temperatures to collector ring and exciter housing.

E. Provide bearings with minimum of 1 active and 1 spare embedded 3-wire, 100-ohm platinum RTD temperature sensors, which shall be interfaced to vibration monitoring equipment.

F. Detector leads shall be brought out and terminated in single terminal box.
   1. Shop Drawings shall indicate location of terminal box.
   2. Leads and terminals shall be legibly labeled.

2.14 EXCITATION SYSTEM

A. Provide generator excitation system complete with equipment, materials, and accessories in accordance with this Section and the specified requirements indicated in Section 00 43 23.

B. Equipment shall have proven record of high availability and reliability, minimal maintenance, ease of servicing, accurate, fast and responsive control, long life, and safe operation at service conditions.

C. Excitation system shall provide adequate field voltage and current to continuously produce generator nameplate rated MVA at maximum rated generator output voltage and meet requirements of interconnection entities and regional electric reliability council.

D. Excitation system shall withstand, without damage, any faults or abnormal operation of generator.

E. Excitation system redundancy:
   1. Provide to allow for device failure and replacement while on-line to avoid compromising turbine-generator availability and output capability.
   2. Minimum redundancy:
      a. Voltage sensing.
      b. Firing circuits and control systems.
      c. Internal communication and channels.

F. Provide excitation equipment with rapid de-excitation means to remove generator contribution to external fault as quickly as possible following receipt of excitation trip signal from generator protection.

G. Excitation equipment enclosure:
   1. Mount complete voltage regulator and associated excitation switchgear and equipment in freestanding, dustproof metal enclosed enclosure.
   2. Required for control or equipment enclosures and rotating equipment enclosures.
   3. Equipment mounted inside housing shall be completely wired with instrument, meter, and control leads wired to terminal blocks for external connection.
   4. Enclosure shall include following equipment:
      a. Thermostatically controlled space heaters to ensure proper ambient temperature and to prevent condensation.
      b. Interior lights for illumination with switch at each door.
      c. Minimum of 1 convenience outlet.
      d. Single source of ac power to enclosure for lights, receptacles, and space heaters.
   5. Equipment mounted on and inside housing shall be fully labeled with phenolic nameplates.
   6. Ventilation: Provide adequate ventilation. Where heat cannot be dissipated with natural ventilation, forced ventilation of adequate size shall be included in panel or cabinet, with suitable screened and filtered openings.
   7. Ground bus:
      a. Install 1" (25 mm) x 1/4" (6 mm) flat copper bar ground bus running full length of each panel.
      b. Drill bus at each end for NEMA 2-hole drilling. Provide with compression-type terminal lug at each end for connection of No. 2/0 AWG bare copper ground cable.

H. Voltage regulator:
   1. Voltage regulator shall be capable of automatic and manual voltage regulation with redundant AVR system. Manual control for testing only.
   2. Manual voltage regulator shall be of static type.
      a. Provide operator with means to regulate excitation system voltage when automatic regulator is not functional.
      b. Manual voltage regulator shall maintain excitation output voltage and/or current to within ±0.5% over range from no-load to full-load.
   3. Automatic voltage regulation shall be by means of solid-state and continuously acting type.
      a. Automatic voltage regulator shall maintain generator terminal voltage within ±0.5% over range from no-load to full-load at rated generator frequency.
      b. Variations in generator terminal voltage shall not exceed ±1% with variations in frequency of ±10%.
   4. Transfer:
      a. Provide automatic tracking to ensure bumpless transfer to/from manual and automatic regulator control without an increase or decrease in excitation value.
      b. Remote meter to ensure equal set point values before transfer is initiated shall be provided for operator.
   5. Provide capability to allow local and remote control of manual and automatic regulator setpoints.
   6. Compensator:
      a. Provided to provide regulator droop for sharing reactive line current between paralleled machines, and provide line drop compensation to regulated voltage at remote points from generator terminals.
      b. Provide controls to adjust ratio of input to output voltage.
   7. Excitation system shall be capable of operating in an island mode with generator not paralleled with system.

8. Protective functions:
   a. Overexcitation limiter:
      1) Provide with excitation equipment to limit continuous operation above capability of machine.
      2) Temperature compensation shall be provided to dynamically adjust overexcitation limiter to allow generator to operate at its rated power factor at all times with varying turbine output (i.e. if turbine output increases with decreasing temperature, overexcitation limiter shall allow generator to operate at its rated power factor with increased output).
      3) Provide alarm function and trip machine if excessive excitation remains for predetermined time, both in automatic and manual operation.
   b. Underexcitation protection:
      1) Provide such that synchronous generator voltage regulator shall be limited by means of adjustable limiting device and automatically prevent operation below rated generator capability for underexcitation and to prevent operation beyond steady-state stability limit.
      2) Provide alarm function and trip machine if excessive excitation remains for predetermined time, both in automatic and manual operation.
   c. Provide volts per Hertz regulator for continuously acting limit to maximum volts/Hertz, acting only in automatic regulator mode.
   d. Provide automatic and continuous ground detection equipment to detect grounds in generator field.
      1) Facilities shall be provided to permit in-service tests of ground detection system at any time.
      2) Ground detection shall be relayed via contact for remote annunciation.
   e. Voltage unbalance detector circuit:
      1) Provide to sense loss of regulator sensing voltage and transfer regulator from automatic to manual.
      2) Remote annunciation shall be provided for loss of metering and regulating VT signals.
9. Power system stabilizer:
   a. Provide type as determined by system stability study performed by Contractor.
   b. Provide calculations and initial settings.
   c. Perform tuning and commissioning.
10. Var/power factor controller:
   a. Provide control of unit power factor and/or var output based on operator or communication channel setpoint.
   b. Operator selectable function.
   c. Comparison shall be of setpoint versus actual output as supplied by transducer or internal turbine-generator computed value
   d. Error signal shall provide "course" and "fine" adjustment feedback to voltage regulator.
11. Tie-line power factor/var control:
   a. Input from remote data link MW and MVAR.
   b. Operator selectable function.
   c. Comparison shall be of setpoint versus remote signal.
   d. Error signal shall provide "course" and "fine" adjustment feedback to governor and voltage regulator.
12. As a minimum, provide metering package locally on regulator with provisions for remote indication:
   a. Exciter field voltage.
   b. Exciter field current.
   c. Exciter field rectifier ac input voltage.
   d. Manual regulator output.
   e. Automatic regulator output.
   f. Ac voltage error.
   g. Minimum excitation limiter output.
   h. Maximum excitation limiter output.
   i. Volts/Hertz limiter output.
   j. Power supply rated 24 volts dc.
   k. Transfer voltmeter.
13. Display of reactive unit reactive capability curve for both local control and input to Unit DCS.

I. Potential-source static excitation system:

1. System shall derive power from potential source and use stationary controlled rectifiers and consist of power conversion module, control and protection module, and operator interface.
2. Power conversion module shall consist of full-wave bridge-type rectifier assembly to convert ac input power to dc power, for use by generator field.
   a. Rectifier assemblies shall be supplied with suitable transient overvoltage protection and required overcurrent protective fuses.
   b. Thyristors and diodes shall be rated at 200% of rectifier assembly nameplate rms voltage rating as a minimum.
   c. Provide light emitting diode indicators to indicate failure of power rectifier.
   d. Configure rectifier assembly such that each assembly shall have capability to be disconnected from input power source while under load to perform maintenance.
   e. Fabricate each rectifier assembly with interchangeable components with each other, and interchangeable with components of other rectifier assemblies provided.
   f. Provide, as required, redundant HVAC or fan cooling for rectifier assemblies.
      1) Each HVAC unit or cooling fan shall have sufficient capacity to maintain rectifier assembly within normal operating temperatures.
      2) One set of HVAC units or operating fans shall be designated as normal air supply and another set of operating fans shall be designated as alternate air supply.
      3) Upon failure of normal air supply, alternate air supply shall be automatically energized to maintain temperatures within acceptable limits.
      4) Provide capability of remote annunciation and tripping of system upon loss of HVAC or fan cooling.
      5) Annunciation shall be instantaneous on loss of normal or alternate air supplies.
      6) Tripping shall be actuated after an adequate time delay of failure of alternate (normal) air supply to automatically energize on loss of normal (alternate) air supply.
      7) Power for HVAC or fans shall come from potential power source.
   g. Electrically operated draw-out type, ac input power circuit breaker with provision for manual trip shall be provided for isolating excitation system from potential power source for maintenance.
3. Field flashing (if required) and control power sources:
   a. Provide external dc voltage station battery power.
   b. Interruption and restoration of dc supply shall not affect excitation system operation.
   c. Provide contacts and wiring required to provide alarm input to Unit DCS for loss or interruption of dc supply.
   d. Available dc supply: 125 volts.
4. Control and protection module(s):
   a. Provide complete exciter control and protection system for static excitation system.
   b. Excitation system shall provide a remote control interface from Unit DCS.
5. Generator collector shall be provided for use with static excitation system, with following features:
   a. Enclosure suitable for either indoor or outdoor locations.
   b. Air cooled with ventilation provided by a centrifugal blower integral to collector shaft assembly.
   c. Collector rings and bushings with subsurface ventilation to enhance brush and ring life.
   d. Brush holders, which are gang mounted in magazine assemblies, having constant force springs, and removable insulated handles to facilitate on-line brush replacement.
   e. Minimum Class F insulation of dc power circuit components.
      1) Main leads.
      2) Brush rigging.
      3) Slip ring assembly.
      4) Flexible leads on shaft.
   f. Insulating separator between polarities to reduce risk of short circuit during brush changing.
   g. Silver-plated and bolted dc power circuit joints.
   h. Replaceable air inlet filters.
   i. Exhaust duct.
6. Instrumentation and alarms:
   a. Provide field temperature indicator/transmitter to transmit main generator field temperatures to Unit DCS for main control room display.
   b. Generator field voltage and generator field current outputs.
   c. Shaft voltage suppressor shall be provided to protect bearings against sustained ceiling excitation system output voltage.

d. Test switches shall permit isolation of voltage regulator from generator voltage transformers. Shorting switches shall permit isolation of generator current transformers from reactive current compensator.

J. Brushless (alternator-rectifier) excitation system:
1. Include rotating exciter, exciter power supply equipment, excitation cubicle, and operator interface.
2. Exciter silicon power diodes and SCR control system: Rotating rectifier exciter assembly directly connected to generator shaft shall be furnished and shall include:
   a. Alternate current main exciter with rotating armature. Output from rotating armature shall feed along shaft to rotating rectifier assembly.
   b. Rotating rectifier assembly including silicon diodes, indicating fuses, and other necessary components shall be included.
      1) Output from diodes shall be transmitted along shaft to rotating generator field.
      2) Fuses:
         a) Fuses shall protect against diode failure and shall be series connected with diodes.
         b) Each fuse shall have an indicating device to indicate whether or not fuse has blown.
         c) Necessary "Strobotac" instrumentation and operator access shall be furnished for viewing fuse assembly during operation.
         d) Sufficient quantity of fuse diode components shall be furnished so that continuous operation at maximum generator output is achieved with at least 80% of diodes per phase in operation.
   c. Rotating components shall be solidly connected together.
   d. No external leads between exciter and generator field shall be required.
3. Enclosure:
   a. Rotating equipment shall be totally enclosed.
   b. Covers shall be easily removable for maintenance and inspection and access doors shall be provided.
   c. Adequate illumination shall be provided.
   d. Provide 120-volt convenience outlet on each side of exciter housing.
4. Insulation: Class F. Temperature rise shall not exceed those permitted for Class B.

K. Power potential transformer:
1. Manufacture in accordance with applicable ANSI and IEEE standards.
2. Size, as a minimum, to supply maximum power requirements of static excitation system.
3. Provide power potential transformer in sheet metal enclosure, floor-mounted, self-ventilated, dry-type, cast-coil design.
4. Current transformers:
   a. Equip each high-voltage bushing with one current transformer.
   b. Wire to 3-phase time overcurrent relay, provided on excitation cubicle.
5. Windings: Copper.
6. Provide remote annunciation capability for winding hot spot temperature alarm for high- and low-voltage windings.

2.15 GENERATOR CONTROL

A. Completely enclosed, freestanding sheet metal generator control panel for each generator.
1. Type: Vertical, stationary equipment panel with open back or closed door construction
2. Nominal dimensions: 90" (2.3 m) high; width as required, but individual sections may not exceed 30" (750 mm).
3. Dual front doors acceptable.
4. Construction: Nominal 1/8", 11-gage, cold-rolled sheet steel, or equivalent hot-rolled stretcher leveled steel, formed with rolled lip on top, bottom, and sides. Provide stiffening members as required.
5. Provide structural steel supporting framework with floor channels, or equivalent means, suitable for anchoring to concrete floor.
6. Color of finish: ANSI No. 70, light gray.
7. Mount accessories not designed for semiflush mounting on rear swinging auxiliary panels or doors

8. Do not obstruct access to devices mounted on front panel.
9. Make provisions for supporting incoming cables from field, for horizontal and vertical wireways, and for mounting 12-pole terminal boards.
10. Equipment terminals shall be readily accessible from rear of panels, without removal of equipment or fixed auxiliary panels.
11. Cables:
    a. Provide for top entrance of control cables.
    b. Provide adequate space for entrance of cable and means for support of cable with preformed cable ties.
    c. Holes for cables from field shall have grommets to protect cable from metal edge.
    d. Provide closure plates for cable ways.
12. Terminal blocks:
    a. For connection of control cables shall be readily accessible.
    b. Facing opposite side of individual panel acceptable if there is adequate working space for connection of control cables in field.
    c. Provide for interpanel wiring on both sides of panels.
    d. Ship switchboard assembled.
13. Panel shall include mounting and wiring of devices to terminal blocks, and contain, as a minimum, devices listed herein and in Section 00 43 23.
14. Provide cartridge type fuses and fuse blocks for, but not limited to:
    a. Secondary leads of potential transformers.
    b. Lockout and auxiliary relays.
    c. Provide 6 spare fuses of each size used.
    d. Power supply for each relay and meter provided.
    e. Finish:
        1) Primer coat: Rust-resisting primer.
        2) Finish coat: ANSI Z55.1 No. 70 sky gray, weather-resisting enamel.
        3) Undersurface of switchgear and aisle shall be protected from corrosion with suitable protective coating.
        4) Provide 1 quart (each color) of matching touch-up paint in aerosol spray cans
15. Nameplates:
    a. Material: Black plastic engraving stock, 1/16" (2 mm) thick with white core.
    b. Lettering: Engraved approximately 3/16" (5 mm) high.
    c. Minimum locations:
        1) Front and rear each unit.
        2) Each control switch.
        3) Each relay.
        4) Each set of low voltage fuses.
        5) Each ac circuit protective device.
        6) Each test switch.
        7) Each meter package.
16. Accessories:
    a. Required software for microprocessor-based relays and meters with perpetual corporate license.
    b. Test plug for each style of relay case and test switch.
    c. Test plug for each style of current and potential test switch.

B. Enclose meters in flush-mounted cases.

C. Synchronizing:
1. Provide packaged control system for manual and automatic synchronizing. Synchronizing relays/circuitry shall be capable of manual and automatic synchronizing.
2. Manual synchronizing:
    a. Scheme shall be able to be operated independent of automatic portion so manual synchronizing of unit can be performed even if automatic unit is out of service.
    b. Locate devices on generator control panel, include:
        1) Synchroscope.
        2) Indicating lights.
        3) "Raise/Lower" control switches for voltage and speed control.
        4) Generator and incoming voltage and frequency meters.

5) Supervising synchronism-check relay.

3. Automatic synchronizing package for each unit:
   a. Complete with required devices to perform following functions and other functions as required for safe operation of turbine generator and electrical system.
   b. Adjustable circuit breaker advance closing time.
   c. Adjustable upper and lower voltage limits.
   d. Adjustable set points for difference of voltage and frequency of two sources being synchronized.
   e. Automatic speed and voltage control of turbine and excitation system to perform automatic synchronizing.
   f. Continuous supervision by synchronism-check relay.
   g. Automatic synchronizing shall be manufacturer-specific design within turbine-generator control system with accessories (if not furnished as part of specific controls).
4. Complete compatibility between synchronizing equipment, synchronizing breaker(s), DCS, and turbine generator control package shall be furnished.
5. Synchronizing system and package:
   a. Capable of controlling and synchronizing one circuit breaker.
   b. Provide appropriate scheme with selector switch(s), auxiliary voltage transformers, auxiliary relays, etc. to allow automatic input of appropriate voltage inputs to synchronizing system and closure of appropriate breaker.
   c. Selection shall be capable of being made remotely from Unit DCS system.

D. Calibrate instruments and provide factory calibration certificates.

2.16 GENERATOR COOLING SYSTEM

A. Hydrogen-cooled:
1. Rotor shall be either directly or indirectly cooled by hydrogen.
2. Unless otherwise specified, stator may be either directly or indirectly cooled by hydrogen or water.
3. Cooling water characteristics and site ambient conditions: As specified in Section 00 43 23. Design generator and heat exchanger based on characteristics specified.
4. Coolers: Shell-and-tube type with materials as specified in Section 00 43 23.
5. Design heat exchanger to permit on-site cleaning. Design for easy removal without loss of hydrogen pressure.
6. Tube bundles shall be complete with flanges for connection to cooling water supply.
7. Design heat exchanger so generator can carry rated load at rated power factors continuously without temperatures of any of parts of generator exceeding their permissible operating range over ambient temperature range specified in Section 01 30 00 and cooling water conditions provided by Contractor.
8. Design heat exchanger so one cooler section can be taken out of service for cleaning while allowing generator to continuously carry 100% load.
9. Provide curve indicating generator capability versus cooling water temperature for various hydrogen pressures.
10. Alarms:
    a. Temperature alarm for high hydrogen (and internal water, if applicable) temperature.
    b. Temperature alarm for high stator temperature.
    c. Cooler leakage detector system. Sufficient quantity of humidistats shall be provided for detection of small leaks in cooling system while machine is running.
11. Generator shall be suitable for operation at rated hydrogen gage pressure at specified altitude above sea level.
12. Hydrogen gas system:
    a. Valves, pressure gages, regulators, and other equipment necessary to maintain desired hydrogen pressure inside generator casing from 0.5 psig to maximum operating pressure.
    b. System for putting hydrogen in and taking hydrogen out of generator by using carbon dioxide as a scavenging medium.
    c. Required instruments and alarms to indicate function of apparatus.
    d. Other equipment required for safe reliable operation.
13. Furnish classified enclosures and fixtures for electrical components located in areas where classified enclosures and fixtures are required by applicable codes.
14. Seal oil and hydrogen gas system controls:

a. Furnish seal oil supply complete including AC and backup DC motor-driven oil pumps, reservoir, demisters, vacuum tank and coolers, regulating valves, gages, control devices, interconnecting piping, piping supports, and other equipment required to provide automatic unit.
b. Furnish seal oil supply and control equipment as complete shop-assembled unit mounted on common structural steel base.
c. Terminate electrical wiring at common junction box. DC motor-driven oil pumps shall be furnished complete with motor starter. DC motor, DC motor starter, and seal oil system shall be capable of operating with dc supply voltage between 90 volts DC and 140 volts DC.
d. Provide oil seal glands at generator shaft to prevent loss of gas or air infiltration. Design oil drains from generator bearings to prevent hydrogen from reaching oil reservoir.
e. Design oil seal glands that upper bearing caps may be removed for inspection without removing hydrogen from generator casing.
f. Equipment for isolating generator bearing oil drains from turbine bearing oil drains shall consist of drain oil settling and loop seal tank and interconnecting drain and vent piping, ac motor-driven vapor extractor, with separator to eliminate carry over.
g. Control panel:
   1) Control devices and instruments required for operation and monitoring of seal oil and hydrogen gas systems shall be furnished and mounted on enclosed sheet steel panel located in vicinity of seal oil unit.
   2) Panel shall include control switches, indicating lights, indicating gages, and annunciator.
   3) Include interface to allow transfer of all control panel signals to the Unit DCS.
h. Provide control switches and indicating lights for:
   1) Air side seal oil pump.
   2) Hydrogen side seal oil pump.
   3) Air side seal oil backup pump.
   4) Vapor extractor.
i. Provide indicators for following functions:
   1) Hydrogen density.
   2) Hydrogen pressure.
   3) Generator fan differential pressure.
   4) Hydrogen purity.
j. Furnish visual annunciation with discrete windows to alarm following conditions:
   1) Hydrogen purity – high or low.
   2) Hydrogen pressure – high or low.
   3) Hydrogen supply pressure – high or low.
   4) Generator water detector – high.
   5) Hydrogen temperature – high.
   6) Generator oil defoaming tank level – high.
   7) Air side seal oil pump – off.
   8) Seal oil pressure – low.
   9) Hydrogen side oil level – low.
   10) Seal oil backup pressure – low.
   11) Hydrogen side seal oil pump – off.
   12) Air side seal oil backup pump – running.
   13) Generator dew point inlet temperature – high.
   14) Generator dew point outlet temperature – high.
   15) Air side seal oil filter differential pressure – high.
   16) Hydrogen side seal oil filter differential pressure – high.
k. Provide initiation devices as required to provide input for indicators and annunciator windows indicated previously.
l. Hydrogen purity alarm switch: Contactless, solid-state design.
m. Hydrogen gas dryer:
   1) Provide with required connections and controls for proper operation of system.
   2) Two tanks of activated alumina desiccant. Each tank shall contain built-in blower with motor, built in heater, and thermostat.
   3) Tanks shall be interconnected by two 4-way valves; controlled by timed, air-operated mechanism for placing each tank into absorption or reactivation.
   4) Operation of system shall be automatic. Status shall be by indicator lights on control panel, and shall include motor starters, control switches, and indicating lights.

n. Demonstrate integrity of hydrogen seal oil system to show leakage rates are within guaranteed tolerances.

15. Hazardous zones:
    a. Identify specific hazardous zones and requirements of zones.
    b. Equipment located within identified zones shall meet classifications and requirements of zones.
16. Provide hazardous zone monitoring panel:
    a. Specifically locate on shop drawings.
    b. Provide specific functions, interfaces and requirements.
    c. Provide multiple output contacts for alarm and unit tripping solely at Owner's option.

2.17 DC REQUIREMENTS

A. DC voltage: 125 volts.

B. DC motor systems and controls including, but not limited to:
   1. Motor or motors.
   2. Motor starters and controls.

C. Insulation class shall match DC voltages.

2.18 JUNCTION BOXES

A. Provide junction boxes and terminal blocks for equipment furnished to effect interface wiring termination.

B. Provide wiring from equipment furnished to junction boxes.

C. Provide Shop Drawings showing physical layout, terminal block designators, cable tags, and conductor identification for manufacturer-supplied wiring.

D. Provide separation of wiring within junction boxes meeting manufacturer's wiring requirements.

E. Size to accommodate wiring intended. Provide terminal blocks inside junction boxes with at least 25% spare capacity.

F. Enclosure type shall be suitably rated for environment installed.

G. Junction boxes shall be rated for location.

H. Terminal blocks for field wiring:
   1. Ring type terminal.
   2. Shorting terminal for CT circuits.

2.19 SPACE HEATERS

A. Provide space heaters to prevent condensation of moisture.

B. Locate heaters in interior of equipment.

C. Thermally insulate from metal to ensure surface will not be damaged or discolored.

D. Space heaters shall maintain internal temperature at no less than 5°F above dew point connected through an adjustable humidistat, factory set.

E. Wire individual heaters to accessible common terminal blocks for connection to single external power source.

F. Protect heater circuits with DIN rail-mounted, miniature circuit breaker(s).

2.20 IDENTIFICATION AND TAGGING

A. Provide phenolic nameplates to identify pieces of equipment.

B. Secure nameplates with self-tapping stainless steel screws. Adhesive nameplates not acceptable, unless required due to physical design limitations and constraints.

C. Lettering: Black letters on white background, with 1/8" (3 mm) engraved letters.

D. Provide nameplates to identify:
   1. Each externally visible devices including, but not limited to, protective relays, lockout relays, meters, switches, instruments, and indicating lights.
   2. Each vertical section shall have nameplate located on front and rear of enclosure. Nameplates shall include equipment description and identification number of equipment being served.

E. Provide instruments with permanently attached stainless-steel tags in accordance with Section 40 91 00.

F. Caution nameplates: Yellow with black letters.

G. Warning nameplates: Red with white letters.

H. Provide typewritten nameplates for terminal blocks and mark in accordance with manufacturer's instructions.

I. Each internal device or component shall have identification marking in accordance with manufacturer's instructions.

J. Nameplates and placards including warning signs and safety placards shall meet NFPA 70E requirements.

2.21 FINISHES

A. Manufacturer's standard finishes shall apply.

B. ANSI standard color: As listed on Data Sheets.

2.22 SOURCE QUALITY CONTROL

A. As a minimum, perform following tests on generator(s):
   1. Insulation resistance measurement:
      a. Measure resistance of stator and rotor, including polarization index, prior to final hi-potential test.
      b. Minimum acceptable value of resistance is 100 Mega-ohms (MΩ).
      c. Minimum acceptable value of polarization Index (defined by ratio of 10 minute reading to 1 minute reading) shall be as listed in IEEE 43 for insulation class.
   2. Measurement of winding resistances:
      a. Measure stator and rotor winding resistances.
      b. Resistance values for stator converted to 25°C shall not vary by more than 6% from manufacturer's design value.
      c. Resistance values for rotor converted to 25°C shall not vary by more than 2% from manufacturer's design value.
   3. Perform high-potential tests on stator and rotor windings.
   4. End winding support: For generators rated 100 MVA and greater, appropriate tests shall be performed to demonstrate that combined core and inner frame is designed to have 4-nodal natural frequency well removed from 100 Hz or 120 Hz.
   5. Stator core iron imperfection test:

a. Stator core iron induction test at 1.0 Tesla, or other stator core imperfection test subject to review by Owner, shall be performed for verification of absence of hot spots in core iron stacking.
b. Test shall be performed after completion of stacking of stator core.

6. Rotor overspeed test:
   a. While generator field assembly is set up in high-speed balance facility, hold for 2 minutes at a speed 20% above rated speed of unit.
   b. Take vibration measurements throughout operating speed range of unit.
   c. Weight adjustments shall be made to reduce exhibited vibration to within manufacturer's engineering guidelines.
7. Field winding shorted turn test at rated speed: During high speed balance process, excitation shall be applied to field winding and resulting flux measured.
8. Frame over-pressurization test (hydrogen-cooled generators only): Pressurize frame with air to 50% above rated value and hold value for minimum of 10 minutes.
9. Frame leakage test (hydrogen-cooled generators only):
   a. Pressurize with air at rated hydrogen pressure.
   b. If generator is packaged with integral seal oil and gas control systems test with generator rotor installed and seal oil system operating, otherwise perform with rotor uninstalled and test plates used to seal end shields.
   c. Monitor internal pressure and temperature over time and calculate leakage.
   d. Results of test shall be within manufacturer's performance guarantee.
10. Hydrostatic testing:
    a. Components other than piping whose operating pressure is greater than 15 psig shall be hydrostatically pressure tested at a minimum of 1.5 times operating pressure held for minimum of 30 minutes.
    b. Equipment hydrostatically tested in shop shall be completely drained and blown dry prior to shipment to ensure against damage from freezing and corrosion.
    c. When drainage requires removal of plugs, drain valves, water box covers, etc., assure that parts are properly reinserted or reassembled prior to shipment.
11. Units with oil piping integral to generator package shall receive oil system flush to remove potential harmful foreign particles from oil lines.
12. Calibration test shall be performed for temperature sensing elements.
13. Other tests as required by standards and those normally performed to ensure quality.

B. As a minimum, perform following tests on excitation equipment and provide complete testing documentation:
   1. Operation of regulator power amplifier(s) at rated supply voltage, and as much current as practical into resistive-inductive load to verify:
      a. Input-output static transfer characteristics.
      b. Ceiling voltage capability.
      c. Stability of control.
      d. Voltage and current sharing.
   2. Dielectric tests in accordance with IEEE 421.3.
   3. Perform following tests on static excitation equipment:
      a. Continuity of rectifier fuses.
      b. Rectifier leakage.
      c. Polarity and phase relationships.
      d. Range and stability of rectifier phase control.
      e. Burn-in test for 48 hours.
      f. Other tests required by standards and those normally performed by manufacturer to ensure quality.
      g. Perform following tests on power potential transformer(s):
         1) Winding resistance.
         2) Polarity and phase relationship check of transformer windings.
         3) Transformer ratio.
         4) No-load loss.
         5) Excitation current at rated voltage.
         6) Induced-voltage test.
         7) High-potential test of transformer windings.

8) Other tests as required by standards and those normally performed by manufacturer to ensure quality.

4. Perform following tests on brushless excitation equipment:
   a. Insulation resistance.
   b. Resistance of windings at 25°C.
   c. Resistance of external current-limiting resistors and field rheostats (where applicable).
   d. Air gap.
   e. No-load saturation curve, from residual voltage to ceiling voltage of exciter rated voltage.
   f. Phase rotation.
   g. Pilot exciter no-load voltage and phase rotation (where applicable).
   h. Continuity of rectifier fuses.
   i. Rectifier leakage.
   j. Range and stability of rectifier phase control (where applicable).
   k. Momentary overspeed.
5. Perform excitation system tests. If test data is available for like unit, test data may be submitted instead of performing test.
   a. Excitation control equipment:
      1) Input-output static transfer characteristics of each excitation control element over specified ranges of supply voltage, frequency, and operating temperature.
      2) Verify gain, linearity, maximum and minimum outputs, and stability to be within tolerance.
      3) Time constants of all excitation system elements by frequency response testing techniques described in IEEE 421.2.
      4) Temperature and cooling air flow; heat runs at rated load and at specified overloads.
      5) Burn-in for 48 hours with regulator power amplifier operating at rated load (current and voltage).
   b. Brushless excitation equipment:
      1) Audible noise.
      2) Load saturation curve, up to 110% of nominal ceiling voltage.
      3) Main exciter regulation.
      4) Pilot exciter regulation (where applicable).
      5) Heat run.
      6) Exciter time constant.
      7) Excitation system voltage response time and response in accordance with IEEE 421.2 (where applicable).
      8) Operating at momentary overspeed, if anticipated overspeed exceeds 125%.
   c. Static excitation equipment:
      1) Controlled rectifier assembly:
         a) Rated current, forward, and reverse losses.
         b) Temperature rise by heat run.
         c) Burn-in for 48 hours.
         d) Power factor and displacement factor, efficiency, and voltage regulation.
         e) Verify current balance.
      2) Power potential transformers:
         a) Impedance, load loss, and regulation.
         b) Computing reactance.
         c) Temperature rise by heat run.
         d) Impulse test(s).
6. Other tests as required by IEEE 421.2 or other standards and tests normally performed by manufacturer to ensure quality.

C. Other equipment: Perform tests as required by standards and tests normally performed by manufacturer to ensure quality.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install in accordance with manufacturer's instructions, procedures, and recommendations.

3.02 FIELD QUALITY CONTROL

A. Inspect system equipment and components and document findings.

B. Instruments shall be either field calibrated or verified.

C. Perform field testing and commissioning in accordance with manufacturer's instructions, procedures, and recommendations.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Drum.

B. Tubes.

C. Headers.

D. Water-cooled furnace.

E. Boiler circulating system.

F. Backpass.

G. Superheater.

H. Reheater.

I. Economizer.

J. Access and observation ports.

K. Penthouse.

L. Sootblowers.

M. Bottom ash system.

N. Personnel access.

O. Hoistways and monorails.

P. Enclosure.

Q. Accessories.

R. Fabrication.

S. Tests and inspection.

T. Cleaning.

1.02 QUALITY ASSURANCE

A. Manufacturer's qualifications:
1. Service requirements: Service on-site presence including service engineers with a maximum response time of 24 hours.
2. Minimum of 25 boilers of similar type and design.
3. When requested by Owner, provide acceptable list of similar equipment installations complying with requirements of specification.
4. ISO 9001 certified.

1.03 DELIVERY, STORAGE, AND HANDLING

A. Storage:
1. Protect interiors of tubes and headers with water soluble preservative.
2. Protect weld ends of headers and tubes:
a. Sizes larger than 2": Fit with protective end caps lined with 3/4" soft wood to prevent damage to machined ends. Seal with waterproof tape.
b. Sizes 2" and smaller: Fit with plastic cap and seal with waterproof tape.

PART 2 PRODUCTS

2.01 SYSTEM DESCRIPTION

A. Single drum, top-supported, radiant-type.

B. Opposed or tangential firing.

C. Balanced draft system.

D. Single reheat, superheater.

E. Natural circulation.

F. Construction:
1. Boiler shall form a pressure tight envelope from secondary air inlet to boiler flue gas outlet.
2. Components shall be shop fabricated and sub assembled to maximum extent practical.

G. Suitable for outdoor service.

2.02 DESIGN REQUIREMENTS

A. Design and construct equipment in compliance with applicable laws, ordinances, and regulations of principality having jurisdiction of plant site; ASME Boiler Code Section 1, ASME 31.1, NFPA 85, and OSHA. Unless noted otherwise, latest editions, including addenda and supplements, of codes, standards, laws, ordinances, and regulations in effect on date of this contract shall apply.

B. Furnace, other air and gas passages, and ductwork: ±35 in, w.g. Furnace wall stiffeners based on requirement for >3 cps natural frequency of tubes and wall.

C. Design pendant, platen, and convection banks with adequate tube spacing and cavities to avoid plugging and fouling, to allow for proper sootblower operation, and to permit maintenance access.

D. Tubing used in boiler construction shall be seamless.

E. Extended surface (finned) tubes are not acceptable for superheater, reheater, or economizer.

F. Use of backing rings for either shop or field welds is not permitted.

G. Owner-approved identification system, employing an alphanumeric number system shall be used for boiler and auxiliary equipment.

H. Provide shop prime painting on interior and exterior structural steel framing, high- and low-temperature pipe, miscellaneous structural steel, and miscellaneous metals in accordance with Section 09 90 00. Shop prime painting not required on surfaces to be covered with insulation and lagging and interior surfaces of boiler and ductwork. Provide nonzinc shop priming as required for rust prevention during ocean transit.

2.03 DRUM

A. Construction:
1. Fusion-welded. Welds shall be preheated and stress relieved.
2. Circumferential and longitudinal drum welds shall be inspected by X-ray with graphic film records.
3. Forged steel manhole in each drum end shall be not smaller than 15-1/2" x 11-1/2"; equip with hinged manhole cover, gasket, and bolts.

B. Steam drum diameter, minimum, inside: 66".

C. Extend steam drum heads a minimum of 3' outside boiler casing.

D. Nozzles:
1. Forged or seamless drawn steel, fusion welded to drum.
2. Length as required for necessary clearance from boiler insulation and casing.
3. Minimum number, minimum size, and type of connections:

	Number	Size	Type of Connection
Feedwater inlet	As req'd	As req'd	Butt weld
Feedwater control drum level elements	6	1.5"	Socket weld
Gage glass	2	1.5"	Socket weld
Continuous blowdown	1	1.5"	Socket weld
Chemical feed	1	1"	Socket weld[1]
Safety valves	As req'd	As req'd	Butt-weld
Pressure gage	As req'd	As req'd	Socket weld
Air vents	As req'd	As req'd	Socket weld
Chemical cleaning	As req'd	As req'd	Socket weld
Steam sampling (On drum steam outlet piping is acceptable)	4	1"	Socket weld
Drum sampling (On cont. blowdown outlet piping is acceptable)	1	1"	Socket weld
[1] Provide thermal sleeve to shield drum wall from temperature differential between chemical and drum.			

E. Valves required for boiler control shall include motor operators.

F. Steam drum internals:
1. Steam separators to limit saturated steam moisture and solids content as specified.
2. Internal feed distribution piping.
3. Continuous blowdown collection piping.
4. Chemical feed distribution piping.
5. Internal distributors, baffles, and shields.

G. Shop cleaning and preparation for shipment:
1. Drum interior: Grit-blast plate prior to fabrication; include suitable desiccant to maintain dry condition. Maintain check and records of desiccant condition. Replace as necessary.
2. Machined surfaces: Coat with anti-rust compound prior to shipment.
3. Openings: Seal openings, including downcomers, steam outlets, water risers, manhole covers, and instrument and gauge connections prior to shipment.

H. Vents:
1. Extend 8' above roof.
2. Double valve.
3. Minimum size: 1".

I. Accessories:
   1. One multiple port bi-color gage glass.
   2. Two remote level indication systems.
   3. Three differential pressure type drum level transmitters.
   4. Three static pressure transmitters.
   5. One pressure gage with? connection each end.

2.04 TUBES

A. Material shall meet requirements of ASTM/ASME.

B. Backing rings not permitted.

C. Shop cleaning and shipment preparation:
   1. Mechanically clean seamless tubes to remove mill scale:
      a. Clean tube ends of mill scale.
      b. Coat machined or cleaned surfaces with anti-rust compound.
      c. Close tube ends for shipment and storage to prevent damage to tube ends and entrance of foreign material or moisture.
   2. Cleaning not required on cold-drawn tubing.

2.05 HEADERS

A. Material and welding: Conform to ASME B&PV Code Section 1 – Power Boilers.

B. Welds shall be preheated and stress relieved.

C. Circumferential welds shall be inspected by X-ray with graphic film records.

D. Steam headers shall not contain distribution baffles.

E. Headers requiring field welding to tubes shall have shop welded tube ends.

F. Headers shall be completely drainable.

G. Provide 1-1/2" inspection nozzles as necessary for annual boiler certification inspections.

2.06 WATER-COOLED FURNACE

A. Definitions:
   1. Gross heat release: Total heat in fuel actually burned, based on higher heating value.
   2. Net heat release: Total heat in fuel actually burned, based on higher heating value, plus heat in preheated air above 80ºF, minus radiation losses, unburned combustible losses, latent heat of moisture contained in fuel and formed by burning hydrogen in fuel.
   3. Furnace: Space provided for combustion of fuel, measured between intersecting planes passing through center lines of tubes forming furnace envelope, including wall tubes and plane at entrance to convection zone.
   4. Furnace volume: Total volume inside furnace envelope.
   5. Plan area: Furnace horizontal cross-sectional area in plane of firing zone.
   6. Volumetric release: Gross heat release divided by furnace volume.
   7. Plan area release: Gross heat release divided by plan area.
   8. Furnace exit gas temperature: Average gas temperature entering convection zone at specified rated capacity.

B. Wall openings: Bend tubes to provide openings for access doors, observation doors, burners, soot blowers, TV furnace monitors, and other similar items.

C. Seals and burner throats: Minimize use of refractory. Openings and seals requiring refractory shall be pressure tight.

D. Water-cooled furnace bottom: Arrange to provide shield for ash hopper and associated refractory and direct ash and slag into drag chain ash conveyor.

E. Maximum gas velocity in boiler: 60 fps.

F. Wall tubes:
1. Materials: In accordance with manufacturer's standards and ASME B&PV requirements.
2. Type:
   a. Vertical bare steel tubes.
   b. Bends: Drainable.
3. Construction:
   a. Continuously welded, gas tight, membrane wall enclosure.
   b. Fin maximum width: 1.00", minimum 0.25".
4. Strength welded connections to headers.
5. Space or bend tubes to permit access for inspection and maintenance of soot blowers, baffles, tube hangers or spacers, and other items within boiler enclosure.
6. Tubes shall completely vent to boiler drum.

G. Water wall feeders and risers:
1. Provide required circulation between boiler drum and water wall headers to prevent overheating of surface under all operating conditions.
2. Arrange exterior tubes to prevent interference with spaces provided for access and inspection doors.
3. Downcomers larger than 6" O.D.: Non heat-absorbing.

H. Roof tubes:
1. Steam or water-cooled with tube spacing not exceeding 4". Provide welded airtight seal between tubes with flexible seal for penetrations.
2. Construction:
   a. Gastight.
   b. Fin maximum width: 1.00", minimum 0.25".

I. Headers:
1. Provide welded drain connection on each lower header.
2. Provide acid cleaning connections on each side at lowest points in circulation system; size to permit draining boiler in approximately two hours.

J. Drain low points. Minimum size: 2".

K. Ash hopper seal plate material: Type 304 stainless steel.

2.07 BACKPASS

A. Wall tubes:
1. Steam or water cooled with tube spacing not exceeding 4".
2. Materials: In accordance with Manufacturer's standards and ASME B&PV requirements.
3. Type:
   a. Vertical bare steel tubes.
   b. Bends shall be drainable.
4. Construction:
   a. Continuously welded, gastight, membrane wall enclosure.
   b. Fin maximum width 1.00", minimum 0.25".
5. Connections: Strength welded to headers.
6. Arrangement: Space or bend tubes as required to permit access for inspection and maintenance of soot blowers, baffles, tube hangers or spacers, and other items within boiler enclosure.

B. Roof tubes:
1. Steam or water-cooled with tube spacing not exceeding 4". Provide welded airtight seal between tubes with flexible seal for penetrations.

2. Construction:
   a. Continuously welded, gas tight, membrane wall enclosure.
   b. Fin maximum width: 1.00", minimum 0.25".

C. Headers: Provide welded drain connection on each lower header.

D. Vent high points:
   1. Extend 8' above roof.
   2. Double valve.
   3. Minimum size: 1-1/2".

E. Drain low points: Minimum size: 2".

2.08 SUPERHEATER

A. Materials: As appropriate in accordance with ASME B&PV Code. Minimize use of T-91 class material. Support lugs and tube restraints shall be of compatible material. Use of code case material not allowed without written approval from Owner.

B. Arrangement:
   1. Properly support, vent and/or drain transfer piping. Account for expansion movements.
   2. Convection banks:
      a. Maximum unsupported tube length: 18'-6".
      b. Side spacing sufficient to prevent ash accumulation and permit effective cleaning.
      c. Accessible for maintenance purposes.
   3. Pendants and platens:
      a. Wrapper tube restraints not permitted.
      b. Side spacing sufficient to prevent ash accumulation and permit effective cleaning.

C. Attemperation:
   1. Arrange two-stage superheater design for interstage steam temperature control, if spray desuperheating is used.
   2. Provide inspection nozzle upstream of desuperheater.

D. Steam sampling connections: Provide saturated steam sampling connections between boiler drum and superheater inlet.

E. Header location: Locate alloy steel headers subject to temperatures exceeding 1,000 °F exterior to boiler setting or provide with protected cavity arranged with suitable access door.

F. Structural supports: Provide built-in supports and hangers that would be considered part of equipment itself.

G. Vent high points:
   1. Extend 8' above roof.
   2. Double valve.
   3. Minimum size: 1", except superheater outlet vent shall be 2" minimum.
   4. Nitrogen capping connection:
      a. Provide 2" connection prior to superheater heater outlet vent valves.
      b. Provide one valve.

H. Drain low points. 1-1/2" minimum size.

I. Connections:
   1. Test gage connection: 1".
   2. Thermocouple wells: Refer to Section 40 91 00.

J. Joints and connections: Welded.

2.09 REHEATER

A. Materials: In accordance with ASME B&PV Code. Minimize use of T-91 and T-92 class materials. Support and alignment lugs shall be of compatible material. Use of code case material not allowed without written approval from Owner.

B. Arrangement:
   1. Properly support, vent and/or drain transfer piping. Account for expansion movements.
   2. Convection banks:
      a. Maximum unsupported tube length: 18'-6".
      b. Side spacing sufficient to prevent ash accumulation and permit effective cleaning
      c. No non-pressure parts element-to-element alignment brackets.
      d. Accessible for maintenance purposes.
   3. Pendants:
      a. Wrapper tube restraints not permitted.
      b. Side spacing sufficient to prevent ash accumulation and permit effective cleaning.

C. Attemperation: Provide one or two attemperation points, as required.

D. Header location: Locate alloy steel headers subject to temperatures exceeding 1,000°F exterior to boiler setting or be provided with protected cavity arranged with suitable access door.

E. Structural support: Provide built-in supports and hangers that would be considered part of equipment itself.

F. Vent high points:
   1. Extend 8' above roof.
   2. Double valve.
   3. Minimum size: 1", except reheater outlet vent shall be 2" minimum.
   4. Nitrogen capping connection:
      a. Provide 2" connection prior to reheater header outlet vent valves.
      b. Provide one valve.

G. Drain low points: 1-1/2" minimum size.

H. Connections:
   1. Test gage connection: 1".
   2. Thermocouple wells: Refer to Section 40 91 00.

I. Joints and connections: Welded.

2.10 ECONOMIZER

A. Feedwater flow: Downflow not permitted.

B. Material: In accordance with manufacturer's standard and ASME B&PV requirements.

C. Maximum economizer feedwater outlet temperature at least 50°F below boiler drum saturated steam temperature.

D. Arrangement:
   1. Horizontal, continuous, drainable, bare tube type. Staggered tubes not allowed.
   2. Provide access for inspection and repair of tubes.
   3. Provide for economizer components, built-in structural supports and hangers, which shall be considered part of equipment.

E. Feedwater pressure loss: As required to effect uniform flow through elements.

F. Elements:
   1. Tube size: Not less than 1-3/4" O.D.
   2. Connections: Strength welded to headers.

G. Headers:
   1. Provide welded drain connection on each lower header.
   2. Provide acid cleaning connections on each side at lowest points in circulation system; size to permit draining boiler in approximately two hours.
   3. Materials: Forged or seamless drawn steel, ASTM A105 or A106.

H. Valves:
   1. Stop valve:
      a. Flexible wedge, parallel slide gate type.
      b. Provide motor operator on stop valve.
   2. Check valve:
      a. Swing type.
      b. Provide adapter for check valve pressure seal connection for use in pre-boiler cycle wash out
   3. Arrangement shall allow easy access from operating platform.

I. Vent high points:
   1. Extend 8' above roof.
   2. Double valve.
   3. Minimum size: 1", except economizer outlet vent shall be 2" minimum.

J. Drain low points. 1-1/2" minimum size.

2.11 ACCESS DOORS AND OBSERVATION PORTS

A. Access doors:
   1. Permit access to furnace, superheater, reheater, between arch tubes and casing, between economizer banks, and in any other areas requiring access. Provide access on one side where there is at least 6'-8" clear height and on both sides where there is less that 6'-8" clear height.
   2. Hinged and pressuretight.
   3. Provide handles welded above and outside access doors to aid personnel entering and exiting interior of boiler.
   4. Refractory lined.
   5. Minimum size: 18" x 24".

B. Scaffold access doors:
   1. Hinged and pressuretight.
   2. Provide handles welded above and outside access doors to aid personnel entering and exiting interior of steam generator.
   3. Refractory lined.
   4. Minimum Size: 24" x 36".
   5. Upper furnace: Provide minimum of 2 scaffold access doors to allow entry to areas between superheater platens, if platens are provided.
   6. Lower furnace: Provide 1 scaffold access door on each side of lower furnace (2 total) near furnace hopper bottom. Locate lower scaffold access doors for convenient access from lower walkways subject to approval of Owner.

C. Observation ports:
   1. Provide an adequate number of conveniently located observation ports including ports for viewing burners, pilots, and instrument connections. Number and location of ports shall be acceptable to Owner.
   2. Rectangular type suitable for wide angle viewing.
   3. Designed to prevent infiltration of air into boiler when in closed position.
   4. Provide furnace walls or roof with necessary openings as recommended by manufacturer for a flame observation television camera(s) to be furnished by others. Furnish port(s) required in

furnace walls, or roof, to permit complete flame observation. Provide required tube arrangement, wall sleeves, mounting plates; and a bolted, refractory lined, blank closure for sealing camera opening(s).

D. Provide access openings in furnace walls to permit installation of a safety net beneath superheater platens, if platens are provided.

E. Provide pipe sleeves for maintenance scaffold rigging cables into interior of boiler through penthouse. Seal weld pipe sleeves at furnace and penthouse roofs, and cap above penthouse roof.
   1. Size: At least 1-1/2" diameter.
   2. Number: Sufficient number to permit access from suspended scaffolds to interior surfaces including furnace, superheater and reheater areas, and each side of platen surfaces.
   3. Maximum distance between cable openings: 8'.
   4. As required to meet OSHA requirements.

2.12 PENTHOUSE

A. Steam drum (except drum ends) and headers, tubes, and piping above furnace and convection pass roof shall be enclosed in penthouse.

B. Construction:
   1. Steel plate, suitably reinforced to adequately support construction and maintenance loads.
   2. Seal weld entire enclosure to maximum extent practicable in keeping with boiler design to maintain pressure-tight integrity.

C. Insulation: Insulate internally or externally in accordance as specified in Section 40 42 23.

D. Access door: 36" x 36" minimum size.

E. Provide ample heat release openings and sealing air inlets in penthouse enclosure walls and roof for accelerated cooling to permit access to penthouse immediately following power outage of boiler. Provide an exhaust fan to provide one air change per minute for accelerated cooling of penthouse.

F. Manufacturer's standard penthouse providing equivalent construction may be proposed subject to Owner's review.

2.13 SOOTBLOWERS

A. Provide as required to maintain cleanliness of furnace wall tubes, superheater, reheater, and economizer tubes, boiler convection surfaces and heat recovery equipment. Intended utilization of sootblowers subject to field optimization is one cycle per shift maximum, three shifts per day.

B. If operation shows need for additional soot blowers for cleaning boiler, furnish and install it at no additional cost to Owner with following limitations:
   1. Additional soot blowers shall be limited to those required to meet maximum continuous rating and rated steam temperatures while burning fuels specified in 01 30 00.
   2. Need shall be determined within 12 months of Substantial Completion.

C. Blowing medium: Steam.

D. Types:
   1. Long retractable: For screen tubes, superheater, and convection surfaces where gas temperatures exceed 1,600°F at specified maximum continuous rating.
   2. Partial travel for lower temperature convection surfaces and economizer.
   3. Furnace wall blowers and/or water cannons.

E. Air heater: Furnish steam blower cleaning devices from same manufacturer as remainder of sootblower system.

F. Sootblowers and water cannons shall be suitable for outdoor service.

G. Retractable sootblowers:
   1. Automatically retract on low air pressure, elapsed operating time, or upon overload of motor.
   2. Provide means for emergency retract of sootblower.

H. Each sootblower shall have adjustable pressure control.

I. Water cannons:
   1. A minimum of one water cannon shall be mounted in each furnace side wall.
   2. Minimum articulation angle: 45° in every direction.
   3. Lance can be removed for maintenance while boiler is in operation.
   4. Provide pressure pumps to supply water cannons with required pressure/flow.
   5. Water cannon operation shall not be affected by having one pump out of service.
   6. Furnish piping between pumps and water cannons.
   7. Provide single terminal point for connection to plant service water.
   8. Control system shall incorporate built-in heat flux and tube temperature sensing devises to measure slag build-up.

J. Control system:
   1. Provide PLC-based control system. Refer to Section 40 94 43 for PLC requirements and Section 40 95 13 for control panel requirements.
   2. Operator shall have capability of starting or stopping sootblowing sequence, modifying sequence, creating a new sequence, and monitoring air system and individual sootblower operation.
   3. Upon complete loss of power to control system, soot blowers shall move to their fail-safe positions and shall have no effect on any stored blowing sequences whether factory or operator programmed.
   4. Provide local "Hand-Auto-Off" (HOA) switch.

K. Design:
   1. Arrange so elements can be removed for inspection and maintenance. Long retractable blowers shall be double units reaching half width of furnace.
   2. Provide adjustable pressure control on soot blower heads.
   3. One-speed, two-speed, or variable-speed type for retractable and half-travel blowers.
   4. Bearings: Welded, of same materials as elements. Locate at intervals not exceeding 24".
   5. Drive motors: 460-volt, 3-phase, 60 Hz induction motors, totally enclosed fan cooled, with suitable speed reducers. Refer to Section 26 05 03.

L. Accessories:
   1. Wall boxes.
   2. Mounting brackets.
   3. Supports including hangers, supports and/or brackets for support of outer end of retractable soot blowers from platform or building steel.
   4. Required accessories for blower.

M. Vents: Vent high points of water for water cannon.

N. Drains:
   1. Water for water cannon:
      a. Drain low points.
      b. Terminate drain after valve.

2.14 BOTTOM ASH SYSTEM

A. Refer to Section 41 12 13-56.

2.15 PERSONNEL ACCESS

A. Provide stairs on each side of boiler from grade to highest operating level.

B. Connect platforms at same elevation by a walkway.

C. Platforms requiring access from elevator shall extend to elevator entrance.

D. Provide emergency escape ladders from any platforms having dead ends longer than 20'-0".

E. Lowest floor elevation: Ground floor, approximately grade level.

F. Valves shall have platform access.

G. Platform locations shall be subject to review by Owner.

H. Provide stair access to elevator machine room and boiler roof.

2.16 HOISTWAYS AND MONORAILS

A. Provide hoistway from top of boiler to ground floor with monorail and electric hoist capable of lifting at least 3 tons.
   1. Hoistway shall be accessible from platforms.
   2. Adjacent platform dimensions: 10' x 10' minimum.
   3. Provide removable handrail sections at platforms adjacent to hoistway.

B. Locate monorails in areas that meet following requirements:
   1. Mobile equipment access where equipment removal is not feasible.
   2. Above rotating equipment over 220 lb.
   3. Locate to allow equipment to be removed and lowered to grade in no more than 2 lifts.

C. Provide hoistways and monorails in other locations where necessary to maintain equipment.

2.17 ENCLOSURE

A. Provide ventilated weather enclosures around burners.

B. Provide concrete slab floor and ventilated enclosure above the coal silos for the coal handling equipment.

2.18 ACCESSORIES

A. Accessories shall be in accordance with ASME B&PV Code Section 1 - Power Boilers.

B. Safety valves for drum, superheater, and reheater:
   1. Provide safety valves in sufficient number and size to relieve maximum steaming capacity of boiler.
   2. Provide power-operated relief valve including shutoff gate valve for installation on or near superheater outlet. Provide blowoff silencer with power relief valve. Provide motor-operated shutoff valve for power-operated relief valve.

C. Drain valves:
   1. Provide in sufficient number to permit draining boiler, superheater headers, reheater headers, water wall headers, and economizer.
   2. Provide piping and fittings required for connecting valves to boiler.
   3. First valve shall be accessible from floor or platform.
   4. Locate second valve at floor or platform in cluster.

D. Miscellaneous valves:
   1. Furnish shut off valves for pressure connections including, but not limited to following. Double valve as required by ASME B&PV Code and lines with design pressures over 600 psig, and as indicated below:
      a. Feedwater control drum level element.

b. Water gage glass drains.
c. Remote drum level indicators.
d. Chemical feed: Double-valve.
e. Continuous blow down:
   1) Double-valve.
   2) Provide angle gate valve with orifice sized for continuous blowdown flow; accessible from operating floor.
   3) Provide gate valve as bypass around angle gate valve.
f. Downcomer drains: Double-valve. Second valve shall be accessible from operating floor.
g. Gages.
h. Air vents.
i. Superheater and reheater header vents: Double-valve.
j. Superheater and reheater header drains: Double-valve.
k. Attemperator spray water connections including check valves.
l. Drum steam sampling connections: Double-valve.
m. Acid cleaning connections.
n. Economizer header vents: Double-valve.
o. Economizer header drain: Double-valve.
p. Nitrogen blanket inlet; arrange connection between double valves of drum and reheat vents.
q. Boiler drains: Double-valve.
r. Water sampling connections.
s. Test gage connections.
t. Economizer recirculation: Motor-operated.

2. Second valve in double-valved drains shall be located at common terminal at floor or platform in cluster.

E. Terminate boiler drum vent piping 8' above roof.

F. Provide drain funnels and drain piping and hangers from safety valves, drip pans, and other atmospheric drains from boiler. Drains shall be piped to safe location at grade. Drain system shall be all-welded.

G. Power operated relief valve silencers:
   1. Provide for power operated relief valves.
   2. Allowable noise level: Refer to Section 01 30 00.

H. Miscellaneous instrumentation:
   1. Provide test connections and thermowells before and after major components.
   2. Provide sufficient metal temperature thermocouples to quantify side-to-side temperature trends in superheater and reheater.
   3. Furnace gas temperature monitors:
      a. Provide two temperature monitors; one for each furnace sidewall, for monitoring furnace gas temperature during start-up and normal operation.
      b. Air-cooled.
      c. Analog output signal 4-20 mA.
      d. Provide smoothed value transform algorithms and running average transform algorithms, plus any other applicable transform algorithms, for programming into DCS.

PART 3 EXECUTION

3.01 NONDESTRUCTIVE EXAMINATIONS

A. Radiographic examinations:
   1. Radiographic examinations shall be in accordance with requirements for radiography as specified by Section I of ASME B&PV Code and by Power Piping Code ANSI/ASME B31.1.
   2. Radiograph 5% of full penetration pressure part butt welds not requiring radiography by referenced code (5% of such welds by each welder shall be radiographed). Category of weld normally includes butt welds in tube bundle downcomer and riser welds, pipe welds in boiler proper, and boiler external piping.

3. If defect is identified, radiograph an additional 5% of welds deposited by that welder.
4. If additional defects are found, radiograph all welds deposited by that welder.

B. Magnetic particle test: Test field welds at corner connections on major structural frames.

3.02 TESTS AND INSPECTIONS

A. Pressure test:
1. Conduct after completion of erection of steam generator pressure parts and prior to insulating (including refractory installation). Hydrostatic test in accordance with ASME B&PV Code in presence of authorized inspector.
2. Valve off or otherwise isolate instruments, controls, or other accessories which may be damaged by test pressure.
3. Correct defects discovered during test, and retest boiler.
4. Following hydrostatic testing, completely drain boiler to operating level and fill with nitrogen to a pressure of 5 psig. Maintain nitrogen cap. Furnish nitrogen, tubing, and indicators.

B. Furnace envelope leakage test:
1. Perform after erection of furnace tubes and/or inner skin casing, ducts, and air heater.
2. Sonic leak detection or vacuum box testing may be used to locate air leaks.
3. Submit proposed sonic detection procedure to Owner for review.
4. Run sonic leak detection test at a pressure of 7" w.g. Correct defects in work discovered as a result of pressure test and retest boiler.

C. Air pressure test:
1. Test casing for casing leaks by procedure approved by Owner.
2. Pressurize boiler with forced draft fan or other means as approved by Owner.
3. Before applying pressure, check following while closing up boiler.
   a. Water seals are filled.
   b. Idle forced draft fans shall be protected from backwards rotation by closed dampers and blocked rotors.
   c. Idle induced draft fan rotors shall be blocked. If fans are operative, fan shall be running with closed dampers.
4. With a forced draft fan running, induced draft fan dampers and forced draft fan dampers shall be operated to gradually develop a maximum pressure of 5" to 7" w.g. in furnace with a minimum airflow going through boiler.
5. Inspect discovered leaks and seal openings.
6. Test roof casing for tightness. Inspect roof casing at same time furnace setting is being tested. Test penthouse enclosure.
7. Check flues between boiler and AQCS inlets, and ducts between forced draft fan and furnace for tightness with rest of boiler while furnace pressure maintained at 5" to 7" w.g. Seal leaks detected in gas flues.
8. Repair leaks identified during testing and retest.

D. Stamping: Inspection stamps and code symbol stamps required, together with other necessary information,shall be applied in accordance with governing codes. For alloy steel piping, stamp information on steel bands at least 1" wide and mechanically fastened to piping. Alternate stamping method allowed is low stress die stamps such as interrupted dot or round nose type tools.

END OF SECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Design, manufacture, deliver, and install two condensing, single reheat steam turbine-generator (STG) including all auxiliary components for proper operation, function, control, and monitoring of STG. Turbine shall be fully compatible and matched with electric generator and accessories.

1.02 QUALITY ASSURANCE

A. Regulatory requirements: Equipment shall comply with applicable federal, state, county, and municipal laws, ordinances, rules and regulations, including but not limited to Occupational Safety and Health Standards for General Industry (OSHA); International Standards Organization (ISO), as applicable; and National Fire Protection Association (NFPA).

B. Materials and workmanship:
1. Contractor's standard materials of construction are acceptable unless specified otherwise or unless other materials are required to permit normal operation at site conditions. STG shall consist of new parts and materials of current manufacture.
2. Each part or component having same part number shall be fully interchangeable without rework with like part or component.

C. Manufacturer's qualifications:
1. Service requirements: Service on-site presence including service engineers with a maximum response time of 24 hours.
2. Minimum of 25 STG's of similar type and design.
3. When requested by Owner, provide acceptable list of similar equipment installations complying with requirements of specification.
4. ISO 9001 certified.

D. Standard product: Steam turbine shall be Contractor's standard package modified as required to meet specification requirements.

PART 2 PRODUCTS

2.01 SYSTEM DESCRIPTION

A. Two reheat, tandem compound, two-flow, condensing, 3,600 rpm, steam turbines, each direct-connected to separate 3-phase, 60 Hz, hydrogen cooled generator.

2.02 SERVICE CONDITIONS

A. Operation: Design and equip turbine-generators for commercial operation as follows:
1. Operate singly or in parallel under automatic load dispatch with other STG's in same station, and with other stations of interconnected system.
2. Capable of operating with steam supplied from a coal fired boiler with integrated boiler turbine control system.
3. Capable of withstanding 100% load rejection to auxiliary power without turbine overspeed trip.
4. Capable of coming to rest without bearing damage on loss of cooling water provided that turbine is tripped immediately after loss.
5. Capable of initiating rapid closure of intercept and governor control valves followed by immediate reopening to achieve a rapid reduction in turbine driving power as a means of maintaining STG stability (remaining in synchronism), during severe generator load loss transients due to external system disturbances.

2.03 STEAM TURBINE

A. Tandem compound, single reheat, double flow exhaust type, with necessary features and accessory equipment including, but not limited to, following.
   1. Protective valve systems, including main stop valve, throttle valves, and reheat stop and intercept valves:
      a. Equip stop valves with coarse mesh corrosion-resistant metal strainers and temporary fine mesh strainers, multi-hole type.
      b. Provide temporary adaptors for steam line blowout.
      c. Provide piping between valves and steam chest or turbine casing as required. Provide piping hangers and supports and supplementary steel as required for supporting from turbine foundation or floor support steel.
   2. Electrohydraulic control system: High-pressure fluid supply system consisting of following:
      a. Fluid reservoir with level indicator and high/low level alarm switches.
      b. Fluid pressure accumulators.
      c. Two full capacity motor-driven high-pressure fluid pumps.
      d. Two full capacity fluid coolers with fluid transfer valving. Tube material shall be stainless steel.
      e. Fluid filters with differential pressure switches to indicate fouling.
      f. Interconnecting fluid piping (stainless steel) and associated control and safety devices.
      g. Arrange high-pressure piping for socket welding. Provide hangers and supports and auxiliary steel for fluid piping.
      h. Factory wire electrical devices on reservoir to terminal box mounted on STG.
      i. Fire-resistant hydraulic fluid shall be used.
   3. Lubricating oil system:
      a. Two ac motor-driven main oil pumps and one dc motor driven emergency oil pump. Provide turning gear oil pump if required by systems design.
      b. Oil reservoir including following features and equipment:
         1) Reservoir level indicator and high/low and overflow level alarms.
         2) Reservoir relief and access doors. Emergency bearing oil pump with dc motor drive, complete with motor starter and control equipment.
         3) Stainless steel strainers at pump suctions.
         4) Oil reservoir vapor extractor with mist eliminator, ac motor driven.
         5) Arrange tank-mounted oil pumps so motor-to-pump shaft coupling is accessible outside oil tank.
         6) Pressure switches for automatic start-up of turning gear oil pump, emergency bearing oil pump and bearing oil pump. Provide test valves with all pressure switches for testing pumps.
         7) Pressure switches for running alarm of turning gear oil pump, emergency bearing oil pump and bearing oil pump.
      c. Two full capacity plate and frame oil coolers.
      d. Sight flow indicators at all turbine and generator bearings.
      e. Provide complete interconnecting oil piping between bearings, oil reservoir, and coolers including measures to prevent potential leakage from spray on hot surfaces. Oil supply lines downstream of filters shall be stainless steel. Provide hangers, supports, and supplementary steel required.
      f. Furnish associated control and safety devices for automatic sequential startup and operation of oil pumps.
      g. Factory wire electrical devices mounted on oil reservoir to terminal box mounted on STG.
      h. Skid-mounted lube oil conditioning system for continuous side stream water and particulate removal.
      i. Duplex, full-capacity (100%) lube oil filters, 25 microns maximum with provisions for on-line switchover.
      j. Provide connections for transferring lube oil to and from clean and dirty oil storage tanks.
   4. Gland steam system:
      a. Facilities as required to provide regulated steam supply of proper pressure and temperature.
      b. Supply from auxiliary source. Provide pneumatically operated gland steam regulators and spillover control.
      c. Motor-operated shutoff and bypass valves for high pressure supply, auxiliary supply, and spillover regulators.

d. Gland steam desuperheater system as required. If system is used during normal operation, provide pneumatic operated modulating valve, isolation valves, globe bypass valve and temperature controls. If system is used as emergency back-up, provide globe valve for condensate supply.
e. Gland steam condenser with 2 motor-driven exhausters. Condenser tube material shall be Type 304 stainless steel.
f. Interconnecting steam seal piping including hangers from supply regulators to turbine and from turbine to gland steam condenser.

5. Turbine casing and auxiliary equipment drains with remotely located power-operated drain valves, including piping from turbine to drain valves and manual valves at turbine or auxiliary equipment connection. Double valving required for systems with design pressure of 565 psig (3.9 MPag) or greater.
6. Exhaust hood temperature control system with spray nozzles and distributing piping from single supply point, equipped with temperature control system, including control valve, isolation valves and bypass piping with globe valve.
7. Rotor turning gear:
   a. Manual and automatic engagement, including zero speed sensing device and bearing oil pressure interlock.
   b. Furnish complete turning gear system including local turbine-mounted turning gear control station.
8. Protective devices:
   a. Exhaust casing relief diaphragms. Furnish spare diaphragm.
   b. Exhaust casing high temperature alarm thermocouple.
9. Turbine insulation:
   a. Block and plastic insulation for lower turbine shells, steam valve bodies and exhaust casings, and crossover pipe where required.
   b. Preformed segmental pipe insulation with 0.02" (0.5 mm) thick embossed aluminum jacketing for steam piping furnished.
   c. Removable 16-gage minimum steel covers filled with block and/or plastic heat retention material for combined stop throttle valves, reheat stop and interceptor valves, pipe flanges at turbine shells and flanges in crossover pipes as required by turbine design.
   d. Reusable blankets for upper turbine shells and horizontal and vertical shell-flange joints which normally unbolt for disassembly.
   e. Insulation thickness: According to manufacturer's standard.
10. Special turbine accessories:
    a. Motor-operated vacuum breaker valve.
    b. Shaft grounding brush.
    c. One set of special tools and lifting slings.
    d. Shims, seating, and sole plates as required to set and align equipment.
    e. Fixators as required to set and align steam turbine and generator.
11. ASME Code performance test connections including:
    a. Pressure test connection piping and isolation valves including necessary piping from low pressure extraction points inside condenser to external point on turbine base above foundation line.
    b. Thermocouples, wells and terminal heads, including necessary insertion tubing from turbine base to low pressure extraction points inside condenser.
    c. Exhaust hood baskets and piping to external connection points on turbine base above foundation line.

2.04 MATERIALS

A. Piping, fittings, and valves 2-1/2" (64 mm) and larger: Butt-welded except where flanges specified or specifically approved by Owner.

B. Piping, fittings, and valves 2" (50 mm) and smaller: Socket welded.

2.05 PIPING AND EQUIPMENT CONNECTIONS

A. Provide for welded connection between turbine and condenser.

B. Terminal points of piping connections shall be arranged for welded connection where possible.

C. Complete oil piping system shall be fabricated to minimize crud traps. Both shop and field welding of all oil piping shall use Heliarc welded root passes.

D. Oil piping and fittings shall be pickled to ensure complete freedom from scale, flushed with rust preventative compatible with turbine lubricating oil. Openings shall be tightly capped and sealed to protect piping during shipment and storage at jobsite. Provision shall be made for oil system flushing before initial start of STG and after overhaul with minimum removal of permanent pipe and easy bypass of bearings.

2.06 PAINTS AND FINISHES

A. Non-machined external surface of turbine-generator shall be shop-painted with prime coat.

B. Control panels and other equipment normally receiving finish coat painting in shop shall be painted with one prime coat and two finish coats. Color of finish coat will be determined by Owner after award of Contract.

2.07 SOURCE QUALITY CONTROL

A. Shop tests:
1. Control valves, all governors and auxiliaries: For correct functioning.
2. Turbine: Balance rotor dynamically, test for overspeed and erect unit to ensure adequate clearance between rotating and stationary parts.
3. Steam valves: Hydrostatic test and seat tightness test.
4. Turbine casing and shell: Hydrostatic test.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install in strict accordance with manufacturer's instructions.

ADDENDUM NO. 1
AUGUST 30, 2013

CORPORACIÓN DOMINICANA DE EMPRESAS ELÉCTRICAS ESTATALES (CDEEE)
LICITACIÓN PÚBLICA INTERNACIONAL No. CDEEE-LPI-01-2013

PARA LA SELECCIÓN DEL CONTRATISTA QUE EJECUTARÁ LOS TRABAJOS DE INGENIERÍA, PROCURA Y CONSTRUCCIÓN (EPC) DE DOS (2) UNIDADES TERMOELÉCTRICAS EN BASE A CARBÓN MINERAL CON UNA CAPACIDAD DE 300 MW (±20%) CADA UNA

ESPECIFICACIONES TECNICAS (INGLES)

1. SECTION 00 43 23 - PROPOSAL TECHNICAL DATA FORM

Delete Table 1 on page 1, in its entirety and insert attached page 1, Rev. 1, in its place.

Delete Table 8 on page 11, in its entirety and insert attached pages 11 and 11a, Rev. 1, in its place.

2. SECTION 01 10 00 - SUMMARY

Article "1.01 CONTRACT DESCRIPTION"

In paragraph A., change “Hatillo, Azua” to read “Punta Catalina, Bani”.

Article "1.02 WORK BY OTHERS"

Change subparagraph A., 1., a. to read:

a. Geotechnical contractor will drill soil borings and write a report.

Delete subparagraph A., 1., b. in its entirety.

Change subparagraph A., 2., b. to read:

b. Climate and meterological data.

Add paragraph A., 3. to read:

3. Ash landfill.

3. SECTION 01 23 00 - ALTERNATES

Delete Section 01 23 00, pages 1 through 2, in its entirety.

4. SECTION 01 30 00 – GENERAL DESIGN REQUIREMENTS

Article "1.01 DESCRIPTION OF PROJECT"

In paragraph B., change “on Ocoa Bay, in Hatillo, Azua” to read “at Punta Catalina, Bani”.

Article "1.02 MINIMUM FACILITY REQUIREMENTS"

Add subparagraph A., 19. to read:

19. Coal storage building.

Change subparagraph B., 10. to read:

10. Vehicle bridges and roads.

At the end of paragraph C., change "XC01R0" to read "XC01CR0".

In paragraph E., change "originate from Ocoa Bay" to read "be sea water".

Delete subparagraph F., 6. in its entirety.

Add paragraph H. to read:

H. Equipment and materials for facility shall be new and unused.

Article "1.03 DEFINITIONS"

Add paragraph K. to read:

K. "Equivalent Availability Factor (EAF)": EAF is the maximum generation that could be provided if limited only by outages and deratings.

$$EAF = \frac{(AG)}{(MG)} \times 100$$

where AG = Available generation; MG = Maximum generation

Article "1.04 FACILITY DESIGN REQUIREMENTS"

Change paragraph B. to read:

B. Each Unit shall be capable of continuous operation at minimum load of 35% MCR.

In subparagraph D., 4., change "O2" to read "O_2".

Article "1.06 COAL AND LIME ANALYSES"

Add paragraph D. to read:

D. No. 2 fuel oil analysis (typical):
1. Sulfur: 0.05 – 1.0%.
2. Hydrogen: 11.8 – 13.9%.
3. Carbon: 86.1 – 88.2%.
4. Nitrogen: 0 – 0.1%.
5. Oxygen: --.
6. Ash: 0 – 0.1%.
7. API Gravity: 28 – 41.
8. Specific Gravity: 0.825 – 0.887.
9. Heating Value: 19,000 – 19,750 BTU/lb.
10. Viscosity (centistokes): 0.5 – 5.8.
11. Pour Point: 32.
12. Water and Sediment: 0 – 0.1%.

Article "1.15 ARCHITECTURAL"

Add paragraph L. to read:

L. Coal storage building:
   1. Building shall be enclosed with painted steel siding and standing seam steel roofing system.
   2. Concrete slab on grade floor.
   3. Rail system for coal handling equipment.

5. SECTION 01 31 00 - QUALITY REQUIREMENTS

Article "1.06 TERMINOLOGY"

In subparagraph A., 1., c. delete the words "Article 9 of".

6. SECTION 01 32 13 – STRUCTURAL DESIGN REQUIREMENTS

Article "1.01 SITE CONDITIONS"

Change paragraph A., to read:

A. Power block elevation: Ground floor shall be approximately 6" (9150 mm) above finish grade. Finish grade shall slope away from buildings.

Article "1.02 STRUCTURAL DESIGN CRITERIA"

In subparagraph D., 2. change "145" to read "149" and delete "(ASCE 7-05, Figure 6-IA)."

Delete subparagraphs E., 1., a. and E., 1., b. in their entirety.

Change subparagraph E., 3. to read:

3. Site Class: Preliminary geotechnical report indicates eastern portion of site is Site Class E, portions of site with liquefiable soils is Site Class F, and remaining portions Site Class D. Contractor shall retain services of a professional Geotechnical Consultant to determine appropriate Site Class for each structure, and locations with a potential for an active fault as required by ASCE 7-05 11.8.1.

Article "1.05 FOUNDATIONS"

Change paragraph B. to read:

B. Owner will provide preliminary geotechnical report for project. Contractor shall retain services of a professional Geotechnical Consultant to perform additional geotechnical investigation, provide information required by IBC Section 1803, and provide geologic hazard investigation required by ASCE 7-05 Section 11.8. Preliminary geotechnical report indicates presence of karst features in limestone bedrock. Contractor shall probe drill at least 10' (3 m) into limestone bedrock located directly below foundations to detect and fill voids in bedrock.

7. SECTION 01 36 43 – CONTROL SYSTEMS DESIGN REQUIREMENTS

Article "1.02 SYSTEM ARCHITECTURE"

In subparagraph C., 1., change the end of the sentence to read:

1. . . . units (i.e., Units 1 and 2, or Units 3 and 4).

Article "1.03 CONTROL SYSTEMS"

Delete subparagraphs C., 5. and C., 6. in their entirety, and insert the following in their place:

5. PLC I/O cabinets shall be located in following locations:
   a. Coal Storage Building Electrical Room.
   b. Crusher Building (for Units 1 and 2).
   c. Unit 1 Turbine Building.
   d. Unit 2 Turbine Building.
   e. Coal Storage Building (for each Portal Relaimer).
   f. Future:
      1) Crusher Building (for Units 3 and 4).
      2) Unit 3 Turbine Building.
      3) Unit 4 Turbine Building.
6. PLC I/O cabinets shall have local HMI operator displays at following locations:
   a. Crusher Building (for Units 1 and 2).
   b. Coal Storage Building.
   c. Future: Future Crusher Building (for Units 3 and 4).

8. SECTION 01 36 00 - MECHANICAL DESIGN REQUIREMENTS

Article "1.16 CONDENSATE STORAGE AND MAKEUP SYSTEM DESCRIPTION"

Change subparagraph C., 1., to read:

3. Condensate storage tanks: Two 100,000-gallon tanks (one each unit).

Article "1.18 WASTEWATER TREATMENT SYSTEMS DESCRIPTION"

Delete paragraph D. in its entirety.

Article "1.32 FIRE PROTECTION SYSTEM DESCRIPTION"

Change subparagraph D., 12., to read:

12. Coal handling areas and equipment including transfer towers, crusher buildings, coal storage building, coal silos, coal unloading, dust collectors, conveyors, and silo fill floor.

Article "1.37 COAL HANDLING"

Change paragraph C. to read:

C. Coal storage pile will consist of active storage. The coal storage pile shall be enclosed inside coal storage building. The storage pile is generated by the tripper conveyors that will transverse on rails down the middle of the storage building with storage piles located between the traversing rails of the portal reclaimers. Coal is reclaimed from the pile using either the portal reclaimer or ground-mounted drag chain reclaimers.

Change subparagraph D., 4., to read:

4. Portal reclaimer.

Delete subparagraph E., 2., in its entirety.

Change subparagraph F., 6., to read:

6. Coal pile storage capacity: Maximize storage capacity consistent with site arrangement; minimum 30 days.

Delete subparagraphs F., 6., a. to F., 6., e. in their entirety.

9. SECTION 01 36 26 - ELECTRICAL DESIGN REQUIREMENTS

Article "1.05 SYSTEM DESCRIPTION"

Change the last sentence of subparagraph J., 1. to read:

1. The 345 kV switchyard shall be designed to allow both main buses to be expanded for up to 2 future generator step-up transformer connections.

Add the following language at end of subparagraph J., 2. to read:

2. . . . The point of demarcation shall be the terminal structure of the incoming 138 kV overhead transmission line. Facilities from and including the terminal structures, equipment, and line circuit to on-site power plant shall be included.

Add the following language at end of subparagraph J., 6. to read:

6. . . . Equipment in the 345 kV substation shall be included in the scope. Communication equipment in the remote end substation (not on the power plant site) is not in the Scope of Work. The point of demarcation is the fiber optic splice box located on the dead-end structure. Facilities from and including the fiber optic splice box into the substation control building and communications equipment from the substation control building into the plant shall be in the Scope of Work.

Change subparagraph J., 8., a., 3) to read:

3) Rated voltage: 362 kV.

Article "1.15 LIGHTING"

In the table following paragraph F., change "Covered coal-storage area" to read:

MINIMUM LIGHTING LEVEL FOR GENERATING STATION		
Location	lux	foot-candles
UNIT EXTERIOR		
Enclosed coal-storage area	110	10

Article "1.21 FIRE ALARM AND DETECTION SYSTEM"

Add subparagraph F., 18. to read:

18. Coal storage building.

10. SECTION 01 39 00 - SITE CONSTRUCTION DESIGN REQUIREMENTS

Article "1.01 SITE CONDITIONS"

Change paragraph A. to read:

A. The site lies south of Highway 2 at Punta Catalina, Bani. Existing site elevations drop off from the local gravel access road to the bay in the south direction. The majority of the site is farmland.

Article "1.03 ROADS, PARKING AND OTHER SITE PAVING"

Change subparagraph H., 3. to read:

3. Coal pile storage building: Two 12' (3.5 m) (minimum) lanes, one at each end.

In paragraph I., change "ash landfill" to read "ash silos"

Article "1.07 GENERAL SYSTEM REQUIREMENTS"

Change subparagraphs D., 2., and D., 3. to read:

2. Storm drainage system shall collect run-off water from(non-process areas of the plant) (areas of the plant without process systems) via sheet flow, ditches, culverts, and underground drainage piping. No runoff water coming into contact with coal, oil, ash, or other process material shall be conveyed to the storm water system.
3. Collect runoff from the ash silo area and deposit into an adjacent basin. Basin shall be a reinforced concrete structure with a sloped ramp for end loader access to remove accumulated solids. Decant the liquid in the basin and drain to the wastewater settling basin.

Delete subparagraph E., 3., in its entirety.

Delete paragraph F. in its entirety.

11. SECTION 01 50 00 - TEMPORARY FACILITIES AND CONTROLS

Article "1.05 VEHICULAR ACCESS"

In paragraph E., change "Highway 2" to read "public roadway".

Article "1.06 PARKING"

In paragraph C., change "highway" to read "public roadway".

12. SECTION 01 83 10 - SUBMITTAL DOCUMENTATION

Article "1.01 REQUIREMENTS INCLUDE"

Change the following items in Table 1 - Submittal Documents to read:

Table 1 - Submittal Documents		
Submittal Description	**Submittal Categories**	**Document Format**
MECHANICAL		
Major Equipment Procurement Specifications:		
~~Linear stacker~~Portal/reclaimer	FI, FR	P, EF
Lists/Sheets		
Capital spare parts list with pricing	WP, FI, FR	P, EF

Add the following items in Table 1 - Submittal Documents to read:

Table 1 - Submittal Documents		
Submittal Description	**Submittal Categories**	**Document Format**
MECHANICAL		
Reports		
CEM report format	FA, FR	P, EF

Table 1 - Submittal Documents		
Submittal Description	**Submittal Categories**	**Document Format**
OPERATION AND MAINTENANCE DOCUMENTATION		
Plant organization Chart (recommended)	FI	P, EF
Planned outages (recommended)	FI	P, EF
Plant Maintenance Procedures	FA, FR	P, EF
Plant and System Operating Procedures	FA, FR	EF

13. SECTION 01 92 00-13 - FACILITY OPERATION AND MAINTENANCE

Delete Section 01 92 00-13, pages 1 through 5, in its entirety.

14. SECTION 41 10 00 – BULK MATERIAL PROCESSING EQUIPMENT

Article "2.03 TRIPPER"

Change paragraph A. to read:

A. Locations: Above silos and above storage pile.

Change paragraph C. to read:

C. Provide discharge chute arrange to allow diversion of coal into silos or storage pile below.

Change paragraph G. to read:

G. Silo fill trippers: Festoon cable system with cable for power and control circuits suitable for use in areas classified by NEC as Class II, Division I, Group F.

Add paragraph L. to read:

L. Storage pile trippers: Cable reel system with power and control circuits suitable for use in areas classified by NEC as Class II, Division I, Group F.

15. SECTION 41 12 13-26 - DRAG CHAIN BULK MATERIAL CONVEYORS

Add Section 41 12 13-26, pages 1 through 3, attached hereto.

16. SECTION 41 12 13-41 - BUCKET WHEEL STACKER RECLAIMER

Delete Section 41 12 13-41, pages 1 through 5, in its entirety.

17. DRAWINGS

The following Drawings have been revised, as indicated by revision number, and are reissued herewith:

Drawing No.	Title	Rev. No.
24761-XG01	Cover Sheet and Drawing Index	1
24761-XC01C	Overall Site Plan	0
24761-XC02C	Enlarged Site Plan	0

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Design, furnish, install, start up, and test portal scraper reclaimers.

1.02 QUALITY ASSURANCE

A. Comply with ISO 5049-1 International Standards Organization, "Mobile Equipment for Continuous Handling of Bulk Materials.

B. Design for general and discipline specific criteria listed in other sections, criteria specified here and code requirements, whatever is most limiting. Design and construct equipment in compliance with all applicable laws, ordinances, and regulations of principality having jurisdiction of plant site.

1.03 CLOSEOUT SUBMITTALS

A. Operation and maintenance data: Instruction manuals and parts list covering installation operation and maintenance of equipment furnished.

PART 2 PRODUCTS

2.01 DESIGN CONDITIONS AND PERFORMANCE REQUIREMENTS

A. Portal scraper reclaimer shall be capable of supporting coal logistics requirements and meet other general design criteria stated in general design criteria specification sections. Provide two 100% units.

B. Parts in touch with coal shall be resistant to abrasion.

C. Equipment shall be integrated into coal handling system controls to allow operations from other coal handling system HMIs.

D. Moving parts of all equipment shall be readily accessible for inspection, lubrication, and repair and, where necessary, shall be protected from flow of conveyed material. Moving parts of equipment shall also be guarded as required to protect personnel during operation.

2.02 PORTAL SCRAPER RECLAIMER

A. Portal reclaimer shall be rail-mounted. Traversing structure shall be supported by a minimum of 8 wheels.

B. Portal reclaimer shall have connected traversing structure and be capable of both automatic and manual reclaiming.

C. Portal reclaimer shall traverse length of storage pile to reclaim and 'clean' entire pile.

D. System: Design for manned operations.

E. Controls: Design for unmanned remote operations.

F. Scraper conveyor sections shall be furnished with overlap if necessary for pile cleanup.

G. Scraper conveyor shall be furnished complete with support structure, chain guides, reclaiming conveyor chains and flights, chain support guides and bearings and chain drive unit with motor hydraulic coupling and gearbox mounted directly on drive shaft.

H. Scraper chain shall be link-type chain constructed of high strength, forged alloy steel with lubricated and sealed pins and bushings. Pins and bushing shall be replaceable. Chain flights shall be lined with abrasion resistant steel plates with hard faced cutting edges.

I. Scraper shall include interface chutework for transfer conveyor.

J. Material of construction for components in contact with coal shall be abrasion-resistant steel with hard faced cutting edges.

K. Provide walkways, access platforms, hand rail and guard rails and stairs to access all mechanical, electrical and control equipment mounted on the reclaimer for operator and maintenance access.

L. Truck wheels:
   1. Forged steel of heavy-duty, double flanged type, shaft-mounted in anti-friction roller type bearings in accordance with ASTM A 504, Class CR.
   2. Tread hardness: 320 Brinell minimum.
   3. At least one-half of the fixed gantry track wheels shall be driven.

M. Travel drive assemblies shall consist of rigid flange coupling mounted reversible gear motor(s) with torque arm(s).

N. Provide rails, rail pads, rail clips, bearing plates, end stops, anchors, and necessary hardware above concrete foundation. Incorporate rails into grounding system.

O. Cable reel:
   1. Single power/control cable and cable reel with fiber optic control cable, security camera cable and a separate communication cable used for operator communication via telephone and public address handset units.
   2. Reel size and cable length: Based on total machine travel distance from junction box.
   3. Complete with magnetic coupling and maximum travel cam limit switch.
   4. Corrosion-resistant elevated trays for cables.

P. Electrical house:
   1. Electrical house and power winding reels: Mount on gantry frame.
   2. Rigidly-supported, sealed, insulated.
   3. Air-conditioned to maintain positive pressure and temperature control: 2 main and 1 spare.
   4. Equip with two 10-lb capacity, portable, wall mounted, dry-chemical fire extinguishers.
   5. House MCC, unit substation, travel and slew drive control panels, isolation transformer, lighting and low voltage distribution transformers, auxiliary (PLC) control panel, and miscellaneous equipment such as control transformers and distribution panels.
   6. For electrical equipment requirements refer to specific technical sections.

Q. Operator control cab:
   1. Provide to allow clear lines of sight during all operations.
   2. Heavy-gage sheet metal construction.
   3. Airtight door with suitable lock shall be fitted. Windows shall be sealed.
   4. Self-leveling cab shall be suspended on a damped pendulum mount. Sound level shall not exceed 65 dB(A) in cab. A permanent or retractable emergency escape ladder shall be provided at cab.
   5. Climate control system:
      a. Provide heating, defrost, and air-conditioning system to maintain cab temperature and humidity. System shall provide a comfortable work environment in all seasons.
      b. Provide particulate filtration and pressurization system to maintain a safe working environment.

R. Controls and communications:
   1. Mount manufacturer's standard reclaimer Human/Machine or HMI display in operator cab to monitor and control operation of reclaimer. Provide for supervisory level system status and alarms to DCS. Details to be coordinated after award of Contract.

2. Coal handling system HMI also mounted in operator cab.
3. Provide control interlocks either hardwired or logic based for protection of all other on reclaimer and other equipment in overall coal handling system.
4. Provide local emergency Stop pushbutton in cab.
5. Modes of control:
   a. Manual mode: reclaiming shall be completed by cab.
   b. Semi-automatic mode: Reclaiming shall be initiated by operator at beginning and ending of each pass (reclaimer traveling full length of the pile) with automatic control of reclaimer travel.
   c. Automatic mode: Reclaiming automatically after initiation by cab operator. Manual start up and shut down is required by cab operator. Fully automatic control includes automatic stop and start after each pass of the reclaimer with multiple passes, after automatic control is initiated by operator with same automatic control capability as indicated above.
   d. Reclaimer and travel shall be controlled via a standard program for reclaiming for both bench and modular routines.

S. Instrumentation:
1. Include, but not limited to, zero speed switches, misalignment switches, pull chord switches, warning horns, emergency stop switches, jog buttons at conveyor drives, and plugged chute detectors.
2. Pile sensing switches: Minimum of 2.
3. Anticollision devices: As necessary to prevent equipment damage through inadvertent plowing into storage pile or boom and pile contact or covered storage structures or other reclaimer.
4. Rail travel limit switches and position:
   a. Redundant lever operated.
   b. Normal, over travel, and emergency limit switches shall be provided on both ends of railway.
5. Proximity/limit switch actuators for traverse encoder automatic recalibration at runway center point.
6. Luffing limit switches and position:
   a. Redundant lever operated.
   b. Guard against over travel of boom horizontal angle.
   c. Encoder type position or proximity switches shall be furnished to control boom vertical position
7. Warning devices:
   a. Equip with audible and visual warning devices.
   b. Audible warning devices shall automatically sound for a preset time before a drive is energized, whether start command is initiated locally or remotely and equipped with audible and visual warning devices.

PART 3 EXECUTION

3.01 FIELD QUALITY CONTROL

A. Install in accordance with manufacturer's requirements.

B. After installation, equipment shall be thoroughly tested to verify performance under actual conditions (loaded and unloaded) and to verify that equipment meets requirements of Contract.

C. Where tests or inspections indicate noncompliance with Contract Documents, repair or replace defective materials. Costs for retesting shall be borne by Contractor.

D. Field test and inspection procedures and field testing schedule shall be submitted 90 days before field testing for review. Field test and inspection procedures and test schedule shall be mutually agreed upon 30 days prior to field testing. Testing and inspection results shall be documented for submittal to Owner.

IMPUESTOS Y EXENCIONES

CONDICIONES ESPECIALES DE TRIBUTACIÓN

1. EXENCIONES IMPOSITIVAS

Por reconocer la Empresa / la Corporación que el Proyecto es de alto interés económico y social para el Estado Dominicano, y atendiendo a las rebajas o reducciones de precio que se han acordado en la Sección 12.1 del Contrato De EPC, el Contratista, las empresas que lo conforman, exclusivamente para los fines del Proyecto, recibirán durante la vigencia del presente Contrato De EPC, las siguientes exenciones impositivas (la "**Exención Tributaria**"), limitadas a los ingresos y/o transacciones gravados que ocurran con ocasión de la realización del Proyecto conforme se establece en este Contrato De EPC, a saber:

i. Impuesto sobre la renta

ii. Todo impuesto, contribución, tasa, arancel, arbitrios municipales, incluyendo pero no estando limitado a, retenciones, impuesto a la transferencia de bienes industrializados y servicios (ITBIS), impuestos y contribuciones municipales, impuesto selectivo al consumo (ISC), impuesto que grava el consumo de combustibles fósiles y derivados del petróleo (Ley de Hidrocarburos No. 112-00), así como cualquier otro impuesto de cualquier naturaleza, establecido por ley, decreto o resolución de la República Dominicana, con la sola excepción del peaje en las autopistas, las tasas que establece el Colegio Dominicano de Ingenieros, Arquitectos y Agrimensores (CODIA) en el artículo 17.03 de su Reglamento Interno Estatutario, las establecidas a favor del Instituto de Formación Técnico Profesional (INFOTEP) y las tasas aplicables a la Seguridad Social y Accidentes de Trabajo de los trabajadores y empleados dominicanos contratados para la ejecución del presente Contrato De EPC, en el marco de la Ley 87-01 que crea el Sistema Dominicano de Seguridad Social, y,

iii. Los aranceles de aduanas, impuestos de importación, impuesto de primera placa y circulación, según cual fuere, conforme se establece más adelante.

Se hacen extensivas a los subcontratistas del Contratista, sobre todos los bienes y servicios destinados al Proyecto, las exenciones del impuesto a la transferencia de bienes industrializados y servicios (ITBIS), y los impuestos de importación que fueren aplicables.

Queda entendido que se ha incluido la exención del impuesto sobre la renta que se contempla en la Sección (i) que antecede, atendiendo a las consideraciones que se indican en la Sección 12.1 del presente Contrato De EPC.

2. IMPUESTOS DE IMPORTACIÓN Y ARBITRIOS

2.1 Equipos, maquinarias y mercancías

Durante el Término del Contrato, el Contratista, las empresas que lo conforman y/o sus subcontratistas estarán totalmente exentos del pago de cualquier arancel (impuesto de importación),

CONSORCIO ODEBRECHT - TECNIMONT - ESTRELLA

impuestos de primera placa o circulación y otros impuestos tales como tasas, derechos, contribuciones, recargos, arbitrios municipales, presentes o futuros, que fueren aplicables a la importación de materiales, equipos, insumos y las piezas y repuestos de equipos de construcción necesarios, única y exclusivamente para el levantamiento, ejecución y mantenimiento de las obras a ser realizadas, de conformidad con este Contrato De EPC, así como equipos pesados, vehículos, equipos de computadora, información, periféricos, maquinarias, repuestos y piezas que éste importe para ser utilizados de manera directa en la ejecución de este Contrato De EPC, incluyendo el impuesto a la transferencia de bienes industrializados y servicios (ITBIS), aplicado en dicha importación. Igualmente, estarán exentos del pago de los mismos impuestos sobre todo tipo de mercancía a ser utilizada y/o consumida directamente por el Contratista, las empresas que le conforman y/o sus subcontratistas en el cumplimiento de las obligaciones y actividades a su cargo conforme se indica en este Contrato De EPC.

Los empleados extranjeros que lleguen al país para prestar servicio al Contratista para la ejecución del Proyecto o que sean asignados a los trabajos del mismo, estarán igualmente exonerados del pago de los derechos de aduana e impuestos internos al llegar a la República Dominicana, en relación a sus efectos personales, incluyendo un vehículo de motor durante su permanencia en el país. Tal exoneración será tramitada por el Contratista a través de los organismos correspondientes, y abarcará todos los efectos personales y de hogar no comprados para fines de venta, sujeto a las limitaciones y prácticas aduaneras respecto a equipaje personal, y tal exoneración de pago de derechos de aduanas e impuestos internos continuará vigente durante su estadía en la República Dominicana.

Las maquinarias, equipos y efectos personales y los vehículos importados con el beneficio de la exoneración, tanto los pertenecientes al Contratista, las empresas que lo conforman y/o sus subcontratistas, como los de sus empleados extranjeros, podrán ser devueltos a su lugar de origen una vez terminado este Contrato, sin pago de impuestos y/o derechos de exportación. En el caso de venta de los mismos a terceros en la República Dominicana, deberán pagarse los derechos de aduana e impuestos internos proporcionalmente, considerando el monto residual contable de dichos vehículos o maquinarias o equipos con base a las tasas de depreciación fiscal aceptadas y practicadas en el país.

3. RETENCIONES

Es convenido entre las Partes que en aquellos casos en los cuales, se trate de contratos intervenidos con personas físicas o jurídicas del exterior, muy particularmente, para el suministro de los bienes y equipos que serán instalados en el Proyecto, el Contratista, las empresas que lo conforman y/o sus subcontratistas estarán dispensadas de tener que efectuar la retención prevista en los artículos 305 y 306 de la Ley 11-92 que establece el Código Tributario de la República Dominicana. Queda entendido que la obligación de realizar retenciones, aquí consignada, se traduce en una exención impositiva en favor de los terceros que presten tales servicios o suministro de bienes y equipos.

Sin perjuicio de lo antes indicado, y sólo para fines ilustrativos, sin limitar otras retenciones u obligaciones fiscales previstas por la ley, no están contempladas en las exenciones fiscales otorgadas, y por lo tanto el Contratista realizará las retenciones siguientes previstas en la ley:

(a) la establecida por el Artículo 309 del Código Tributario, cuando se trate de personas físicas con domicilio y radicadas en el país;
(b) la establecida por el Artículo 307 del Código Tributario a la tasa prevista en el Artículo 296 respecto del impuesto sobre la renta de sus empleados nacionales; y,

(c) las previstas por el Código Tributario y sus normas de aplicación con respecto a pagos realizados (i) a personas físicas o morales que no sean beneficiarios de las exenciones fiscales previstas en este documento; (ii) a cualquier persona física o moral, domiciliada o Extranjera, por conceptos no cubiertos por la exención fiscal aquí conferida; y/o (iii) fuera del plazo de vigencia de la exención de que se trate.

4. ALCANCE DEL RÉGIMEN FISCAL

Los beneficios tributarios a que se refiere esta Sección sólo podrán alcanzar a hechos o actuaciones que tengan relación o conexión directa con el Proyecto, bajo el entendido de que dichos beneficios tributarios se extienden por todo el período de vigencia del Contrato De EPC hasta la Fecha de Término.

5. PROCEDIMIENTO ESPECIAL

En virtud del régimen fiscal aquí establecido, el Estado Dominicano establecerá un procedimiento especial y expedito para obtener el beneficio de las exenciones fiscales aquí concedidas, proporcionando a los beneficiarios un régimen especial que permita acceder a dichos beneficios fiscales sin demora o retrasos en su tramitación, como sigue:

5.1 Importaciones de Materiales, Bienes y Servicios. El beneficiario de la Exención Fiscal establecida en este documento, quien será el "importador" para todos los efectos de esta Sección (el "**Beneficiario**"), tendrá a su cargo la realización de todas las gestiones necesarias ante las autoridades correspondientes para materializar la Exención Tributaria relacionada con la importación de que se trate. Para tales efectos, se seguirá el siguiente procedimiento:

a) El Beneficiario entregará al Ministerio De Hacienda, a través del Contratista si dicho Beneficiario fuere un Subcontratista o proveedor del Contratista, una Solicitud De Exención respecto de dicha importación, la cual incluirá la información del envío respectivo (en adelante, "**Información De Envío**"), consistente en copia de los documentos de embarque, describiendo el contenido de dicho envío y el punto exacto y fecha estimada de llegada a la República Dominicana;

b) La referida Solicitud De Exención será respondida por el Ministerio De Hacienda con el Certificado De Exención de lugar, si ese fuere el caso, a más tardar dentro del plazo de quince (15) Días contados a partir de la fecha de la Solicitud De Exención de lugar (en adelante, "**Fecha Límite De Respuesta-Exención Importación**");

c) El Contratista notificará por escrito y entregará a la Dirección De Aduanas la siguiente documentación:

1. Solicitud de entrega provisional dirigida a la Dirección De Aduanas;
2. Copia de la Solicitud De Exención respectiva, debidamente recibida por el Ministerio De Hacienda; y
3. Triplicado o "printer" de la Información De Envío correspondiente; y

Una vez obtenido el Certificado De Exención correspondiente, el Contratista comunicará dicho hecho a la Dirección De Aduanas para los fines correspondientes. En caso de no ser otorgado el Certificado De Exención que procediere de conformidad con estas Condiciones De Tributación en o antes de la correspondiente Fecha Límite De Respuesta-Exención Importación, el Beneficiario respectivo procederá con la importación y pago del impuesto reclamado correspondiente, según proceda y podrá solicitar el reembolso de los montos pagados por este concepto a la Empresa y/o Corporación según fuesen aplicables la Exención Tributaria que se invoque.

5.2 Combustibles. Con el fin de hacer efectiva la Exención Tributaria relativa a Impuestos que apliquen sobre los combustibles a utilizar de manera directa en la ejecución de las Obras, en particular el impuesto selectivo al consumo (ISC), tanto específico como ad-valorem, se seguirá el siguiente procedimiento:

a) A más tardar tres (3) Días Hábiles anteriores al último Día de cada mes, el Contratista entregará al Ministerio De Hacienda, tanto respecto de sí mismo como de cualquier otro Beneficiario, (i) una lista de los vehículos y equipos que serán utilizados durante el mes siguiente, de manera directa, en la ejecución de las Obras, indicando para cada uno de ellos el número de serie o de chasis, según corresponda, el número de matrícula y copia de las mismas según aplique, el correspondiente Beneficiario propietario del mismo, su función exacta, el tipo de combustible que utiliza y las horas y carga de trabajo correspondientes, (ii) un estimado de los tipos y volúmenes totales de combustible a ser utilizados en ocasión de los referidos vehículos y/o equipos, (iii) una confirmación escrita del Beneficiario respectivo de que el uso indicado de dichos vehículos y/o equipos será exclusivamente para ejecutar, de manera directa, trabajos/servicios relacionados con las Obras y (iv) una Solicitud De Exención para que el Ministerio De Hacienda confirme, mediante Certificado De Exención, si ese fuere el caso, que el combustible a ser empleado en el uso de dichos vehículos y/o equipos está exento del impuesto selectivo al consumo (ISC), y autorice a la Refinería Dominicana de Petróleo a suplirle los tipos y volúmenes de combustible correspondientes, para el caso de que el Beneficiario respectivo decida adquirir dicho combustible directamente de la Refinería Dominicana de Petróleo;

b) La referida Solicitud De Exención será respondida por el Ministerio De Hacienda con el Certificado De Exención de lugar, si ese fuere el caso, a más tardar dentro del plazo de quince (15) Días contados a partir de la fecha de la Solicitud De Exención de que se trate (en adelante, "**Fecha Límite De Respuesta-Exención Combustible**");

c) En caso de ser otorgado el Certificado De Exención en o antes de la respectiva Fecha Límite De Respuesta-Exención Combustible, el Beneficiario correspondiente procederá a efectuar la compra de combustible directamente en régimen de exención; y

d) Si la Exención Tributaria correspondiente aplicare de conformidad con estas Condiciones De Tributación y el Certificado De Exención respectivo no se emitiere en o antes de la respectiva Fecha Límite De Respuesta-Exención Combustible, (i) el Beneficiario correspondiente procederá con la respectiva compra de combustible, incluyendo el pago del Impuesto Reclamado correspondiente, y (ii) las Empresas

reembolsarán a dicho Beneficiario, a través del Contratista, el Impuesto Reclamado correspondiente, según proceda.

5.3 Compras y Gastos Locales en General. El Beneficiario correspondiente hará sus mejores esfuerzos para obtener un Certificado De Exención previo a efectuar compras a subcontratistas o suplidores dominicanos, según corresponda, siempre y cuando el plazo de obtención de dicho certificado no perjudique el desarrollo de las Obras. Para tales efectos, se seguirá el siguiente el procedimiento:

a) El Beneficiario entregará al Ministerio De Hacienda, a través del Contratista si dicho Beneficiario fuere un Subcontratista o proveedor del Contratista, una Solicitud De Exención que incluya ejemplares originales de las facturas pro-forma o cotizaciones de los bienes o servicios locales de que se trate, así como una justificación de que la Exención Tributaria correspondiente aplica;

b) La referida Solicitud De Exención será respondida por el Ministerio De Hacienda con el Certificado De Exención de lugar, si ese fuere el caso, a más tardar dentro del plazo de sesenta (60) Días contados a partir de la fecha de la Solicitud De Exención correspondiente (en adelante, "**Fecha Límite De Respuesta-Exención Compras/Gastos Locales**");

c) En caso de ser otorgado el Certificado De Exención en o antes de la Fecha Límite De Respuesta-Exención Compras/Gastos Locales, el Beneficiario respectivo procederá a efectuar la compra o gasto local correspondiente en régimen de exención; y

d) Si la Exención Tributaria correspondiente aplicare de conformidad con estas Condiciones De Tributación y el Certificado De Exención respectivo no se emitiere en o antes de la respectiva Fecha Límite De Respuesta-Exención Compras/Gastos Locales, (i) el Beneficiario respectivo procederá con la correspondiente compra o gasto local, incluyendo el pago del Impuesto Reclamado correspondiente, y (ii) las Empresas reembolsarán a dicho Beneficiario, a través del Contratista, el Impuesto Reclamado correspondiente según proceda.

ANEXO S

LÍMITES DE LOS SEGUROS

Para fines de este **Anexo S**, los límites y montos aquí incluidos deberán ser considerados indicativos, ya que los mismos serán revisados con un asegurador local aceptado por las Partes.

Seguro	Especificaciones Aplicables
* Seguro Responsabilidad Civil-Vehículos (USD)	USD 500.000
* Seguro de Equipo Móvil (USD)	*Valor de Reposición de cada Unidad*
* Seguro de Todo Riesgo de Construcción y Montaje	
-Límite	Monto Total del Precio Del Contrato
-Cobertura Mínima por Amplio Mantenimiento(Años)	2 Años
- Cobertura de Responsabilidad Civil	USD 20.000.000
* Todo Riesgo de Construcción y Montaje-Extensiones (USD):	
-Remoción de Escombros	5% de la pérdida con un máximo de US$ 30.000.000.
-Gastos de aceleración incluyendo flete aéreo	US$ 10.000.000
-Transporte terrestre y almacenamiento fuera de obra para suministros nacionales	10% del valor asegurado

CORPORACIÓN DOMINICANA DE EMPRESAS ESTATALES VICEPRESIDENCIA EJECUTIVA cdeee

CONSORCIO ODEBRECHT - TECNIMONT - ESTRELLA

-Honorarios profesionales	US$ 4.000.000
-Reposición archivos, planos y documentos	US$ 3.000.000
* Cobertura Seguro ALOP por Seguro Todo Riesgo de Construcción y Montaje	US$300,000,000 por nueve (9) meses
* Seguro de Transporte Marítimo/Aéreo/Terrestre de Importación.	Equivalente a su valor CIF. Deducible no superior a USD20.000,000 por evento.
* Seguro ALOP	US$300,000,000 por nueve (9) meses

ANEXO T

MONTO DE LAS PENALIDADES

1. PENALIDAD POR ATRASO EN EL CUMPLIMIENTO DE LOS PLAZOS DE ENTREGA DE LAS DOS (2) UNIDADES.

a) Monto por Día de Atraso por Unidad:	0.025% del Precio Del Contrato
b) Monto máximo por atraso para cada Unidad:	5% del Precio Del Contrato
c) El Monto máximo por atraso en la entrega de las dos (2) Unidades:	10% del Precio Del Contrato.

2. INDEMNIZACION POR FALLA EN EL CUMPLIMIENTO DE LAS PRUEBAS DE ACEPTACION (APLICABLE POR UNIDAD) SEGÚN LA SECCION 00 43 23 DE LAS ESPECIFICACIONES TECNICAS.

Capacidad (Potencia) Neta Garantizada- kW:	2,000USD/kW Dólares por cada kW de menor potencia alcanzada respecto del valor de garantía ofrecido por el Contratista bajo las condiciones de las Especificaciones Técnicas.
Rechazo: (Fuera Rango)	Deficiencia de hasta 5% de menor potencia neta respecto del valor garantizado (Formulario TS-01).
Capacidad (Potencia) Neta Mínima de Operación Continua y en Automático de la Unidad (kW):	1,000.00USD/kW Dólares por cada kW de mayor potencia alcanzada respecto del valor de garantía ofrecido por el Contratista bajo las condiciones de las Especificaciones Técnicas.
Rechazo: (Fuera Rango)	Si la potencia mínima excede en 10% el valor garantizado (Formulario TS-01).
Rendimiento Térmico (Heat Rate) Neto Garantizado- BTU/kWh:	100,000.00USD/(BTU/kWh) Dólares por cada BTU/kWh de mayor Rendimiento Térmico (Heat Rate) Neto alcanzado respecto del valor de garantía ofrecido por el Contratista bajo las condiciones de las Especificaciones Técnicas.
Rechazo: (Fuera Rango)	Si la desviación del Rendimiento Térmico (Heat Rate) Neto excede de 5% del valor garantizado (Formulario TS-01).
Consumo de Cal para Desulfurización (lb/hr):	2,000.00USD/(lb/hr) Dólares por cada lb/hr de mayor consumo de cal alcanzado respecto del valor de garantía ofrecido por el Contratista bajo las condiciones de las

CORPORACIÓN DOMINICANA DE EMPRESAS ELÉCTRICAS ESTATALES PRESIDENCIA EJECUTIVA cdeee

CONSORCIO ODEBRECHT - TECNIMONT - ESTRELLA

	Especificaciones Técnicas.
Rechazo: (Fuera Rango)	Si el consumo de cal excede de 20% en valor garantizado (Formulario TS-01).
Valores de Emisión de PM, SO2 y NOx:	Se considerará como no aceptable el desempeño del(de los) equipo(s) correspondiente(s) si el valor de emisión medido respecto del valor de garantía ofrecido por el Contratista bajo las condiciones de las Especificaciones Técnicas, excede el valor garantizado correspondiente.

3. LIMITES TOTALES.

Límite de Penalidades:	**10% del Precio Del Contrato.**
Límite de Indemnización:	**11% del Precio Del Contrato.**
Total Límite de Penalidades e Indemnización:	**21% del Precio Del Contrato.**

ANEXO V

FORMATO DE ORDEN DE PROCEDER

[Fecha]

Señores
Consorcio **integrado por las Personas Jurídicas**
Constructora Norberto Odebrecht, S.A**.,** Tecnimont S.p.A.
e Ingeniería Estrella S.R.L.
Calle Pedro Henríquez Ureña No. 152, Edificio Diandy XIX, Piso 9, Ensanche La Esperilla,
Santo Domingo de Guzmán, Distrito Nacional,

Atención: **Representante Autorizado.**

Referencia: Orden De Proceder

Estimados Sres.,

La presente Orden De Proceder se emite en virtud de la Sección 2.2 del Contrato de Ingeniería, Procura y Construcción (en adelante, "**Contrato De EPC**") de fecha __ de _____ de dos mil catorce (2014) entre **Edenorte Dominicana, S.A.**, sociedad anónima legalmente constituida y existente de conformidad con las leyes de República Dominicana, **Edesur Dominicana, S.A.**, sociedad anónima legalmente constituida y existente de conformidad con las leyes de República Dominicana, y **Empresa Distribuidora de Electricidad del Este, S.A.**, sociedad anónima legalmente constituida y existente de conformidad con las leyes de República Dominicana (en adelante, de manera colectiva, la "**Empresa**"), debidamente representada por la **Corporación**, y el Consorcio constituido por las Personas Jurídicas (i) **Constructora Norberto Odebrecht, S.A.**, sociedad anónima legalmente constituida y existente de conformidad con las leyes de la República Federativa del Brasil, (ii) Tecnimont S.p.A., sociedad por acciones legalmente constituida y existente de conformidad con las leyes de Italia, y (iii) Ingeniería Estrella S.R.L., sociedad de responsabilidad limitada legalmente constituida y existente de conformidad con las leyes de la República Dominicana (en adelante, de manera colectiva, el "**Contratista**"). Para efectos de esta Orden De Proceder, aquellos términos que no estuvieren expresamente definidos en la presente Orden De Proceder tendrán el significado que se les asigna en el Contrato De EPC.

Por medio de la presente Orden De Proceder, la Corporación instruye al Contratista el comienzo de las Obras de conformidad con el Contrato De EPC a más tardar con fecha _____ de _____ de _____ **[Insertar fecha que no sea anterior a diez (10) Días siguientes a la fecha de esta Orden De Proceder]**. **[Lo anterior se entiende en adición a aquellas Obras que fueron objeto de la Orden Limitada De Proceder emitida por la Corporación al Contratista con fecha __ de ____ de _____.]**

Atentamente,

Res. No. 225-14 que aprueba el contrato entre el Estado dominicano y el señor Luis Encarnación Pimentel, en relación al traspaso por parte del primero a favor del segundo, del apartamento No. 401, edificio No. C, Proyecto Habitacional Residencial Torres Pedro Henríquez Ureña, Distrito Nacional. G. O. No. 10764 del 18 de julio de 2014.

EL CONGRESO NACIONAL
En Nombre de la República

Res. No. 225-14

VISTO: El Inciso 19 del Art.37 de la Constitución de la República.

VISTO: El contrato de venta suscrito en fecha 3 de mayo del 1993, entre el Estado dominicano y el señor **LUIS ENCARNACIÓN PIMENTEL.**

R E S U E L V E:

UNICO: APROBAR el contrato de venta suscrito en fecha 3 de mayo del 1993, entre el Estado dominicano, debidamente representado en este acto por el Administrador General de Bienes Nacionales, señor **DR. RODOLFO RINCON MARTINEZ,** de una parte, y de la otra parte, el señor **LUIS ENCARNACIÓN PIMENTEL,** por medio del cual el primero traspasa al segundo, a título de venta, el apartamento marcado con el No.401, correspondiente al edificio No.”C”, construido de blocks y concreto, ubicado en el Proyecto Habitacional “RESIDENCIAL TORRES PEDRO HENRIQUEZ UREÑA, de esta ciudad, valorado en la suma de (OCHOCIENTOS VEINTITRES MIL SETECIENTOS SESENTINUEVE PESOS CON 95/00) RD$823,769.95, que copiado a la letra dice así:

ENTRE **CONTRATO NO.2415**

EL ESTADO DOMINICANO, representado en este acto por el Administrador General de Bienes Nacionales, señor **DR. RODOLFO RINCON MARTINEZ,** de nacionalidad dominicana, mayor de edad, funcionario público, de estado civil casado, portador de la Cédula de Identificación Personal No.18311, Serie 49, debidamente renovada para el corriente año con el sello de Rentas Internas No._____, provisto del Carnet del Registro Electoral No.____, domiciliado y residente en la casa No.____ de la calle_____, de esta ciudad de Santo Domingo, en virtud del Poder conferido por el Señor Presidente de la República, en fecha 14 de mayo de 1995, quien en lo adelante para los fines y consecuencias de este contrato se denominará **EL VENDEDOR,** de una parte, y de la otra parte, el señor **LUIS ENCARNACIÓN PIMENTEL,** mayor de edad, de nacionalidad

dominicana, de estado civil casado con la **LIC. GUADALUPE BERNABEL,** portador de la Cédula de Identificación Personal No.152845, Serie 1ra., debidamente renovada para el presente año con el sello de Rentas Internas No.____, provisto del Carnet del Registro Electoral No.___, de la calle_____, de quien para los fines del presente contrato se denominará **EL COMPRADOR.**

SE HA CONVENIDO Y PACTADO LO SIGUIENTE

PRIMERO: EL VENDEDOR, vende, cede y traspasa con todas las garantías de derecho **AL COMPRADOR,** quien acepta el inmueble siguiente: El apartamento marcado con el No.401, correspondiente al edificio No. "C", construido de blocks y concreto, ubicado en el Proyecto Habitacional Residencial Torres Pedro Henríquez Ureña, de esta ciudad.

SEGUNDO: El precio de la presente venta ha sido fijado por la suma de (OCHOCIENTOS VEINTITRES MIL SETECIENTOS SESENTINUEVE PESOS ORO CON 95/00) RD$823,769.95, que **EL COMPRADOR** pagará **AL VENDEDOR** en la siguiente forma: La suma de RD$200,000.00 (DOSCIENTOS MIL PESOS ORO) como pago inicial, pagada según consta en el recibo No.4389, de fecha 3 de julio del 1992, expedido por la Adm. Gral. de Bienes Nacionales; y el resto o sea la cantidad de RD$623,769.95 (SEISCIENTOS VEINTITRES MIL SETECIENTOS SESENTINUEVE PESOS CON 95/00) para ser pagada en mensualidades iguales y consecutivas de RD$2,599.05 (DOS MIL QUINIENTOS NOVENTINUEVE PESOS CON 05/00) cada una, hasta la total cancelación de la deuda.

TERCERO: Las partes convienen que **EL COMPRADOR** no será propietario del inmueble hasta que no haya pagado la totalidad del precio convenido.

CUARTO: La falta de pago de las dos (2) mensualidades de las convenidas en el precio de esta venta, dará derecho al **VENDEDOR** a notificar **AL COMPRADOR** una intimación de pago, concediéndole un plazo de quince días, a partir de la fecha de notificación para que efectúe dicho pago. Si al vencimiento del referido plazo **EL COMPRADOR** no realiza el pago, la venta quedará resuelta de pleno derecho, sin intervención judicial ni procedimiento alguno, quedando en libertad **EL VENDEDOR** de proceder al desalojo inmediato de las personas que ocupan el inmueble y de disponer de él en la forma que considere pertinente.

QUINTO: EL COMPRADOR puede en cualquier momento pagar la totalidad del precio de la venta o realizar abonos a cuenta del mismo, en cantidades mayores a las convenidas en este contrato, siempre que no haya violación de ninguno de los términos del mismo.

SEXTO: EL COMPRADOR conviene en que el presente contrato sirva por sí mismo de oposición para que el Registrador de Títulos no opere la transferencia en su favor del derecho de propiedad, mientras él no le pruebe al Registrador de Títulos que ha pagado el precio total de la misma, más los gatos de mutación establecidos por las leyes.

SEPTIMO: EL COMPRADOR se compromete y obliga a habitar el inmueble, hasta tanto no haya pagado la totalidad del precio, a mantenerlo en perfecto estado de conservación, corriendo por su cuenta los gastos de pintura y de reparaciones, a no alquilar ni realizar cambios o innovaciones que puedan afectar la seguridad o la estética del edificio o servicio comunes.

OCTAVO: Queda expresamente establecido entre las partes, que el presente contrato debe ser sometido al Congreso Nacional para su aprobación, en vista de que el inmueble a que el mismo se contrae tiene un valor que excede de la suma de RD$20,000.00, en virtud de las disposiciones del Art.55, Inciso 10 de la Constitución de la República.

NOVENO: Queda prohibido terminantemente al **COMPRADOR** realizar cualquier tipo de anexos o modificaciones al inmueble objeto del presente contrato. La violación de esta cláusula dará derecho al **VENDEDOR** a proceder de inmediato a la rescisión de dicho contrato.

DECIMO: El inmueble objeto del presente contrato se considerará en Bien de Familia, conforme a la Ley No.339 de fecha 22 de agosto de 1968, sin necesidad de ningún otro requisito de tipo legal. En consecuencia, no podrá ser transferido en ningún tiempo a otra persona aunque haya sido pagado en su totalidad, sino cuando se cumplan las disposiciones del Artículo 14, de la Ley No.1024, de fecha 24 de octubre de 1928 y sus modificaciones, relativa al Bien de Familia, previa autorización del Poder Ejecutivo.

UNDECIMO: En los casos de resolución **EL COMPRADOR** conviene en que de los pagos por él realizados, **EL VENDEDOR** retenga el 30% de los valores pagados a la fecha de la desocupación de la casa y de haber sido recibida conforme por el **VENDEDOR,** deducción hecha de los valores adeudados por **EL COMPRADOR** hasta la fecha de la entrega del inmueble, a título de reparación de los daños y perjuicios sufridos por **EL VENDEDOR,** en razón de la resolución del contrato y como compensación del goce del inmueble por **EL COMPRADOR** hasta la fecha que se reasuma conforme el inmueble por **EL VENDEDOR.** Sin embargo, **EL VENDEDOR** devolverá al **COMPRADOR** las sumas que hubiese recibido por concepto de pagos adelantados a la fecha de la desocupación del inmueble.

DUODECIMO: Para los fines del presente contrato, **EL VENDEDOR** elige domicilio en la oficina de la Administración General de Bienes Nacionales y **EL COMPRADOR** en la casa objeto del presente contrato.

HECHO Y FIRMADO de buena fe, en cuatro originales en Santo Domingo, Distrito Nacional, capital de la República Dominicana, a los 3 días del mes de mayo del año mil novecientos noventa y tres (1993).

Res. No. 226-14

VISTO: El Inciso 19 del Art.37 de la Constitución de la República.

VISTOS: El contrato de venta entre el Estado dominicano y el señor Carlos I. Sartori e Hijos, C. por A., suscrito en fecha 3 de febrero de 1999, y su adéndum, de fecha 18 de julio de 2002.

R E S U E L V E

UNICO: APROBAR el contrato de venta suscrito en fecha 3 de febrero de 1999, entre el Estado dominicano, representado por el señor Carlos Alberto Amarante Baret, de una parte, y de la otra parte, el señor Carlos I. Sartori e Hijos, C. por A., mediante el cual el primero

traspasa a la segunda los locales comerciales marcados con los números 101, 102, 103, y 201, del edificio No.60, construidos de blocks y concreto, ubicados en el Proyecto Habitacional de la Ave. México en la ciudad de Santo Domingo. D.N., valorados en la suma de cuatrocientos noventa mil pesos con 00/100 (RD$490,000.00), y su adéndum de fecha 18 de julio de 2002 mediante el cual se corrige el error material en el sentido de que el número de la parcela que ampara dicho inmueble es el 138, de la manzana No. 138, del Distrito Catastral No.1, del Distrito Nacional y el Certificado de Título es el 63-103, que copiados a la letra dicen así:

ENTRE: **CONTRATO No.0205**

EL ESTADO DOMINICANO, debidamente representado en este acto por el Administrador General de Bienes Nacionales, señor LIC. CARLOS ALBERTO AMARANTE BARET, de nacionalidad dominicana, mayor de edad, casado, funcionario público, de este domicilio y residencia, portador de la Cédula de Identidad y Electoral No.054-0006341-7, quien actúa en virtud de las disposiciones contenidas en el Poder de fecha 15 de agosto de 1996, expedido por el Poder Ejecutivo, que lo faculta para el otorgamiento del presente documento, de una parte, y de la otra parte, el señor CARLOS I. SARTORI E HIJOS, C POR A., de nacionalidad dominicana, de estado civil casado con Rosanna S. Sartori, domiciliado y residente en los locales comerciales Nos.101, 102, 103, y 201 de la Avenida México, de ocupación comerciante, portador de la Cédula de Identidad y Electoral No.001-1227764-5, se ha convenido y pactado el siguiente**:**

CONTRATO:

PRIMERO: EL ESTADO DOMINICANO, por órgano de su representante, VENDE, CEDE Y TRANSFIERE, con todas las garantías de derecho, libre de cargas y gravámenes, en favor del señor CARLOS I. SARTORI E HIJOS, C POR A., quien acepta los inmuebles que se describe a continuación:

Los locales comerciales marcados con los números 101, 102, 103, y 201 del edificio No.60, construidos de block y concreto, ubicados en el Proyecto Habitacional de la Avenida México, en la ciudad de Santo Domingo, D.N.

SEGUNDO: El precio convenido y pactado entre las partes para la presente venta, ha sido fijado por la suma de cuatrocientos noventa mil pesos con 00/100 (RD$490,000.00), la cual será pagada por el COMPRADOR en la siguiente forma: La suma de un inicial de ciento cuarenta y siete mil pesos con 00 (RD$147,000.00), de cuya suma el Estado resuelve acreditarse cincuenta mil pesos (RD$50,000.00) por concepto de gastos de remodelación, de la cual la cantidad restante ha sido pagada de la siguiente forma: un primer pago de RD$19,400.00, según recibo de pago No.03606 de 7/9/1990, un segundo pago de RD$19,400.00, según recibo de pago No.03718, de 26/10/1990, un tercer pago de RD$19,400.00, según recibo de pago No.___, de 13/12/1990, y un cuarto y último pago de RD$38,800.00 de 26/7/1991, y el resto para ser pagado en mensualidades iguales y consecutivas de RD$3,275.00 cada una, hasta la total cancelación de la deuda.

TERCERO: La falta de pago de tres (3) mensualidades consecutivas, hará perder al DEUDOR el beneficio del término acordado.

CUARTO: EL ESTADO DOMINICANO, justifica su derecho de propiedad sobre el inmueble objeto del presente contrato, en virtud del Certificado de Título No._____, expedido en su favor por el Registrador de Títulos de _____.

QUINTO: Las partes convienen que EL COMPRADOR no será propietario del inmueble objeto del presente contrato hasta que no haya pagado la totalidad del precio convenido.

SEXTO: La falta de pago de tres (3) mensualidades de las convenidas en el precio de esta venta, dará derecho al VENDEDOR a notificarle AL COMPRADOR una intimación de pago, concediéndole un único plazo de 30 días, a partir de la fecha de notificación para que efectúe dicho pago. Si al vencimiento del referido plazo EL COMPRADOR no ha realizado el pago, la venta quedará resuelta de pleno derecho, sin intervención judicial ni procedimiento alguno, quedando en libertad EL VENDEDOR de proceder al desalojo inmediato de las personas que ocupan el inmueble y de disponer de él en la forma que considere pertinente.

SEPTIMO: EL COMPRADOR conviene en que el presente contrato sirva por sí mismo de oposición para que el Registrador de Títulos no opere la transferencia en su favor del derecho de propiedad, mientras él no le pruebe al Registrador de Títulos que ha pagado el precio total de la misma, más los gastos de mutación establecidos por las leyes.

OCTAVO: EL COMPRADOR puede en cualquier momento pagar la totalidad del precio de la venta o realizar abonos a cuenta del mismo, en cantidades mayores a las convenidas en este contrato, siempre que no haya violación de ninguno de los términos del mismo.

NOVENO: Queda convenido entre las PARTES que el COMPRADOR entrará en posesión y goce inmediato de los inmuebles, a partir de la fecha de la entrega de las llaves, asumiendo desde entonces los gastos ocasionados por todo tipo de reparación y mantenimiento de la unidad de su propiedad, conforme a lo establecido en este acto respecto al uso y cuidado del edificio. Queda entendido asimismo, que desde este momento el inmueble no puede ser modificado o variado en forma alguna que produzca un cambio sustancial en el valor o uso del mismo, sin obtenerse previamente el consentimiento expreso de la Administración General de Bienes Nacionales.

DECIMO: EL COMPRADOR se compromete y obliga a utilizar personalmente los inmuebles, hasta tanto no haya pagado la totalidad del precio, a mantenerlos en perfecto estado de conservación, corriendo por su cuenta los gastos de mantenimiento y reparaciones, a no alquilarlos ni realizar cambios o innovaciones que puedan afectar la seguridad o la estética del edificio o servicios comunes y a ceñirse en cuanto al uso de rejas, verjas, plantas eléctricas de emergencia, cisternas, o ductos de basura y todo cuando pueda afectar la apariencia del edificio, a las normas que en este sentido emanen de la Administración General de Bienes Nacionales.

DECIMO PRIMERO: En el disfrute y aprovechamiento de los inmuebles, el COMPRADOR tendrá que ceñirse obligatoriamente al destino que se le haya asignado a éste, no pudiendo dedicarlos a otro fin sin el consentimiento previo y expreso del Administrador General de Bienes Nacionales. Debe asimismo ajustar en todo momento su conducta al orden, disciplina, moralidad, decoro y normas de convivencias establecidas por la ley y reglamento que se dicte de conformidad con la Ley 5038, del 21 de noviembre del 1958.

DECIMO SEGUNDO: Queda expresamente establecido entre las partes que el presente contrato deberá ser sometido al Congreso Nacional para su aprobación, en vista de que los inmueble a que el mismo se contraen tienen un valor que excede de RD$20,000.00 (veinte mil pesos oro con 00/100), en virtud de las disposiciones del Art.55, Inciso 10 de la Constitución de la República.

DECIMO TERCERO: Las partes aceptan todas las estipulaciones del presente contrato y para lo no previsto en el mismo, se remiten al derecho común.

HECHO Y FIRMADO en dos (2) originales de un mismo tenor, uno para cada una de las partes contratantes, en Santo Domingo, Distrito Nacional, capital de la República Dominicana, a los tres (3) días del mes de febrero del año los mil novecientos noventa y nueve (1999).

DRA. ELSA GERTRUDIS PEREZ
NOTARIO PUBLICO

ADENDUM DE CONTRATO

ENTRE: De una parte, EL ESTADO DOMINICANO, debidamente representado en este acto por el titular de la Administración General de Bienes Nacionales, institución del Estado dominicano, organizada y existente de conformidad con la Ley No. 1832, de fecha 3 de noviembre del año 1948, señor BIENVENIDO BRITO, dominicano, mayor de edad, funcionario público, casado, portador de la Cédula de Identidad y Electoral No.001-0901865-5, domiciliado en la calle Pedro Henríquez Ureña esquina Pedro A. Lluberes de esta ciudad, quien en lo adelante y para los fines y consecuencias legales del presente contrato, se denominará LA PRIMERA PARTE o por su propio nombre, y de la otra parte, LA COMPAÑIA I. SARTORI E HIJOS, C X A, representada por su Presidente el señor CARLOS I. SARTORI, dominicano, mayor de edad, casado, empresario, portador de la Cédula de Identidad y Electoral No.001-1227764-5, domiciliado y residente la Avenida Florencio Terry No. 10, del Ensanche Naco, de esta ciudad, quien en lo delante y para los fines y consecuencias legales del presente contrato, se denominará LA SEGUNDA PARTE, o por su propio nombre.

PREAMBULO

POR CUANTO: El Presidente de la República emitió el Poder de fecha 15 de agosto del año mil novecientos noventa y seis (1996), mediante el cual el Estado dominicano debidamente representado por el Administrador General de Bienes Nacionales, suscribió un contrato de venta con LA COMPAÑIA I. SARTORI E HIJOS, C X A, sobre los locales comerciales Nos.101, 102, 103, y 201 del edificio No.60, del Proyecto Habitacional Avenida México, de esta ciudad.

POR CUANTO: En el contrato antes mencionado se deslizó un error material, donde se omitió el número de Certificado de Titulo que ampara dicho inmueble.

POR CUANTO: Esta Administración General de Bienes Nacionales, solicitó al Registrador de Títulos una certificación de la parcela que ampara dicho inmueble.

POR TANTO, y en el entendido de que el preámbulo que antecede forma parte integral del presente contrato, las partes de manera libre y voluntaria.

HAN CONVENIDO Y PACTADO LO SIGUIENTE:

PRIMERO: LAS PARTES, por medio del presente acto, corrigen el error material cometido en el contrato de venta de fecha 3 de febrero del año 1999, en donde las partes contratantes fueron el Estado dominicano, debidamente representado por el Administrador General de Bienes Nacionales y el señor LA COMPAÑIA I. SARTORI E HIJOS CXA, en el sentido de que el número de parcela que ampara dicho inmueble es el 138, de la manzana No.138, del Distrito Catastral No.1 del Distrito Nacional y el Certificado de Titulo es el 63-103.

SEGUNDO: LAS PARTES reconocen que el presente adéndum forma parte integral del contrato de venta de fecha 3 de febrero del año 1999.

TERCERO: Para los fines del presente contrato LA PRIMERA PARTE elige domicilio en la oficina de la Administración General de Bienes Nacionales y LA SEGUNDA PARTE en el domicilio indicado anteriormente.

HECHO Y FIRMADO de buena fe, en seis (6) originales de un mismo tenor y efecto. En la ciudad de Santo Domingo, Distrito Nacional, capital de la República Dominicana, a los dieciocho (18) días del mes de julio del año dos mil dos (2002).

POR LA PRIMERA PARTE

CONTRATO DE COMPRA-VENTA DE TERRENOS

ENTRE: De una parte, el INGENIO RIO HAINA, institución autónoma del Estado dominicano, organizada y existente de conformidad con la Ley No.7, de fecha 19 del mes de agosto del año 1966, debidamente representado por el Director Ejecutivo, ING. VÍCTOR MANUEL BAEZ, dominicano, mayor de edad, casado, portador de la Cédula de Identidad y Electoral No.001-0166750-9, domiciliado y residente en esta ciudad de Santo Domingo, quien actúa en virtud del Poder No.556-02, que le fuere otorgado por el Presidente de la República, en fecha 21 de agosto del año 2002, que en lo que sigue del presente contrato se denominará EL INGENIO, y de la otra parte, la señora ESPERANZA MOREL PEREZ DE BECO, dominicana, mayor de edad, casada, portadora de la Cédula de Identidad y Electoral No.031-0336500-7, domiciliada y residente en la calle No.4, sector Las Antillas, del municipio de San Pedro de Macorís y accidentalmente en esta ciudad de Santo Domingo, quien en lo que sigue del presente contrato se denominará LA COMPRADORA.

PREAMBULO

CONSIDERANDO: Que en fecha 14 de agosto del 2002, contenida en el Acta No.34, la Comisión de Ventas adoptó la Resolución No.9, recomendando la venta de terrenos a favor de LA COMPRADORA dentro del Proyecto de Lotificación de Solares Quinto Sueño.

CONSIDERANDO: Que la citada Resolución fue debidamente presentada al conocimiento y decisión del Consejo de Directores, la cual autoriza al C.E.A., a iniciar el proceso de venta de terrenos en el Proyecto de Lotificación de Solares La Marumba a favor de LA COMPRADORA, mediante la Decimoséptima Resolución, contenida en el Acta No.1208, de fecha 20 de agosto del 2002.

CONSIDERANDO: Que el citado adquiriente pagó un porciento del valor total del terreno por concepto de avance de inicial del precio que le fue fijado.

POR TANTO: Este preámbulo que antecede forma parte íntegra del presente contrato:

SE HA CONVENIDO Y PACTADO LO SIGUIENTE

PRIMERO: EL INGENIO vende, cede y transfiere, con todas las garantías ordinarias de derecho, a favor de LA COMPRADORA, quien acepta, el siguiente inmueble:

Una porción de terreno con una extensión superficial de cuatro mil novecientos quince punto noventa y tres (4,915.93) metros cuadrados, ubicada dentro del ámbito de la Parcela No.7 (Parte) D.C. No.1, del municipio de Ramón Santana, provincia San Pedro de Macorís, sección Cumayasa, lugar Proyecto de Solares La Marumba, con los siguientes linderos:

Al Norte: Resto de la parcela No. 7.
Al Este: Resto de la parcela No. 7.
Al Sur: Resto de la parcela No. 7.
Al Oeste: Calle.

SEGUNDO: EL INGENIO justifica, su derecho de propiedad sobre el inmueble objeto de la presente venta, en virtud del Certificado de Título No.76-7, de fecha cinco (5) de febrero del año 1976, expedido por el Registrador de Títulos del Departamento de San Pedro Macorís, correspondiente al inmueble de que se trata.

TERCERO: El precio convenido y pactado para a la presente operación de compra venta de terreno, es de un millón cuatrocientos setenta y cuatro mil setecientos setenta y nueve pesos oro dominicanos con: 00/100 (RD$1,474,779.00), o sea, a razón de trescientos pesos oro dominicanos con 00/100 (RD$300.00) el metro cuadrado, el cual será pagado por LA COMPRADORA, de la siguiente manera:

La suma de quinientos dieciséis mil ciento setenta y dos pesos oro dominicanos con 65/100 (RD$516,172.65), como pago inicial al suscribirse el presente contrato, valor que será pagado por LA COMPRADORA de la siguiente manera:

a) La suma de doscientos cuarenta y dos mil pesos oro dominicanos con 00/100 (RD$242,000.00), como avance del inicial, valor que declara EL INGENIO haber recibido en cheques certificados Nos. 0943628, 943753 y 1000458, de fechas 26-6-2002, 5-8-2002 y 6-12-2002, mediante comprobantes de caja y banco Nos. 2002-18175 y 2002-23438, 2002-39279, de fechas 26-6-2002, 5-8-2002 y 6-12-2002, razón por la cual este acto sirve a LA COMPRADORA como recibo de descargo y finiquito legal por dicha suma; y

b) El resto del inicial, o sea la suma de doscientos setenta y cuatro mil ciento setenta y dos pesos oro dominicanos con 65/100 (RD$274,172.65), será pagada mediante un acuerdo de pago, que será pagado por LA COMPRADORA, de la siguiente manera:

   1) La suma de cien mil pesos oro dominicanos CON 00/100 (RD$100.000.00), en fecha quince (15) de enero del 2003.

   2) La suma de cien mil pesos oro dominicanos con 00/100 (RD$100.000.00), en fecha quince (15) de febrero del 2003.

   3) La suma de setenta y cuatro mil ciento setenta y dos pesos oro dominicanos con 65/100 (RD$74,172.65), en fecha quince (15) de marzo del 2003.

c) El resto, o sea, la suma de novecientos cincuenta y ocho mil seiscientos seis pesos oro dominicanos con 35/100 (RD$958,606.35), en el plazo de tres (3) años, mediante treinta y seis (36) cuotas, iguales y consecutivas, más los intereses legales correspondientes, a razón de treinta y tres mil ciento trece pesos oro dominicanos con 03/100 (RD$33,113.03), a partir del día quince (15) de abril del 2003.

PARRAFO: El precio de trescientos pesos oro dominicanos con 00/100 (RD$300.00) por metro cuadrado, fue establecido tomando en consideración las tasaciones hechas por la Dirección General del Catastro Nacional, de fecha siete (7) de enero del 2002 y una firma de tasadores privada, mediante avalúo de fecha nueve (9) de enero del 2002.

PARRAFO II: Queda convenido entre las partes contratantes, que la suma de dinero adeudada por LA COMPRADORA ascendente a novecientos cincuenta y ocho mil seiscientos seis pesos oro dominicanos con 35/100 (RD$958,606.35), devengará intereses a razón del UNO POR CIENTO (1%) mensual.

CUARTO: Para seguridad y garantía del pago íntegro del precio convenido para la venta, EL INGENIO, se reserva un privilegio del vendedor no pagado por la suma adeudada, ascendente a novecientos cincuenta y ocho mil seiscientos seis pesos oro dominicanos con

35/100 (RD$958,606.35), todo de acuerdo a lo consagrado en el Artículo 2103, del Código Civil dominicano, para que, en caso de incumplimiento por parte de LA COMPRADORA, de satisfacer el pago de las cuotas convenidas, proceder en consecuencia al Embargo Inmobiliario y ejecución del privilegio inscrito sobre el inmueble objeto de la presente venta, por lo que LA COMPRADORA autoriza al Registrador de Títulos del Departamento de San Pedro de Macorís a inscribir dicho privilegio a favor de EL INGENIO.

PARRAFO I: Queda entendido que el presente privilegio se extiende a todo lo clavado o adherido al suelo, muros, techos, anexidades, dependencias, mejoras actualmente existentes y a las que en lo sucesivo haga LA COMPRADORA.

PARRAFO II: Queda entendido entre las partes, que si LA COMPRADORA se atrasa en el pago convenido durante un período de cinco (5) meses, EL INGENIO se reserva el derecho de rescindir el presente contrato, expropiando cualquier mejora que haya sido fomentada en el terreno, como pago compensatorio a la deuda contraída por LA COMPRADORA.

QUINTO: Las partes acuerdan que el inmueble puesto en garantía no podrá ser vendido, hipotecado o modificado, ni variado en forma alguna que pueda producir un cambio sustancial en el valor o uso del mismo, sin obtener previamente y por escrito el consentimiento del Consejo Estatal del Azúcar (C.E.A.).

SEXTO: LA COMPRADORA obliga a pagar todos los gastos que se originen al momento del pago de la deuda, así como todos los gastos que ocasione o pueda originar el presente contrato ya sean judiciales o extrajudiciales, honorarios, impuestos, tasas, contribuciones y en general los que se originen con la redacción, inscripción, legalización y todos aquellos gastos que realice el C.E.A. como consecuencia del presente contrato.

SEPTIMO: Queda convenido entre las partes, que si al elaborar el plano catastral definitivo, surge alguna diferencia en cuanto a la extensión del terreno, LA COMPRADORA debe pagar el área que exceda al precio estipulado en el Párrafo I, del Artículo Tercero de este contrato; si el área resultare menor, EL INGENIO acreditará la diferencia al monto adeudado por LA COMPRADORA.

OCTAVO: El presente contrato, después de suscrito entre las partes, si procede, deberá ser sometido al Congreso Nacional, a través de la Consultoría Jurídica del Poder Ejecutivo, para su aprobación definitiva

NOVENO: Para lo no previsto en este contrato, las partes se acogen a las disposiciones legales que rigen los contratos de compra y ventas de inmuebles.

DECIMO: Para los fines y consecuencias legales del presente contrato, las partes eligen su domicilio del siguiente modo: EL INGENIO, en el edificio del Consejo Estatal del Azúcar (C.E.A.), en el Centro de los Héroes de Santo Domingo y LA COMPRADORA en la dirección indicada en el inicio de este contrato.

HECHO Y FIRMADO en cuatro (4) originales, de un mismo tenor y efecto, uno para cada una de las partes, y otro para ser depositado ante el Registro de Títulos correspondiente, y así se han distribuido a los nueve (9) días del mes de diciembre del año dos mil dos (2002), en Santo Domingo, Distrito Nacional, capital de la República Dominicana.

POR EL INGENIO: **POR LA COMPRADORA:**

CONTRATO DE COMPRA VENTA DE TERRENOS

ENTRE: De una parte, el INGENIO BOCA CHICA, institución autónoma del Estado dominicano, organizada y existente de conformidad con la Ley No.7, de fecha 19 del mes de agosto del año 1966, válidamente representado por el Director Ejecutivo, ING. VÍCTOR MANUEL BÁEZ, dominicano, mayor de edad, casado, portador de la Cédula de Identidad y Electoral No. 001-0166750-9, domiciliado y residente en esta ciudad de Santo Domingo, quien actúa en virtud del Poder No. 761-01, que le fuere otorgado por el Presidente de la República, en fecha 26 de diciembre del año 2001, que en lo que sigue del presente contrato se denominará EL INGENIO; y de la otra parte, el señor HECTOR VINICIO CALERO ECHAVARRIA, dominicano, mayor de edad, casado, portador de la Cédula de Identidad y Electoral No.001-0328739-7, domiciliado y residente en la C/2da. No. 6, Villa Fontana, Mejoramiento Social, de esta ciudad de Santo Domingo, quien en lo que sigue del presente contrato se denominará EL COMPRADOR.

PREAMBULO

CONSIDERANDO: Que en fecha 6 de marzo del 2002, contenida en el Acta No.27, la Comisión de Ventas adoptó la Resolución No.1, recomendando la venta.

CONSIDERANDO: Que la citada Resolución fue debidamente presentada al conocimiento y decisión del Consejo de Directores, la cual autoriza al C.E.A., a iniciar el proceso de venta de terrenos en el Proyecto Brisas de las Américas a favor de EL COMPRADOR, mediante la Segunda Resolución, contenida en el Acta No. 1202, de fecha 16 de abril del 2002.

CONSIDERANDO: Que la citada adquiriente pagó un porciento del valor total del terreno por concepto de avance de inicial del precio que le fue fijado.

POR TANTO, este preámbulo que antecede forma parte íntegra del presente contrato.

SE HA CONVENIDO Y PACTADO LO SIGUIENTE:

PRIMERO: EL INGENIO vende, cede y transfiere, con todas las garantías ordinarias de derecho, a favor de EL COMPRADOR, quien acepta el siguiente inmueble:

Una porción de terreno con una extensión superficial de doscientos cincuenta (250) metros cuadrados, ubicada dentro del ámbito de la Parcela No.204-B (Pte.), del D.C. No.32, del Distrito Nacional, sección Los Frailes, lugar Brisas de las Américas, manzana No.14, solar No.11, con los siguientes linderos:

Al Norte : Solar No.6.
Al Este : Solar No.10.
Al Sur : Calle en proyecto.
Al Oeste : Solar No. 12.

SEGUNDO: EL INGENIO justifica su derecho de propiedad sobre el inmueble objeto de la presente venta, en virtud del Certificado de Título No.21-451, de fecha veintitrés (23) de febrero del año 1949, expedido por el Registrador de Títulos del Distrito Nacional, correspondiente al inmueble de que se trata.

TERCERO: El precio convenido y pactado para la presente operación de compra-venta de terreno, es de veinticinco mil pesos oro dominicanos con 00/100 (RD$25,000.00), o sea a razón de cien pesos oro dominicanos con 00/100 (RD$100.00) por metro cuadrado, el cual será pagado por LA COMPRADORA, de la siguiente manera:

a) La suma de dieciséis mil con 00/100 pesos oro dominicanos (RD$16,000.00), como pago inicial al suscribirse el presente contrato, valor que declara EL INGENIO

haber recibido en dinero en efectivo mediante comprobante de Caja y Banco No.201-24541, de fecha 26-12-2001, razón por la cual este acto sirve a EL COMPRADOR como recibo de descargo y finiquito legal por dicha suma; y

b) El resto, o sea la suma de nueve mil con 00/100 pesos oro dominicanos (RD$9,000.00), en el plazo de tres (3) años, mediante treinta y seis (36) cuotas, iguales y consecutivas, más los intereses legales correspondientes, a razón de trescientos diez con 89/100 pesos oro dominicanos (RD$310.89), a partir de la fecha del presente contrato.

PARRAFO I: El precio de cien pesos oro dominicanos con 00/100 (RD$100.00) por metro cuadrado, fue establecido tomando en consideración las tasaciones hechas por la Dirección General del Catastro Nacional, de fecha diecinueve (19) de julio del 2001 y una firma, de tasadores privada, mediante avalúo de fecha diecinueve (19) de julio del 2001.

PARRAFO II: Queda convenido entre las partes contratantes, que la suma de dinero adeudada por LA COMPRADOR ascendente a nueve mil con 00/100 pesos oro dominicanos (RD$9,000.00), devengará intereses a razón del uno por ciento (1%) mensual.

CUARTO: Para seguridad y garantía del pago íntegro del precio convenido para la venta, EL INGENIO, se reserva un privilegio del Vendedor No Pagado por la suma adeudada, ascendente a nueve mil con 00/100 pesos oro dominicanos (RD$9,000.00), todo de acuerdo a lo consagrado en el Artículo 2103, del Código Civil dominicano, para que, en caso de incumplimiento por parte de EL COMPRADOR, de satisfacer el pago de las cuotas convenidas, proceder en consecuencia al Embargo Inmobiliario y ejecución del privilegio inscrito sobre el inmueble objeto de la presente venta, por lo que EL COMPRADOR autoriza al Registrador de Títulos del Distrito Nacional a inscribir dicho privilegio a favor de EL INGENIO.

PARRAFO I: Queda entendido que el presente privilegio se extiende a todo lo clavado o adherido al suelo, muros, techos, anexidades, dependencias, mejoras actualmente existentes y a las que en lo sucesivo haga EL COMPRADOR.

PÁRRAFO II: Queda entendido entre las partes, que el C.E.A, no se compromete a construir aceras ni contenes, ni instalar el servicio de suministros básicos, tales como electricidad y agua potable.

PÁRRAFO III: Queda entendido entre las partes, que si EL COMPRADOR se atrasa en el pago convenido durante un período de cinco (5) meses, EL INGENIO se reserva el derecho de rescindir el presente contrato, expropiando cualquier mejora que haya sido fomentada en el terreno, como pago compensatorio a la deuda contraída por EL COMPRADOR.

QUINTO: Las partes acuerdan que el inmueble puesto en garantía no podrá ser vendido, hipotecado o modificado, ni variado en forma alguna que pueda producir un cambio sustancial en el valor o uso del mismo, sin obtener previamente y por escrito el consentimiento del Consejo Estatal del Azúcar (C.E.A.).

SEXTO: EL COMPRADOR se obliga a pagar todos los gastos que se originen al momento del pago de la deuda, así como todos los gastos que ocasione o pueda originar el presente contrato ya sean judiciales o extrajudiciales, honorarios, impuestos, tasas, contribuciones y en general los que se originen con la redacción, inscripción, legalización y todos aquellos gastos que realice el C.E.A. como consecuencia del presente contrato.

SEPTIMO: Queda convenido entre las partes que si al elaborar el plano catastral definitivo, surge alguna diferencia en cuanto a la extensión del terreno, EL COMPRADOR debe pagar el área que exceda, al precio estipulado en el Párrafo I del Artículo Tercero de este contrato; si el área resultare menor, EL INGENIO acreditará la diferencia al monto adeudado por EL COMPRADOR.

OCTAVO: El presente contrato después de suscrito entre las partes, si procede, deberá ser sometido al Congreso Nacional, a través de la Consultoría Jurídica del Poder Ejecutivo, para su aprobación definitiva.

NOVENO: Para lo no previsto en este contrato las partes se acogen a las disposiciones legales que rigen los contratos de compras y ventas de inmuebles.

DECIMO: Para los fines y consecuencias legales del presente contrato, las partes eligen su domicilio del siguiente modo: EL INGENIO, en el edificio del Consejo Estatal del Azúcar (C.E.A.), en el Centro de los Héroes de Santo Domingo y EL COMPRADOR, en la dirección indicada en el inicio de este contrato.

HECHO Y FIRMADO en cuatro (4) originales, de un mismo tenor y efecto, uno para cada una de las partes, y otro para ser depositado ante el Registro de Títulos correspondiente, y así se han distribuido, a los veintiocho (28) días del mes de mayo, del año dos mil tres (2003), en Santo Domingo, Distrito Nacional, capital de la República Dominicana.

POR EL INGENIO: **POR EL COMPRADOR**:

Ing. Víctor Manuel Báez.
Director Ejecutivo

Héctor Vinicio Calero Echavarría

YO, **DR. NILSON A. VELEZ Y ROSA**, Notario Público de los del Número del Distrito Nacional, CERTIFICO Y DOY FE: Que por ante mí comparecieron, libre y voluntariamente, los señores ING. En ejercicio de las atribuciones que me confiere el Artículo 128 de la Constitución de la República.

PROMULGO la presente Resolución y mando que sea publicada en la Gaceta Oficial, para su conocimiento y cumplimiento.

DADA en Santo Domingo de Guzmán, Distrito Nacional, capital de la República Dominicana, a los dieciséis (16) días del mes de julio del año dos mil catorce (2014); años 171 de la Independencia y 151 de la Restauración.

DANILO MEDINA

Res. No. 229-14 que aprueba el contrato entre el Estado dominicano y la señora Bienvenida Antonia Díaz Valerio, mediante el cual el primero traspasa a la segunda, una porción de terreno dentro de la parcela No. 87 (pte), D.C. No. 15, sector Los Mina, D.N. G. O. No. 10764 del 18 de julio de 2014.

EL CONGRESO NACIONAL
En Nombre de la República

Res. No. 229-14

VISTO: El Inciso 19 del Art. 37 de la Constitución de la República.

VISTO: El contrato de venta de terreno entre el Estado dominicano y la señora BIENVENIDA ANTONIA DÍAZ VALERIO.

R E S U E L V E

UNICO: APROBAR el contrato de venta de terreno suscrito en fecha 17 de noviembre del año 2006, entre el Estado dominicano, debidamente representado en este acto por el Administrador General de Bienes Nacionales, DR. JOSÉ FRANCISCO ZAPATA PICHARDO, de una parte, y de la otra parte, la señora BIENVENIDA ANTONIA DÍAZ VALERIO, por medio del cual el primero traspasa a la segunda, a título de venta, una porción de terreno con una extensión superficial de ciento sesenta y nueve punto cuarenta y seis metros cuadrados (169.46 Mt2), dentro del ámbito de la parcela No. 87 (Parte), del Distrito Catastral No. 15, del Distrito Nacional, ubicada en el sector Los Mina, valorada en la suma de RD$105,912.50 (ciento cinco mil novecientos doce pesos oro dominicanos con 50/100), que copiado a la letra dice así:

CONTRATO CONDICIONAL DE VENTA DE TERRENOS **003074**

ENTRE: De una parte, EL ESTADO DOMINICANO, debidamente representado en este acto por el titular de la Administración General de Bienes Nacionales, institución del Estado dominicano, organizada y existente de conformidad con la Ley No. 1832, de fecha 3 de noviembre del año 1948, DR. JOSÉ FRANCISCO ZAPATA PICHARDO, dominicano, mayor de edad, casado, funcionario público, portador de la Cédula de Identidad y Electoral No.001-0009433-3, domiciliado en la calle Pedro Henríquez Ureña esquina Pedro A. Lluberes, de esta ciudad, quien en lo que sigue del presente contrato se denominará EL VENDEDOR, o por su propio nombre; y de la otra parte, la señora BIENVENIDA ANTONIA DÍAZ VALERIO, dominicana, mayor de edad, casada, maestra, portadora de la Cédula de Identidad y Electoral No.001-0488081-0, domiciliada y residente en la calle Alejandro Geraldino No.38, del sector Los Mina Viejo, municipio Santo Domingo Este, quien en lo adelante del siguiente acto se designará como LA COMPRADORA, o por su propio nombre.

PREAMBULO

POR CUANTO: A que el Administrador General de Bienes Nacionales requiere de un Poder otorgado por el Presidente de la República para suscribir contratos de enajenación de inmuebles del Estado, razón por lo que LA COMPRADORA consiente en otorgarle el carácter provisional al presente acto.

POR CUANTO: A que la Administración General de Bienes Nacionales solicitará al Presidente de la República el referido Poder en lo relativo a las partes, las estipulaciones y el objeto de este contrato, quedando acordado entre ambas que si el Poder señalado es denegado, el mismo queda automáticamente rescindido, sin compensación alguna para LA COMPRADORA, salvo lo prescrito en el Acápite Quinto del presente acto, y en el momento de que fuere otorgado formará parte del mismo y conjuntamente con el contrato será remitido al Congreso Nacional para su aprobación en virtud de lo establecido por el Artículo 55, numeral 10 de la Constitución.

POR CUANTO: A que LA COMPRADORA declara saber que será sólo tras la obtención de la aprobación del presente contrato por parte del Congreso Nacional, que el mismo adquirirá de pleno derecho un carácter definitivo y podrá ser inscrito en la oficina del Registro de Títulos correspondiente.

Por tanto y en el entendido de que el preámbulo que antecede forma parte integral del presente contrato, se ha convenido y pactado lo siguiente.

PRIMERO: EL VENDEDOR, vende, cede y transfiere, con todas las garantías de derecho a favor de LA COMPRADORA, quien acepta el siguiente inmueble:

Una porción de terreno con una extensión superficial de ciento sesenta y nueve punto cuarenta y seis metros cuadrados (169.46 Mts2), dentro del ámbito de la Parcela No.87 (Parte), del Distrito Catastral No. 15, del Distrito Nacional, ubicada en el sector Los Mina, con los siguientes linderos: AL NORTE: Parcela No.87 (Resto), AL SUR: Calle Horacio Ortiz Álvarez, AL ESTE: Calle Alejandro Geraldino; y AL OESTE: Parcela No.87 (Resto).

SEGUNDO: EL VENDEDOR justifica su derecho de propiedad respecto de la porción de terreno registrada a favor de EL ESTADO DOMINICANO en la Parcela No.87, del Distrito Catastral No. 15 del Distrito Nacional, en virtud del Certificado de Título No.60-3528, según consta en la certificación de fecha 20 de octubre del año 2006, expedida por la Registradora de Títulos del Distrito Nacional.

TERCERO: El precio acordado para la presente venta de terreno asciende a la suma de ciento cinco mil novecientos doce pesos dominicanos con 50/100 (RD$105,912.50), a razón de seiscientos veinticinco pesos dominicanos con 00/100 (RD$625.00) el metro cuadrado, menos un cuarenta por ciento (40%) de descuento por concepto de pago total de terreno, en virtud de la Resolución Administrativa de fecha 6 de diciembre del año 2005, por lo que LA COMPRADORA ha pagado a EL VENDEDOR la suma de sesenta y tres mil quinientos cuarenta y siete pesos dominicanos con 50/100 (RD$63,547.50), mediante cheque No. 1220494 de fecha 31 de enero del año 2006 del Banco de Reservas, según recibo de ingreso No.27310, de fecha 31 de enero del año 2006, expedido por la Administración General de Bienes Nacionales, por lo que el presente contrato sirve de constancia de pago y recibo de descargo.

PÁRRAFO I: El precio de seiscientos veinticinco pesos dominicanos con 00/100 (RD$625.00) por metro cuadrado fue establecido tomando en consideración la tasación de fecha 21 de diciembre del año 2005, realizada por el Departamento de Avalúo de esta Administración General de Bienes Nacionales.

PÁRRAFO II: Queda convenido y acordado entre las partes que hasta tanto el presente contrato no adquiera un carácter definitivo, tras su aprobación por parte del Congreso Nacional, LA COMPRADORA no puede sin la autorización de EL VENDEDOR, suscribir arrendamientos, traspaso, venta, consentir hipotecas ni afectar en modo alguno como garantía el inmueble objeto del presente contrato, dado en primer lugar el carácter provisional del presente contrato y en segundo lugar el hecho de que el mismo es suscrito en razón de la evaluación y calificación de LA COMPRADORA, por lo que el mismo tiene un efecto intuitu personae. La violación a este párrafo, comprobada objetivamente por EL VENDEDOR producirá la rescisión del contrato sin intervención judicial pudiendo disponer nuevamente del inmueble en la forma en que desee.

PÁRRAFO III: Se conviene y pacta además, que en caso de que por error surja alguna diferencia en cuanto a la extensión del terreno objeto del presente contrato, LA COMPRADORA deberá pagar los metros que excedan en base a la actualización del precio al momento en que esta situación fuere determinada.

PÁRRAFO IV: Queda convenido entre las partes que el Estado dominicano reembolsará la diferencia o la totalidad de la suma pagada o permutará el área vendida a LA COMPRADORA, en los casos en que éste se exceda en la disponibilidad de terreno que posee, tomando en consideración que al momento del presente acto pudieran existir ventas que aún no han sido depositadas por ante el Registrador de Títulos correspondiente y/o los colindantes no estén deslindados.

CUARTO: Queda convenido y pactado entre las partes que en caso de que LA COMPRADORA realice la transferencia a un tercero del inmueble objeto del presente contrato, antes de haber saldado el precio de venta y ejecutado el traspaso por ante las oficinas del Registro de Títulos correspondiente, el nuevo adquiriente debe pagar un diez por ciento (10%) del valor actualizado del inmueble, establecido por el promedio de las tasaciones del sector privado y de esta Administración, por concepto de dicha transferencia.

QUINTO: En los casos de rescisión de contrato por falta imputable a LA COMPRADORA, las partes convienen y LA COMPRADORA así lo acepta, que EL VENDEDOR retenga el treinta por ciento (30%) de los valores pagados a la fecha de la desocupación del inmueble, a los fines de compensar el uso, los deterioros, y la depreciación que haya sufrido el inmueble. En caso de que la falta no sea imputable a LA COMPRADORA, le será devuelto el cien por ciento (100%), de los valores pagados a la fecha.

SEXTO: LA COMPRADORA se obliga a pagar todos los gastos que se originen como consecuencia del presente contrato, ya sean judiciales o extrajudiciales, y de manera particular, los impuestos relativos al traspaso del derecho de propiedad.

SÉPTIMO: Cualquier violación a una de las cláusulas de este contrato o cualquier información falsa dada por LA COMPRADORA, comprobada objetivamente por EL VENDEDOR, dará lugar a la rescisión del contrato con la sola notificación a LA COMPRADORA.

OCTAVO: Para todos los fines del presente contrato, EL VENDEDOR, elige domicilio en la oficina de la Administración General de Bienes Nacionales y LA COMPRADORA en el inmueble objeto del presente contrato y en su defecto en la oficina del Procurador Fiscal del lugar en que se encuentra el inmueble.

NOVENO: Para todo lo no previsto en el presente contrato, las partes se remiten a las disposiciones legales especiales que rigen los contratos de venta de inmuebles del Estado y al Derecho Común y Administrativo.

HECHO Y FIRMADO de buena fe, en siete (7) originales, de un mismo tenor y efecto. En la ciudad de Santo Domingo, Distrito Nacional, capital de la República Dominicana, a los diecisiete (17) días del mes de noviembre del año dos mil seis (2006).

CONTRATO DE COMPRA VENTA DE TERRENOS

ENTRE: De una parte, el INGENIO SANTA FE, institución autónoma del Estado dominicano, organizada y existente de conformidad con la Ley No.7, de fecha 19 del mes de agosto del año 1966, válidamente representado por el Director Ejecutivo, DR. DOMINGO ENRIQUE MARTÍNEZ REYES, dominicano, mayor de edad, casado, portador de la Cédula de Identidad y Electoral No.026-0046124-4, domiciliado y residente en esta ciudad de Santo Domingo, quien actúa en virtud del Poder No.306-03, que le fuere otorgado por el Presidente de la República, en fecha 16 de junio del 2003, que en lo que sigue del presente contrato se denominará EL INGENIO; y de la otra parte, el señor RENE PASCUAL FANY, dominicano, mayor de edad, soltero, portador de la Cédula de Identidad y Electoral No.001-1721667-1, domiciliado y residente en la calle Enrique Rijo No.8, Ingenio Provenir, provincia de San Pedro de Macorís, y accidentalmente en esta ciudad de Santo Domingo, quien en lo que sigue del presente contrato se denominará EL COMPRADOR.

PREAMBULO

CONSIDERANDO: Que en fecha 25 de enero del 2005, contenida en el Acta No.01, la Comisión de Ventas adoptó la Resolución No.9, recomendando la venta.

CONSIDERANDO: Que la citada Resolución fue debidamente presentada al conocimiento y decisión del Consejo de Directores, la cual autoriza al C.E.A., a iniciar el proceso de venta de terrenos en el Proyecto Los Profesionales, a favor de EL COMPRADOR, mediante la Primera Resolución-I, contenida en el Acta No.1241, de fecha 2 de febrero del 2005.

CONSIDERANDO: Que en fecha 26 de octubre del 2000, contenida en el Acta No.2, la Comisión de Ventas mediante la Resolución No.8, otorgó facultad legal al Director de Inmobiliaria a realizar un descuento por saldar el valor total del terreno de un cinco a un diez por ciento (5% a un 10%).

CONSIDERANDO: Que la citada Resolución fue debidamente presentada al conocimiento y decisión del Consejo de Directores, la cual fue ratificada mediante la Resolución No.1, contenida en el Acta No.1189, de fecha 31 de octubre del 2000.

CONSIDERANDO: Que la citada adquiriente pagó un porciento del valor total del terreno por concepto de avance de inicial del precio que le fue fijado.

POR TANTO, este preámbulo que antecede forma parte íntegra del presente contrato.

SE HA CONVENIDO Y PACTADO LO SIGUIENTE:

PRIMERO: EL INGENIO vende, cede y transfiere, con todas las garantías ordinarias de derecho, a favor de EL COMPRADOR, quien acepta el siguiente inmueble:

Una porción de terreno con una extensión superficial de doscientos (200.00) metros cuadrados, ubicada dentro del ámbito de la Parcela No.15-A (Pte.), D.C. No.16/4ta, del municipio de San Pedro de Macorís, lugar Los Profesionales, Manzana No.6, Solar No.16, con los siguientes linderos
:

Al Norte : Solar No.17.
Al Este : Solar No.7.
Al Sur : Solar No.15.
Al Oeste : Calle.

SEGUNDO: EL INGENIO justifica su derecho de propiedad sobre el inmueble objeto de la presente venta, en virtud del Certificado de Título No.61-151, de fecha cuatro (4) de septiembre del año 1961, expedido por el Registrador de Títulos del Departamento de San Pedro de Macorís, correspondiente al inmueble de que se trata.

TERCERO: El precio convenido y pactado para la presente operación de compra venta de terreno, es de treinta mil pesos oro dominicanos con 00/100 (RD$30,000.00), o sea a razón de ciento cincuenta pesos oro dominicanos con 00/100 (RD$150.00) por metro cuadrado, aplicando a dicho valor un seis punto treinta y dos por ciento (6.32%) de descuento, lo que hace un valor de veintiocho mil ciento cinco pesos oro dominicanos con 00/100 (RD$28,105.00), suma ésta que fue pagada por EL COMPRADOR, según consta en los recibos de Caja y Banco Nos.2003-51148 y 2004-07700, de fechas 08-09-2003 y 11-02-2004, valor que declara haber recibido EL INGENIO en su entera satisfacción, razón por la cual este acto sirve a EL COMPRADOR como recibo de finiquito y descargo legal por dicha suma.

PARRAFO I: El precio de ciento cincuenta pesos oro dominicanos con 00/100 (RD$150.00) por metro cuadrado, fue establecido tomando en consideración las tasaciones hechas por la Dirección General del Catastro Nacional, de fecha diecinueve (19) de noviembre del 2002 y una firma de tasadores privada, mediante avalúo de fecha veintiséis (26) de noviembre de 2002.

PARRAFO II: Queda entendido entre las partes, que el C.E.A, no se compromete a construir aceras ni contenes, ni instalar el servicio de suministros básicos, tales como electricidad, agua potable, ni asfaltos en las calles.

CUARTO: El presente contrato, después de suscrito entre las partes, si procede, deberá ser sometido al Congreso Nacional, a través de la Consultoría Jurídica del Poder Ejecutivo, para su aprobación definitiva.

QUINTO: Para lo no previsto en este contrato, las partes se acogen a las disposiciones legales que rigen los contratos de compra y ventas de inmuebles.

SEXTO: Para los fines y consecuencias legales del presente contrato, las partes eligen su domicilio del siguiente modo: EL INGENIO, en el edificio del Consejo Estatal del Azúcar (C.E.A.), en el Centro de los Héroes de Santo Domingo, y EL COMPRADOR en la dirección indicada en el inicio de este contrato.

HECHO Y FIRMADO en cuatro (4) originales, de un mismo tenor y efecto, uno para cada una de las partes, y otro para ser depositado ante el Registro de Títulos correspondiente, y así se han distribuido, a los ocho (08) días del mes de abril del año dos mil cinco (2005), en Santo Domingo, Distrito Nacional, capital de la República Dominicana.

POR EL INGENIO:	**POR EL COMPRADOR**:

otorgado por el Presidente de la República, en fecha 3 de octubre del año 2006, que en lo que sigue del presente contrato se denominará EL INGENIO, y de la otra parte, la señora IRENE METIVIER, dominicana, mayor de edad, soltera, empleada privada, portadora de la Cédula de Identidad y Electoral No. 223-0021313-3, domiciliada y residente en la calle Juan Marichal No. 2, de esta ciudad de Santo Domingo, debidamente representado por el señor RAFAEL PEREYRA, dominicana, mayor de edad, casado, portador de la Cédula de Identidad y Electoral No. 050-0025040-6, domiciliado y residente en la calle 3 No. 16, sector Josué Primero, de esta ciudad de Santo Domingo, en virtud del Poder Especial o Mandato de fecha trece (13) del mes de marzo del año dos mil siete (2007), quien en lo que sigue del presente contrato se denominará LA COMPRADORA..

PREAMBULO

CONSIDERANDO: Que en fecha 10 de agosto del 2005, contenida en el Acta No.04, la Comisión de Ventas adoptó la Resolución No. 18, recomendando la venta.

CONSIDERANDO: Que la citada Resolución fue debidamente presentada al conocimiento y decisión del Consejo de Directores, la cual autoriza al C.E.A., a iniciar el proceso de venta de terrenos en el Proyecto El Tamarindo a favor de LA COMPRADORA, mediante la Tercera Resolución, contenida en el Acta No. 001-2006, de fecha 10 de enero del 2006.

CONSIDERANDO: Que el citado adquiriente pagó un porciento del valor total del terreno por concepto de avance de inicial del precio que le fue fijado.

POR TANTO, este preámbulo que antecede forma parte íntegra del presente contrato.

SE HA CONVENIDO Y PACTADO LO SIGUIENTE:

PRIMERO: EL INGENIO vende, cede y transfiere, con todas las garantías ordinarias de derecho, a favor de LA COMPRADORA, quien acepta el siguiente inmueble:

Una porción de terreno con una extensión superficial de DOSCIENTOS UN PUNTO TREINTA Y OCHO (201.38) metros cuadrados, ubicada dentro del ámbito de la Parcela No. 8-REF (PTE.) D. C. No. 9, del Distrito Nacional, lugar: Villa Tropicalia, sección El Tamarindo, con los siguientes linderos:
:

Al Norte : Calle Juan Marichal.
Al Este : P. No. 8-Ref. (Resto).
Al Sur : P. No. 8-Ref. (Resto).
Al Oeste : P. No. 8-Ref. (Resto) y calle Rosa Duarte.

SEGUNDO: EL INGENIO justifica su derecho de propiedad sobre el inmueble objeto de la presente venta, en virtud del Certificado de Título No. 74- 2871, de fecha 11 de julio del 1974, expedido por el Registrador de Títulos del Distrito Nacional, correspondiente al inmueble de que se trata.

TERCERO: El precio convenido y pactado para la presente operación de compra venta de terreno, es de SESENTA MIL CUATROCIENTOS CATORCE PESOS ORO DOMINICANOS CON 00/100 (RD$60,414.00), o sea a razón de TRESCIENTOS PESOS ORO DOMINICANOS CON 00/100 (RD$300.00) por metro cuadrado, el cual será pagado por LA COMPRADORA, de la siguiente manera:

a) La suma de veinticuatro mil novecientos treinta y tres pesos oro dominicanos con 30/100 (RD$24,933.30), como pago inicial al suscribirse el presente contrato, valor que declara EL INGENIO haber recibido en dinero en efectivo mediante comprobantes de Caja y Banco Nos. 2004-06946, 2004-52609, de fechas 09/02/2004, y 25/11/2004, razón por la cual este acto sirve a LA COMPRADORA como recibo de descargo y finiquito legal por dicha suma; y

b) El resto, o sea, la suma de treinta y cinco mil cuatrocientos ochenta pesos oro dominicanos con 70/100 (RD$35,480.70), en el plazo de tres (3) años, mediante treinta y seis (36) cuotas, iguales y consecutivas, más los intereses legales correspondientes, a razón de ochocientos cincuenta y un pesos oro dominicanos con 72/100 (RD$851.72), a partir de la fecha del presente contrato.

PARRAFO I: El precio de trescientos pesos oro dominicanos con 00/100 (RD$300.00) por metro cuadrado, fue establecido tomando en consideración las tasaciones hechas por la Dirección General del Catastro Nacional, de fecha veintiséis (26) de julio del 2004 y una firma de tasadores privada, mediante avalúo de fecha treinta (30) de mayo de 2004.

PARRAFO II: Queda convenido entre las partes contratantes, que la suma de dinero adeudada por LA COMPRADORA ascendente a la suma de treinta y cinco mil cuatrocientos ochenta pesos oro dominicanos con 70/100 (RD$35,480.70), devengará intereses a razón del uno por ciento (1%) mensual.

CUARTO: Para seguridad y garantía del pago íntegro del precio convenido para la venta, EL INGENIO se reserva un privilegio del Vendedor No Pagado por la suma adeudada, ascendente a treinta y cinco mil cuatrocientos ochenta pesos oro dominicanos con 70/100 (RD$35,480.70), todo de acuerdo a lo consagrado en el Artículo 2103 del Código Civil dominicano, para que, en caso de incumplimiento por parte de LA COMPRADORA, de satisfacer el pago de las cuotas convenidas, proceder en consecuencia al Embargo Inmobiliario y ejecución del privilegio inscrito sobre el inmueble objeto de la presente venta, por lo que LA COMPRADORA autoriza al Registrador de Títulos del Distrito Nacional a inscribir dicho privilegio a favor de EL INGENIO.

PÁRRAFO I: Queda entendido que el presente privilegio se extiende a todo lo clavado o adherido al suelo, muros, techos, anexidades, dependencias, mejoras actualmente existentes y a las que en lo sucesivo haga LA COMPRADORA.

PARRAFO II: Queda entendido entre las partes, que el C.E.A, no se compromete a construir aceras ni contenes, ni instalar el servicio de suministros básicos, tales como electricidad, agua potable, ni asfaltos en las calles.

PÁRRAFO III: Queda entendido entre las partes, que si LA COMPRADORA se atrasa en el pago convenido durante un período de cinco (5) meses, EL INGENIO se reserva el derecho de rescindir el presente contrato, expropiando cualquier mejora que haya sido fomentada en el terreno, como pago compensatorio a la deuda contraída por LA COMPRADORA.

PÁRRAFO IV: Esta Dirección Inmobiliaria no se hace responsable que el uso que en un futuro se le dará al terreno afecte la ecología e interfiera con las condiciones y regulaciones de la Secretaria de Estado de Recursos Naturales y Medio Ambiente, u otra institución pública o privada.

QUINTO: Las partes acuerdan que el inmueble puesto en garantía no podrá ser vendido, hipotecado o modificado, ni variado en forma alguna que pueda producir un cambio sustancial en el valor o uso del mismo, sin obtener previamente y por escrito el consentimiento del Consejo Estatal del Azúcar (C.E.A.).

SEXTO: LA COMPRADORA se obliga a pagar todos los gastos que se originen al momento del pago de la deuda, así como todos los gastos que ocasione o pueda originar el presente contrato ya sean judiciales o extrajudiciales, honorarios, impuestos, tasas, contribuciones y en general los que se originen con la redacción, inscripción, legalización y todos aquellos gastos que realice el C.E.A. como consecuencia del presente contrato.

SEPTIMO: Queda convenido entre las partes, que si al elaborar el plano catastral definitivo, surge alguna diferencia en cuanto a la extensión del terreno, LA COMPRADORA debe pagar el área que exceda, al precio estipulado en el Párrafo I, del Artículo Tercero de este contrato; si el área resultare menor, EL INGENIO acreditará la diferencia al monto adeudado por LA COMPRADORA.

OCTAVO: El presente contrato, después de suscrito entre las partes, si procede, deberá ser sometido al Congreso Nacional, a través de la Consultoría Jurídica del Poder Ejecutivo, para su aprobación definitiva.

NOVENO: Para lo no previsto en este contrato, las partes se acogen a las disposiciones legales que rigen los contratos de compra y ventas de inmuebles.

DÉCIMO: Para los fines y consecuencias legales del presente contrato, las partes eligen su domicilio del siguiente modo: EL INGENIO, en el edificio del Consejo Estatal del Azúcar (C.E.A.), en el Centro de los Héroes de Santo Domingo y LA COMPRADORA en la dirección indicada en el inicio de este contrato.

HECHO Y FIRMADO en cuatro (4) originales, de un mismo tenor y efecto, uno para cada una de las partes, y otro para ser depositado ante el Registro de Títulos correspondiente, y así se han distribuido, a los veintinueve (29) días del mes de mayo del año dos mil siete (2007), en Santo Domingo, Distrito Nacional, Capital de la República Dominicana.

CONTRATO DE COMPRA-VENTA DE TERRENOS

ENTRE: De una parte, el INGENIO OZAMA, institución autónoma del Estado dominicano, organizada y existente de conformidad con la Ley No.7, de fecha 19 del mes de agosto del año 1966, válidamente representado por el Director Ejecutivo, ING. VICTOR MANUEL BAEZ, dominicano, mayor de edad, casado, portador de la Cédula de Identidad y Electoral No.001-0166750-9, domiciliado y residente en esta ciudad de Santo Domingo, quien actúa en virtud del Poder No.297-03, que le fuere otorgado por el Presidente de la República, en fecha 16 de junio del año 2003, que en lo que sigue del presente contrato se denominará EL INGENIO; y de la otra parte, la Compañía DOCAR, S.A., debidamente representada por el señor JANGLE MARCO ANTONIO VASQUEZ RODRIGUEZ, dominicano, mayor de edad, casado, portador de la Cédula de Identidad y Electoral No. 001-0491575-6, domiciliado y residente en la Avenida Padre Castellanos No.249, de esta ciudad de Santo Domingo, quien en lo que sigue del presente contrato se denominará LA COMPRADORA.

PREAMBULO

CONSIDERANDO: Que en fecha 16 de enero del 2002, contenida en el Acta No.24, la Comisión de Ventas adoptó la Resolución No.24, recomendando la venta.

CONSIDERANDO: Que la citada Resolución fue debidamente presentada al conocimiento y decisión del Consejo de Directores, la cual autoriza al C.E.A., a solicitar al Poder Ejecutivo el Poder Especial para la transferencia y venta de terrenos a favor de LA COMPRADORA, mediante la Tercera Resolución, contenida en el Acta No. 1203, de fecha 22 de Mayo del 2002.

CONSIDERANDO: Que el citado adquiriente pagó un porciento del valor total del terreno por concepto de avance de inicial del precio que le fue fijado.

POR TANTO: Este preámbulo que antecede forma parte íntegra del presente contrato:

SE HA CONVENIDO Y PACTADO LO SIGUIENTE

PRIMERO: EL INGENIO vende, cede y transfiere, con todas las garantías ordinarias de derecho, a favor de LA COMPRADORA, quien acepta el siguiente inmueble:

Una porción de terreno con una extensión superficial de tres mil setecientos setenta y tres punto cero cuatro (3,773.04) metros cuadrados, ubicada dentro del ámbito de la Parcela No.21-C-2 (Pte.), D.C. No.32, del Distrito Nacional, lugar Cruce de Guerra, con los siguientes linderos:

Al Norte: Resto de la parcela.
Al Este: Carretera a Guerra.
Al Sur: Carretera Mella.
Al Oeste: Resto de la parcela.

SEGUNDO: EL INGENIO justifica su derecho de propiedad sobre el inmueble objeto de la presente venta, en virtud del Certificado de Título No.61-280, de fecha seis (6) de febrero del año 1961, expedido por el Registrador de Títulos.

TERCERO: El precio convenido y pactado para la presente operación de compra-venta de terreno, es de setecientos cincuenta y cuatro mil seiscientos ocho pesos oro dominicanos con 00/100 (RD$754,608.00), o sea a razón de doscientos pesos oro dominicanos con 00/100 (RD$200.00) por metro cuadrado, el cual será pagado por LA COMPRADORA, de la siguiente manera:

a) La suma de trescientos setenta y siete mil trescientos pesos oro dominicanos con 00/100 (RD$377,300.00), como pago inicial al suscribirse el presente contrato, valor que declara EL INGENIO haber recibido según consta en los comprobantes de Caja y Banco Nos.2001-22466 y 2002-10588, de fechas 12-12-2001 y 3-4-2002, razón por la cual este acto sirve a LA COMPRADORA como recibo de descargo y finiquito legal por dicha suma; y

b) El resto, o sea, la suma de trescientos setenta y siete mil trescientos ocho pesos oro dominicanos con 00/100 (RD$377,308.00), en el plazo de tres (3) años, mediante treinta y seis (36) cuotas, iguales y consecutivas, más los intereses legales correspondientes, a razón de trece mil treinta y tres pesos oro dominicanos con 31/100 (RD$13,033.31), a partir de la fecha del presente contrato.

PARRAFO: El precio de doscientos pesos oro dominicanos con 00/100 (RD$200.00) por metro cuadrado, fue establecido tomando en consideración las tasaciones hechas por la Dirección General del Catastro Nacional, de fecha veintisiete (27) de diciembre del 2002 y una firma de tasadores privada, mediante avalúo de fecha veintiocho (28) de agosto del 2001.

PARRAFO II: Queda convenido entre las partes contratantes, que la suma de dinero adeudada por LA COMPRADORA ascendente a trescientos setenta y siete mil trescientos ocho pesos oro dominicanos con 00/100 (RD$377,308.00), devengará intereses a razón del uno por ciento (1%) mensual.

CUARTO: Para seguridad y garantía del pago íntegro del precio convenido para la venta, EL INGENIO, se reserva un privilegio del vendedor no pagado por la suma adeudada, ascendente a trescientos setenta y siete mil trescientos ocho pesos oro dominicanos con 00/100 (RD$377,308.00), todo de acuerdo a lo consagrado en el Artículo 2103, del Código Civil dominicano, para que en caso de incumplimiento por parte de LA COMPRADORA, de satisfacer el pago las cuotas convenidas, proceder en consecuencia al Embargo Inmobiliario y ejecución del privilegio inscrito sobre el inmueble objeto de la presente venta, por lo que LA COMPRADORA autoriza al Registrador de Títulos del Distrito Nacional a inscribir dicho privilegio a favor de EL INGENIO.

PARRAFO I: Queda entendido que el presente privilegio se extiende a todo lo clavado o adherido al suelo, muros, techos, anexidades, dependencias, mejoras actualmente existentes y a las que en lo sucesivo haga LA COMPRADORA.

QUINTO: Las partes acuerdan que el inmueble puesto en garantía no podrá ser vendido, hipotecado o modificado, ni variado en forma alguna que pueda producir un cambio sustancial en el valor o uso del mismo, sin obtener previamente y por escrito el consentimiento del Consejo Estatal del Azúcar (C.E.A.).

SEXTO: LA COMPRADORA se obliga a pagar todos los gastos que se originen al momento del pago de la deuda, así como todos los gastos que ocasione o pueda originar el presente contrato ya sean judiciales o extrajudiciales, honorarios, impuestos, tasas, contribuciones y en general los que se originen con la redacción, inscripción, legalización y todos aquellos gastos que realice el C.E.A. como consecuencia del presente contrato.

SEPTIMO: Queda convenido entre las partes, que si al elaborar el plano catastral definitivo, surge alguna diferencia en cuanto a la extensión del terreno, EL COMPRADOR

debe pagar el área que exceda al precio estipulado en el Párrafo I, del Artículo Tercero de este contrato; si el área resultare menor, EL INGENIO acreditará la diferencia al monto adeudado por LA COMPRADORA.

OCTAVO: El presente contrato, después de suscrito entre las partes, si procede, deberá ser sometido al Congreso Nacional, a través de la Consultoría Jurídica del Poder Ejecutivo, para su aprobación definitiva.

NOVENO: Para lo no previsto en este contrato las partes se acogen a las disposiciones legales que rigen los contratos de compra y ventas de inmuebles.

DECIMO: Para los fines y consecuencias legales del presente contrato, las partes eligen su domicilio del siguiente modo: EL INGENIO, en el edificio del Consejo Estatal del Azúcar (C.E.A.), en el Centro de los Héroes de Santo Domingo y LA COMPRADORA en la dirección indicada en el inicio de este contrato.

HECHO Y FIRMADO en cuatro (4) originales, de un mismo tenor y efecto, uno para cada una de las partes, y otro para ser depositado ante el Registro de Títulos correspondiente, y así se han distribuido, a los veinticinco (25) días del mes de junio del año dos mil tres (2003), en Santo Domingo, Distrito Nacional, Capital de la República Dominicana.

Res. No. 233-14

VISTO: El Inciso 19 del Art. 37 de la Constitución de la República.

VISTO: El contrato de venta de terreno entre el Estado dominicano y la señora Águeda Morales de Lozano

R E S U E L V E:

ÚNICO: APROBAR el contrato de venta de terreno suscrito en fecha 4 de junio del año 2007, entre el Estado dominicano, debidamente representado en este acto por el Administrador General de Bienes Nacionales, Dr. José Francisco Zapata Pichardo, de una parte, y de la otra parte, la señora Águeda Morales de Lozano, por medio del cual, el primero traspasa a la segunda, a titulo de venta, una porción de terreno con una extensión superficial de ochenta y nueve punto veintiocho metros cuadrados (89.28Mts²), dentro del ámbito de la parcela No. 154 (parte), del Distrito Catastral No. 15, del Distrito Nacional, ubicada en el sector Vietnam, Los Mina, valorada en la suma de RD$44,640.00 (cuarenta y cuatro mil seiscientos cuarenta pesos dominicanos con 00/100), que copiado a la letra dice así:

CONTRATO CONDICIONAL DE VENTA DE TERRENOS

003859

ENTRE: De una parte, el Estado dominicano, debidamente representado en este acto por el titular de la Administración General de Bienes Nacionales, institución del Estado dominicano, organizada y existente de conformidad con la Ley No.1832, de fecha 3 de noviembre del año 1948, Dr. José Francisco Zapata Pichardo, dominicano, mayor de edad, casado, funcionario público, portador de la Cédula de Identidad y Electoral No. 001-0009433-3, domiciliado en la calle Pedro Henríquez Ureña, esquina Pedro A. Lluberes, de esta ciudad, quien en lo que sigue del presente contrato se denominara EL VENDEDOR, o por su propio nombre, y de la otra parte la señora Águeda Morales de Lozano, dominicana,

mayor de edad, casada, enfermera, portadora de la Cédula de Identidad y Electoral No. 001-1290427-1, domiciliada y residente en la calle José Feliú, casa No. 70, del sector Vietnam, Los Mina, municipio Santo Domingo Este, quien en lo adelante del siguiente acto se designará como LA COMPRADORA o por su propio nombre.

PREAMBULO

POR CUANTO: A que el Administrador General de Bienes Nacionales requiere de un Poder otorgado por el Presidente de la República para suscribir contratos de enajenación de inmuebles del Estado, razón por lo que LA COMPRADORA consiente en otorgarle el carácter provisional al presente acto.

POR CUANTO: A que la Administración General de Bienes Nacionales solicitará al Presidente de la República el referido Poder en lo relativo a las partes, las estipulaciones y el objeto de este contrato, quedando acordado entre ambas que si el poder señalado es denegado, el mismo quedará automáticamente rescindido, sin compensación alguna para LA COMPRADORA, salvo lo prescrito en el Acápite Quinto del presente acto; y en el momento de que fuere otorgado formará parte del mismo y conjuntamente será remitido al Congreso Nacional para su aprobación en virtud de lo establecido por el Artículo 55, Numeral 10 de la Constitución.

POR CUANTO: A que LA COMPRADORA acepta y conviene que será sólo tras la obtención de la aprobación del presente contrato por parte del Congreso Nacional, que el mismo adquirirá de pleno derecho un carácter definitivo y podrá ser inscrito en la oficina de Registro de Títulos correspondiente.

Por tanto y en el entendido de que el preámbulo que antecede forma parte integral del presente contrato, se ha convenido y pactado lo siguiente:

PRIMERO: EL VENDEDOR, vende, cede y transfiere, con todas las garantías de derecho a favor de LA COMPRADORA, quien acepta el siguiente inmueble:

Una porción de terreno con una extensión superficial de ochenta y nueve punto veintiocho metros cuadrados (89.28 Mts²) dentro del ámbito de la Parcela No. 154 (parte) del Distrito Catastral No. 15, del Distrito Nacional, ubicada en el sector Vietnam, Los Mina, con los siguientes linderos: Al Norte: Parcela No. 154 (resto); Al Sur: Parcela No. 154 (resto); Al Este: calle José Feliú; y Al Oeste: Parcela No. 154 (resto).

SEGUNDO: EL VENDEDOR justifica su derecho de propiedad respecto de la porción de terreno registrada a favor de El Estado dominicano en la parcela No. 154, del Distrito Catastral No. 15, del Distrito Nacional, en virtud del Certificado de Titulo No. 63-103, según consta en la Certificación de fecha 27 de octubre del año 2006, expedida por la Registradora de Títulos del Distrito Nacional.

TERCERO: El precio acordado para la presente venta de terreno asciende a la suma de cuarenta y cuatro mil seiscientos cuarenta pesos dominicanos con 00/100 (RD$44,640.00),

a razón de quinientos pesos dominicanos con 00/100 (RD$500.00) el metro cuadrado, menos un treinta por ciento (30%) de descuento por concepto de pago total del terreno, en virtud de la Resolución Administrativa de fecha 4 de diciembre del año 2006, por lo que LA COMPRADORA ha pagado a EL VENDEDOR, la suma de treinta y un mil doscientos cuarenta y ocho pesos dominicanos con 00/100 (RD$31,248.00), en efectivo, según recibo de ingreso No. 27981, de fecha 21 de marzo del año 2007, expedido por la Administración General de Bienes Nacionales, por lo que el presente contrato sirve de constancia de pago y recibo de descargo.

PÁRRAFO I: El precio de quinientos pesos dominicanos con 00/100 (RD$500.00) por metro cuadrado (Mts²), fue establecido tomando en consideración la tasación de fecha 10 de enero del año 2007, realizada por el Departamento de Avalúo, en función del Dec. No. 555-03, de fecha 10 de junio del año 2003.

PÁRRAFO II: Queda convenido y acordado entre las partes que hasta tanto el presente contrato no adquiera un carácter definitivo, tras su aprobación por parte del Congreso Nacional, LA COMPRADORA no puede sin la autorización de EL VENDEDOR, suscribir arrendamientos, traspaso, venta, consentir hipotecas ni afectar en modo alguno como garantía el inmueble objeto del presente contrato, dado en primer lugar el carácter provisional del presente contrato y en segundo lugar el hecho de que el mismo es suscrito en razón de la evaluación y calificación de LA COMPRADORA, por lo que el mismo tiene un efecto intuitu personae. La violación a este párrafo, comprobada objetivamente por EL VENDEDOR producirá la rescisión del contrato sin intervención judicial pudiendo disponer nuevamente del inmueble en la forma que desee.

PARRAFO III: Se conviene y pacta además, que en caso de que por error surja alguna diferencia en cuanto a la extensión del terreno objeto del presente contrato, LA COMPRADORA deberá pagar los metros que excedan en base a la actualización del precio al momento en que esta situación fuere determinada.

PARRAFO IV: Queda convenido entre las partes que el Estado dominicano reembolsará la diferencia o la totalidad de la suma pagada o permutará el área vendida a LA COMPRADORA, en los casos en que éste se exceda en la disponibilidad de terreno que posee, tomando en consideración que al momento del presente acto pudieran existir ventas que aun no han sido depositadas por ante el Registrador de Títulos correspondiente y/o los colindantes no estén deslindados.

CUARTO: Queda convenido y acordado entre las partes que en caso de que LA COMPRADORA realice la transferencia a un tercero del inmueble objeto del presente contrato, antes de haber saldado el precio de venta y ejecutado el traspaso por ante las oficinas del Registro de Títulos correspondiente, el nuevo adquiriente debe pagar un diez por ciento (10%) del valor actualizado del inmueble, establecido por el promedio de las tasaciones del sector privado y de esta Administración, por concepto de dicha transferencia.

QUINTO: En los casos de rescisión de contrato por falta imputable a LA COMPRADORA, las partes convienen y LA COMPRADORA así lo acepta, que EL VENDEDOR retenga el treinta por ciento (30%) de los valores pagados a la fecha de la desocupación del inmueble, a los fines de compensar el uso, los deterioros, y la depreciación que haya sufrido el inmueble. En caso de que la falta no sea imputable a LA COMPRADORA, le será devuelto el cien por ciento (100%) de los valores pagados a la fecha.

SEXTO: LA COMPRADORA se obliga a pagar todos los gastos que se originen como consecuencia del presente contrato, ya sean judiciales o extrajudiciales, y de manera particular, los impuestos relativos al traspaso del derecho de propiedad.

SEPTIMO: Cualquier violación a una de las cláusulas de este contrato o cualquier información falsa dada por LA COMPRADORA, comprobada objetivamente por EL VENDEDOR, dará lugar a la rescisión del contrato con la sola notificación a LA COMPRADORA.

OCTAVO: Para todos los fines del presente contrato, EL VENDEDOR, elige domicilio en la oficina de la Administración General de Bienes Nacionales y LA COMPRADORA en el inmueble objeto del presente contrato y en su defecto en la oficina del Procurador Fiscal del lugar en que se encuentra el inmueble.

NOVENO: Para todo lo no previsto en el presente contrato, las partes se remiten a las disposiciones legales especiales que rigen los contratos de venta de inmuebles del Estado y al Derecho Administrativo, y de manera supletoria, al Derecho Común.

HECHO Y FIRMADO de buena fe, en siete (7) originales, de un mismo tenor y efecto. En la ciudad de Santo Domingo, Distrito Nacional, capital de la República Dominicana, a los cuatro (4) días del mes de junio del año dos mil siete (2007).

VISTO: El contrato de venta de terreno entre el Estado dominicano y la señora Úrsula Brunilda Rodríguez Pérez.

R E S U E L V E:

UNICO: APROBAR el contrato de venta de terreno suscrito en fecha 3 de julio del año 2006, entre el Estado dominicano, debidamente representado en este acto por el Administrador General de Bienes Nacionales, señor Aristipo Vidal, de una parte, y de la otra parte, la señora Úrsula Brunilda Rodríguez Pérez, por medio del cual el primero traspasa a la segunda, a titulo de venta, una porción de terreno con una extensión superficial de ciento cincuenta y tres punto treinta y un metros cuadrados (153.31 Mts²), dentro del ámbito de la parcela No. 133-parte, del Distrito Catastral No. 15, del Distrito Nacional, del sector Los Mina, valorada en la suma de RD$95,818.75 (noventa y cinco mil ochocientos dieciocho pesos dominicanos con 75/100), que copiado a la letra dice así:

CONTRATO CONDICIONAL DE VENTA DE TERRENOS

ENTRE: De una parte el Estado dominicano, debidamente representado en este acto por el titular de la Administración General de Bienes Nacionales, institución del Estado dominicano, organizada y existente de conformidad con la Ley No. 1832, de fecha 3 de noviembre del año 1948, señor Aristipo Vidal, dominicano, mayor de edad, casado, funcionario público, portador de la Cédula de Identidad y Electoral No. 001-0012010-4, domiciliado en la calle Pedro Henríquez Ureña esquina Pedro A. Lluberes, de esta ciudad,

quien en lo que sigue del presente contrato se denominará EL VENDEDOR, o por su propio nombre, y de la otra parte, la señora Úrsula Brunilda Rodríguez Pérez, dominicana, mayor de edad, soltera, quehaceres domésticos, portadora de la Cédula de Identidad y Electoral No. 001-0457412-4, domiciliada y residente en la calle Peatón 5 No.9, El Invi, Los Mina, quien en lo que sigue del presente contrato se denominará LA COMPRADORA, o por su propio nombre.

PREAMBULO

POR CUANTO: A que el Administrador General de Bienes Nacionales requiere de un Poder otorgado por el Presidente de la República, para suscribir contratos de enajenación de inmuebles del Estado, razón por lo que LA COMPRADORA declara saber que este acto tiene un carácter provisional.

POR CUANTO: A que el Administrador General de Bienes Nacionales solicitará al Presidente de la República el referido Poder en lo relativo a las partes, el contenido y el objeto de este contrato, quedando acordado entre las partes que si el poder señalado es denegado, este contrato queda automáticamente rescindido, sin compensación alguna para LA COMPRADORA, salvo lo prescrito en el Acápite Quinto del presente acto, y en el momento de que fuere otorgado formará parte del mismo y conjuntamente con el contrato será remitido al Congreso Nacional para su aprobación en virtud de lo establecido por el Articulo 55, Numeral 10 de la Constitución.

POR CUANTO: LA COMPRADORA declara saber que será sólo tras la obtención de la aprobación del presente contrato por parte del Congreso Nacional, que el mismo adquirirá de pleno derecho un carácter definitivo y podrá ser inscrito en la oficina del Registro de Títulos correspondiente.

Por tanto y en el entendido de que el preámbulo que antecede forma parte integral del presente contrato, se ha convenido y pactado lo siguiente.

PRIMERO: EL VENDEDOR, vende, cede y transfiere, con todas las garantías de derecho a favor de LA COMPRADORA, quien acepta el siguiente inmueble:

> Una porción de terreno con una extensión superficial de ciento cincuenta y tres punto treinta y un metros cuadrados (153.31 Mts²), dentro del ámbito de la parcela No. 133-parte, del Distrito Catastral No. 15, del Distrito Nacional, del sector Los Mina, con los siguientes linderos: Al Norte: Peatón 5, Al Sur: Parcela No. 133-Resto, Al Este: Parcela No. 133- Resto; y Al Oeste: Parcela No. 133- Resto.

SEGUNDO: EL VENDEDOR justifica su derecho de propiedad respecto de la porción de terreno registrada a favor del Estado dominicano en la parcela No. 133, del Distrito Catastral No. 15, del Distrito Nacional, en virtud del Certificado de Título No. 62-819, según consta en la Certificación de fecha 18 de mayo del año 2006, expedida por el Registrador de Títulos del Distrito Nacional.

TERCERO: El precio acordado para la presente venta de terreno asciende a la suma de noventa y cinco mil ochocientos dieciocho pesos dominicanos con 75/100 (RD$95,818.75), a razón de seiscientos veinticinco pesos dominicanos con 00/100 (RD$625.00) el metro cuadrado, menos un cuarenta por ciento (40%) de descuento por concepto de pago total del terreno, o sea que LA COMPRADORA ha pagado a EL VENDEDOR la suma de cincuenta y siete mil cuatrocientos noventa y un pesos dominicanos con 25/100 (RD$57,491.25), mediante cheque No. 222 de fecha 28 de febrero del año 2006, del Banco BHD, según recibo de ingreso No. 27380 de fecha 7 de febrero del año 2006, expedido por la Administración General de Bienes Nacionales, por lo que el presente contrato sirve de constancia de pago y recibo de descargo.

PARRAFO I: El precio de seiscientos veinticinco pesos dominicanos con 00/100 (RD$625.00) el metro cuadrado, fue establecido tomando en consideración la tasación de fecha 6 de febrero del año 2006, realizada por el Departamento de Avalúo, en función del Dec. No. 329-98, de fecha 25 del mes de agosto del año 1998.

PARRAFO II: Queda convenido y acordado entre las partes que hasta tanto el presente contrato no adquiere un carácter definitivo, tras su aprobación por parte del Congreso Nacional, LA COMPRADORA no puede sin la autorización de EL VENDEDOR, suscribir arrendamientos, traspaso, venta, consentir hipotecas ni afectar en modo alguno como garantía el inmueble objeto del presente contrato, dado en primer lugar el carácter provisional del presente contrato y en segundo lugar el hecho de que el mismo es suscrito en razón de la evaluación y calificación de LA COMPRADORA, por lo que el mismo tiene un efecto intuitu personae. La violación a este párrafo, comprobada objetivamente por EL VENDEDOR, producirá la rescisión del contrato sin intervención judicial y podrá disponer nuevamente del inmueble EL VENDEDOR en la forma en que desee.

PARRAFO III: Queda convenido entre las partes que en caso de que por error surja alguna diferencia en cuanto a la extensión del terreno objeto del presente contrato, LA COMPRADORA deberá pagar los metros que excedan en base al precio estipulado anteriormente y en el caso contrario le será devuelta la diferencia del precio a su favor.

PARRAFO IV: Queda convenido entre las partes que el Estado dominicano reembolsará la diferencia o la totalidad de la suma pagada o permutará el área vendida a LA COMPRADORA, en los casos en que éste se exceda en la disponibilidad de terreno que posee, tomando en consideración que al momento del presente acto pudieran existir ventas que aún no han sido depositadas por ante el Registrador de Títulos correspondientes y/o los colindantes no estén deslindados.

CUARTO: Queda convenido y pactado entre las partes, que en caso de que LA COMPRADORA realice la transferencia a un tercero del inmueble objeto del presente contrato, antes de haber saldado el precio de venta y ejecutado el traspaso por ante las oficinas del Registro de Títulos correspondiente, el nuevo adquiriente debe pagar un diez por ciento (10%) del valor actualizado del inmueble, establecido por el promedio de las tasaciones del sector privado y de esta Administración, por concepto de dicha transferencia.

QUINTO: En los casos de rescisión de contrato por falta imputable a LA COMPRADORA, las partes convienen y LA COMPRADORA así lo acepta, que EL VENDEDOR retenga el treinta por ciento (30%) de los valores pagados a la fecha de la desocupación del inmueble, a los fines de compensar el uso, los deterioros, y la depreciación que haya sufrido el inmueble. En caso de que la falta no sea imputable a LA COMPRADORA, le será devuelto el cien por ciento (100%) de los valores pagados a la fecha.

SEXTO: LA COMPRADORA se obliga a pagar todos los gastos que se originen como consecuencia del presente contrato, ya sean judiciales o extrajudiciales, y de manera particular, los impuestos relativos al traspaso del derecho de propiedad.

SEPTIMO: Cualquier violación a una de las cláusulas de este contrato o cualquier información falsa dada por LA COMPRADORA, comprobada objetivamente por EL VENDEDOR, dará lugar a la rescisión del contrato con la sola notificación a LA COMPRADORA.

OCTAVO: Para todos los fines del presente contrato, EL VENDEDOR, elige domicilio en la oficina de la Administración General de Bienes Nacionales, LA COMPRADORA en el inmueble objeto del presente contrato y en su defecto en la oficina del Procurador Fiscal del lugar en que se encuentra el inmueble.

NOVENO: Para todo lo no previsto en el presente contrato, las partes se remiten a las disposiciones legales especiales que rigen los contratos de venta de inmuebles del Estado y al Derecho Común y Administrativo.

HECHO Y FIRMADO de buena fe, en siete (7) originales, de un mismo tenor y efecto. En la ciudad de Santo Domingo, Distrito Nacional, capital de la República Dominicana, a los tres (3) días del mes de julio del año dos mil seis (2006).

Dec. No. 224-14 que autoriza a la Corporación Dominicana de Empresas Eléctricas Estatales y a las Empresas Distribuidoras de Electricidad Edenorte, S.A., Edesur, S.A. y EdeEste, S.A., a hacer uso de una franja marítima, paralela al mar de 60 metros de ancho, comprendida dentro del ámbito de las parcelas Nos. 136 y 233 del D.C. No. 2, distrito municipal Catalina, municipio Bani, para desarrollar todas las construcciones para la ejecución del Proyecto Central Termoeléctrica Punta Catalina. G. O. No. 10764 del 18 de julio de 2014.

DANILO MEDINA
Presidente de la República Dominicana

NÚMERO: 224-14

CONSIDERANDO: Que el Estado dominicano tiene como objetivo fundamental procurar la eficiencia del servicio de suministro de electricidad en la República Dominicana.

CONSIDERANDO: Que en la actualidad la oferta de energía eléctrica en la República Dominicana no satisface la demanda de la población y constituye un obstáculo para el desarrollo integral de todos los sectores del país, por lo que se requiere aumentar la capacidad de producción de la energía eléctrica.

CONSIDERANDO: Que para incrementar la oferta de energía eléctrica, el Gobierno decidió, a través de la Corporación Dominicana de Empresas Eléctricas Estatales (CDEEE), lanzar en fecha 13 de mayo de 2013, la "Licitación Pública Internacional No. CDEEE-LPI-01-2013", para la selección del Contratista que ejecutará los trabajos de Ingeniería, Procura y Construcción (EPC) de dos (2) Unidades Termoeléctricas, en base a carbón mineral, con una capacidad de 300 MW (20%), a ser instaladas en el distrito municipal de Punta Catalina, Baní, provincia Peravia, República Dominicana, procedimiento que fue posteriormente ratificado mediante el Decreto No.167-13, del 21 de junio de 2013, modificado por el Decreto No.197-13, del 11 de julio de 2013, que declaró de emergencia nacional el aumento de la capacidad de generación eléctrica a bajo costo.

CONSIDERANDO: Que como resultado de la Licitación Pública Internacional No.CDEEE-LPI-01-2013, se dispuso que en los inmuebles ubicados dentro del ámbito de las Parcelas Nos. 136, 137 y 233, del Distrito Catastral No.2, del municipio de Baní, provincia Peravia, se desarrolle el Proyecto de instalación y puesta en operación de la Central Generadora de Electricidad a Carbón Mineral denominada "Central Termoeléctrica Punta Catalina", con una capacidad bruta de 752 MW (compuesta por dos unidades con una capacidad bruta de 372 MW cada una), que aportará una capacidad neta garantizada de 674.78 MW (337.39 MW por cada unidad), y todas las instalaciones comunes, incluyendo

sin limitación: (i) un puerto de descarga de carbón mineral y un sistema de recepción y manejo de carbón y combustibles líquidos; (ii) un sistema de captación y descarga de agua de mar, y (iii) todos los demás trabajos, infraestructuras e instalaciones requeridas por el éxito del Proyecto "Central Termoeléctrica Punta Catalina".

CONSIDERANDO: Que para fines de (i) construcción del muelle, atracaderos y obras de protección, así como rompeolas; (ii) realización de dragado en la zona marítima adyacente; (iii) construcción de la toma de agua de mar, y (iv) construcción de todas las demás obras asociadas al Proyecto "Central Termoeléctrica Punta Catalina", se requiere la autorización del Poder Ejecutivo, para el uso de la franja marítima localizada dentro del ámbito de las Parcelas Nos. 136 y 233, del Distrito Catastral No. 2, del municipio de Baní, provincia Peravia.

CONSIDERANDO: Que los trabajos de construcción de un muelle, en las inmediaciones y terrenos adyacentes a la "Central Termoeléctrica Punta Catalina", incluirán la construcción de un terraplén y una estructura de soporte construida principalmente por pilotes, tanto para el puente de acceso como para el muelle de atraque; un sistema de descarga de embarcaciones; un sistema de transporte de descarga a tierra mediante correas y tuberías; dragados de construcción y de mantenimiento del lecho marino; así como la realización de sondeos geológicos y batimétricos en la zona del mar adyacente a la costa; vías de acceso al muelle y, en general, todas las obras necesarias para la construcción segura de dichas instalaciones.

VISTA: La Constitución dominicana proclamada el 26 de enero de 2010, que dispone en su Artículo 128, literal 1, acápite i) con arreglo a la ley, todo lo relativo a las zonas aéreas, marítimas, fluviales, terrestres, militares y policiales, en materia de seguridad nacional, con los estudios previos realizados por los ministerios y sus dependencias administrativas.

VISTA: La Ley No.305, del 23 de mayo del 1968, que modifica el Artículo 49, de la Ley No. 1474, sobre Vías de Comunicación, del 22 de febrero del 1938 (G.O. No. 9082, del 29 de mayo de 1968).

VISTA: La Ley General de Medio Ambiente y Recursos Naturales No.64-00, del 18 de agosto de 2000, su Reglamento de Aplicación, instituido mediante el Decreto No.555-02, del 19 de julio de 2002, y sus respectivas modificaciones.

VISTA: La Ley Orgánica de Turismo No.541, del 31 de diciembre del 1969, y sus modificaciones.

VISTA: La Ley No. 84, del 26 de diciembre del 1979, que crea la Secretaria de Estado de Turismo.

VISTA: La Ley General de Electricidad No.125-01, del 26 de julio de 2001, su Reglamento de Aplicación, instituido mediante el Decreto No.555-02, del 19 de julio de 2002, y sus respectivas modificaciones.

VISTO: El Decreto No.167-13, del 21 de junio de 2013, modificado por el Decreto No.197-13, del 11 de julio de 2013, que declaró de emergencia nacional el aumento de la capacidad de generación eléctrica a bajo costo.

En ejercicio de las atribuciones que me confiere el Artículo 128, de la Constitución de la República Dominicana, proclamada el 26 de enero de 2010, dicto el siguiente:

DECRETO

ARTICULO 1: Se autoriza a la Corporación Dominicana de Empresas Eléctricas Estatales (CDEEE) y a las Empresas Distribuidoras de Electricidad Edenorte Dominicana, S.A. (EDENORTE), Edesur Dominicana, S.A. (EDESUR) y Empresa Distribuidora de Electricidad del Este, S.A. (EDEESTE), a hacer uso de la franja de sesenta (60) metros de ancho, paralela al mar, denominada "franja marítima", así también de la franja del mar adyacente al terreno, comprendida dentro del ámbito de las Parcelas Nos. 136 y 233 del Distrito Catastral No. 2, del distrito municipal Catalina, municipio de Baní, provincia Peravia, para desarrollar todas las construcciones requeridas para la ejecución del Proyecto "Central Termoeléctrica Punta Catalina", incluyendo de manera enunciativa y no limitativa: (i) la construcción del muelle, atracaderos y obras de protección, así como rompeolas; (ii) la realización de dragado en la zona marítima adyacente; (iii) la construcción de la toma de agua de mar, y (iv) la construcción de todas las demás obras asociadas, requeridas para la construcción y puesta en operación de toda la infraestructura relacionada con el Proyecto "Central Termoeléctrica Punta Catalina".

ARTÍCULO 2: Todos los departamentos oficiales, autoridades gubernamentales y funcionarios públicos prestarán el más amplio apoyo y efectiva colaboración a la CDEEE, a las Empresas Distribuidoras de Electricidad y a sus respectivos funcionarios para la ejecución del Proyecto "Central Termoeléctrica Punta Catalina" y sus obras asociadas, así como también para el cabal cumplimiento de las disposiciones contenidas en el presente Decreto.

ARTÍCULO 3: Envíese a la Corporación Dominicana de Empresas Eléctricas Estatales (CDEEE), al Ministerio de Obras Públicas y Comunicaciones, al Ministerio de Medio Ambiente y Recursos Naturales, al Ministerio de Turismo y al Abogado del Estado, para los fines correspondientes.

DADO en la ciudad de Santo Domingo de Guzmán, Distrito Nacional, capital de la República Dominicana, a los once (11) días del mes de julio del año dos mil catorce (2014), años 171 de la Independencia y 151 de la Restauración.
